' Authority to use for comment the Pharmacopœia of the United States of America, Eighth Decennial Revision, in this volume, has been granted by the Board of Trustees of the United States Pharmacopœial Convention, which Board of Trustees is in no way responsible for the accuracy of any translations of the official weights and measures or for any statements as to strength of official preparations.'

The Board of Inland Revenue have consented to recognise 'Squire's Companion to the British Pharmacopœia' as a 'well known' book of reference in connection with the exemption from Medicine Stamp Duty in favour of 'known, admitted and approved' remedies

PREFACE

TO EIGHTEENTH EDITION.

THE SEVENTEENTH EDITION of SQUIRE'S COMPANION was published in 1899, and since that time a great advance has been made in the testing of Drugs and Chemicals used in medicine, a very large number of new synthetic products have also been introduced. Several foreign Pharmacopœias have issued new editions, viz, Austrian, Belgian, Danish, Dutch, French, German, Italian, Russian, Spanish, Swedish, Swiss and United States, the Japanese is a new Pharmacopœia.

To bring SQUIRE'S COMPANION up to date and to make it conform to modern requirements, it has been necessary to practically re-write it from cover to cover. The general arrangement of the book remains the same as before. Substances which are official in the British Pharmacopœia have the names in larger type than those which are 'Not Official,' and the same distinction also applies to the preparations, it is therefore quite easy to see at a glance whether any particular substance or preparation is official or not. This is, moreover, supplemented by a list of 'Official' and 'Not Official' preparations given under each substance immediately following the dose, so that a prescriber can quickly ascertain the various forms in which any medicament can be given. Following the precedent of the previous editions, the formulas are given in parts, solids by weight, liquids by measure, and where it has been necessary to depart from this course, it is stated in the text. In dealing with German and other Continental Pharmacopœias, it must be understood that parts refer to parts by weight.

The arrangement of the matter and the headings to the several paragraphs, which have always been the distinctive feature of the COMPANION, have been retained. 'Solubility,' 'Medicinal Properties,' 'Dose,' 'Prescribing Notes,' 'Incompatibles,' list of 'Official Preparations,' 'Antidotes,' and 'Foreign Pharmacopœias,' this arrangement having been found very convenient to those who use the work as a book of reference. The term 'Medicinal Properties,' although very old fashioned, has been retained in order to keep the plan of the book uniform with previous editions, this portion has been carefully read and corrected by Dr. Taylor Grant.

The 'Descriptive Notes' have been written specially for this book by Mr. E. M. Holmes, they deal with the principal distinguishing features of the vegetable drugs, the commercial qualities, and the probable contaminations and sophistications. He has also assisted in the revision of the Organic Materia Medica.

The 'Tests' have been entirely re-written, and include a critical comparison of the tests given in the Pharmacopœias of Great Britain,

Germany, and the United States of America, together with such further tests as have been found useful in the laboratory of the Author. The French Codex, so recently published, could not be included in the critical comparison mentioned above, but the more important tests therein contained have been dealt with, and this work has delayed the publication of the COMPARISON beyond the time at which it was intended to have been ready.

The standardisation of preparations is exciting special interest, and considerable attention has been devoted to this subject, the standards and methods for ensuring them, which are employed in various Pharmacopœias are given, and are supplemented by figures which have been obtained from work devoted to this purpose in the author's laboratory.

A large number of formulas which appear in the British Pharmaceutical Codex are compared with those previously published in books of reference in common use.

The chapter on Therapeutic Agents of Microbial Origin has been revised and partly re-written by Dr. R. Tanner Hewlett.

The author wishes to acknowledge his indebtedness to the members of his staff who have assisted in the preparation of this edition, and to various friends who have supplied information on subjects with which their names have been particularly associated. His thanks are specially due to Mr Charles M. Caines, who has devoted the whole of his attention to the Chemical portion, and who has been the principal chemist employed on the experimental work.

P. W. SQUIRE.

413 Oxford Street,
November, 1908.

THE CONTENTS OF THIS BOOK

ARE ARRANGED AS FOLLOWS —

	PAGE
Preface	v
Abbreviations	viii
Symbols and Equivalent Weights of the Elementary Bodies	x
Weights and Measures of the British and other Pharmacopœias	xi
Metric Measures and Standards	xii
Weights Avoirdupois compared with the Metric	xiii
Imperial Weights and Measures with the Metric Equivalents	xiv
Thermometers—Fahrenheit, Centigrade, and Réaumur compared	xv
Alcohol Table	xvi
Beaumé's Hydrometer Table for Liquids heavier than Water	xvii
Table of Materia Medica of the Organic Kingdom, showing from what source the Drugs are obtained, and into what Preparations they enter	xviii
A tabulated comparison of the chief Standardised Potent Preparations of the British, United States, German and French Pharmacopœias	xxviii
Materia Medica arranged in Alphabetical Order, under which are given—first, all the Pharmacopœial Preparations, with the medicinal properties and doses, each of which is compared with those of the Continental Pharmacopœias and of the United States Pharmacopœia, then follow the Not Official Preparations, such as are frequently prescribed, but are not found in the British Pharmacopœia 1 to 1257	
Therapeutic Agents of Bacterial Origin	1260
Chemical Reagents, etc., used in Qualitative Testing	1269
Volumetric Analysis	1292
Indicators of Neutrality	1309
Thermometric Memoranda and Special Tests	1315
Spas of Europe, enumerating first those of Britain, afterwards the Continental, giving the Locality, Temperature, Season, and Medicinal Properties	1319
Spas classified as to their Temperature and Properties	1330
Therapeutical Classification of Remedies	1333
Remedies for Special Ailments	1342
General Index	1363

EXAMPLE *L '04*, i 56, refers to *Lancet*, 1904, Volume I, page 56

The British Pharmacopœia, published in 1898, is in this work compared with the latest editions of the foreign Pharmacopœias, which are as follows —

Austrian	published in 1906	Mexican	published in 1896
Belgian	" " 1906	Norwegian	" " 1895
Danish	" " 1907	Portuguese	" " 1876
Dutch	" " 1905	Russian	" " 1902
French	" " 1908	Spanish	" " 1905
German	" " 1900	Swedish	" " 1901
Hungarian	" " 1888	Swiss	" " 1907
Italian	" " 1902	United States	" " 1905
Japanese	" " 1907		

and are thus expressed — Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Norw., Port., Russ., Span., Swed., Swiss, U.S.

The following works have also been consulted — 'United States Dispensatory', Dorvault, 'L'Officine', Gray's 'Supplement', Gildemeister and Hoffmann, 'Volatile Oils', Parry, 'Chemistry of Essential Oils', Sutton, 'Volumetric Analysis', Pluckiger and Hanbury, 'Pharmacographia', Vogl, 'Anatomischer Atlas zur Pharmakognosie', Vogl, 'Pharmakognosie', Planchon and Collin, 'Les Drogues Simples d'Origine Végétale', Tschirch and Oesterle, 'Anatomischer Atlas', Moeller, 'Leitfaden zu Microscopisch pharmacognostischen Übungen', Schneider, 'Powdered Vegetable Drugs', Greenish and Collin, 'An Anatomical Atlas of Vegetable Powders', Koch, 'Die Microscopische Analyse der Drogenpulver.'

SYMBOLS, AND ATOMIC WEIGHTS OF THE ELEMENTARY BODIES, MENTIONED IN THE BRITISH PHARMACOPOEIA

H = 1.00

Elementary Bodies	Symbol and Atomic Weights	International Atomic Weights H = 1
Aluminium	Al = 26.90	26.90
Antimony (Stibium)	Sb = 119.00	119.00
Arsenium	As = 74.50	74.40
Barium	Ba = 136.40	136.40
Bismuth	Bi = 207.30	206.90
Boron	B = 10.85	10.90
Bromine	Br = 79.35	79.36
Calcium	Ca = 89.71	89.80
Carbon	C = 11.91	11.91
Cerium	Ce = 139.20	139.20
Chlorine	Cl = 35.19	35.18
Chromium	Cr = 51.71	51.70
Copper (Cuprum)	Cu = 63.12	63.10
Gold (Aurum)	Au = 195.70	195.70
Hydrogen	H = 1.00	1.00
Iodine	I = 125.90	125.90
Iron (Ferrum)	Fe = 55.60	55.60
Lead (Plumbum)	Pb = 205.35	205.35
Lithium	Li = 6.97	6.98
Magnesium	Mg = 24.18	24.18
Manganese	Mn = 54.52	54.60
Mercury (Hydrargyrum)	Hg = 198.80	198.50
Nitrogen	N = 13.91	13.98
Oxygen	O = 15.84	15.88
Phosphorus	P = 30.80	30.77
Platinum	Pt = 193.30	193.80
Potassium (Kalium)	K = 38.83	38.86
Silver (Argentum)	Ag = 107.11	107.12
Sodium (Natrium)	Na = 22.88	22.89
Sulphur	S = 31.82	31.88
Stannum	Sn = 118.20	118.10
Zinc	Zn = 64.91	64.90

THE WEIGHTS AND MEASURES OF THE BRITISH PHARMACOPŒIA
AT THE TEMPERATURE OF 60° FAHRENHIT

WEIGHTS

The Avoirdupois pound = 16 oz = 7000 grains
 1 oz = 437 5 grains
 1 gr = 1 grain

In addition to the use of the Imperial weights it is permitted in the Act of 1878 that drugs when sold by retail may be sold by apothecaries' weight. The use in trade of a weight or measure of the metric system was made lawful by the Weights and Measures (Metric System) Act, 1897.

The Preface to the British Pharmacopœia states 'It is strongly urged upon all medical men to avoid the use of the terms ounce and pound with reference to any other than the avoirdupois or Imperial standard weight, but it is still optional with the physician in *prescribing* to use the symbols ℥ (scruple) and ℥ (drachm), the former representing 20 and the latter 60 grains. In the measurement of liquids the Imperial measure is used for higher denominations, and the fluid ounce and its subdivisions into fluid drachms and minims for the lower denominations of volume.'

MEASURES

The Imperial gallon contains 277 274 cubic inches of distilled water at 60° F

℥ 1 gallon	= 8 pint,	weighing 10 pounds,	contains 76,800 minims
℥ 1 pint	= 20 fluid ounces	1½ "	" 9,600 "
℥ oz 1 fluid ounce	= 8 fluid drachms	437 5 grains	" 480 "
℥ dr 1 fluid drachm	= 60 minims	54 68 "	" 60 "
℥ m 1 minim		91 grain	" 1 minim

It must be remembered that the minim is less than the grain measure, 109 7148 minims (taken as 110 minims throughout *B.P.* '94) = the volume of 100 grains of Water at 60° F (15 5° C).

To find the capacity in gallons of any rectangular vessel, multiply the length in inches by the breadth, and the product by the depth in inches, then divide the total by 277 274, which is the number of cubic inches contained in the gallon.

To find the capacity in gallons of a cylindrical vessel, multiply the square of half the diameter in inches by 8 1416 and the resulting figure by the depth in inches, divide the result by 277 274.

Graduated measures may be checked with good weights and scales, and distilled water. Every fluid ounce of distilled water at 60° F (15 5° C) weighs an ounce avoirdupois, but there are two lines on the surface of a liquid; the upper one is that of capillary attraction to the sides of the vessel, the lower one the exact surface of the fluid. This should be on a line with the eye to measure accurately.

The Continental Pharmacopœias give the formulas in parts by weight; in some instances the gramme is indicated as the unit. The formulas in the United States Pharmacopœia are given in grammes and cubic centimetres.

The British Pharmacopœia still gives the formulas in weights and measures, both by the Imperial and the metric systems. Liquids are as a rule ordered by measure, but there is no uniformity in this: for instance, in *Tinctura Terebinthina Aceticum* the Chloral Acetic Acid is weighed, but in *Acetum Cantharidis* it is measured, in *Oxymel* the clarified Honey is weighed, but in *Oxymel Scillæ* it is measured. Glycerin and other fluids, in some preparations are weighed, in others they are measured.

METRICAL MEASURES.

ALSO RELATION OF THE METRICAL MEASURES TO THE
MEASURES OF THE BRITISH PHARMACOPEIA.

LENGTH.

1 Millimetre	the thousandth part of a metre, or 0.001 metre	= 0.03937 inch.
1 Centimetre	the hundredth " "	0.01 " 0.39371 "
1 Decimetre	the tenth part " "	0.1 " 3.93708 inches.
1 Metre	89.87079 inches, or 1 yard 3.37 inches nearly.	

1 Line	$\frac{1}{12}$ inch	
1 Inch	$\frac{1}{12}$ foot	0.02540 metre, or 25.40 millimetres.
12 Inches	1 foot	0.30480 metre, or 30.48 centimetres
36 "	3 feet 1 yard	0.91440 metre.

Length of pendulum vibrating seconds of mean time in the
latitude of London, in a vacuum at the level of the sea } 39.1393 inches.

It is remarkable that the English and French standards, taken from such
different sources, should so nearly agree

The English, from the length of a pendulum vibrating seconds of
mean time, from which the yard (36 inches) is computed } 39.1393.
The French being the ten-millionth part of a quarter of the
earth's meridian, and called a metre } 39.37079

CAPACITY.

1 Millilitre	= 1.00016 cubic centimetre, or the volume of 1 gramme of water at 4°C.	
1 Centilitre	=	10 grammes " "
1 Decilitre	=	" 100 " " "
1 Litre or 1000 Millilitres	} 1.00016 cubic decimetre	" 1000 " (1 kilo) "

1 Cubic Centimetre = .00084 millilitre.

1 Cubic Decimetre (1000 c c) = .00084 litre.

1 Cubic Centimetre = 15.48286 grain measures of 16.9 minims nearly.

1 Litre = 1.7598 pints, 35½ fl. oz. and 11 minims, or 16482.848 grain-measure.

1 Gallon = 4.5460821 litres.

1 Pint = 568.2454 litre, or 568.336 cubic centimetres nearly.

1 Fluid Ounce = .0284128 litre, or 28.417 cubic centimetres nearly

1 Fluid Dram = .008652 litre, or 8.652 cubic centimetres nearly

1 Minim = .000059 litre, or .056 cubic centimetre nearly.

EQUIVALENTS OF ENGLISH WEIGHTS TO FRENCH GRAMMES.

1 pound avoirdupois	7000 grains.	or 16 ounces.	= 458 592 French grammes
	5562 5	or 15	= 425 2425 " "
	5125	or 14	= 396 8925 " "
	5687 5	or 13	= 368 5435 " "

38	1 355	77	2 180

SPECIFIC GRAVITY of Syrups, etc., may be tested with a ten ounce measure
Ten measured ounces of simple syrup should weigh nearly thirteen ounces and
146 grains representing the sp. gr. 1 330.

MATERIA MEDICA TABLE

See Notes

R. P. Name	Obtained from	Natural Order	Geographical Source
Acacia Cortex.	Acacia Arabica and Acacia decurrens	Leguminosæ (Fabaceæ)	Africa, Australia and India
Acacia Gummi	Acacia Senegal, and other species	"	Rhodesia in East of Africa
Acalypha	Acalypha Indica	Euphorbiaceæ	India
Aconiti Folia	Aconitum 'Napellus'	Ranunculaceæ	Britain
Aconiti Radix	"	"	"
Aconitina	"	"	"
Adeps Iamæ	Ovis Ariæ	Ungulata	Domesticated everywhere
Adops	Sus Scrofa	"	"
Adhatoda	Adhatoda Verrea (Justicia Adhatoda)	Acanthaceæ	India
Agropyrum	Agropyrum repens	Graminaceæ	Europe, North America, and Asia
Ajowan Oleum	Carum Copticum	Umbellifera (Apiaceæ)	India, Egypt and Persia
Aloe Barbadosensis	Aloe Chinensis, A vera, and probably other species	Liliaceæ	(Dutch West Indian Islands) and Barbados
Aloe Socotrina	Aloe Perryi and probably other species	"	Socotria (shipped by way of Bombay and Zanzibar)
Alstonia	Alstonia scholaris Alstonia constricta	Apocynaceæ	India, the Philippine Islands, Australia
Ammoniacum	Dorema Ammoniacum and other species	Umbellifera	Persia
Amygdala Amara	Prunus Amygdalus (var amara)	Rosaceæ	(South of France, Sicily, and Morocco)
Amygdala Dulcis	Prunus Amygdalus (var dulcis)	"	Spain, Portugal, and South of France
Amygdala Oleum	Both of the above	"	" " "
Amylum	Triticum sativum (wheat). Zea 'Mays' (maize). Oryza sativa (rice)	Graminaceæ	(Cultivated in various parts of the world)
Andrographis	Andrographis paniculata	Acanthaceæ	India, Ceylon, Java
Anethi Fructus	Poucedanum graveolens	Umbellifera	(Ireland, Middle and South of Europe)
Anisi Fructus	Pimpinella Anisum.	"	(Central and Southern Europe, etc.)
Anisi Oleum	Illicium anisatum	Magnoliaceæ	(Distilled in Europe and in China)
Anthemidis Flores	Anthemis nobilis	Compositæ (Asteraceæ)	(Britain and Belgium, cultivated)
Anthemidis Oleum	" "	"	(Britain and Belgium, and France, etc.)
Apomorphina Hydrochloridum	Morphina or Codeina	see Opium	see Opium
Arachidis Oleum	Arachis hypogæa	Leguminosæ	(Tropical Africa, China, India, etc., cultivated)

OF THE ORGANIC KINGDOM.

on p xxxvi

Parts used

Preparations into which it enters

Dried bark	Decoctum Acacie Corlicis
Gum exuded from stem and branches	Mucilago Acacie Pulv Amygdalæ Co and Pulv Tragaanth Co All Trochisci
Fresh and dried herb	Extractum Acalyphæ Liquidum, and Succus Acalyphæ
Fresh leaves and flowering tops	
Dried root	Lanimum, and Tinctura Aconiti, and Aconitina
Dried root	Unguentum Aconitine
The purified cholesterol fat of sheep's wool	Adeps Laniæ Hydrosus
Purified fat of the abdomen	Adeps Benzoeatus, Empl Canthar, Pilula Phosphori, Unguenta Aconitine, Atropinæ, Cocainæ, Hydrargyri, Hydrag Nitratis, Iodi, Resinæ, and Veratrinæ
Fresh and dried leaves	Extractum Adhatodæ Liquidum, Succus Adhatodæ, and Tinctura Adhatodæ
Dried rhizome	Decoctum Agropyri, and Extractum Agropyri Liquidum
Distilled from fruit	
Juice of the leaf evaporated to dryness	Mom Decoct Aloe Co Ext Aloe Barb, Ext Coloc Co, Pil Aloe Barb, Pil Aloes et Ferri, Pil Cambogiæ Comp, Pil Colocynthidis Co, Pil Colocynthidis et Hyoscyami Tinctura Aloes
Juice of the leaf evaporated to dryness	Mom Ext Aloes Socotrine, Pil Aloes et Asafetidæ, Pil Aloes et Myrrha, Pil Aloes Socot, Pil Rhei Co, Tinct Benzoin Co
Dried bark	Infusum Alstoniæ, and Tinctura Alstoniæ
Gum resinous exudation from the flowering and fruiting stem	Emplastrum Ammoniaci c Hydrargyro, Emplast Galbani, Mistura Ammoniaci, Pilula Scillæ Co, Pil Ipecac c Scillâ.
Ripeseed	Oleum Amygdalæ
Ripeseed	Oleum Amygdalæ, Pulvis Amygdalæ Compositus, Mistura Amygdalæ
Expressed oil from seeds	Ol Phosphoratum, Unguenta Aquæ Rosæ, and Cetacei
Starch	Glycerinum Amyli, Pulvis Tragacanth Co
Dried plant	Infusum Andrographidis, Laquor Andrographidis Concentratius, and Tinctura Andrographidis.
Dried ripe fruit	Aqua Anethi, Oleum Anethi
Dried ripe fruit	Aqua Anisi, Oleum Anisi
Oil distilled from fruits	Spiritus Anisi, Tinct Camph Co, Tinct Opi Ammoniacata
Dried expanded flower heads or capitula	Extractum and Oleum Anthemidis The latter is also used in the preparation of the Extract
Volatile oil	Extractum Anthemidis
Salt of the alkaloid	Injection Apomorphinæ Hypodermica
Expressed oil, without heat	

R.P. Name	Obtained from	Natural Order	Geographical Source
Araroba	Andia 'Araroba'	Leguminosae	Brazil (Bahia)
Areca	Areca Catechu	Palmaceae	Malayan Archipelago
Aristolochia	Aristolochia Indica	Aristolochiaceae	India and Holland
Arnicae Radix	Cochlearia <i>Arnica</i>	Cruciferae (Brassicaceae)	Britain, cultivated
Arnicae Flores	Arnica montana	Compositae	Mountainous parts of Middle and Southern Europe
Arnicae Rhizoma	" "	" "	" "
Asafoetida	<i>Perula fetida</i> , and " " " "	Umbelliferae	Afghanistan and Persia
Atropina	<i>Belonia</i> <i>Atropa</i> <i>Folia</i>	Solanaceae	Britain, Germany, Austria, etc.
Aurantii Floris Aqua	<i>Citrus Aurantium</i> var 'Bigaradia'	Rutaceae	South of Europe
Aurantii Cortex	" "	" "	" "
Aurantii Cortex Indicus	<i>Citrus Aurantium</i>	" "	India and Ceylon
Asadirachta Indica	<i>Melia Asadirachta</i>	Meliaceae	Southern India, Ceylon
Balsamum Peruvianum	<i>Myroxylon Peronae</i>	Leguminosae	San Salvador, in Central America
Balsamum Toluianum	<i>Myroxylon Toluifera</i>	" "	New Granada
Bebeeru Cortex	<i>Nectandra Rodiei</i>	Lauraceae	Guiana
Belle Fructus	<i>Aegle Marmelos</i>	Rutaceae	India
Belladonna Folia	<i>Atropa Belladonna</i>	Solanaceae	Britain
Belladonnae Radix	" "	" "	Britain, Germany, etc.
Benzoinum	<i>Styrax Benzoin</i> and other species	Styracaceae	Siam and Sumatra
Berberidis Cortex	<i>Berberis vulgaris</i>	Berberidaceae	Britain
Berberis	<i>Berberis aristata</i>	" "	India and Ceylon
Betel	<i>Piper Betle</i>	Piperaceae	India, Ceylon, etc.
Bryoniae Radix	<i>Bryonia dioica</i> <i>Bryonia alba</i>	Cucurbitaceae	England and Central and Southern Europe
Buchu Folia	<i>Barosma betulina</i>	Rutaceae	Cape Colony
Butea Gummi	<i>Butea frondosa</i>	Leguminosae	India
Butea Seminum	" "	" "	" "
Cardianum Oleum	<i>Juniperus Oxycedrus</i> and other species	Coniferae (Pinaceae)	Southern Europe
Caffeina	<i>Camellia Thea</i> <i>Coffea Arabica</i>	Camelliaceae Rubiaceae	China, Japan, and Upper India Cultivated throughout the Tropics (native of Abyssinia)

Parts used	Preparations into which it enters
{ A substance found in cavities in the trunk of Andira Araroba, freed as much as possible from fragments of wood, dried and powdered }	Chrysaroban, of Chry-aroban, Ung Chrysaroban
Seeds	
Dried stem and root	Liquor Aristolochie Concentratus, and Tinctura Aristolochie
Fresh root	Spiritus Armoracis Compositus
Dried flower-heads	Tinctura Arnicæ Florum
Dried rhizome and roots	Tinctura Arnicæ
Gum resin	{ Pil Aloes et Asafetide, Pil Galbani Co, Spiritus Ammoniacæ Fœtidus, Tinctura Asafetide
Alkaloid	Unguentum Atropine, Atropine Sulphas, Lamelle Atropine and Liquor Atropine Sulphatis
Distilled water of flowers	{ Syrupus Auranti Floris, Mistura Olei Ricini, Syrupus Calcii Lactophosphatis
Dried outer part of the rind	{ Fresh Peel Tinctura Auranti, Vinum Aurant, Syrupus Auranti, Tinct Quina, Syrupus Aromaticus, and Syrup Cascara Vinat Dried Peel Inf Auranti, Inf Aurantil Comp, Inf Gentian Comp, Tinct Cinchon Comp, Tinct Gentian Comp, Spirit Armoracis Comp
{ The fresh and dried outer part of the rind }	
Dried bark of the stem	Infusum Azadirachtæ Indice, and Tinctura Azadirachtæ
Balsam, from the trunk	
Balsam, from the trunk	{ Mist Ammoniaci, Syrupus Tolutanus, Tinct Tolutana, Tinct Benzoin Co, Tolu Basis, Troch Acidi Carbolici, Troch Morphine, Troch Morphine et Ipecacuanhæ
Dried bark	
Fresh half-ripe fruit	Extractum Belladonnæ Liquidum
Fresh leaves and branches	Extract Belladonnæ Viride, Succus Belladonnæ, Atropina, Atropina, Emplast Belladonnæ, Extract Belladonnæ Alcoholium, Extractum Belladonnæ Liquidum, Linimentum Belladonna Tinct Belladonna, Ung Belladonnæ, Suppos Belladonnæ
Dried root	{ Acidum Benzoicum, Adeps Benzoeatus (and Ointments containing it), Tinct Benzoin Co, Ung Cæteri Extractum Berberidis Fluidum, Berberine Phosphas Liquor Berberidis Concentratus, and Tinctura Berberidis.
Balsamic resin	
Dried bark	
Dried stem	
Leaves	
Fresh and dried root	Tinctura Bryoniæ
Dried leaves	Infusum Buchu, Tinctura Buchu
Impassated juice from stem	
Seeds	Pulveris Butei Seminum
{ An empyreumatic oily liquid obtained by destructive distillation of the branches and wood }	
{ Alkaloid from leaves of tea or seeds of coffee }	Cassanea Citras, Cassanea Citras Effervescens.

B.P. Name.	Obtained from	Natural Order	Geographical Source
Cajuputi Oleum	Melaleuca leucadendron	Myrtaceæ	{ Imported from Batavia and } Singapore
Calendula Flores	Calendula officinalis	Compositæ	Texas and Southern Europe
Calotropis . . .	{ Calotropis pinnatifida } { Calotropis gigantea }	Asclepiadaceæ	India
Calumbæ Radix	Jateorhiza 'Calumbæ'	Menispermaceæ	{ Eastern Africa, between India } and the Zambesi
Cambogia	Garcinia Hanburyi	Clusiaceæ	Siam
Cambogia Indica	Garcinia Morella	"	India
Camphora . . .	Cinnamomum Camphora	Lauraceæ	{ China (Formosa) and Japan } { (produced in Britain and } elsewhere)
Canellæ Cortex	Canella alba	Canellaceæ	West Indies
Cannabis Indica	Cannabis sativa	Urticaceæ	India
Cantharis . . .	Cantharis vesicatoria	Coleoptera	Spain, France, Sicily, Hun }
Caoutchouc . .	Hevea Brasiliensis	Euphorbiaceæ	{ ary, and Southern Russia } { Brazil (Para)
Capsici Fructus .	Capsicum minimum	Solanaceæ	Zanzibar, Sierra Leone, etc.
Carbo Ligni . .	Wood	Various	Britain
Cardamomi Semina	Elettaria Cardamomum	Scitamineæ	India and Ceylon
Carrageen . . .	Chondrus crispus	{ Algae } { (Gelatinifera) }	{ (North Cape to Gibraltar) } { (Eastern Coasts of N. America)
Carui Fructus.	Carum Carvi . . .	Umbellifera	Europe
Carui Oleum . .	" "	"	Central and Northern Europe
Caryophylli Oleum	Eugenia caryophyllata	Myrtaceæ	{ Molucca Islands, Zanzibar, } { and Pemba }
Caryophyllum	" "	"	{ Zanzibar, Penang, Bon } { eolien, etc }
Cascara Sagrada	Rhamnus Purshiana	Rhamnaceæ	California
Cascarilla . . .	Croton Elateria	Euphorbiaceæ	Bahama Islands
Cassia Pulpa	Cassia fistula . . .	Leguminosæ	East and West Indies
Castoreum	Castor Fiber . . .	Rodentia . . .	Siberia and Canada
Catechu	Uncaria 'Gambier'	Rubiaceæ . . .	{ Singapore, and other places } { in the Eastern Archipelago }
Catechu Nigrum } (Pegu Catechu } and Gutch) . . }	Acacia Catechu . . .	Leguminosæ . .	India and Burma
Cera Alba . . .	Apis mellifica . . .	Hymenoptera .	Britain
Cera Flava . . .	" "	"	Britain, etc.
Cetaceum	Physoter macrocephalus	Cetacea	Pacific and Indian Oceans .
Cetraria	Cetraria Islandica	{ Discomycetes } { or Disco- } lichones . . . }	North of Europe

Parts used	Preparations into which it enters
{ Volatile oil distilled from the leaves	{ Spiritus Cajuputi, Lin Crotonis
Dried florlets	
Dried root bark	
{ Dried transversely cut slices of the root	{ Infusum, Liquor Columbe Concentratus, and Tinct Columbe
Gum resin	
Gum resin	Pilula Cambogire Composita
{ A white crystalline substance obtained from the wood	{ Aqua Camph, Linimenta Acroni, Belladonnae, Camph, Camph Ammoniatum, Chloroformi, Hydrargyri, Opii, Saponis, Sinapis, Terbinthinae and Terob Aceticum, Spiritus Camph, Tinct Camph Co, Ung Hydrarg Co
Dried bark	
{ Dried flowering or fruiting top of female plants	{ Extractum Cannabis Ind, Tinctura Cannabis Ind, Tinct Chlorof et Morphinae Comp
The dried beetle	
Prepared milk juice	{ Acetum, Emplastrum, Tinctura and Unguentum Cantharidis, Colloidium Vesicans, Liquor Epispast, Emplast Calofaciens, Liquor Crotonis, Charta Sinapis
Dried ripe fruit	{ Tinctura Capsici, Tinct Chlorof et Morphinae Comp, Ung Capsici
{ Carbonaceous residue from wood	{ Tinct Cardui Co, Ext Coloc Co, Pulv Cinnam Co, Pulv Ciste Arom, Tinct Gentian Co, Tinct Rhei Co, Decoct Aloes Comp, Mist Sennae Comp
The dried ripe seeds	
Dried seaweed	Saccharum, and Gelatina Carrageen
Dried fruit	{ Aqua and Oleum Carui Conf Piperis, Pulvis Opi Compositus, Tinct Cardui Co, Tinct Sennae Co, Pil Aloes Barb
Volatile oil	Pilula Aloes Barbadosensis
Volatile oil	{ Pilula Colocynthis, Composita, Pilula Colocynthis et Hyoscyami
Dried flower buds	{ Infusum and Oleum Caryophylli, Inf Aurant Co, Pulv, Creta Aromat, Pil Coloc Co, Pil. Coloc et Hyoscyami.
Dried bark	{ Ext Cascar Sagrada, Ext Cascar Sagrad Liquid, Syrup Cascar Aromaticus
Dried bark	{ Infusum and Tinctura Cascarilla
Pulp from the pods	
{ Dried preputial follicles and secretion	{ Confectio Sennae
{ An extract of the leaves and young shoots	
Extract from the wood	{ Tinctura Castorei
Honeycomb, wax, bleached	{ Pulvis Catechu Compositus, Tinctura Catechu, Trochiscus Catechu
Honeycomb	{ Pilula Phosphori, Suppositoria Acidi Carbolic, Unguentum Aqua Rosae, and Unguentum Cetacei
{ A concrete fatty substance, mixed with oil, obtained from the head of the sperm whale, purified	{ Emplast Calofaciens, Cantharidis, Pielis; Unguenta Hydrarg Co, Menthol, Pielis Liquid, Rosinum, and Staphisagriae Cera Alba
Dried lichen	
	{ Pilula Phosphori, Suppos Acidi Carbolic, Ung Aquae Rosae, Ung Capsici
	Unguentum Cetacei, Ung Aquae Rosae and Ung Capsici
	Decoctum Cetrariae, Saccharum Cetrariae, Gelatina Cetrariae

R P Name	Obtained from	Natural Order	Geographical Source

Coriandri Fructus	Coriandrum sativum . .	Umbelliferae	Germany and Britain, etc . .
Coriandri Oleum			
Cocœinium	Cocœinium fenestratum . .	Menispermaceæ	Ceylon and Southern India
Coto	{ Botanical source uncertain . .	Lauracæ	New Granada
Orocus	Crocus sativus	Iridacæ	Spain and Persia, etc . .
Crotonis Oleum	Croton Tigillum	Euphorbiacæ	{ Hindostan, Ceylon, and Indian Archipelago . .
Jubææ Fructus	Piper Cubeba	Piperacæ	Java
Cucurbitæ Semina Preparata	Cucurbita maxima (Cucurbita Pepo) . .	Cucurbitaceæ	{ Italy, West Indies, Burma, and South America, cultivated . . .
Cuxara	Strychnos toxifera, etc. . .	Loganiacæ	South America
Cuspariæ Cortex	Cusparia febrifuga	Rutacæ	Tropical South America
Cuxa	Brayera anthelmintica . .	Rosacæ	Abyssinia
Cydonium	Pyrus Cydonia	"	Western Asia and Europe . .
Damiana	{ Turnera aphrodisiaca, etc	Turneracæ	Mexico and California . .

Parts used	Preparations into which it enters
Dried plant	Infusum, Liquor Chiratae Concentratus, and Tinctura Chiratae
Dried rhizome and roots	Ext Cinchifugae Liquid, Tinct Cinchifugae
Dried bark	Used in the preparation of the official Salts of Quinine
Dried bark	{ Its use is permitted for the manufacture of the official Salts of Quinine
{ Dried bark of stem and branches of cultivated plants }	{ Ext Cinchon Liquid, Inf Cinchon Acid; Tinct Cinchonae, Tinct Cinchon Comp, Quinine
{ The dried inner bark of shoots from the truncated stocks }	{ Aqua, Oleum, Pulvis Co, and Tinct Cinnamomi, Pulvis Catechu Comp Tinct Catechu, Decoct Hamatoxyli, Pulv Crotae Arom, Pulv Kino Co, Tinct Cardam Co., Tinct Lavand Co, of the Water, Mist Crotae, Mist Guaiaci, Mist Olei Ricini, Mist Spiritus Vin Gallici, Syrupus Aromaticus and Syrupus Cascariae Aromaticus
Volatile oil from bark	{ Spiritus Cinnamomi, of the Compound Powder, Pil. Aloes et Ferri, and Pil Cambogiae Composita, of the Spirit, Acidum Sulphuricum Aromaticum
Dried root	Decoctum Cassiaepae, and Extractum Cassiaepae Liquidum
Dried leaves	Ext Cocae Liquid, Cocaine Hydrochloridum, Cocaine
Salt of the alkaloid	Lamellae Cocaine and Injectio Cocaine Hypodermica
Dried fecundated female insect	Tinctura Cocci, Tinct Cardam Co, Tinct Cinchonae Co
Fresh corn dried	Extractum and Vinum Colchici
Dried ripe seeds	Tinctura Colchici Scammum
{ Dried pulp of the fruit freed from seeds }	{ Extractum Coloc Co, Pil Coloc Co, Pil Coloc et Hyoscyam
Dried bark	
{ Fresh leaves and young branches }	Succus Conii, Unguentum Conii (from Succus)
Dried full-grown unripe fruits	Tinctura Conii
Oleo resin from the trunk	Oleum Copaibae
Distilled oil from oleo resin.	
Dried ripe fruit	{ Oleum Coriandri, Conf Sennae, Syrupus Rhei et Tinct Rhei Co, Syrupus Sennae et Tinct Sennae Co
Volatile oil.	
Dried stem	{ Infusum Coccini, Liquor Coccini Concentratus, and Tinctura Coccini
Bark	
{ The dried stigmas and tops of the styles }	Tinctura Croci, Decoct Aloes Co, Tinct Cinchon Co
Expressed oil from the seeds	Linimentum Crotonis
Dried full grown unripe fruits.	Oleum Cubebae, Tinctura Cubebae
Fresh ripe seeds.	
Extract from plant	
Dried bark	
{ Dried panicles of pistillate flowers. }	Infusum Cuspariae, and Liquor Cuspariae Concentratus
Seeds.	
Leaves

Gualaci Lignum .	<i>Gualacum officinale</i> or <i>Gualacum sanctum</i> .	Zygophyllaceæ .	St. Domingo and Jamaica .

Parts used

Preparations into which it enters

Dried leaves

Dried seeds

Dried leaves

Nearly ripe fruit

Oleo resinous exudation

Fluit

The sclerotium of *Claviceps purpurea*, originating in the ovary of *Saccharale*

Bark

Distilled oil from the fresh leaves

A ruby coloured exudation

Dried root bark

Dried herb

Concrete resinous juice

The purified ox bile

Dried fleshy receptacles

Dried rhizome

Dried ripe fruit

Dried seaweed

Gum-resin

Excrecences caused by the punctures and deposition of an egg or eggs of *Cynips Galla tinctoria*

Distilled oil

Dried rhizome and roots

Dried rhizome and roots

The peeled root and peeled subterranean stem

Dried root bark

Hairs of the seed

Distilled oil 'Oil of Verbena'

Dried bark of the stem and root

Dried leaves and flowering tops

Heart wood

Resin from the stem

Tinctura Daturæ Seminum

Infusum and Tinctura Digitalis

Elatium, Pulvis Elatium Compositus

Extractum Ergotæ, Extractum Ergotæ Liquidum, Infusum Ergotæ, and Tinctura Ergotæ Ammoniata, Ergotinum, Inject Ergotæ Hypodermi

Unguentum Eucalypti

Trochiscus Eucalypti Gummi

Extractum Euonymi Siccum

Confectio Sennæ

Extractum Filicis Liquidum

Aqua Fœniculi, Pulv Glycyrrhizæ Co

Pil Galbani Co

Acidum Gallicum and Tannicum, Tinct Gallæ, Ung Gallæ, and Ung Gallæ c Opio

Tinct Gelsemi

Extractum, Infusum Co, and Tinct Gentianæ Co

Extract, Ext Liquid, Liquor Sarsæ Comp Conc, and Pulv Glycyrrh Co, Pil Hydr Of the Extract, Conf Sennæ, and Decoct Aloes Comp Of the Liquid Extract, Mistura Sennæ Comp, and Tinctura Aloes

Decoctum Gossypii Radicis Corticis, and Extractum Radicis Corticis Liquidum

Pyroxylin

Decoctum Granati Corticis

Extractum Grindeliæ Liquidum

Liquor Sarsæ Compositus Concentratus

Mist Guaiaci, Pil Hydrarg Subchlor Co, Tinct Guaiaci Ammon Trochiscus Guaiaci Resinæ

B.P. Name	Obtained from	Natural Order.	Geographical Source
Gummi Indrieum	Anogeissus latifolia	Combretaceae	India and Ceylon.
Gynocardia Oleum	Taraktogenos Kurzii	Bixaceae	India, Eastern
Hæmatoxylum Lig- num	Hæmatoxylum Campe- chianum	Leguminosae	Campechy, Honduras, and Jamaica
Hamamelidis Cor- tex	Hamamelis Virginiana	Hamamelidaceae	United States and Canada.
Hamamelidis Folia	"	"	"
Hemidesmus Radix	Hemidesmus Indicus	Asclepiadaceae	India and Ceylon
Hirudo	Sanguisuga {medicinalis (speckled) offenalis (green)}	Hirudinea	Spain, France, Italy, Hungary
Hirudo Austriaca	Hirudo quadrata (Linn.) (Lamellidella quad- rata)	"	Australia
Hydrastis Rhizoma	Hydrastis Canadensis	Ranunculaceae	United States and Canada.
Hygrophila	Hygrophila spinosa	Acanthaceae	India
Hyoscyami Folia	Hyoscyamus niger	Solanaceae	Britain and Germany, etc
Ignatia amara	Stychnos Ignatii	Loganiaceae	Philippines
Ipecacuanha Radix	Psychotria Ipecacuanha	Rubiaceae	Brazil and Selangor
Iris	Iris versicolor	Iridaceae	United States
Isapgula	Isotriaena ovata	Plantaginaceae	India and Persia
Jaborandi Folia	Piper Jaborandi	Rutaceae	Brazil (Pernambuco)
Jalapa	Ipomoea 'Purga'	Convolvulaceae	Mexico (cultivated in Ja- maica and India)
Juniperi Oleum	Juniperus communis	Coniferae	North of Europe, indigenous
Kaladana	Ipomoea hederacea	Convolvulaceae	India and Persia
Kamala	Mallotus Philippinensis	Euphorbiaceae	Ceylon, the Philippines, etc.
Kava Rhizoma	Piper Methysticum	Piperaceae	China, Australia, etc.
Kino	Pterocarpus marsupium	Leguminosae	Sandwich Islands
Kino Eucalypti	" eucalyptia	Myrtaceae	Malabar
Kola	Cola acuminata	Sterculiaceae	Western Australia
Krameria Radix	Krameria radialis (Peruvian) Krameria argentea (Pará)	Polygalaceae	West Coast of Africa.
Lactuca	Lactuca virosa	Compositae	Peru and Brazil
Larici Cortex	Larix Europaea	Coniferae	Western, Central and South- ern Europe and Britain
Laurocerasus Folia	Prunus Laurocerasus	Rosaceae	England, Southern and Cen- tral Europe.
Lavandula Oleum	Lavandula vera	Labiatae (Lamiaceae)	Britain, cultivated England, cultivated (also the Western shores of the Mediterranean)

Parts used	Preparations into which it enters
{ Gummy exudation from the wood	Mucilago Gummi Indici
Fatty oil expressed from seeds	Unguentum Gynocardiae
Heart wood	Decoctum Hamamelidis
Dried bark	Tinctura Hamamelidis
Leaves, fresh and dried	{ Of the Dried Leaves, Extractum Hamamelidis Liquidum, Unguentum Hamamelidis (from Liquid Extract) Of the Fresh Leaves, Liquor Hamamelidis
Dried root	Syrupus Hemidesmi
Leech (annelid)	
Leech (annelid)	
Dried rhizome and roots	Extractum Hydrastis Liquidum, Tinctura Hydrastis
Dried herb including the root	Decoctum Hygrophilae
{ Fresh leaves and flowers, with branches	Extractum Viride, Succus, and Pil Coloc et Hyoscyam
{ Dried leaves and flowering tops	{ Tinctura Hyoscyami, Hyoscyam Hydrobrom, Hyoscyamine Sulphas
Seeds (dried)	
Dried root	{ Tinctum Ipecac, Pil Ipecac e Scilla, Pulv Ipecac Co, Trochiscus Ipecac, Trochiscus Morphinae et Ipecac, Vinum Ipecac, Extractum Ipecacuanha Liquidum
Rhizome and roots	
Dried seeds	Decoctum Ispaghulae
Dried leaflets	Extract Liquidum, and Tinct Jaborandi; Pilocarpinae Nitras
Dried tubercles	{ Extractum, Pulv Co, Resina, and Tinctura Jalapa, Pilula Scammoni Composita, Pulvis Scammoni Comp
{ Oil from the full grown unripe green fruit	Spiritus Juniperi, and Mistura Crocoti
Dried seeds	{ Pulvis Kaladanae Compositus, Resina Kaladanae, and Tinctura Kaladanae
{ Minute glands and hairs from the fruits	
Rhizome without the roots	Extractum Kava Liquidum
{ Juice from the trunk evaporated to dryness	Pulvis Compositus, Tinct Kino, Pulv Catechu Co
Exudation from the stem	
The seeds	
Dried root	{ Extractum, Infusum, Tinctura Krameriae, Pulv Catechu Co, Liqueur Krameriae Concentratus, Troch Krameriae; Troch Krameriae et Cocumae
{ Fresh herb	
Bark (dried)	
Fresh leaves	Aqua Laurocerasi
Distilled oil from flowers	{ Spiritus and Tinctura Lavandulae Comp, Lin Camph Ammoniatum, Tinct Lavand Comp is contained in Liqueur Arsenicalis

R.P. Name	Obtained from	Natural Order	Geographical Source
Limonis Cortex	<i>Citrus medica</i> var. <i>"Limonium"</i>	Rutaceæ	South of Europe
Limonis Succus	"	"	" and West Indies
Linum	<i>Linum usitatissimum</i>	Linacæ	Britain, Holland, Russia, etc.
Lobelia	<i>Lobelia inflata</i>	Campanulacæ	North America
Lupulinum	<i>Humulus Lupulus</i>	Urticacæ	England, imported from Europe, United States, and Canada
Lupulus	"	"	"
Lycopodium	<i>Lycopodium clavatum</i> and other species	Lycopodiaceæ	Great Britain, Central and Northern Europe, etc.
Manna	<i>Fraxinus Ornus</i>	Oleaceæ	Sicily and Calabria
Mastiche	<i> Pistacia Lentiscus</i>	Anacardiaceæ	The Island of Sicily
Matico	<i>Piper acutifolium</i>	Piperacæ	Peru, etc.
Mel Depuratum	<i>Apis mellifica</i>	Hymenoptera	Universally domesticated
Menthæ piperitæ Oleum	<i>Mentha piperita</i>	Labiatæ	Britain and the United States, etc.
Menthæ viridis Oleum	<i>Mentha viridis</i>	"	Britain and Germany, etc.
Menthol	<i>Mentha arvensis</i> vars. <i>piperascens</i> and <i>glabrata</i> <i>Mentha piperita</i>	"	China and Japan United States
Mezeri Cortex	<i>Daphne</i> { <i>Mazoreum</i> <i>Laurula</i> <i>Gnidium</i> }	Thymelacææ	Mountainous parts of Europe
Morphinæ Acetas	Opium	see Opium	see Opium
Morphinæ Hydrochloridum	"	"	"
Morphinæ Tartras	"	"	"
Morrhue Oleum	<i>Gadus Morhua</i>	Telosteæ	Coasts of Norway, France, and England, Newfoundland and Labrador
Moschus	<i>Moschus moschiferus</i>	Ungulata	Native of Central Asia, imported from China.
Mylabris	<i>Mylabris phalerata</i> and <i>M. Cichorii</i>	Coleoptera	China, Southern Europe, and India
Myristica	<i>Myristica fragrans</i>	Myristicacææ	Banda Islands of the Malay Archipelago and Sumatra, etc.
Myristicæ Oleum	" "	"	" "
Mysobalanum	<i>Terminalia Chebula</i>	Combretacææ	East Indies
Myrrha	<i>Balsamodendron</i> { <i>Myrrha</i> and probably other species }	Burseracææ	Somali-land and Arabia Felix
Nux Vomica	<i>Strachnos Nux vomica</i>	Loganiacææ	India, reported from Java, Ceylon, and Cochinchina

Parts used	Preparations into which it enters
Flesh outer part of the pericarp of the fruit	Oleum, Sympus, Tinctura Jambonis, Inf Aurant Co, Inf Gentian Co The Oil is contained in Lin Pot Iodid, c Saponis, Spir Amm Aromat, Tinct Guaiac Amm and Tinct Valer Amm
Freshly expressed juice of the ripe fruit	Syrupus Jambonis, Acidum Citricum
Dried ripe seeds, entire and reduced to a coarse powder	Linum Contusum, Oleum Jamb
Dried flowering herb	Tinct Lobelia Etherea
Glands from the strobiles	
Dried strobiles	Infusum, Tinctura Lupuli, Lupulinum
The minute yellow spores	
Concrete saccharine exudation	
Concrete resinous exudation	
Dried leaves	
Saccharine secretion in honey comb	Mel Borac, Oxymel, Oxymel Scille, Conf Piper
Oil distilled from fresh flowering peppermint	Aqua, and Spiritus Menthe Piperite, Pil Rhei Co, Tinct Chloroform et Morphine Comp
Oil distilled from fresh flowering spearmint	Aqua Menthe Viridis
(A crystalline substance obtained by cooling the oil)	Emplastrum Menthol
Dried bark	Liquor Sarsa Compositus Concentratus
Salt of the alkaloid	Liquor Morphine Acetatis
Salt of the alkaloid	Liquor Morph Hydrochlor, Suppos Morph, Tinct Chloroform et Morph Comp, Trochiscus Morph, also of Ipecac
	Injectio Morphine Hypodermica, and Liquor Morphine Tartratis
Oil of fresh liver of the cod	
(Dried secretion from the preputial follicles)	
The dried beetle	Acetum Mylabridis, Emplastrum Mylabridis, Emplastrum Calefaciens Mylabridis, Liquor Epispasticus Mylabridis, Unguentum Mylabridis
Dried seed divested of its testa	Oleum, and Oleum Myristice Expressum, Pulv Catechu Co, Pulv Cate Aromat, Sp Armoracis Co, Tinct Lavand Co
Oil distilled from seed	Pil Aloes Sacot, Spir Ammon Arom, Spir Myristice, Tinct Guaiac Amm and Tinct Valer Amm, of the Spirit, Mist Ferri Comp
Dried immature fruits	Unguentum Myrobalani, Unguentum Myrobalani c. Opio.
Gum-resin (from the stem)	Tinct Myrrh, Pil Aloes et Myrrh, Decoct Aloes Co, Mist Ferri Co, Pil Galban Co, Pil Rhei Co
Dried ripe seeds.	Extractum, Extractum Liquidum, and Tinctura Nucis Vomice, Strychnina

B. P. Name	Obtained from	Natural Order	Geographical Source
Olive Oleum .	Olea Europaea	Oleaceae	South of Europe
Oliveri Cortex.	Cinnamomum Oliveri	Lauraceae	{Australia, India, Burma, North America, and Southern United States . }
Opium . .	Papaver somniferum	Papaveraceae	Asia Minor (Smyrna, etc.)
Papaveris Capsulae	"	"	Britain and Asia Minor
Parcelm Radix	{Chondrodendron tomentosum	Menispermaceae	Brazil . .
Pepsinum	{Sus Scrofa Ovis Aries Bos Taurus	Ungulata	Domesticated everywhere .
Physostigmatis Semen	Physostigma venenosum	Leguminosae	Western Africa
Pterorhiza .	Pterorhiza 'Kuriou'	Scrophulariaceae	Northern India .
Pterotoxinum	Anamirta paniculata	Menthastraceae	Eastern India and the Malayan Island . }
Pimenta .	Pimenta officinalis	Myrtaceae	Jamaica
Pimentis Oleum	" "	"	{West Indies, Mexico, and Jamaica, etc. . . . }
Pinii Oleum .	Pinus pumilio	Coniferae	Mountains of Central Europe
Piper Nigrum .	Piper nigrum	Piperaceae	East Indies
Pice Burgundica	Picea excelsa .	Coniferae	Germany
Pice Laguida	{Pinus sylvestris and other species	"	Scotland, Russia, Denmark, and Norway . }
Podophylli Indici Rhizoma	Podophyllum pmodi	Berberidaceae	Indigenous to the Himalayas
Podophylli Rhizoma	Podophyllum peltatum	"	North America
Pruni Virginianae Cortex	Prunus serotina . .	"	" "
Prunum . . .	Prunus domestica .	Rosaceae	South of France .
Pterocarpis Lignum	Pterocarpus santalinus	Leguminosae	Madras and Ceylon . . .
Pyrethri Flores	{Pyrethrum cinerarius- folium, P. roseum and P. carneum	Compositae	{California, Dalmatia, and the Caucasus . . . }
Pyrethri Radix .	Anacyclus Pyrethrum .	"	Algeria
Quassiae Lignum	Picramnia excelsa .	Simarubaceae	Jamaica
Quillaise Cortex	Quillaja 'Saponaria'	Rosaceae	Chile and Peru
Quininae Hydrochlor . . .	{Various species of Cin- chona and Remijna }	Rubiaceae	{South America, India, Ceylon, and Java . . }
Quininae Sulphas .	" "	"	" "
Resina . . .	Various species of Pinus	Coniferae . .	North America
Rhamni Purshiani Cortex	See Oascara Sagrada.		
Rhei Radix .	{Rheum palmatum, Rheum officinale, and probably other species }	Polygonaceae .	China and Tibet .
Rheados Petala .	Papaver Rhoeas . .	Papaveraceae .	Britain

Parts used	Preparations into which it enters
Expressed oil from the ripe fruit	Emplastrum Ammoniac e Hydrag, Hydriac Piceis, Plumbi, Linimenta Ammoniac, Cicutis and Camphorae, Sapo Durus and Molles, Unguentum Capsici, Hydrag, Comp, Hydrag Nitratis, and Resin e
Dried bark	Tinctura Olivæ Corticis
Inspissated juice from unripe capsules	Preparations many Tida Opium
Nearly ripe dried fruits	
Dried root	Extractum Pareiræ Liquidum
An enzyme from the mucous lining of the fresh and healthy stomach of the pig, sheep or calf	Glycorium Pepsinæ
Ripe seeds	Extractum Physostigmatis, Physostigminum Sulphur, from which is prepared Lamellæ Physostigminæ
Dried rhizome	Extractum Pterorhizæ Liquidum, Tinctura Pterorhizæ
A neutral principle from the fruits	
Dried full grown unripe fruit	Aqua, Oleum Emulsi e
Volatile oil from unripe fruit	
Oil distilled from fresh leaves and shoots	
Dried unripe fruit	Confectio Piperis, Pulvis Opii Co
Resinous exudation from the stem	Emplastrum Piceis
Bituminous liquid obtained from the wood	Unguentum Piceis Liquid e
Dried rhizome and roots	Resina Podophylli Indici, and from it Tinctura Podophylli Indici
Dried rhizome and roots	Resina Podophylli, and from it Tinctura Podophylli
The bark	Syrupus and Tinctura Pruni Virginianæ
Dried ripe fruits	Confectio Sennæ
Heart-wood	Tinctura Lavandulæ Composita
Flower heads in powder	
Dried root	Tinctura Pyrethri
Wood of the trunk and branches	Infusum, Liquor Concentratus and Tinctura Quassæ
The inner part of the bark	Tinctura Quillaiæ and Liquor Piceis Carbonis
Salt of the alkaloid	Tinctura Quininae and Vinum Quininae
Salt of the alkaloid	Ferri et Quininae Citras, Tinct Quininae Ammon, Pulvis Quin Sulphat, Syrup Ferri Phosphoric Quin et Strych
The residue left after the distillation of the Oil of Turpentine from the crude oleo resin	Emplastrum and Unguentum Resin e Emplastrum Calefaciens, Cantharidis, Menthol, Piceis, Plumbi Iodidi, and Saponis
The erect rhizome, deprived of more or less of its cortex and dried	Extractum Rhei, Infusum Rhei, Liquor Rhei Concentratus, Pilula Rhei Co, Pulvis Rhei Co, Syrupus Rhei, Tinctura Rhei Comp
Fresh petals	Syrupus Rhinados

Bot. Name	Obtained from	Natural Order	Geographical Source
Ricini Oleum	<i>Ricinus communis</i>	Euphorbiaceæ	India
Rose Gallicæ Petala	<i>Rosa Gallica</i>	Rosaceæ	Britain and France cultivated
Rose Oleum	<i>Rosa Damascena</i>	"	Bulgaria, etc.
Rosmarini Oleum	<i>Rosmarinus officinalis</i>	Labiatæ	South of Europe, cultivated in England
Rutæ Oleum	<i>Ruta graveolens</i>	Rutaceæ	England and Southern Europe
Sabine Cacumina	<i>Juniperus Salina</i>	Conifera	Britain, Southern Europe, etc.
Saccharum Purificatum	<i>Saccharum officinarum</i>	Graminaceæ	West Indies and British Guiana
Saccharum Lactis	<i>Pos Taurus</i>	Ungulata	Domesticated everywhere
Salleinum	From various Salix, Salix fragilis and Populus	Salicaceæ	Temperate regions of the Northern Hemisphere
Sambuci Flores	<i>Sambucus nigra</i>	Caprifoliaceæ	Britain, Central and Southern Europe
Santal Oleum	<i>Santalum album</i>	Santalaceæ	India
Santonium	<i>Artemisia maritima</i> var <i>Stechmanniana</i>	Compositæ	Asiatic Russia
Sappan	<i>Casalpinia Sappan</i>	Leguminosæ	Madras and Malayan Peninsula
Sassa Radix	<i>Smilax ornata</i>	Liliaceæ	Costa Rica and South America
Sassafras Radix	<i>Sassafras officinale</i>	Lauraceæ	North America
Scammonæ Radix	<i>Convolvulus Scammonia</i>	Convolvulaceæ	Syria and Asia Minor
Scammonæ Resina	"	"	"
Scammonium	"	"	Chiefly from Smyrna, in Asia Minor
Scilla	<i>Liginea Scilla</i>	Liliaceæ	Mediterranean coasts
Scopari Cacumina	<i>Cytisus Scoparius</i>	Leguminosæ	Britain
Senegæ Radix	<i>Polygala Senega</i>	Polygalaceæ	North America
Senna Alexandrina	<i>Cassia acutifolia</i>	Leguminosæ	Soudan, imported from Alexandria
Senna Indica	<i>Cassia angustifolia</i>	"	Southern India and Arabia
Serpentaria Rhizoma	<i>Aristolochia Serpentaria</i> or <i>Aristolochia reticulata</i>	Aristolochiaceæ	Southern parts of North America
Sesami Oleum	<i>Besamum Indicum</i>	Pedaliaceæ	Indigenous to India, cultivated in Turkey and Greece
Sesum Præparatum	<i>Ovis Arlos</i>	Ungulata	Domesticated everywhere
Sinepis	<i>Brassica</i> { <i>alba</i> <i>nigra</i> }	Crucifera	Britain
Staphisagria	<i>Delphinium Staphisagria</i>	Ranunculaceæ	South of Europe
Stramonii Folia	<i>Datura Stramonium</i>	Solanaceæ	Britain, cultivated
Stramonii Semina	<i>Strophanthus "Kombé"</i>	Apocynaceæ	East Africa
Strophanthus	<i>Strychnos Nux vomica</i> and other species of <i>Strychnos</i>	Loganiaceæ	East Indies and Philippines

Parts used	Preparations into which it enters
Oil expressed from the seeds	Collodium Flexile, Lin. Sinapis, Mistura Olei Ricini, Pil. Hydrarg. Subchlor. Co.
{ Fresh and dried unexpanded petals	Confectio Rosæ Gallicæ, Syrupus Rosæ Acidum Of the Confection, Pilule Aloës Barb., Aloës et Asafetide, Aloës Socot., and Hydrarg.
Oil distilled from fresh flowers	Unguentum Aqua Rosæ
{ Oil distilled from the flowering tops	Spiritus Itosinatum, Lin. Saponis and Tinct. Lavand. Comp.
{ Volatile oil distilled from fresh herb	
Fresh and dried tops	
Juice of the sugar cane	All Syrups and Lozenges, and several other preparations.
Whey of milk, evaporated	{ Pulv. Elettarii Comp., Extract. Bellad. Alcohol., Nuclei Vom., Physostigmatis, and Strophanthi.
{ Crystalline glucoside obtained from the bark	
Flowers separated from stalks	Aqua Sambuci
Oil distilled from the wood	
A crystalline principle	Trochiscus Santonini
Heart-wood	Decoctum Sappan
Dried root	{ Extractum Sarsæ Liquidum, and Liquor Sarsæ Compositus Concentratus
Dried root	Liquor Sarsæ Compositus Concentratus
Dried root	Resina Scammonia
Resin from root	{ Pil. Scam. Co., Pulv. Scam. Co., Ext. Col. Co., Pil. Col. Co., Pil. Col. et flyoscyam
{ Gum resin obtained from living root.	
Sliced and dried bulb	{ Acetum, Oxymel, Pilula Co., Syrupus and Tinctura Scillæ; Pil. Ipecac. c. Scillâ
Fresh and dried tops	Infusum Scoparii (from dried), Succus Scoparii (from fresh).
Dried root	Infusum and Tinctura Senegæ, Liquor Senegæ Concentratus.
Dried leaflets	Confectio, Infusum, Mistura Co., Syrupus, and Tinctura Sennæ, Pulvis Glycyrrhizæ Compositus, Liquor Sennæ Concentratus
Dried leaflets	May be used in the place of Alexandrian Senna
Dried rhizome and roots	{ Infusum, Liquor Serpentinae Concentratus, and Tinctura Serpentinae, Tinct. Cnithon Co.
Oil expressed from seeds.	
Internal fat of the abdomen	Unguentum Hydrargyri
{ Dried ripe seeds of both, powdered and mixed	{ Charta Sinapis, Oleum Sinapis Volatile (from Black Mustard only), Lin. Sinapis from the Oil
Dried ripe seeds	Unguentum Staphisagriae
Dried leaves	Tinctura Stramonii
Dried ripe seeds.	Extractum Stramonii
Dried ripe seeds freed from awns	Tinctura Strophanthi and Extractum Strophanthi
The alkaloid.	

BP Name	Obtained from	Natural Order	Geographical Source
<i>Styrax praeparata</i> Succinum .	Liquidambar orientalis Pinites succinifer	Hamamelidaceae Coniferae	South-west of Asia Minor Shores of the Baltic
<i>Sumbul Radix</i> .	Fetula 'Sumbul'	Umbelliferae	Asiatic Russia
<i>Tabaci Folia</i> .	<i>Nicotiana Tabacum</i>	Solanaceae	America
<i>Tamarindus</i>	<i>Tamarindus Indica</i> .	Leguminosae	West Indies
<i>Taraxaci Radix</i> .	<i>Taraxacum officinale</i>	Compositae	Britain
<i>Terobinthina</i> <i>Canadensis</i> .	<i>Abies balsamea</i> .	Coniferae	Canada
<i>Terobinthina</i> <i>Oleum</i> .	<i>Pinus Teda, palustris</i> , and other species .	"	United States of America .
<i>Theobromatis</i> <i>Oleum</i> .	<i>Theobroma Cacao</i>	Sterculiaceae	Central America .
<i>Thuja Americannum</i>	<i>Pinus (Teda, palustris)</i>	Coniferae	{ Southern States of North America }
<i>Thymol</i> .	<i>Thymus vulgaris</i> <i>Monarda punctata</i> <i>Carum Coptum</i> .	Labiatae Umbelliferae	Manufactured in Britain .
<i>Thyroidum</i> Ste- eum	<i>Ovis Arica</i>	Ungulata .	
<i>Tinospora</i> .	<i>Tinospora cordifolia</i>	Menispermaceae	Tropical India
<i>Toddalia</i> .	<i>Toddalia aculeata</i> .	Rutaceae	Madras Peninsula
<i>Tragacantha</i>	<i>Astragalus gummifer</i>	Leguminosae	Asia Minor and Persia
<i>Turpethum</i>	<i>Ipomoea Turpethum</i>	Convolvulaceae	India and Ceylon
<i>Tylophora Folia</i>	<i>Tylophora asthmatica</i> .	Asclepiadaceae	{ Bengal, Madras Peninsula and other parts of India, and Ceylon .
<i>Ulm Cortex</i> .	<i>Ulmus campestris</i>	Urticaceae	and Southern and England .
<i>Urginea</i> .	<i>Urginea Indica</i> and <i>Scilla Indica</i>	Liliaceae .	India
<i>Uva Ursi Folia</i>	<i>Arctostaphylos Uva ursi</i>	Ericaceae	Britain
<i>Valeriana Indica</i> Rhizoma	<i>Valeriana Wallichii</i>	Valerianaceae	Himalayas
<i>Valeriana Rhizoma</i>	<i>Valeriana officinalis</i>		
<i>Vanilla</i>	<i>Vanilla planifolia</i> .	Orchidaceae	
<i>Veratri Viridis</i> Rhizoma	<i>Veratrum viride</i> .	Liliaceae	United States and Canada
<i>Veratrina</i> .	<i>Schœnocephalon officinale</i>	"	Mexico .
<i>Viburnum</i> .	<i>Viburnum pumifolium</i>	Caprifoliaceae	{ Middle and Southern United States
<i>Zingiber</i> .	<i>Zingiber officinale</i> .	Scitamineae .	{ West Indies, India, and Co- chin China .

In these Tables, Bentham and Hooker's *Genera Plantarum* has been followed in the names of the botanical sources of the drugs have been made, with the view of name is derived from the vernacular name, italics indicate that the name has been given in parentheses in the first instance where such natural orders occur.

Parts used	Preparations into which it enters.
Balsam from the trunk purified	Tinctura Benzoini Composita
Fossil resinous exudation	
{ Dried transverse slices of the root	Tinctura Sumbul
Dried leaves	
{ Fruits freed from the brittle outer part of the pericarp	Confectio Sennæ.
Fresh and dried roots	Extractum, Extractum Liquidum, Succus Taraxaci
The oleo-resin .	Collodium Flexile
Oil distilled from turpentine	Lanimentum, Lanimentum Aceticum, and Terobenum
{ Concrete oil from warm crushed seeds	All Suppositories except Glycerin
Concrete oleo resin	Emplastrum Picis
{ A crystalline substance from the oils	
{ Fresh and healthy thyroid gland	Liquor Thyroides
Dried stem	{ Infusum Tinosporæ, Liquor Tinosporæ Concentratus, Tinctura Tinosporæ
Dried root-bark	{ Infusum Toddalæ, Liquor Toddalæ Concentratus
Gummy exudation	{ Mucilago, Glycerinum, Pulv Tragac Co ; Conf Sulphuris, Pulv Opi Co, Mist Cretæ and Guaiaci, Pil Quinin, Sulph, of the Mucilage, Lotio Hydrarg Nigra
Dried root and stem	
Dried leaves	
Dried inner bark	
Younger bulbs	{ Pilulæ Ipecacuanhæ c Urgineæ, Acetum Urgineæ, Oxymel Urgineæ, Pilula Urgineæ Composita, Syrupus Urgineæ, and Tinctura Urgineæ
Dried leaves	Infusum Uvæ Ursi
Dried rhizome and rootlets	Tinctura Valerianæ Indicæ Ammoniata
Dried erect rhizome and roots	Tinctura Valerianæ Ammoniata
Dried fruit	
Dried rhizome and rootlets	
The alkaloid from cevadilla	Unguentum Veratrinæ
Dried bark	Extractum Viburni Prunifoli Liquidum
Scraped and dried rhizome	{ Syrupus and Tinctura, Zingiberis It is also used in some powders and other preparations

with respect to botanical classification, and some alterations in the method of print-making the Table more useful to students, thus quotation marks imply that the previously been used as a generic name, and an initial capital letter that the name. The names of the natural orders have been used with the termination *acae* as been retained, the name recommended by Lindley, for the sake of uniformity, has

MATERIA MEDICA

WITH

COMPOUNDS AND PREPARATIONS.

Not Official

ABSINTHIUM

WORMWOOD

The leaves and flowering tops of *Artemisia Absinthium*, L. The drug possesses an aromatic odour and a very bitter taste. It contains a crystallisable bitter principle, **Absinthin**, slightly soluble in Water, readily in Absolute Alcohol, Chloroform and Ether, also a volatile oil, to which its physiological properties are due.

Medicinal Properties—Cerebral stimulant. Absinthe, an alcoholic beverage used on the Continent, contains the chief constituents of Wormwood, its excessive use causes the disease known as absinthism.

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Fr, (Absinthe), Ger (Wermut), Hung, Ital (Assenzio), Jap, Mex, Norw, Port (Losna), Rus, Span (Ajenjo), Swed and Swiss. An extract is official in Belg, Fr, Ger, Ital, Port, Russ, Span, Swed and Swiss.

Descriptive Notes—Wormwood has silvery leaves, due to the surface on both sides being covered with appressed silky hairs, each attached by a central stalk of two to four cells. The leaves are tripinnatisect near the root with short pinnules about $\frac{1}{2}$ inch long. The upper leaves are less divided, becoming trifid or simple on the inflorescence, which is a panicle of small globular greenish-yellow capitula about $\frac{1}{2}$ of an inch in diameter. It is a local plant often occurring about old farmyards, especially near the sea. The mugwort (*Artemisia vulgaris*, L.) bears a resemblance to Wormwood, but the flower heads are oblong and the leaves are dark green on the upper surface, but silvery beneath. The leaves are larger and more acute.

TINCTURA ABSINTHII—Wormwood, 1, Alcohol (60 p c), to make 10.

Dose—1 to 4 fl drin = 3.6 to 14.2 c c.

Foreign Pharmacopœias—Official in Belg, Dan, Ger, Ital, Mex, Norw, Port, Russ and Swiss, 1 in 5, Austr and Hung (compound), 1 in 10, Mex. (compound), 1 in 10, Swed and Swiss (compound), 1 in 12 $\frac{1}{2}$, all by weight.

ACACIÆ GUMMI.

GUM ACACIA

FR, GOMME ARABIQUE, GER, ARABISCHES GUMMI, ITAL, GOMMA ARABICA, SPAN, GOMA ARABICA

A colourless or yellowish product obtained from *Acacia Senegal* and other species.

Solubility.—1 in 1 of Water. Insoluble in Absolute Alcohol, Ether and Oils.

Medicinal Properties.—Demulcent. Allowed to dissolve slowly in the mouth, allays tickling cough. For a demulcent drink, 1 of Mucilage, 1 of Syrup, and 20 of Water.

Prescribing Notes.—It is chiefly used in the form of Mucilage in cough lozenges and lozenges, and to render oils, etc., emulsive with aqueous fluids.

In an 8 oz. mixture 3 dm of Mucilage of Gum Acacia are usually required for 1 oz of oils or resinous tinctures, and 10 dm for 1 oz of Balsam of Copaiba. The Mucilage should be put into a mortar and the oil added by degrees with constant trituration until an emulsion is formed, then the Water or other aqueous fluid can be added by degrees. Resinous tinctures should be added to the Mucilage which has been first diluted with twice its volume of Water, but Fixed and Volatile Oils are best added to the undiluted Mucilage. It is impossible to make a nice emulsion with Oil of Male Fern unless the Mucilage be quite fresh, in such case it is better to make the Mucilage at the time by rubbing 2 of powdered Gum with 3 of Water. Another method, which gives good results with fixed oils, is to replace the Mucilage by half its weight of powdered Gum Acacia, rub the oil with the powder, then add all at once Water equal to double the weight of the powder and rub till an emulsion is formed, now add by degrees the remainder of any aqueous liquid ordered in the prescription. Resin of Copaiba makes a nice emulsion with powdered Gum and Water. The Resin is trituated in a warm mortar, the powdered Gum mixed with it and then the Water added as in the last instance. Mucilage is used to suspend insoluble powders in mixtures, but in some cases (I mean salts, for instance) Tragacanth answers better. It used to be employed for making powders into pills, but they soon became hard, and it is now displaced by 'Dispensing Syrup' (see 'Glycerin'), Glucose, Syrup of Glucose, 'Diluted Glucose,' or Glycerin of Tragacanth.

Official Preparations.—None so Acacia; also used in the preparation of Pulvis Anagallis, Pulvis Tragacanthae Compositus, and all Trochisci.

Not Official.—Mucilage Acacie, Mistura Mucilaginis, Potio Gommeuse, Sirop de Gomme, Syrupus Acacie, also used in the preparation of Unna's Gum Pastes.

Foreign Pharmacopœias. Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Mex., Norw., Port., Russ., Span., Swed., Swiss and U.S.

Descriptive Notes.—Gum Acacia is derived from different species of *Acacia* occurring in different countries, and in some cases from more than one species in the same district, and consequently is not uniform in character. It is sorted on its arrival in European ports into different qualities for various economic uses; hence for medicinal use, only the selected or 'picked' gum corresponding to the B.P. description should be used. The finest for this purpose is the Khordofan, or 'Turkey' gum of commerce, and is derived from *Acacia Senegal*, Willd.

The Gum Acacia official in the B.P. for medicinal use is limited to the finer commercial qualities, and is characterised by the opaque outer surface, translucent interior, nearly white or faint yellowish-white colour, by readily breaking up into angular fragments, being almost odourless, with a mucilaginous but insipid taste. See also Tests.

Gum that gives a glary or ropy mucilage, like some samples of Talce and Sennaar gum, is not admissible.

Senegal gum is derived from *A. Senegal*, Delile, in the Soudan, and from *A. Adansoni*, Guill and Perr., in Senegal. It differs from the Khordofan gum in the less cracked surface and the tough and less easily fractured interior, and is characterised by the presence of

vermicular amongst the rounded pieces. The mucilage is very adhesive, and is valuable for technical purposes.

East African gum of Senegal character, and similar gum exported from Jafferabad reach England *via* Bombay, and are known in commerce as East India or Bombay gum. That exported from Senegal comes *via* Bordeaux, but all possess the same characters. True East Indian gum is very mixed in character, and several commercial varieties are recognised derived from different trees, the form and use being applied to the reddish kinds.

West African gum (1 *nilotica*, D. Lile) resembles Senegal gum, but occurs in larger pieces, without vermicular pieces intermixed.

Cape gum (1 *horrida*, Willd., and 1 *Kraussiana*, Meisn.) is distinguished by its very brittle character, and by giving a weak and not strongly adhesive mucilage.

Australian gum (1 *pycnantha*, Benth.) is usually reddish, and contains Tannin. Selected white qualities of these gums can only be used if they comply with the above tests.

The Talca or Sennar gum (1 *Fistula*, Schweinf.) that gives aropy mucilage is not easily distinguished from small gum of good quality until dissolved, except by the presence of a faint greenish tinge.

The Gummi Indicum of the *Ind* and *Col* *Ind* is derived from *Anogeissus latifolia*, Wall., and occurs in vermicular or rounded nodules, almost white if of good quality, translucent when fractured, but tough rather than brittle, and often with small fragments of bark attached, a characteristic feature which is not recognised in the Pharmacopœia. It is required, nevertheless, to yield not more than 4 p.c. of ash. The mucilage differs from that of Gum Acacia in being proportionally twice as viscid and in having a more pronounced taste.

Tests—(Gum Acacia dissolves entirely in Water, forming a distinctive more or less transparent mucilaginous liquid, which possesses a feebly acid reaction towards blue Litmus paper; it is insoluble in Alcohol (90 p.c.), its aqueous solution is precipitated by Solution of Lead Subacetate, but not by Lead Acetate Solution, and is also precipitated by strong solutions of Borax.

The more generally occurring adulterations are gums of inferior origin, Starch or Dextrin, Tannic Acid, certain Sugars, and an excessive amount of mineral matter. Inferior gums are detected by the glairy mucilage produced when the gum is dissolved in an equal weight of Water, and by the formation of a gummy deposit when this mucilage is further diluted with Water and allowed to stand. Starch or Dextrin is readily detected by Iodine Solution, Tannic Acid by the bluish-black coloration produced with Ferric Chloride Test-solution, the Sugars by Fehling's (Potassio-cupric Tartrate) Solution, and excess of mineral matter by the amount of ash left on ignition. This should not amount to more than 4 p.c. Three samples recently examined in the author's laboratory yielded 2.8, 2.9, and 3.0 p.c. The limit of ash adopted by the *B.P.* and *U.S.P.* is 4.0 p.c., by the *P.G.*, 5.0 p.c.

Preparation

MUCILAGO ACACIÆ. MUCILAGE OF GUM ACACIA

4 of washed Gum Acacia dissolved in 6 of Water, the product measures about 8½

Dose.—1 to 4 fl. dr. = 3·6 to 14·2 c.c. or more

Mucilage keeps well if made cold, poured into small bottles quite full, and stored in a cool place, but if kept carelessly it becomes sour very quickly in hot weather, and its emulsive property is impaired, if made with hot Water the change is more rapid

Incompatibles Strong Alcohol and Sulphuric Acid, Borax, Ferric salts and Lead Subacetate render it gelatinous. It is not affected by neutral Lead Acetate

Foreign Pharmacopœias.—Official in Dutch and Port., 2 and 3, Fr. and Mex., 1 and 1, Dan., Ger., Hung., Ital., Jap., Norw., Russ., Swed. and Swiss, 1 and 2, Span., 1 and 3, Belg., 1 and 9; Austr. and U.S., 31 in 100. All by weight.

Not Official.

MUCILAGO ACACIÆ (U.S.)—Washed Gum Acacia, 34; Lime Water, 31, Water, to make 100, all by weight.

MISTURA MUCILAGINOSA—Syrup, 80 minims; Mucilage of Gum Acacia, 2 fl. dr.; Water, to 1 oz. (imp.)

POTION GOMMEUSE.—Powdered Gum Arabic, 1, Simple Syrup, 3; Orange Flower Water, 1; Water, 10, all by weight.—*P.*

This has been incorporated in the *B.P.C.* as follows

Mistura Acaciæ. *Syn.* Potion Gommeuse. Gum Arabic, 1, coarse powder, 6, Syrup, 16, Orange Flower Water, 6, Distilled Water, q.s. to produce 100.

SIROP DE GOMME.—Gum, 10; Sugar, 56, Water, 31, dissolve the Gum in cold Water, then the Sugar by the aid of a water-bath, and strain.—*P.*

SYRUPUS ACACIÆ (U.S.)—Selected Gum Acacia, 10, Sugar, 80; Distilled Water, to make 100 by volume.

The formula in the previous edition of the *U.S.P.* reads.—

Syrupus Acaciæ.—Mucilage of Acacia, 25, Syrup, 75

This latter has been incorporated in the *B.P.C.*

It has been suggested that a Mucilage of Acacia should be made with Chloroform Water to overcome the tendency to fermentation.

UNNA'S GUM PASTES—A mixture of equal parts of Mucilage of Gum Acacia and Glycerol, with which are incorporated various medicaments such as Zinc Oxide and Nitric Oxide.

ACACIÆ CORTEX.—The dried bark of *Acacia arabica*, and also the dried bark of *Acacia decurrens*, Willd, the Sydney Black Wattle, or of the Victorian and Tasmanian Black Wattle, are official in *Ind.* and *Col. Add.* for India and the Australian and Eastern Colonies

Decoctum Acaciæ Corticis (1 in 16) is also official in *Ind.* and *Col. Add.* for India and the Australian and Eastern Colonies.

See also *Gummi Indicum*.

Not Official.

ACALYPHA.

The fresh and the dried herb of *Acalypha Indica*, L., are official in the *Ind.* and *Col. Add.* for India and the Eastern Colonies

Extractum Acalyphæ Liquidum (1 in 1 with Alcohol 90 p.c.), dose 5 to 80 minims = 0·8 to 1·8 c.c.

Succus Acalyphæ, the juice expressed from the bruised fresh *Acalypha* 3; Alcohol (90 p.c.), q.s. to yield 4, dose, 1 to 4 fl. dr. = 3·6 to 14·2 c.c.

Both the Liquid Extract and the Succus are official in the *Ind.* and *Col. Add.* for India and the Eastern Colonies.

ACETANILIDUM.

ACETANILIDE

C_8H_9NO , eq 134 10

B P Syn — *PHENYL ACETAMIDE* Commonly known as 'Antifebrin'

Colourless, glistening, crystalline lamellae, having a burning and somewhat bitter taste, or a white crystalline powder

It is the Monacetyl derivative of Aniline, and is prepared by the action of Glacial Acetic Acid upon Aniline

Solubility.—1 in 190 of Water, 1 in 18 of boiling Water, 1 in 12 of Alcohol (60 p c), 1 in 4 of Alcohol (90 p c), about 1 in 40 of Glycerin, it is also soluble in Ether, Benzol, and Chloroform

Medicinal Properties.—A powerful antipyretic Useful in the pyrexia of typhoid fever, erysipelas, phthisis, acute rheumatism, and smallpox An analgesic in neuralgia and other painful nerve affections, such as locomotor ataxia

In some cases it produces profuse sweating, accompanied with cyanosis and rigor, it is therefore safer to commence with small doses

From the report of a committee of the British Medical Association, it would appear that Antifebrin is less safe and less constant in its action than Antipyrine, and still less so than Phenacetin but it is possible that the ill effects noted were brought about by injudicious dosage To give it in doses of 5, 6, 8, or even 10 grains, still more to repeat these after a short interval, is highly injudicious, such doses are excessive The relative dose appears to be about one fifth that of Antipyrine (*see* Phenazonum) — *B M J* '94, i 89

Cases of poisoning by Acetanilide — death after taking 60 grains in 6 powders — *B M J N* '02, i 20, *L* '02, i 213

Antidotes.—Alcohol, Strychnine, Ether, warmth to feet, etc., Oxygen inhalation

Dose.—1 to 3 grains = 0 06 to 0 2 gramme

Ph *Gr* maximum single dose, 0 5 gramme, maximum daily dose, 1 5 grammes

Prescribing Notes.—*Best given in wafer paper or cachets, or dissolved in some weak spirit May also be suspended in Water by Compound Powder of Tragacanth or Mucilage of Gum Acacia It is sometimes given as a compressed tablet, or as an effervescent granule*

Not Official.—Mistura Acetanilidi, Pulvis Acetanilidi Compositus, Ammonol, Hydracetin, Neuronal, Phenalgin, Bromoacetanilide

Foreign Pharmacopœias — Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Jap, Mex, Norw, Russ, Span, Swed, Swiss and U S Not in the others

Tests.—Pure dry Acetanilide melts at 113° to 114° C (235·4° to 237·2° F), commercial Acetanilide melts at 111 36° C (232·45° F), dried Acetanilide at 112 42° C (234 35° F), and purified Acetanilide at 113 49° C. (236 28° F) The *B P* gives the melting point when dry as 113 5° C (236 5° F), the *U S P* gives 113° C (235·4° F), the *P G* 113° to 114° C (235 4° to 237 2° F.) The melting point given in the *B P*. will only be found in samples which have been purified, and dried at 100° C. (212° F) Most commercial samples melt somewhat lower It visibly softens several degrees below the actual melting point If heated below Water it fuses

considerably under 100°C . (212°F) The method of determining melting points adopted by the *B.P.* has been commented upon (*Y.B.P.*, '99, 427, *C.D.*, '99, n 219, 231) and the melting points of several substances taken by four different methods compared. Great variation was found between dried and undried commercial articles and purified products. It would appear that the *B.P.* figures are compiled and not the result of actual determination. This surmise is confirmed by a statement made by Professor Atfield that 'in the future it must be distinctly understood that the method described in the *B.P. Appendix* had not necessarily been the one by which the melting points recorded in the Pharmacopoeia had been determined.' The boiling point usually given is 295°C . (563°F), but it volatilises to a considerable extent at 100°C . (212°F), and if an aqueous solution be distilled, Acetanilide may be detected in the distillate by the Isonitrile test. The *U.S.P.* gives the boiling point as 295°C (563°F) and states that it boils without decomposition.

The distinguishing test for Acetanilide is the formation of the disagreeable and highly poisonous odour of Phenyl Isonitrile when a minute quantity of the specimen is heated with Potassium Hydroxide Solution, a few drops of Alcohol (90 p.c.) and a little Chloroform. When heated with Potassium Hydroxide Solution alone, the characteristic aromatic odour of Aniline is evolved. The test is common to the *B.P.*, *U.S.P.*, and *P.G.*, the *U.S.P.* giving quantities 0.1 gramme Acetanilide, 5 c.c. of Potassium Hydroxide Solution, and 1 c.c. of Chloroform. Various other substances yield odours somewhat resembling Phenyl-Isonitrile when treated by the Isonitrile test, but the interfering action of these substances may be destroyed by the following modification of the test, which has been tried in the author's laboratory and found to be very satisfactory, readily detecting an addition of 2 p.c. of Acetanilide. The substances experimented on were Methacetin, Phenacetin, Lactophenin, Salophen, and Phenocell Hydrochloride. The test was carried out in the following manner - A weighed quantity of 0.1 gramme of each of the substances is boiled with 10 c.c. of Water (Salophen is the only one not soluble in 10 c.c. of boiling Water), the mixture is cooled quickly by immersion in cold Water and filtered through Cotton-Wool. To 2 or 3 c.c. of the filtrate is added an equal volume of Potassium Hydroxide Solution (5 p.c.). The liquid is boiled, and small fragments of Potassium Permanganate added until the green colour first produced gives way to violet or purple. Two or three drops of a mixture made of 10 c.c. of Chloroform, 10 c.c. of Alcohol (90 p.c.), and 5 c.c. of Ammonia Solution are added, the mixture boiled, and a little more of the Chloroform, Alcohol, and Ammonia mixture added if the Permanganate has not been reduced completely. After the Chloroform has vapourised by standing a few moments, the odour is noted, and compared, if doubtful, with that yielded by a minute fragment of Acetanilide or a dilute Acetanilide solution. In testing Exalgin omit the Potassium Permanganate, otherwise the test is made as above.

The *U.S.P.* and the *P.G.* give a confirmatory test for Aniline, the

former requiring that 0.1 gramme of Acetanilide, when boiled with 2 c.c. of Hydrochloric Acid for several minutes, shall yield a clear solution which, when mixed with 3 c.c. of a 1 in 20 aqueous Phenol Solution and 5 c.c. of filtered saturated Chlorinated Lime Solution, shall produce a brownish-red colour, changing to deep blue on supersaturation with Ammonia Solution. The *BP* does not give a similar test, neither does it specifically require Acetanilide to afford 'the reactions characteristic of Acetic Acid'. The acetic radical may be satisfactorily tested for, by warming a little of the specimen with Potassium Hydroxide Solution, cooling and removing the Aniline by means of Ether. The residue left after the evaporation of the Ether from the ethereal liquid, may be examined for Aniline by the Chlorinated Lime and Ammonia test. A portion of the aqueous liquid, after the removal of the dissolved Ether, is mixed with an equal volume of Sulphuric Acid (the mixture being meanwhile kept cool), a few drops of Alcohol (90 p.c.) are added and the liquid warmed, the characteristic odour of Acetic Ether is evolved.

A cold saturated aqueous solution decolorises Bromine Water and at the same time throws down a white precipitate quite distinct even at a dilution of 1 in 2000. If the Bromine Water precipitate be dissolved by heat, it crystallises out on cooling in long tufted needles. The production of this insoluble Bromine compound distinguishes Acetanilide from Phenacetin. The Isomitate test distinguishes it from Methylacetanilide (Ezalgin), Phenacetin, and Phenazone (Antipyrine), neither of these substances yielding the reaction with this test.

The more generally occurring impurities are free Acetic Acid, unconverted Aniline, Aniline salts and mineral matter. Acetanilide should be neutral in reaction towards Litmus solution, as is also Phenacetin, but with Acetone and Aniline salts the solution becomes red, and with Phenazone blue, so that the reaction towards Litmus at once detects the presence of free Acetic Acid and affords confirmatory evidence of the presence of Acetone, Aniline salts or Phenazone. The reaction in the cold towards Ferric Chloride Test-solution ensures the absence of Acetone, Phenazone and salts of Aniline. The aqueous solution of Acetanilide should not be affected by this reagent. Acetone is a most unlikely impurity, and the object of answering a test is therefore not apparent. The value of Ferric Chloride as a reagent for Acetone is, moreover, open to question. Phenazone gives a deep red coloration, which is discharged by strong Hydrochloric Acid. On boiling, Acetanilide and Phenacetin solutions become red, and in both cases the colour is discharged by strong Hydrochloric Acid. Aniline Chloride with this reagent gives no change at first, but in a few moments becomes green. Very little importance can be attached to the behaviour of Acetanilide when boiled with Ferric Chloride Test-solution, as the Ferric Chloride itself becomes of a reddish-brown colour on boiling, owing to the formation of basic Iron salts. Acetanilide should form practically colourless solutions with Sulphuric or Nitric Acid, indicating the absence of readily charred organic impurities, Phenacetin and

Official Preparations.—Acidum Aceticum Dilutum Used in the preparation of Liquor Ammonii Acetatis, Oxyinel and Oxyinel Scillae.

Incompatibles—Ammonia, Lime, fixed Alkalis, and Carbonates.

Foreign Pharmacopœias Official in Jap, 36 p.c., sp. gr. 1.018, U.S., 36 p.c., sp. gr. 1.045 at 25° C (77° F), Norw., 30 p.c., sp. gr. 1.012, Dan., 29 p.c., sp. gr. 1.011, Dutch and Russ., 30 p.c., sp. gr. 1.011, Port. (Acido Acetico Hydratado), 48 p.c., sp. gr. 1.050, Fr., 50 p.c., sp. gr. 1.060, Swed., 25 p.c., sp. gr. 1.036.

The Acidum Aceticum of Belg., Fr., Ger., Spain and Swiss is practically Glacial, Belg. and Ger., 98 p.c., sp. gr. 1.064.

The Acidum Aceticum Dilutum of Austr., Ger., Hung. and Swiss more resembles *B.P.* Acidum Aceticum, Hung., 20 p.c., Austr., Ger. and Swiss, 30 p.c.

Tests. Acetic Acid has a specific gravity of 1.044, which corresponds with the *B.P.* figure; the *U.S.P.* gives 1.045 at 25° C (77° F), the *P.G.* Dilute Acetic Acid, which corresponds to the Acetic Acid *B.P.*, is required to possess a specific gravity of 1.041. The acid is required to contain 33 p.c. of absolute Acetic Acid, as indicated by titration with Volumetric Sodium Hydroxide Solution, 1 c.c. of an acid of the official strength neutralising 5.5 c.c. of the Normal Solution. The *U.S.P.* acid is required to contain not less than 36 p.c. by weight of absolute Acetic Acid, a weighed portion of the acid being diluted with Water and an aliquot portion of the dilution titrated with Normal Volumetric Potassium Hydroxide Solution, the *U.S.P.* stating that Phenolphthalein Test solution is to be used as an indicator of neutrality, the *P.G.* acid contains 30 p.c. w/w of pure acid. The exactly neutralised liquid yields on the addition of Ferric Chloride Test solution a deep red coloration, and on boiling the liquid, a reddish brown precipitate is thrown down; the red coloration is destroyed by Hydrochloric Acid. A portion of the acidified liquid mixed with an equal volume of Sulphuric Acid, the mixture on a while being carefully kept cool affords when warmed, after the addition of a few drops of Alcohol (90 p.c.), a characteristic ethereal odour of Acetic Ether.

The more generally occurring impurities are empyreumatic matter, Sulphurous and Formic Acids, Arsenic, Copper and Lead, Chlorides and Nitrates and fixed impurities.

All three Pharmacopœias employ the Permanganate test for fixing a limit to the quantity of empyreumatic matter; the *B.P.* and the *U.S.P.* both employ 2 c.c. of the acid previously diluted with 10 c.c. of Water. The *B.P.* directs 1 drop of Potassium Permanganate Solution (1 p.c. w/v), and requires that after the lapse of half a minute the liquid shall still retain a shade of crimson; the *U.S.P.* adds 5 drops of Tenth-normal Volumetric Potassium Permanganate Solution, and requires that the liquid shall not become entirely free from pinkish brown in less than half a minute. Both Pharmacopœias require that the Permanganate Solution shall not be immediately decolorised, the *P.G.* employs 20 c.c. of the acid and 1 c.c. of Potassium Permanganate Solution (0.1 p.c. w/w) requiring that the red coloration shall not disappear within 10 minutes. The ammoniacal Silver Nitrate test may be employed for the detection of Formic and Sulphurous Acid, 5 c.c. of the acid should yield no dark

deposit when boiled for one or two minutes with 10 c.c. of Ammonia Solution and 5 c.c. of Volumetric Silver Nitrate Solution. The *BP* uses a solution of the acid exactly neutralised with Ammonia Solution, the *PG* does not include a test. A 1 in 10 dilution of the acid slightly acidified with diluted Hydrochloric Acid Solution shall give no coloration on the addition of Hydrogen Sulphide Solution, indicating the absence of Arsenic, Copper and Lead, the *PG* includes a specific test for Arsenic requiring that 1 c.c. of the acid and 3 c.c. of Stannous Chloride Solution shall not assume a dark coloration after the lapse of an hour. The presence of Copper is also shown when the liquid is slightly supersaturated with Ammonia Solution, the liquid assuming a bluish tint if that metal be present. A 1 to 10 dilution should not yield a precipitate or turbidity with Silver Nitrate Solution or with Barium Chloride Solution, indicating the absence of Chlorides and Sulphates. It should leave no residue when evaporated to dryness, indicating the absence of fixed impurities; this requirement is common to the *BP*, and the *USP*.

Volumetric Determination.—5 c.c. require 26 c.c. of Potassium Hydroxide Solution, *Pf*, when 10 grammes are diluted with Water to 100 c.c., 50 c.c. of the dilution should require 36 c.c. of Normal *V.S.* of Potassium Hydroxide, Phenolphthalein Solution being used as an indicator, *USP*.

Preparation

ACIDUM ACETICUM DILUTUM. DILUTED ACETIC ACID

Acetic Acid, 2½, diluted with Distilled Water, *qs* to yield 20

Dose. —½ to 2 fl. drm. = 1.8 to 7.1 c.c.

Official Preparations.—Used in the preparation of Acetum Ipecacuanhæ, Acetum Scillæ, and Liquor Morphine Acetatis.

Foreign Pharmacopœias.—Official in Austr., Ger., and Swiss, 80 p.c. Acetic Acid, sp. gr. 1.041, Hung., 20 p.c., Ital., A. A. Conc. 1, Water 4, sp. gr. 1.027, Belg., A. A. 8, Water 7, Jap. and Dutch, 6 p.c., Port. (A. A. Aquoso), 10 p.c., sp. gr. 1.015, *US*, 6 p.c., sp. gr. 1.006 at 25°C (77°F), Mex., 8.68 p.c., Fr., 10 p.c., sp. gr. 1.014. See also Acetum.

Tests.—Diluted Acetic Acid has a sp. gr. of 1.006 and is officially required to contain 1.27 p.c. by weight of Hydrogen Acetate, $\text{HC}_2\text{H}_3\text{O}_2$, eq. 59.58, as ascertained by titration with Deci-normal Volumetric Sodium Hydroxide Solution. Acetic Acid *BP* is used in the preparation of the diluted acid, which is therefore naturally required to answer the tests given under Acetic Acid. The Diluted Acetic Acid of the *USP* is required to contain not less than 6 p.c. w/w of absolute Acetic Acid, Diluted Acetic Acid *PG* corresponds very closely to the Acetic Acid *BP*.

ACIDUM ACETICUM GLACIALE.

GLACIAL ACETIC ACID

Fr., ACIDE ACÉTIQUE CRISTALLISABLE, (GER., EISIGSAURE, Ital. and SPAN., see below)

A clear colourless liquid, having a pungent acetic odour. It crystallises in the cold, but again becomes fluid at temperatures above

contain 98.9 p.c w/w of absolute Acetic Acid as determined by titration with Volumetric Sodium Hydroxide Solution, 1 gramme diluted with 50 times its volume of Water neutralising 16.6 c.c. of the Volumetric Solution, the *USP* requires it to contain not less than 99 p.c w/w of absolute Acetic Acid, mentioning that Phenolphthalein Test-solution is to be used as an indicator, the *Ph* requires it to contain at least 96 p.c w/w of absolute Acetic Acid. The two latter Pharmacopœias employ Normal Volumetric Potassium Hydroxide Solution for the titration, as shown in the small type below. Both the *BP* and the *USP* require the acid to answer the tests of purity given under Acidum Aceticum, the latter Pharmacopœia includes an additional recommendation, that in carrying out the Permanganate test 2 c.c. of the acid diluted with 10 c.c. of Water should be used, that two drops of Tenth-normal Volumetric Potassium Permanganate Solution should be added and that the tint produced should not be changed to brown within two hours.

The miscibility of Turpentine with an equal volume of Glacial Acetic Acid has been proposed as a test of strength of the latter (*PJ* '99, ii. 201), but the author has shown (*PJ* '02, i. 513) that an acid conforming strictly to the *BP* titration test cannot be expected to form a clear solution with all samples of Oil of Turpentine when mixed in equal volumes. It becomes, however, a delicate test for a strength of 99.5 p.c. acid or stronger.

Volumetric Determination.—Each 5 c.c. of a mixture of 1 part Acid and 9 parts Water by weight should require at least 8 c.c. Normal Volumetric Potassium Hydroxide Solution, *Ph* 3 grammes of Acid are accurately weighed, diluted with 50 c.c. of Water, and titrated with Normal Volumetric Potassium Hydroxide Solution, Phenolphthalein T.S. being used as indicator, *USP*.

Not Official

ACIDUM ACETICUM AROMATICUM.—Glacial Acetic Acid, 72, Oil of Cloves, 9, Oil of Lavender, 6, Oil of Orange, 6, Oil of Bergamot, 3, Oil of Thyme, 3, Oil of Cinnamon, 1. All by weight, mix and filter.

This has been incorporated in the *BP C* as follows—

Acidum Aceticum Aromaticum.—Oil of Bergamot, 2.50, Oil of Cinnamon, 1.25, Oil of Cloves, 10, Oil of Lavender, 5, Oil of Orange, 5, Oil of Thyme, 2.50, Glacial Acetic Acid, *qs* to produce 100.—*BP C*

ACETUM AROMATICUM (*Gl*)—Oils of Lavender, Peppermint, Rosemary, Juniper, and Cinnamon, of each 1, Oil of Lemon, 2, Oil of Cloves, 2, Spirit, 441, Diluted Acetic Acid, 650, Water, 1900. All by weight, digest 8 days, and filter.

Preparations containing similar ingredients but in different proportions are given in Austr., Fr., Hung., Ital., Jap., Mex., Norw., Port., Russ., Swed. and Swiss.

Acetum Aromaticum.—Eau de Cologne, 980, Tincture of Benzoin, 10, Glacial Acetic Acid, 60.—*Belg*

Acetum Odoratum.—Oil of Bergamot, 0.50, Oil of Cassia, 0.10, Oil of Cloves, 0.80, Oil of Lavender, 0.20, Oil of Lemon, 0.50, Tincture of Balsam of Tolu, 1, Simple Tincture of Benzoin, 10, Alcohol (90 p.c.), 50, Glacial Acetic Acid, 4, Distilled Water, *qs* to produce 100.—*BP C*

VINAIGRE ANGLAIS.—Glacial Acetic Acid, 500, Camphor, 50, Oil of Cinnamon, 1, Oil of Cloves, 1, Oil of Lavender, $\frac{1}{2}$. All by weight, mix.

VINAIGRE DES QUATRE VOLEURS.—Tops of the Greater and Lesser Wormwood (*Artemisia Absinthium* and *A. pontica*), Rosemary, Sage,

Peppermint, Rue, and Lavender Flowers, of each 15, Calamus Root, Cinnamon Cloves, Nutmeg, and Garlic, of each 2, Camphor, 1, Glacial Acetic Acid, 15, Strong White Vinegar, 1000. Dissolve the Camphor in the Glacial Acid, macerate the other ingredients in the Vinegar for ten days, press and mix.

VAPOR ACIDI ACETICI Glacial Acetic Acid and Acetic Acid, equal parts, mix. Two teaspoonfuls in a pint of Water at 140° F. for each inhalation. Sedative and antiseptic, used for inflammatory sore throat of scarlet fever — *Throat*.

ACIDUM TRICHLORACETICUM A substitution product of Acetic Acid, but it is more antiseptic and is formed by adding Chloral Hydrate with Nitric Acid in sunlight. Colourless, deliquescent crystals, which fuse at 55° C. (131° F.), and boil at 195° C. (383° F.).

Roughly soluble in Water and in Alcohol (90 p.c.).

It is a powerful antiseptic and caustic. 1 or 2 p.c. solutions have been used as a dressing for wounds, and as a lotion and spray in acute coryza. Internally, in dilute solution, 2 to 5 grams for adults, $\frac{1}{2}$ to 1 gram for children, in gastric catarrh and summer diarrhoea — *L. M. R.* '83, 285, *T. G.* '85, 63, and '91, 319.

A test for albumen in urine — *B. M. J.* '89, ii 1114; and '90, i 681.

Foreign Pharmacopœias — Official in Dutch, Ger., Jap., Mex., Swiss, U. S.

ACIDUM ARSENIOSUM.

ARSENIOS ANHYDRIDE

B. P. Syn.—ARSENIC; WHITE ARSENIC; ARSENIOS ACID.

FR., ANHYDRIDE ARSENIQUE; GER., ARSENIIGESAURE; ITAL., ANIDRIDE ARSENIOSA; SPAN., ANHIDRIDO ARSENIOSO.

As_2O_3 , eq. 393.28.

A heavy white odourless and tasteless powder, or white opaque and crystalline or glassy and amorphous masses, obtained from arsenical ores.

Solubility.—1 in 100 of cold Water, 1 in 20 of boiling Water; 1 in 500 of Alcohol (90 p.c.), 1 in 6 of Hydrochloric Acid; 1 in 8 of Glycerin; 1 in 11 of Solution of Potash, 1 in 40 of saturated solution of Sodium Carbonate.

These figures are approximate. The published solubilities of Arsenious Acid are very contradictory, owing, no doubt, to the specimens examined being either vitreous, opaque, or a mixture of the two, and therefore of different solubilities.

Medicinal Properties.—A general tonic and alterative. Valuable in chorea, chronic (not acute) eczema, lichen, acne and psoriasis, in gout and chronic rheumatism, in painful dyspepsia, in neuralgia and spasmodic asthma, especially if anæmic or malarial in origin; in the intervals between the attacks of angina pectoris, recommended in hay fever. Given in pernicious anæmia and allied blood diseases with good result. Indispensable in all forms of weak heart accompanied by pain. Antiperiodic in malaria, in small doses it is stimulant to nervous system. In the form of **paste** it is used to destroy the pulp before stopping carious teeth.

Small doses of Arsenic, from 8 to 5 minims of Fowler's Solution, well diluted, three times a day, the best tonic treatment of the rapid heart of influenza. — *L.* '99, ii 1079.

Arsenical mixture for the removal of malignant tumours. Arsenious Acid, 1, Absolute Alcohol, 75, Aqua Dest 75, increasing the strength of Arsenic to 1 in 100, or even 1 in 80.—*B M J E '01*, n 15

Large doses in chorea. Fowler's Solution, 15 to 20 minims three times daily, reduced to 5 minims, and discontinued on the eighth day.—*B M J '01*, n 1152

Arsenic may be administered in solution, in pills, or by injection, injections are painful, Asatic pills are much used on the Continent, but on the whole the advantages are all in favour of the time honoured Fowler's Solution.—*L '03*, i 784, *B M J '01*, i 656

Dose— $\frac{1}{10}$ to $\frac{1}{4}$ of a grain = 0.001 to 0.004 gramme

Ph Ger maximum single dose, 0.005 gramme, maximum daily dose, 0.015 gramme

Prescribing Notes In solution, tablet or pill. A good pill is made by well triturating with Milk Sugar and massing with 'Diluted Glucose'. Arsenic is usually given immediately after a meal. Solution of Arsenic is frequently prescribed with Solution of Stychnium, in such cases the (acid) Liq. Arsenici Hydrochloricus should be ordered, and not the (alkaline) Liquor Arsenicalis

Incompatibles.—Salts of Iron, Magnesia, Lime Water, and vegetable astringents

Official Preparations. Liquor Arsenicalis, Liquor Arsenici Hydrochloricus. Other preparations containing Arsenium: Arseni Iodidum, Ferri Arsenas, Sodii Arsenas, Liquor Sodii Arsenatis and Liquor Arseni et Hydrargyri Iodidi

Not Official.—Liquor Ammonii Arsenitis, Pilula Asatica, Granula Dioscoridis, Arsenical Paste, Arsenical Pilula, Arsenical Cautery Powders, Leveco Water and La Bourboule Water. See also Liq. Aurii et Arseni Bromidi (*L S N F*), Sodium Cacodylicum, Arseni Bromidi Liquor

Antidotes.—The freshly prepared moist Ferric Hydroxide, or large quantities of Colicmed Magnesia, Diluted Iron followed by some Common Salt (to ensure precipitation of Ferric Hydroxide). Stomach tubes, Emetics, Mucilaginous drinks, Olive Oil, or Cotton Oil, stimulants freely, if much prostration, warmth (hot blankets and bottles)

Antidotum Arsenici (*Belg*, *Dan*, *Dutch*, *Hung*, *Ital*, *Jap*, *Port*, *Russ*, *Swiss* and *U S*)

They vary considerably in the quantities of Iron, Magnesia, and Water. *Hung*, *Jap*, *Russ*, *Swiss* and *U S* employ Ferric Sulphate; *Belg*, *Dan*, *Dutch* and *Port* use Ferric Chloride

U S formula (Ferri Hydroxidum cum Magnesi Oxido).—Mix 40 c.c. of Solution of Ferric Sulphate (sp gr 1.432) with 120 c.c. of Water, and keep the liquid in a large, well stoppered bottle. Rub 10 grammes of Magnesium Oxide with cold Water to a smooth and thin mixture, transfer this to a bottle capable of holding about 1000 c.c., and fill it with Water to about three fourths of its capacity. When the preparation is wanted for use, shake the Magnesium Oxide mixture to a homogeneous, thin magma, gradually add to it the diluted solution of Ferric Sulphate, and shake them together until a uniform smooth mixture results

Note.—The diluted Solution of Ferric Sulphate, and the mixture of Magnesium Oxide with Water, should always be kept on hand, ready for immediate use

Foreign Pharmacopoeias.—Official in *Belg*, *A* Arseniorum; *Austr*, *Dan*, *Dutch*, *Ger*, *Hung*, *Jap*, *Norw*, *Russ*, *Swed* and *Swiss*, *A* Arsenicosum; *Fr*, *Ital*, *Mex* and *Port*, Acido Arsenoso; *Spain*, *U S*, Arseni Trioxidum

Tests.—Arsenious Acid is distinguished by the following tests: (1) the microscopical appearance of the sublimate produced on heating a small quantity in a test tube, brilliant transparent octahedral crystals being formed, (2) the pale yellow coloured precipitate, soluble in Ammonia Solution and in Nitric Acid, which is thrown

down when Silver Ammonio-nitrate Solution is added to its aqueous solution, (3) when dropped upon red-hot charcoal it produces the characteristic alliacious odour of Cacodyl, and when gently heated with charcoal in a tube it is reduced, yielding a sublimate of Arsenic.

It is officially required to contain from 99.89 to 100 p.c. of pure Arsenious Anhydride as volumetrically determined by means of Deci-normal Volumetric Iodine Solution, a weighed quantity of 0.25 gramme of the acid being dissolved in Water by boiling it with five times its weight of Sodium Bicarbonate, the solution cooled, three drops of Hydrochloric Acid added to neutralise or to reconvert into Bicarbonate any Sodium Carbonate produced during the boiling. It should require from 50.8 to 50.9 c.c. of the Volumetric Solution.

The *U.S.P.* requires it to contain not less than 99.8 p.c. of pure Arsenic Trioxide, the *P.G.* not less than 98.32 p.c. of pure Arsenious Anhydride. It will be noticed from the small type below under the heading of Volumetric Determination that neither the *U.S.P.* nor the *P.G.* employ Hydrochloric Acid in performing the test. The necessity for the addition of Hydrochloric Acid is stated to be to neutralise or to reconvert into Bicarbonate any Sodium Carbonate produced during the boiling, but experiments made in the author's laboratory, using the *B.P.*, *U.S.P.*, and *P.G.* processes, showed that it made very little difference whether the Hydrochloric Acid was added or not.

The more generally occurring impurities are mineral residue, Antimony, Cadmium, Lead, Tin and Arsenious Sulphide. The specimen should be entirely volatilised on heating, indicating the absence of mineral residue. The aqueous solution acidified with Hydrochloric Acid yields with Hydrogen Sulphide Solution a lemon-yellow precipitate; it should be completely soluble in Ammonium Carbonate Solution, indicating the absence of Antimony, Cadmium, Lead and Tin. It should dissolve entirely in about ten times its weight of Ammonia Solution, forming a colourless solution when diluted with Water; it should not assume a yellow colour when acidified with Hydrochloric Acid. The *B.P.* gives no quantities, the *U.S.P.* employs 1 gramme of the substance and 10 c.c. of Ammonia Solution; the *P.G.* 1 part of Arsenious Acid in 10 parts by weight of Ammonia Solution, the test indicates the absence of Arsenious Sulphide. The *U.S.P.* has an additional test for the absence of this latter impurity, and requires that the sublimate obtained on carefully heating the substance in a dry test-tube of hard glass should not at first show a yellow colour. The *U.S.P.* states that it may be distinguished from Arsenic Acid by the lemon-yellow precipitate produced on the addition of Silver Ammonio-nitrate Test-solution to its aqueous solution, this precipitate dissolving on the addition of Ammonia Solution and depositing metallic Silver when heated.

Volumetric Determination.—A weighed quantity of 0.1 of a gramme of Arsenic Trioxide mixed with 1 gramme of Sodium Bicarbonate dissolved by the aid of a gentle heat in 20 c.c. of Water should require for decolorising not less than 20.8 c.c. of Tenth-normal Volumetric Iodine Solution, *U.S.P.*, a weighed quantity of 0.5 of a gramme of the acid dissolved in 8 grammes of Sodium Bicarbonate and 20 c.c. of boiling Water is cooled and made up to 100 c.c. 10 c.c.

of this solution should decolorise 10 c.c. of Decinormal Volumetric Iodine Solution, *P G*

Preparations

LIQUOR ARSENICALIS. ARSEFICAL SOLUTION *BP Syn* —
LIQUOR POTASSÆ ARSENIIS FOWLER'S SOLUTION

Arsenious Anhydride, 87½ grains, Potassium Carbonate, 87½ grains, Compound Tincture of Lavender, 5 fl drms, Distilled Water, q.s. to form 20 fl oz (1 in 100)

A clear red liquid possessing a Lavender odour and an alkaline reaction towards red Litmus paper. It contains 1 p.c. w/v of Arsenious Anhydride. The Liquor Potassii Arsenitis of the *USP* contains 1 p.c. w/w of Arsenic Trioxide, the Liquor Kali Arsenicosi of the *PG* contains 1 p.c. w/v of Arsenious Acid. The *Brussels Conference* recommends a standard of 1 p.c. w/w.

It is officially directed to be prepared by dissolving 87½ grains each of Arsenious Anhydride and Potassium Carbonate in 10 fl oz of Water, but it is preferably prepared by dissolving this quantity of the solid ingredients in ½ oz of the Water in a flask by the aid of heat, and diluting the solution to 10 fl oz with more of the Water, when cooled the compound Tincture of Lavender is added and the product diluted with sufficient Distilled Water to produce 20 fl oz. The *USP* employs relatively about 2 fl oz for the purpose, the *PG* also uses a minimum amount of Water to first effect solution of the ingredients, subsequently diluting with Water to the required volume. The *PG* uses simple Spirit of Lavender and the preparation is colourless.

11 minims contain 1½ grain, 1 c.c. = 0.01 gramme

Dose.—2 to 8 minims = 0.1 to 0.5 c.c.

Larger doses are given in chorea.

Ph Ger maximum single dose, 0.5 gramme, maximum daily dose, 1.5 grammes

An interesting account of the introduction of Fowler's Solution is given *CD '04*, ii 685, also in *L '01*, ii 1472.

Foreign Pharmacopœias.—Official in Aust, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Russ, Spain, Swed, Swiss and *US*, 1 Arsenious Acid in 100. All by weight.

Tests.—Liquor Arsenicalis has a specific gravity of 1.010 to 1.015. The *BP* gives no figure for the sp. gr. It is officially required to contain from 0.93 to 1.0 p.c. of Arsenious Anhydride, as determined by titration of the neutralised solution with Volumetric Iodine Solution, a faintly alkaline reaction being maintained throughout the titration by a slight excess of Sodium Bicarbonate. The *USP* dilutes 21.6 grammes of solution with Water to 100 c.c., acidifies the mixture very slightly with diluted Hydrochloric Acid, adds 2 grammes of Sodium Bicarbonate and titrates with Tenth normal Volumetric Iodine Solution, of which it is required not less than 50 c.c. should be necessary. The *PG* mixes 5 c.c. of solution with 1 gramme of Sodium Bicarbonate and 20 c.c. of Water, and after the addition of a few drops of Starch Solution adds Tenth-

normal Volumetric Iodine Solution, no permanent blue coloration should be produced by the addition of 10 c.c., but a permanent blue coloration should be produced on the further addition of 0.1 c.c. of the Volumetric Iodine Solution.

LIQUOR ARSENICI HYDROCHLORICUS. *Hydrochloric Solution of Arsenic*

Arsenious Anhydride, 87½ grams, Hydrochloric Acid, 2 fl. dm. Distilled Water, *q.s.* to form 20 fl. oz. (1 in 100)

A clear colorless liquid possessing a strongly acid reaction towards blue Litmus paper. It contains 1 p.c. w/v of Arsenious Anhydride and is thus of the same strength as *Liquor Arsenicalis*. The *U.S.P.* *Liquor Acidi Arsenosi* corresponding to this preparation contains 1 p.c. w/v of Arsenic Trioxide. The official directions for its preparation are to dissolve 87½ grams of Arsenious Anhydride and 2 fl. dm. of Hydrochloric Acid in 10 fl. oz. of Water by the aid of heat, subsequently diluting the solution to the required volume, but solution is more readily effected by dissolving the Arsenious Acid with the Hydrochloric Acid in 5 fl. oz. of Water by the aid of heat, and diluting the cool solution with sufficient Distilled Water to produce 20 fl. oz. The *U.S.P.* employs relatively about 5 fl. oz. of Water for this purpose.

11 minims contain ½ grain, 1 c.c. = 0.01 gramme, Arsenious Anhydride.

De Valangin's Solution was 4 of this strength

Dose. -2 to 8 minims = 0.1 to 0.5 c.c.

Tests.--Hydrochloric Solution of Arsenic has a specific gravity of 1.010 to 1.014, no figure for the specific gravity is given in the *B.P.* It is officially required to indicate 0.99 to 1.0 p.c. of Arsenious Anhydride as determined by the titration of 25 c.c. of the liquor with Volumetric Iodine Solution, sufficient Sodium Bicarbonate being added to ensure an alkaline reaction during titration, from 50.8 to 50.9 c.c. should be required. The *U.S.P.* employs a weighed quantity of 21.6 grammes of the solution, about 2 grammes of Sodium Bicarbonate, and 100 c.c. of Water, not less than 50 c.c. of Tenth-normal Volumetric Iodine Solution should be required.

LIQUOR ARSENII ET HYDRARGYRI IODIDI. *See ARSENII IODIDUM*

ARSENAS FERRI. *See FERRI ARSENAS.*

ARSENAS SODII. *See SODII ARSENAS.*

ARSENATIS SODII LIQUOR. *See LIQUOR SODII ARSENATIS.*

Not Official

LIQUOR AMMONII ARSENITIS is made of the same strength as *Liquor Arsenicalis*, Ammonium Carbonate being substituted for Potassium Carbonate.

PILULA ASIATICA—Arsenious Acid, ½ grain; Black Pepper, ½ grain; for one pill.

The quantities vary in different books. *Gray's Supp* gives Arsenious Acid, $\frac{1}{2}$ grain, Black Pepper, 1 grain. *Swed Fil Acid* Arsenios containing $\frac{1}{2}$ grain in each. *BPC* gives the formula which was official in *Dutch Supp* 1902, but which was omitted in *Dutch* 1905—Arsenious Anhydride, $\frac{1}{16}$ grain, Black Pepper, $\frac{1}{2}$ grain.

Used in various chronic skin diseases.

GRANULA DIOSCORIDIS (*Fr* and *Dur*)—Each granule contains 1 milligramme of Arsenious Acid.

ARSENICAL PASTE for Dentists—Arsenious Acid, 2, Morphine Sulphate, 1, Creosote, to make a stiff paste. A quantity of the size of a pin's head is ample for one application. It should be spread on Cotton Wool and placed in the tooth. It will thus destroy the sensibility of a carious tooth, and in a few hours the tooth will be ready for stopping. Cocaine has been used in place of Morphine, but it is not so good.

ARSENICAL FIBRE for Dentists—Arsenious Acid, 5, Tannin, 2, Morphine Sulphate, 5, make into a paste with Creosote, mix with Cotton Wool, and dry. This preparation is an improvement on the paste, for the latter is apt to be squeezed out over the gum edge of the cavity and cause inflammation of the surrounding tissue.

ARSENICAL PASTE (*Frère Côme's*)—For cancer, applied after the surface has been laid bare by the application of Caustic Potash. Arsenic, 1, Charcoal, 1, Red Mercury Sulphide, 4, Water, $q\ s$.

ARSENICAL CAUSTIC POWDERS Each contains from $\frac{1}{2}$ grain to $\frac{1}{4}$ grain of Arsenious Acid to 1 grain of Calomel, Vermilion or Antimony Sulphide, or of any combination of them.

La Bourboule Water contains about $\frac{1}{12}$ grain of Arsenious Anhydride in 20 fl oz.

Levico Water (strong) contains about $\frac{1}{8}$ grain of Arsenious Anhydride in 20 fl oz.

ACIDUM BENZOICUM.

BENZOIC ACID.

$\text{HC}_7\text{H}_5\text{O}_2$, eq 121.13

Fr, ACIDE BENZOIQUE, *Ger*, BENZOSÄURE, *Ital* and *Span*, ACIDO BENZOICO.

Light colourless, or almost colourless, feathery crystals, which are odourless or have a faint odour of Benzoin.

It should be preserved from the air and light in well stoppered amber tinted bottles and should be kept in a cool atmosphere.

BP and *USP* permit the use of synthetic Benzoic Acid, but *Aust.*, *Ger*, *Swiss* and *Swed* Pharmacopœias recognise only the Acid prepared from Benzoin.

The *BP* states that it is obtained from Benzoin by sublimation, or it may be prepared synthetically from Toluene, from Hippuric Acid, and from other organic compounds, from which it would appear that the authorities give a preference to the resin sublimed Acid, but their description, 'odourless when quite pure, but when obtained from Benzoin possesses an agreeable aromatic odour,' conveys an impression just the reverse of this.

The Commercial varieties of this Acid are ---

1 Resin Sublimed Acid.—Characterised by its strong empyreumatic odour, colour (varying from a pale yellow to light brown), and reducing action on both Permanganate Solution and ammoniacal Silver Nitrate, it may or may not contain Cinnamic Acid, according to the variety of the Benzoin from which it is made.

2 Resin Precipitated Acid. This is prepared from Benzoin by one of the 'wet processes,' such as boiling with Milk of Lime to form a soluble Benzoate, which is afterwards decomposed by an Acid with separation of the slightly soluble Acid Benzoin. It is practically a pure chemical, has no empyreumatic odour, and has no reducing action either on Permanganate or ammoniacal Silver solution. This is the *A. S. C. P.* only *A. S. C. P.* and is that intended to be used in the U.S., the latter, however, will pass a sufficiently purified Acid, from whatever source derived.

3 Hippuric Benzoic Acid.—When imperfectly purified this Acid retains a distinct urinous odour, and is guarded against in most Foreign Pharmacopœias, but it has been shown (*P. J.* (9) xiv, 463) that acid from this source, after resublimation, will pass the purity tests of any Pharmacopœia, so that its use is mainly a question of price.

4 Toluene Benzoic Acid.—This is manufactured in very large quantities, principally for conversion into alkali Benzoates, but partly for sale as Benzoic Acid. In the latter case it is frequently said to be sublimed over a little Gum Benzoin to give it something of the aromatic odour of the Natural Acid. This Artificial Acid conforms with most tests, but is practically certain to be contaminated with Chlorine compounds, easily detected by mixing $\frac{1}{2}$ gramme of the Acid with slaked Lime (free from Chlorine), damping with Water, igniting, dissolving the residue in Nitric Acid and adding Silver Nitrate Solution. A turbidity or precipitate is practical proof of the Toluene source of the Acid.

Solubility.—1 in 390 of Water; 1 in 12 of boiling Water, 1 in $2\frac{1}{2}$ of Alcohol (90 p.c.); 1 in $2\frac{1}{2}$ of Ether, nearly 1 in 6 of Chloroform; 1 in 12 of Benzol; about 1 in 30 of Glycerin. Borax increases its solubility in Water, 1 of Borax and 1 of Acid are soluble in 100 of Water, Sodium Phosphate also aids its solution. Soluble in aqueous solutions of the Caustic Alkalis and in hot Milk of Lime, forming Benzoates, from which it is precipitated on the addition of Hydrochloric Acid unless the solutions are very dilute.

Medicinal Properties.—Most useful in acidifying and disinfecting an alkaline and decomposing urine, a stimulant and disinfecting expectorant in chronic bronchitis and phthisis; an antipyretic in acute rheumatism.

The Sodium and Ammonium salts are preferable, as they are less irritating to the alimentary canal.

It is also useful in preventing fats from becoming rancid, and it is used as a food preservative.

Dose—5 to 15 grains = 0.3 to 1 gramme.

Prescribing Notes. *Given in cachets, in pills made up with 'Diluted Glucose' or in the form of Soda Benzoate.*

Official Preparation. *Trochiscus Acidi Benzoici*, $\frac{1}{2}$ grain in each. Contained in *Tinctura Camphore Composita*, 2 grains in each oz.; *Tinctura Opii Annoniata*, 9 grains in each oz. Used in the preparation of *Ammonii Benzoas* and *Sodii Benzoas*.

Not Official.—*Vapor Acidi Benzoici*, *Benzoic Gauze*, *Annothesm*, *Subcutin*.

Foreign Pharmacopœias. Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Norw., Port., Russ., Span., Swed., Swiss and U.S.

Tests.—Pure Benzoic Acid melts at 121.4°C (250.5°F), the acid obtained from Benzoin at 120°C (248°F). The U.S.P. states 121.4°C (250.5°F) and mentions that the acid sublimed from Benzoin has a lower melting point. The *P. G.* does not include a melting point. The pure acid possesses a boiling point of 249°C . (480.2°F), the acid prepared from Benzoin at 238.9°C (462°F). The carefully

neutralised aqueous solution yields on the addition of Ferric Chloride Test solution a buff coloured precipitate. The *USP* and the *PG* adopt the following method of applying this test. The *USP* adds Ferric Chloride Test-solution diluted with 2 volumes of Water to the carefully neutralised solution of Benzoic Acid in an alkali Hydroxide Solution, the *PG* mixes 0.2 of a gramme of the acid with 20 c.c. of Water and 1 c.c. of Normal Volumetric Potassium Hydroxide Solution, and after shaking vigorously filters after 15 minutes and adds 1 drop of Ferric Chloride Solution to the filtrate. In the case of this acid the *BP* does not require it to yield 'when neutralised the reactions characteristic of Benzoic Acid'. The *USP* states that when heated in a dry test-tube with 3 parts of slaked Lime, Benzene is evolved. The acid may be readily determined by titration with Normal Volumetric Sodium Hydroxide Solution, using Phenolphthalein Solution as an indicator of neutrality, 1 c.c. of Normal Volumetric Sodium Hydroxide Solution corresponding to 0.12113 gramme of Benzoic Acid. The method for its determination in Compound Tincture of Camphor will be found under the heading of Tincture Camphorae Composita.

The more generally occurring impurities are mineral matter, Chlorobenzoic Acid, Cinnamic and Hippuric Acids. The *USP* includes a test for readily carbonisable organic impurities. Mineral matter, if present, is at once detected by a residue remaining after ignition. Chlorobenzoic Acid and Chlorine compounds (indicating when present the synthetic origin of the acid) are readily detected by the addition of Silver Nitrate Solution to the solution in Nitric Acid of the residue remaining after igniting the acid with twice its weight of Calcium Carbonate. The tests adopted by the *BP*, *USP* and *PG* are compared below in the small type paragraph headed Silver Nitrate. Potassium Permanganate and Diluted Sulphuric Acid and Potassium Permanganate Solution serve to detect Cinnamic and Hippuric Acids, and organic substances capable of reducing Potassium Permanganate Solution. The tests adopted by the *BP*, *USP*, and *PG* for the detection of these substances are described in the small type paragraph under the heading of Potassium Permanganate.

The addition of Calcium Chloride Solution to a solution of the acid rendered faintly alkaline with Ammonia Solution should produce no turbidity or precipitate, indicating the absence of Oxalic Acid. The *USP* employs Sulphuric Acid to detect readily carbonisable organic impurities.

Silver Nitrate. The solution obtained by dissolving in diluted Nitric Acid the residue left when 0.5 gramme of the Acid is heated with twice its weight of Calcium Carbonate in a closed vessel, should yield only the slightest cloudiness with Silver Nitrate Solution, indicating the absence of Chloro Benzoic Acid, *BP*. The quantities for this test given in the *PG*, and *USP* are 0.2 gramme of Acid with 0.4 gramme of Calcium Carbonate, and 0.5 gramme of Acid with 0.8 gramme of Calcium Carbonate respectively. These Pharmacopoeias direct that the Acid and Carbonate be mixed with a little Water and dried before ignition. The *PG* residue after ignition is dissolved in Nitric Acid and diluted to 10 c.c. with Water, while the *USP* residue is dissolved in 20 c.c. of Distilled Water with the aid of a slight excess of Nitric Acid, before the addition of the

test reagent. The degree of colour permitted in the *U.S.P.* is not much more than that produced by a blank experiment with the same Calcium Carbonate as used in the test.

Potassium Permanganate.—A mixture of 1 part of the Acid and 1 part of Potassium Permanganate when warmed with 10 parts by weight of Diluted Sulphuric Acid, should not evolve the odour of Benzaldehyde (Bitter Almond Oil), *R.P.* The *P.G.* and *U.S.P.* tests are made with Water instead of Diluted Sulphuric Acid, and they direct that the mixture be gently warmed for a short time (45° C (113° F) for about 10 minutes, *U.S.P.*) in a loosely stoppered test glass, and then cooled.

The colour of 2 drops of Potassium Permanganate Solution (1 p.c. w/v) should not be immediately destroyed by 0.2 grammes of the Acid suspended in 10 c.c. of Water, indicating the absence of Hippuric and Cinnamic Acids, *R.P.* A yellow to brownish cloudy solution should be obtained with 0.1 gramme Benzoic Acid and 1 c.c. Solution of Ammonia, from which Benzoic Acid is again precipitated on the addition of 2 c.c. of Diluted Sulphuric Acid; this acid mixture should almost completely decolorise 5 c.c. of Potassium Permanganate Solution (0.1 p.c.) after the lapse of 1 hour, *P.G.*

Sulphuric Acid.—On gently warming a solution of Benzoic Acid in pure cold Sulphuric Acid the colour of the solution should not become darker than light brown, and when poured into Water Benzoic Acid should separate, yielding a colourless liquid, indicating absence of readily carbonisable matter, *P.G.*

Preparation.

TROCHISCUS ACIDI BENZOICI. BENZOIC ACID LOZENGE

$\frac{1}{2}$ grain of Benzoic Acid in each, with Fruit Basis

Dose.—1 to 5 lozenges

Not Official.

VAPOR ACIDI BENZOICI.—Benzoic Acid, 3 grains, Kaolin, 12 grains; rub together and add Water, $\frac{1}{2}$ oz., Tincture of Tolu, 18 minims. Shake and make up with Water to 1 oz.—*Throat*

Extremely serviceable in sub-acute affections of the air passages.

BENZOIC GAUZE.—Contains 4 p.c. of Benzoic Acid

ANÆSTHESIN (the Ethyl-ester of ortho-ethoxybenzoic acid).—A white, odourless powder soluble 1 in 1200 of cold Water, soluble 1 in 6 of Alcohol (90 p.c.), and in ether. Introduced as a local anæsthetic and as a substitute for Orthoform (even in cases of gastric irritation).—*B.M.J.* '01, ii. 32. In suflated, dusted on or used as an ointment, is most efficient (*H.M.J.* '05, ii. 1008) in allaying the pain of burns, ulcerative stomatitis, tuberculous and malignant ulceration, whether of the larynx or other regions, or it may be given internally up to 8 grains in gastric ulcer, carcinoma, or nervous dyspepsia.

Dose.—5 to 10 grains = 0.32 to 0.65 grammes. Maximum daily dose, 40 grains = 2.6 grammes.

Suboutin (Anæsthesin paraphenol sulphonate) is a product of greater stability.

ACIDUM BORICUM.

BORIC ACID.

B.P. Syn—BORACIC ACID, HYDROGEN BORATE.

Fr., ACIDE BORIQUE; *Ger.*, BORSAURE; *Ital.* AND *Span.*, ACIDO BORICO.

H_3BO_3 , eq. 61.49.

Colourless and odourless pearly scales, or a fine, white, odourless powder, unctuous to the touch, and possessing a faintly acid and

slightly bitter taste. It volatilises in the vapour of boiling Water. It is obtained by the decomposition of Borax with a mineral acid, preferably Sulphuric Acid, or by the purification of native Boric Acid.

Solubility.—1 in 25 of cold Water, 1 in 3 of boiling Water, 1 in 4 of Glycerin, 1 in 28 of Alcohol (90 p.c.), insoluble in Ether.

Medicinal Properties.—An unstimulating local antiseptic and desiccant, it is used as a **dressing** for granulating and suppurating surfaces in general, as an **eye-wash**, 2 to 5 grains in an oz. of Water, as a **lotion, douche**, or as a **mouth-wash**, 10 to 15 grains to an oz. of Water, as a **paint** for the throat, 1 in 5 of Glycerin, as a **pessary**, 10 or 20 grains with Gelatin Mass or Oil of Theobroma.

Given internally, in cystitis associated with decomposing urine.

Used as a **dusting powder** it prevents fetid perspiration.

Small doses internally to sterilise the urine, 48 hours before operation for stricture of the urethra.—*L.* '98, i 1103.

As a **preservative**, a mixture with equal parts of Borax is more convenient than Boric Acid alone.

So called danger from the use of Boric Acid in Milk. It is far from proved that small quantities of Boric Acid, if used for a long time, are poisonous to adults or children. Large doses are, however, not considered so innocuous.—*L.* '00, i 13, 131, 574, 740.

Report of the Departmental Committee appointed to inquire into the uses of preservatives and colouring matters in foods, Boric Acid or mixtures of Boric Acid recommended to be recognised as a legal addition to cream in amount not exceeding 0.25 p.c. expressed as Boric Acid, and in butter not exceeding 0.5 p.c. expressed as Boric Acid.—*L.* '01, ii 1681, *J.S.C.I.* '01, 1228.

Report of evidence taken before the Departmental Committee. *L.* '99, ii, 1181, 1588, 1786. '00, i 207, 279, 129, 507, 586, 1409, '00, ii 276. Opinions differ as to the use of Boric Acid as a preservative of foods.—*L.* '03, i 749, 897, 920.

Influence of Boric Acid on the metabolism of children. Neither Boric Acid nor Borax in any way affected the general health and well being of the children.

B.M.J. '01, i 1397. *J.C.S.* '01, *Abstr.* ii 517.

Influence of chemical preservatives of food on health. Extremely improbable that Boric Acid if used in proper proportions would cause any injurious effect whatever to the average adult, but because of certain possible injurious effects which might be produced, the use of such preserved milk for invalids and young children is to be condemned.—*L.* '99, ii 1127, 1177.

A record of 22 cases of toxic symptoms certainly caused by Boric Acid. General conclusion is that it is capable of producing dangerous pathological effects and ought not to be considered harmless.—*L.* '01, ii 1817.

Use of Boric Acid and Borates in surgery and their internal administration, though usually free from danger, ought to be carefully guarded in patients suffering from kidney affections, and immediately discontinued should dermatitis or other toxic symptoms appear.—*L.* '99, i 23.

Skin eruptions caused by the use of Boric Acid. Attention drawn to the possibility of fomentations or ointment as sources of toxic symptoms when applied to large areas of skin. Almost all the serious cases of toxic effects of Boric Acid have occurred where it had been locally applied to an absorptive surface.—*L.* '99, i 281.

Toxic effects following the use of Boric Acid given internally, also, after irrigation with strong solutions. Erythema followed by dermatitis, which disappeared on discontinuing its use.—*B.M.J.* '99, i 17, 209, *H.M.J.* '01, ii 94, *L.* '01, ii 1511.

Dose.—5 to 15 grains = 0.32 to 1 gramme.

Prescribing Notes.—*Can be given in mixture, powders, or oachets.*

Official Preparations.—Glycerinum Acidi Borici and Unguentum Acidi Borici

Not Official.—Boric Acid dressings, Collodium Acidi Borici, Collodium Acidi Borici et Zinci Sulphatis, Lotio Acidi Borici, Mistura Acidi Borici, Pastillus Acidi Borici, Boro Glyceride, Liquor Magnesi Boratis, Magnesi Borocitras, Pulvis Acidi Borici Comp, Pulvis Magnesi Borocitricus Comp

Foreign Pharmacopœias Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., N. Am., Pers., Russ., Span., Swed., Swiss and U.S.

Tests.—Boric Acid is distinguished by its behaviour with Turmeric paper, and the green coloration which it imparts to a non-luminous flame. The Turmeric test is conveniently performed by so immersing the Turmeric paper in the fluid to be tested that only one half becomes moistened, the fluid is evaporated on a water-bath, and any brownish red colour produced is instantly noted, the paper can then be moistened with Ammonia Solution, and any further alteration in colour observed. In performing the 'flame' test, the *B.P.* uses 'Alcohol,' but it is preferable to employ purified Methylic Alcohol. The behaviour of Boric Acid towards the usual indicators of neutrality does not permit of its volumetric determination under ordinary circumstances, but in a solution containing not less than 30 p.c. of Glycerin the end reaction is quite definite with Phenolphthalein Solution. One gramme of Boric Acid should require for its neutralisation about 16.1 c.c. of Volumetric Sodium Hydroxide Solution equivalent to 99.0 p.c. of Hydrogen Borate. The *U.S.P.* has adopted the process recommended (*P.J.* '02, 1. 345, *C.D.* '02, 1. 660) for inclusion in the *B.P.*, and dissolves 1 gramme of the Boric Acid in 50 c.c. of Water after the addition of 50 c.c. of Glycerin, and states that it should require 16.2 c.c. of Normal Volumetric Sodium Hydroxide Solution, equivalent to at least 99.8 p.c. of Boric Acid. The *B.P.* does not mention a method of determination. When carefully heated Boric Acid fuses and swells up, and is finally converted into a transparent glassy hygroscopic mass. With slight modifications in the wording this statement appears in the *B.P.* and the *P.G.*, the former stating the loss of weight which should occur, namely 43.6 p.c., the *U.S.P.* states that dehydration takes place at 100° C (212° F) with formation of Metaboric Acid, and on further heating it fuses at 160° C (320° F.) to a glassy mass of Tetraboric Acid, and at a higher temperature loses all its Water and is converted into Boron Trioxide.

The more generally occurring impurities are Calcium, Copper, Lead, Iron and Magnesium, also Sulphates and Chlorides. Copper, Lead and Iron may be detected by the Hydrogen Sulphide test given in the small type below, Calcium and Magnesium by the Ammonium Oxalate or Sodium Phosphate test, Chlorides by the Silver Nitrate test and Sulphates by the Barium Chloride or Nitrate test each of which appears under its individual heading. The *B.P.* includes tests for Potassium, Sodium and Ammonium. The two former may be detected by the characteristic colours which they impart to a non-luminous flame, the latter by boiling a small quantity

of the sample with Potassium Hydroxide Solution, when no ammoniacal odour should be perceptible, nor should the issuing vapour possess an alkaline reaction towards moistened red Litmus paper. The *U S P*. includes the modified Gutzert test for Arsenic, but no special test for this substance appears in either *B P* or *P G*. A test indicating a limit of Iron is included in the *U S P* and *P G*, but not in *B P*, it is given in the small type below under the heading of Potassium Ferrocyanide. A figure of less than 10 parts per million has been suggested (*C D* '08, 1795) as a fair limit for Lead, and there seems no reason for adopting a higher limit than 5 parts per million for Arsenic.

Litmus and Turmeric.—The aqueous solution reddens blue Litmus, Turmeric paper moistened with it and dried is coloured brownish red, even in presence of Hydrochloric Acid. This brownish red colour is changed to greenish black (bluish black, *P S P*) by Alkali Hydroxide Solution (*B P* gives Potassium Hydroxide Solution, *U S P* and *P G* give Ammonia Solution).

Flame Test.—The alcoholic solution when ignited imparts to the flame a greenish tinge (especially when the solution is acidulated with Sulphuric Acid, *B P*), *B P*, *P G* and *U S P*. Glycerin solutions also colour the flame green when ignited, *P G* and *U S P*.

Barium Chloride or Nitrate.—An aqueous solution (*P G* 1:50, *U S P* 1:25) should not be affected by Barium Chloride Solution, *U S P*, or by Barium Nitrate Solution, *P G*.

Ammonium Oxalate or Sodium Phosphate.—An aqueous solution (*P G* 1 in 50, *U S P* 1 in 25) should not be affected by Ammonium Oxalate Solution, or by Sodium Phosphate Solution in presence of Solution of Ammonia, *P G* and *U S P*.

Hydrogen Sulphide.—An aqueous solution (1 in 25) should not respond to the time limit test for heavy metals, *U S P*, Hydrogen Sulphide solution should not affect an aqueous solution (1-50), *P G*.

Potassium Ferrocyanide.—The *P G* and *U S P* require that 0.5 c.c. Solution of Potassium Ferrocyanide should not immediately produce a blue colour with 30 c.c. of a 2 p.c. Solution of Boric Acid in 1 part of Hydrochloric Acid and 49 parts of Water.

Modified Gutzert Test.—5 c.c. of an aqueous solution (1 in 25) should not respond to the modified Gutzert test for Arsenic, *U S P*.

Preparations

GLYCERINUM ACIDI BORICI.

6 of Boric Acid in powder, treated with 9 of Glycerin (by weight) at 302° F. (150° C.), until the whole is reduced to 10 by weight, it is then mixed with 10 of Glycerin.

If the liquid is kept constantly stirred, instead of only 'frequently' as officially ordered, the length of time required to complete the process is considerably reduced and the product is more likely to be a good colour. Boric Acid in crystals gives rather a lighter coloured product. It is too viscid for general use.

Foreign Pharmacopœias.—Official in Russ (*Acidum Boroglycerinum*), *U S* (*Glyceritum Boroglycerini*) 5 p.c., Mex (*Glicerina Borica*) 5 p.c. Not in the others.

UNGUENTUM ACIDI BORICI. BORIC ACID OINTMENT

Finely powdered Boric Acid, 1, Paraffin Ointment, white, 9
(1 in 10)

The commercial 'Fuly subtil' contains coarse particles, before use it should be passed through a fine lawn sieve.

Foreign Pharmacopœies. Official in Austri, Dutch, Fr. (Pommade d'Acide Boric), Ger. (Neu Vaselineum Boricum, Span. and Swiss Boric Acid 1, Vaseline 9), Dan. (Boric Acid 1, Simple ointment 9), Dan. Boric Acid 1, Washed Lard 9, Dan. has also Vaselineum Boricum, Boric Acid 1, Vaseline 9, Ger. and Jap. Boric Acid 1, Paraffin ointment 9, Swed. Boric Acid 1, Wool Fat 1, Vaseline 8, U.S., Boric Acid 1, Paraffin 1, White Petroleum 8. Not in Hung., Ital., Port. or Russ.

Not Official.

COLLYRIUM ACIDI BORICI Boric Acid, 10 grains, Distilled Water, 1 oz. —*King's.*

COLLYRIUM ACIDI BORICI ET ZINCI SULPHATIS —Boric Acid, 5 grains; Zinc Sulphate, 4 grain, Distilled Water, to 1 oz. —*Middleb.*

Boric Acid, 1, Zinc Sulphate, 0.10, Distilled Water, q.s. to produce 100. —*B.P.C.*

The *B.P.C.* Supplement now employs diluted Rose Water in place of Distilled Water.

LOTIO ACIDI BORICI Boric Acid, 15 grains, Water, 1 oz. —*St. Thomas's*
Boric Acid, 9, Water, 100. —*B.P.C.*

LINTEUM ACIDI BORICI. Lint dipped in a hot saturated aqueous solution of Boric Acid and then dried. Should contain 50 p.c. of Boric Acid, and not be soaly. It is usually coloured pink.

Used as an antiseptic dressing for wounds and ulcers.

Boric Gauze, 20 p.c., Boric Wool, 25–50 p.c. —*Fr. Gaze Boriquée*, 10 p.c.

MISTURA ACIDI BORICI Boric Acid, 10 grains, Dilute Nitro-Hydrochloric Acid, 10 minims, Compound Tincture of Gentian, 1 drim., Water, to 1 oz. —*Lock.*

PASTILLUS ACIDI BORICI.—2 grains in each pastille

BORO-GLYCERIDE —A patented preparation for preserving different kinds of food. A combination of Boric Acid and Glycerin.

A solution, 1 in 20 of Water, has been used as an antiseptic in operative surgery. Used as a paint in throat affections, 1 in 2 of Glycerin, as a tampon in dysmenorrhœa.

LIQUOR MAGNESII BORATIS —*Light* Magnesium Carbonate, 1; Boric Acid, 27, Water, 127, hot and filtered. They dissolve almost completely but crystallise out when forty eight hours. Half the quantity of *Light* Colloid Magnesia can be used in the place of the Carbonate.

MAGNESII BORO-CITRAS.—A white powder, or in glistening scales, prepared by the interaction of Boric and Citric Acids with Magnesium Oxide. Stated to be useful in the uric acid diathesis and for the removal of urinary calculi —*L.* '03, 1 837, 920.

Inferior to Magnesium Lactate as a haemostatic in hæmophilia —*L.* '08, 1 96.

Dose.—15 to 30 grains = 1 to 2 grammes, several times daily.

Pulvis Magnesii Borocitratis Compositus —Magnesium Borocitrate, 1; Powdered Sugar, 2.

Dose —30 to 60 grains = 1.8 to 3.6 g.c.

PULVIS ACIDI BORICI COMP —Boric Acid, 1; Zinc Oxide, 3; Starch, 6. —*Guy's.*

Boric Acid, 24, Potassium Bromide, 24, Starch, 99, Iodoform, 2; Morphine Acetate, 1. For insufflation.

Boric Acid and Starch Powder, equal parts —*St. Thomas's* and *B.P.C.*

Listerine and **Zymocide** are liquid specialties containing Boric Acid together with other antiseptics.

Antipyrone, **Aseptin**, **Branalcan**, and **Glacialine** are preservative mixtures containing Boric Acid.

ACIDUM CARBOLICUM.

PHENOL.

C_6H_6O , eq 93.34

FR, PHENOL OFFICIAL, GER, KARBOLSAURE, ITAL, FENOLO CRISTALLIZZATO, SPAN, ACIDO FINICO

Small crystals which are colourless, but have a tendency to deliquesce and acquire a pink colour on exposure to light and air. Phenol has a characteristic odour and taste, and a strongly cauterising action upon the skin. The chief commercial source is the fraction of coal tar distilling between 150 and 200° C (302° and 392° F). It may also be synthetically prepared from Benzol, and is supplied commercially of very good quality. It should be kept in dark amber-coloured well stoppered bottles.

Carbolic Acid, or Phenol, is prepared in a crude state by treating certain oils, heavier than Water, obtained in the distillation of Coal Gas Tar, with a dilute solution of Caustic Soda, and by subsequently separating the crude Carbolic Acid from the alkaline solution by the addition thereto of a mineral Acid (usually Sulphuric). The crude Carbolic Acid thus obtained is submitted to fractional distillation and crystallisation, with other purification processes, having for their object the entire removal of the last traces of Cresylic and other Tar acids and bases, Sulphur compounds, etc.

Solubility. 1 in 13 (or a little less) of Water, 1 in 2 of Olive Oil, $3\frac{1}{2}$ in 1 of Glycerin, 3 in 1 of Chloroform, 4 in 1 of Ether, 6 in 1 of Alcohol (90 per cent), $2\frac{1}{2}$ in 1 of Benzol, $2\frac{1}{2}$ in 1 of Carbon Bisulphide, freely in Liquor Potassæ, in Liquor Sodæ, and in Volatile Oils.

The B.P. requires that at 60° F (15.5° C) 100 parts of Phenol should be liquefied by the addition of 10 parts of Water, should form a clear liquid with 30 to 40 of Water, and should be completely dissolved by 1200 of Water.

When 1 or 2 parts of melted Carbolic Acid are mixed with 1 of Water, the Acid separates on cooling in oil like globules, but when 3, 4, 5, 6, 7, 8, and even 9 of Acid to 1 of Water are mixed the solution is perfect at ordinary temperatures, when, however, the temperature sinks to 40° F or under, the 8 and the 9 will crystallise out again.

Pure Carbolic Acid readily absorbs Water from the air, and combines with it to form a definite crystalline Hydrate $2C_6H_6O.H_2O$, containing 8.74 per cent of Water and melting at 63° F (17.2° C) — *Mon.*

Medicinal Properties. — Antiseptic, disinfectant, and local anæsthetic. Given as an intestinal and gastric antiseptic in flatulence, and in dilated stomach with fermentative change, it is most efficacious in typhoid in the form of 1½ grain pills. It relieves the itching of psoriasis. It has been used with advantage internally in phthisis, bronchitis, gangrene of the lung, whooping-cough, and puerperal fever, as a prophylactic against scarlet fever. Placed in a carious tooth, or cautiously applied to the gum, relieves tooth-ache. Used as a **paint** for the throat (30 grains to 1 oz of Glycerin), as a **gargle** (2 grains to 1 oz) for tonsillitis, it used

with a **spray apparatus**, 3 grains in an oz. of Water, or for **inhalations**, 20 grains dissolved in a pint of hot Water; as an **injection** (1 grain to 1 oz. of Water), for the vagina or the bladder, as an antiseptic. Externally, used alone is a powerful caustic, as a **lotion** (15 to 30 grains to 1 oz.) for foul or syphilitic ulcers, carbuncles, scabies, ringworm and other parasitic skin diseases, (5 grains to 1 oz.) excellent for eczema and eruptions attended with itching, or as the official **ointment**. For a **mouth-wash**, see Phenate de Soude, p. 35

Carbolic Oil, 1 or 2 in 40 of Olive Oil, used for dressing scalds and burns.

Carbolic Solution, 1 or 2 in 10 of Water, used in surgery as an antiseptic

2 p.c. solutions have been used for **hypodermic injection**.

Deep hypodermic injections (4 grain to 20 minims Water) have been found most successful in erysipelas, poisoned wounds and deep seated inflammations — *Whitt*

As solutions of Carbolic Acid in strong Alcohol or concentrated Glycerin are not caustic, but become so when diluted with Water, it is suggested that in cases of burning with concentrated Carbolic Acid it would be better to remove the Acid with strong Alcohol rather than with Water. — *P. J.* '91, n. 783

Actual contact would appear to be necessary for Carbolic Acid to act as a germicide. A few inches from the surface of pure Carbolic Acid in a bottle (open to the air) putrefaction and fermentation go on as rapidly as in the open air — *P. J.* '93, n. 545.

As an ointment or plaster (1 in 15 or 20) in lupus — *M. A.* '94, 416

Carbolic Acid mixed with 5 to 10 p.c. of Glycerin injected for hydrocele — *B. M. J.* '86, i. 1164, 1214

2 p.c. spray for ... — *P. J.* '86, n. 917

Injection of a ... for anthrax — *B. M. J.* '86, n. 601; *L.* '87, n. 1186; *L. M. R.* '89, 122; *M. A.* '94, 79

1 grain in 1 oz. of Water every 4 hours for vomiting in pregnancy. — *L.* '89, i. 1121

Throat ... treated with Carbolic Acid — *B. M. J.* '97, i. 1314.

How ... pills in acute diarrhoea — *L.* '93, n. 1305

Indisputably in the treatment of tetanus, 2 minims in 30 minims of Water injected 3 times a day — *L.* '99, i. 1497, '99, n. 1589; *B. M. J. E.* '99, i. 15, '00, i. 82.

Treatment of tetanus in horses by hypodermic injections — *L.* '00, i. 538

Treatment of influenza — *L.* '99, i. 958, '00, i. 143, 509, 667, 1030

The offensiveness of the pustular stage of eruption in smallpox successfully treated by the pure liquefied acid, applied with a small camel's hair brush to the rash over a certain area of the body each day, commencing with the face and head, until the whole of the vesicles had been touched, care being taken to prevent the acid running on the healthy skin — *L.* '03, i. 518, '04, n. 1151, 1781

In the treatment of plague, 12 grains given in a mixture every two to four hours — *L.* '99, n. 1589; '00, i. 614, '01, n. 753

Fixation of movable kidney by means of strong Carbolic Acid, six cases — *L.* '03, i. 1142.

Treatment of erysipelas — *B. M. J.* '02, i. 1142.

Cases of Carbolic Acid gangrene — *T. G.* '01, 739, 192 cases of gangrene due to weak solutions of Carbolic Acid — *Med. Review* '00, 449

Treatment of various vegetations with pure Carbolic Acid — *T. G.* '01, 689.

A 5 p.c. solution failed to destroy anthrax spores after twenty four hours' exposure, but destroyed the bacillus pyocyaneus, staphylococcus pyogenes aureus, and the bacilli of typhoid fever, diphtheria, cholera, and tuberculosis — *London County Council's Report on Disinfectants*, *L.* '02, i. 754.

Carbolic Acid (5 p.c.) and Mercuric Chloride Solution (1 in 1000) proved to

be the only real germicides for tubercle bacilli—*Report of the London County Council on Disinfectants*, L '02, i 759

Poisoning from the application of Carbolic Acid to the unbroken skin A 2 p c solution being used as an application for pruritus, followed by the use on another day, after a bath, of a 4 p c solution applied to the abdomen, the thighs and the lumbar region Recovery in ten days—*L*, '02, i 1551

Alcohol stated to be one of the best antidotes in Carbolic Acid poisoning The patient is made to drink promptly a few oz of brandy, whisky, or other spirit Immediately after this a soft india rubber tube is passed through the oesophagus and into the stomach A funnel is attached to the upper end and about a pint of Water (more or less, according to the circumstances) is poured into the stomach The upper end of the tube is now depressed and the fluid is syphoned out Washing the stomach is repeated two or three times, and finally 1 drm Sodium Sulphate dissolved in a wineglassful of Water is given—*Medic's Archives* (December '99), *L*, '00, i 481, *T'G* '01, 587, '01, 707, '02, 114, *P'J* '00, i 1, '02, ii 85, *Squibb*, '01, 2563

Bacterial standardisation of disinfectants—In the 'drop' method of testing the bactericidal power of disinfectants, originated by Rideal and Walker, pure Phenol is recommended as the standard control disinfectant. It is employed in aqueous solution, and the proportion of absolute Phenol present should be determined by titration with Bromine as given under Tests The method ascertains what dilution of the disinfectant under examination kills a given bacterial culture within the same time as the standard Phenol dilution The quotient of the two dilutions indicates the efficiency of the disinfectant and is called its Carbolic Acid coefficient, or its Rideal Walker coefficient Thus if a 1 in 3000 dilution is found to be as germicidal as a 1 in 100 Phenol, the disinfectant is said to have a Phenol efficiency of 30, that is, it possesses a germicidal power thirty times stronger than Phenol In the routine testing of disinfectants the typhoid bacillus is generally used because of its medium resistance, its easy cultivation, and because it forms a good suspension, but it is noteworthy that the coefficients of a disinfectant for different bacteria are not always identical

The presence of organic matter has been found to exert an appreciable effect on the Carbolic Acid coefficients as determined by the Rideal-Walker method Meredith Blyth is of opinion that disinfectants, containing the higher Phenols, suffer great loss of efficiency when mixed with fat, albumen, faeces and urine The germicidal value of the disinfectant acting on a 'naked' organism gives little, if any, indication of its value in the presence of organic matter It appears impossible in the Phenol class to combine a low toxic value with a high germicidal value in the presence of much organic matter—*Analyst*, '06, 154.

Dose.—1 to 3 grains = 0.06 to 0.2 gramme

Ph Ger maximum single dose, 0.1 gramme, maximum daily dose, 0.3 gramme

Prescribing Notes—Usually given internally in the form of a pill 12 grains of Carbolic Acid make a good pill mass with 24 grains of *Liquorice Powder*, another good formula is, Carbolic Acid 12 grains, *Liquorice Powder* 18 grains, *Compound Tragacanth Powder* 6 grains Used in various forms as an application

Compressed tablets are supplied for extemporaneously preparing a solution

The addition of free Ammonia to solution of Carbolic Acid slowly turns the colour blue, which darkens on keeping—*P'J* (i) xxi 593

Sulphurous Acid, added in very small proportion to Carbolic Acid melted, has been stated (*C'D* '05, i 859) to counteract the tendency of the acid to acquire a red tint.

Official Preparations.—*Acidum Carboicum Liqfactum*, *Glycerinum Acid Carboici*, *Suppositorium Acid Carboici*, *Trochiscus Acid Carboici*, *Unguentum Acid Carboici* Used in the preparation of *Salol*, *Sodii Sulphocarbolas* and *Zinci Sulphocarbolas* Contained in *Injectio Ergota Hypodermica* and *Liquor Thyroidei*

Not Official—Anti catarrhal Salts, Gargarisma Acidi Carbolici, Kraus's Catheter Lubricant, Latio Acidi Carbolici, Latio Acidi Carbolici et Boracis, Liqueur Sodii Carbolatæ, Mistura Acidi Carbolici, Lind's Oil, Oleum Lubrificans, Pasta Lubrificans, Pastillus Acidi Carbolici, Resina Carbolica, Vapor Acidi Carbolici, Antiseptic dressings, Carbolic Soap, Solution of Phenate de Soude, Acidum Carboliceum Crudum, Phenolæ xl Phenol Camphor, Phenol lodatum, Pigmentum Phenol Iodati, Tribromphenol, Para mono-chlorophenol, Trichlorophenol, Sulphaminol, Sulphocarbolice Acid and Sulphocarbolates

Foreign Pharmacopœias—Aust., Belg., Dan., Dutch, Fr., Ger., Hung., Ital. (Fenolo cristallizzato), Jap., Mex. (Acido Fenico), Norw., Port., Russ., Span., Swed., Swiss and U.S.

Melting Point (Centigrade) compared with Foreign Pharmacopœias. Brit., 38.8°; Port., 35°; Dan., 39°; Fr., Spin and Swed., 42°, Hung., 36–41°; Ital., 40°; Mex., 40°; Norw., 40°; Austr., Belg., Dutch, Ger., Jap., Russ. and Swiss, 40°–42°; Swed., 39°; U.S., not lower than 40

Boiling Point (Centigrade) compared with Foreign Pharmacopœias. Austr., 178–180°; Brit., not higher than 180°; Ital., 182°; Dutch, 181–182°; Port. and Swed., b.p. not given; Fr., 180°; Belg., Ger., Jap., Norw., and Russ., 178–182°; Hung., 180–184°; Spin., 180°; Swiss, 183°–184°; U.S., not higher than 188

Antidotes.—Stomach tube, Emetics. Alcohol, Albumen, Saccharated Solution of Lime, soluble Sulphates (Magnesium or Sodium), Olive or Castor Oil; stimulants to counteract narcotism, warmth to the extremities. Hypodermic injection of Atropine Sulphate $\frac{1}{2}$ grain. Inhalations of Amyl Nitrite.

Case of Carbolic Acid poisoning by absorption treated successfully with 1 grain doses of Camphor (dissolved in Syrup) every hour for four hours—*L. M. R.* '84, 217. 100 grammes of Camphorated Oil administered in case of Carbolic Acid poisoning complete recovery—*G. D.* '99, n 1055. Recovery after swallowing 3 oz Carbolic Acid, treated by hypodermic injection of $\frac{1}{2}$ grain Apomorphine, Olive Oil and Lime Water being given freely—*L. M. J.* '89, n 1336. Soap—*L.* '89, n 415. Vinegar neutralises the effects of Carbolic Acid on the skin and mucous membrane, and is useful when Carbolic Acid has been swallowed—*L.* '96, n 251, *Pr.* Kn 220, *B. M. J.* '97, n 595.

Tests. Carbolic Acid is distinguished by the following tests: (1) its melting point, (2) the boiling point, (3) its specific gravity at the melting point, (4) the production of a deep purple-violet colour when its aqueous solution is mixed with Ferrie Chloride Test-solution, (5) the production of a white precipitate of Tribromphenol when an excess of Bromine Solution is added to its cold aqueous solution, and (6) the production of a bluish colour when 4 parts of its aqueous solution are mixed with 1 part of Anemone Solution and a few drops of Chlorinated Soda Solution, and the mixture gently warmed.

The melting point is officially required to be not lower than 102° F. (38.8° C.). The melting point 91.5° F. (33° C.) given in *B.P.* 1885, was lower than that of any other Phenol preparation, it has very properly been raised to a maximum of 102° F. (38.8° C.). It is possible with special precautions to raise the melting point of Carbolic Acid to 108° F. (42.2° C.), but the highest melting point commercially obtainable appears to be about 106° F. (41.1° C.), and no exception can be taken to a melting point of 104° F. (40° C.). The *P. G.* gives the melting point as 40° to 42° C. (104° to 107.6° F.); the *U.S.P.* requires that when Phenol is gently heated till liquid, then slowly cooled, with constant stirring until partial recrystallisation occurs, the semi liquid mass formed should have a temperature

(remaining stationary for some time) not lower than 39° C (102.2° F). A lower boiling point or a higher melting point indicates a less hydrated Phenol. The melting point and the boiling point are influenced by the presence of Water or Cresylic Acid, so that to eliminate the first it should be boiled for a few seconds and cooled. Starting with an acid melting at 104° F (40° C), 1 p.c. of added Water reduced the melting point to 98° F (36.6° C), 3 p.c. to 86° F (30° C), and 5 p.c. to 71° F (23.3° C).

The boiling point of the acid is about 180° C (356° F), the *BP* states not higher than 182° C (359.6° F), the *USP* and the *PG* 178° to 182° C (352.1 to 359.6° F). The acid has a specific gravity at its melting point of about 1.060, the *BP* states 1.060 to 1.066.

Lunge has shown (*PJ* (3) xii 593), that the addition of 1.3 p.c. of Cresylic Acid to pure Phenol reduces the melting point from 40.5° C (104.9° F) to 32.5° C (90.5° F). The lower the melting point and the higher the boiling point, the more impure is the acid. The pure acid melts at 42° C (107.6° F), and boils at 182° C (359.6° F). A useful method of judging of the purity of a commercial acid is by determining the solidifying point of the 62.5 p.c. fraction, after the first 10 p.c. fraction containing the Water and light oils has been removed.

The aqueous solution of Phenol is faintly acid to blue Litmus paper. The *BP* states that it does not immediately reddens blue Litmus, the *USP* that it is faintly acid to blue Litmus paper. An aqueous solution of Phenol yields a fine violet colour on the addition of Ferric Chloride Test-solution, the colour being pronounced even in very dilute solution. The *USP* gives quantities for this test, 1 drop of Ferric Chloride Test-solution to 10 c.c. of a 1 p.c. aqueous Phenol Solution yielding a violet-blue colour. The *PG* employs a solution of 20 parts of Phenol in 10 parts of Alcohol (90 p.c.) and states that when this solution is mixed with 1 part of Ferric Chloride Test-solution a dirty green coloration is produced, the solution when diluted with Water to 1000 parts assuming a nearly permanent light violet colour. Phenol even in dilute solution affords a white precipitate with Bromine Water. The test is common to the *BP*, *USP* and *PG*. The *USP* states that the precipitate of Tribromophenol first formed is redissolved, but becomes permanent with more of the reagent, and that when examined under the microscope it appears crystalline. The *PG* directs a 1 in 50,000 solution of the Phenol to be employed, and states that the precipitate is flocculent.

Phenol coagulates Albumen Solution and Gelatin, and forms a liquid with Camphor.

No process of assay has been introduced into the *BP*. The Eighth Decennial Revision of the *USP* has adopted the Tribromophenol or Koppeschaum's process. The Phenol is precipitated as a Bromine compound by the addition of Bromine Solution and the excess of Bromine is determined by the addition of solution of Potassium Iodide (20 p.c.), and titration of the liberated Iodine with

Tenth normal Volumetric Solution of Sodium Thiosulphate. The acid is required to show 96 p.c. of absolute Phenol. An outline of the process is given in the small type below under the heading of Volumetric Determination. The process originally recommended by Koppeschaar is given (*Zeitschrift für analytische Chemie*, xvi, 233), and consists in precipitating Phenol from its aqueous or dilute alcoholic solution with Bromine Water, the strength of the Bromine Water being determined by titration with Volumetric Sodium Thiosulphate and Potassium Iodide. The process is modified by Allen as follows. A quantity corresponding to about 0.1 of a gramme of Phenol is carefully weighed and transferred to a stoppered bottle, to this is added a solution prepared by gradually adding Bromine to 7 c.c. of Normal Volumetric Sodium Hydroxide Solution until a permanent yellow colour appears, and then boiling the liquid. When cold a measured quantity of 5 c.c. of concentrated Hydrochloric Acid is rapidly introduced, the bottle stoppered and shaken. A solution of 1.25 grammes of pure Potassium Iodide is added, the bottle shaken and allowed to stand, the liberated iodine is titrated with Deci-normal Volumetric Sodium Thiosulphate Solution, using Starch Mucilage as an indicator. In calculating out the result 7 c.c. of Normal Volumetric Sodium Hydroxide Solution neutralises 0.566 gramme of Bromine, all of which is liberated by Hydrochloric Acid. 0.1 of a gramme of Phenol requires 0.4068 gramme of Bromine, leaving a surplus of 0.1532 gramme, which would be sufficient to neutralise 19.5 c.c. of Deci-normal Volumetric Sodium Thiosulphate Solution, each c.c. of Volumetric Thiosulphate used over and above this indicates 0.00197 gramme of impurities in 0.1 gramme of the sample.

The more commonly occurring impurities are excess of Water and the presence of Cresylic Acid and Creosote. The presence of excess of Water is indicated by the lowering of the melting point, which may also indicate the presence of Cresylic Acid. The latter acid and Creosote are detected by the behaviour of a mixture of equal volumes of the liquefied acid and of the Glycerin when mixed with 3 volumes of Water. The *B.P.* and *U.S.P.* state that a clear liquid should be formed when 1 volume of Phenol liquefied by the addition of 10 p.c. of Water (8 p.c., *U.S.P.*) is mixed with 1 volume of Glycerin, and it is not rendered turbid when 3 volumes of Water are added.

Volumetric Determination.—The following process, which is a modification of that originally devised by Koppeschaar, is included in the *U.S.P.* A measured quantity of 25 c.c. (= 0.0389 gramme of Phenol) of a solution obtained by dissolving 1.566 grammes of the specimen in sufficient Water to produce 1000 c.c. is mixed in a glass stoppered bottle with 80 c.c. of Tenth-normal Volumetric Bromine Solution, 5 c.c. of Hydrochloric Acid added, followed by 5 c.c. of an aqueous Potassium Iodide Solution (20 p.c. w/v), rapidly introduced; the mixture is shaken, the stopper and neck of the bottle rinsed with a little Water, allowing the washings to run into the bottle, 1 c.c. of Chloroform added and the mixture well shaken. The liberated iodine is titrated with Tenth-normal Volumetric Sodium Thiosulphate Solution, of which the number of c.c. used subtracted from 80 and the remainder multiplied by 4 yields the percentage of absolute Phenol present in the specimen operated upon.

Preparations

ACIDUM CARBOLICUM LIQUEFACTUM. LIQUEFIED PHENOL
LIQUEFIED CARBOLIC ACID

Phenol, 10, Distilled Water, 1, by weight

It forms a clear, colourless, highly refractive liquid possessing the characteristic odour of Phenol. It has a tendency to acquire a pinkish tint, and should therefore be preserved in well-stoppered dark amber tinted glass bottles

Dose.—1 to 3 minims = 0.06 to 0.2 c c

Foreign Pharmacopœias—Official in Austr, Belg, Fr, Ger, Hung, Jap and Russ, Carbolic Acid, 100, Water, 10. Dan, Ital., Norw, Span, Swed and Swiss, Carbolic Acid, 90, Water, 10. Dutch, Carbolic Acid, 100, Water, 20, U S, not less than 86.4 p c. Not in the others

A weak **Solution of Carbolic Acid** is official in the following Pharmacopœias—Ital (Aqua Phenicata), and Port (Aqua Phenica), 1 in 100, also 1 in 1000, (Aqua Carbolisata), Austr, Belg, Dutch and Ger, 1 in 50, Hung (Aqua Carbolata), Mex (Soluciones de Acido Fenico), and Swiss (Aqua Phenolata), 1 in 100, Dan (Solutio Phenoli), Fr (Soluté de Phénol), Norw (Solutio Acidi Carbolici) and Swed (Solutio Phenoli), 1 in 50, Span (Aqua Fenicada), 1 in 50. The *Brussels Conference* adopted a strength of 2 p c w/w for Phenol: Solutio seu Aqua Phenolata

Tests—Liquefied Carbolic Acid has a specific gravity ranging from 1.064 to 1.069, a boiling point not higher than 182° C (359.6° F), and it should answer the tests of identity and purity given under Acidum Carbolicum

When a small quantity of solution (say, 2 fl dm, in a test-tube with a thermometer dipping into the solution) is cooled to about 10° C (50° F) and gently stirred, it becomes a mass of crystals, which will entirely disappear when the temperature rises to 14.4° C (58° F)

GLYCERINUM ACIDI CARBOLICI. GLYCERIN OF PHENOL

Phenol, 1, Glycerin, sufficient to produce 5 (1 in 5)

Used as an antiseptic packing in cases of acute middle ear catarrh, and has given good results—*B M J* '04, n 1210. A 10 p c aqueous solution of the acid with Cocaine affords relief of pain in non suppurative middle-ear disease—*B M J* '04, n 1211

Mixed with an equal bulk of Water, may be applied to aphthous stomatitis, or to ulcers in the month, or to inflamed tonsils. Mixed with 20 or 30 parts of Water, it makes an excellent gargle

Foreign Pharmacopœias—Official in U S, 1 in 5, Mex, 1 in 50; Port, 1 in 100, Span, 1 in 100. Not in the others

SUPPOSITORIA ACIDI CARBOLICI. PHENOL SUPPOSITORIES

Each suppository contains 1 grain of Phenol, 2 grains of White Beeswax, and about 12 grains of Oil of Theobroma

The addition of Wax to Oil of Theobroma raises the melting point of the mass without producing the required firmness. Suggested that future *B P* basis should be Theobroma alone, *I. J.*, '00, n 85

TROCHISCUS ACIDI CARBOLICI. PHENOL LOZENGE

1 grain of Phenol in each, flavoured with Tolu.

Dose.—1 to 3 lozenges

UNGUENTUM ACIDI CARBOLICI. PHENOL OINTMENT OINTMENT OF CARBOLIC ACID—*B.P.* '85.

Phenol, 1, Glycerin (by weight), 3; white Paraffin Ointment, 21 (1 in 25)

In *B.P.* '85 ointment, part of the Phenol crystallised on keeping, and acted as a caustic. To avoid this the Phenol is now dissolved in Glycerin.

Attention has been directed (*L.* '05, i. 514) to the tendency of the *B.P.* Ointment to crystallise, and a modified formula suggested.—Phenol, 1, Hard Paraffin, 6; Soft Paraffin, 18. This formula is stated to be superior to the official one, and to be recommended especially for obstetric use. The desirability of adopting alternative formulas for ointment bases in the *B.P.* Ointment bases may be classed into (1) Non absorbent ointment bases, e.g., Hard and Soft Paraffin, (2) Emollient absorbent ointment bases, e.g., Lard and Olive Oil, (3) Systematic absorptive dermatine bases, e.g., Wool Fat.

The ointment made according to the directions contained in the British Pharmacopoeia has been the subject of a good deal of discussion from time to time, some authorities holding that even now it is not a satisfactory product, whilst others hold that it is. According to *P.J.* '05, i. 344, the formula as it stands has been well designed, and it produces an excellent ointment.

The *B.P.* 1885 ordered Carbolic Acid 1, Soft Paraffin 12, Hard Paraffin 6 = 1 in 19. The *Companion* noted the fact that the Carbolic Acid did not dissolve until the melted mixture was heated to 60°C (140°F) or over, and that part of the Carbolic Acid crystallised on keeping the ointment, but no crystals were formed when the strength was reduced to 1 in 30. The *U.S.P.* has now been altered to 8 in 100, and this has been incorporated in the *B.P.C.* under the title **Paraffinum Carbolisatum**.

Foreign Pharmacopœias Ointment Fr (Pommade de Phénol), Phenol 1, Vaseline 99, Ital (Pomata Fenata) Carbolic Acid 1, Benzoylated Lard 99; Mex (Pomada de Acido fenico), Carbolic Acid 1, Alcohol 1, Vaseline 98; U.S. (Unguentum Phenolis), Phenol 3, White Petroleum 97. Not in the others.

Not Official.

ANTI-CATARRHAL SALTS—Phenol, 1, Eucalyptus Oil, 1, Pumilio Pine Oil, $\frac{1}{2}$, Strong Iodine Solution, $\frac{1}{2}$; Camphor, 1, Ammoniated Alcohol, 2; Pine Sawdust, 2, or *q.s.*—*Martindale*

This is incorporated in the *B.P.C.* under the title **Vapor Eucalypti Compositus** with *q.s.* anti-catarrhal Salts.

GARGARISMA ACIDI CARBOLICI.—Glycerin of Phenol, 1 fl. oz.; Water, to 1 pint.—*St. Thomas's*

This has been incorporated in the *B.P.C.*

Glycerin of Carbolic Acid, 25 minims; Water, to 1 fl. oz. *London.*

LOTIO ACIDI CARBOLICI.—Carbolic Acid, 30 grains; Water, 8 oz. This lotion applied to mosquito bites relieves the itching, pain, and swelling. If mixed with a little Glycerin and sponged over the face and hands before retiring to rest, the mosquitoes will not bite until the Acid be thoroughly evaporated by the heat of the skin—*L.* '78, ii. 280.

See also Foreign Pharmacopœias under 'Acidum Carboliceum Liquefactum'

Lotio Acidi Carbolici.—Carbolic Acid (crystals), 1 oz., Water, to 20 fl. oz.—*London*

Liquefied Carbolic Acid, 21 minims; Water, to 1 oz.—*Westminster*

Phenol Crystals, 1, Water, to 20. Usually diluted with Water before use, as an antiseptic in surgery—*B.P.C.* See also Carbolic Solution, p. 28.

LOTIO ACIDI CARBOLICI ET BORACIS—Glycerin of Phenol, 2 fl oz, Glycerin of Borax, 2 fl oz, Water, to 1 pint To be diluted with five to ten parts of Water—*St Thomas's*

This has been incorporated in the *B P C*

Lotio Boracis cum Acido Carbolico.—Bicarbonate of Sodium, 20 grams, Borax, 20 grams, Glycerin of Carbolic Acid, 1 fl dm, Distilled Water, to 1 oz—*Royal Free*

Lotio Acidi Carbolici cum Borace—Glycerin of Carbolic Acid, 6 minims, Glycerin of Borax, 6 minims, Water, to 1 oz—*Children's Hospital, G O S*

MISTURA ACIDI CARBOLICI (Roth)—Pure Carbolic Acid, 12 minims, Tincture of Iodine, 16 minims, Tincture of Orange, 90 minims, Syrup, 3 dm, Water, to 8 oz Recommended for use in typhoid fever, 1 oz every 4 hours—*J. '88, 1 1214*

LUND'S OIL—Phenol, 1, Castor Oil, 4, Almond Oil, 20—*Joel*

Phenol, 1, Castor Oil, 4, Almond Oil, 15—*Companion* (1899).

This has been incorporated in the *B P C* under the title **Oleum Lubrificans**.

A solution of Carbolic Acid in Oil is frequently used to lubricate and at the same time disinfect catheters, but Koch's experiments show that such a solution has no antiseptic power, and they ought to be first disinfected with an aqueous solution, and afterwards oiled—*Brunton*

Kraus's Catheter Lubricant—Tragacanth, 2 5, Glycerin, 10, Phenol Water (3 p c), 90

This paste facilitates the passage of the catheter and is easily washed off in warm Water—*P J '99, n 529*

This has been incorporated in the *B P C* as under—

Pasta Lubrificans Syn Catheter Paste—Carbolic Acid, 3, Glycerin, 10, Tragacanth, 2 50, Distilled Water, q s to produce 100—*B P C*

PASTILLUS ACIDI CARBOLICI—Carbolic Acid, $\frac{1}{2}$ gram, Glycerogelatin, 18 grains in each

RESINA CARBOLICA—Resin, 4, Carbolic Acid Crystals, 4, Chloroform, 3—*R D H*

Resin, 45, Carbolic Acid, 85, Chloroform, 20—*B P C*

VAPOR ACIDI CARBOLICI—Pure Carbolic Acid, 420 grams, Water, 1 dm, dissolve 20 drops in a pint of Water at 140° F for each inhalation Antiseptic, very serviceable in syphilitic and carcinomatous ulcerations

CARBOLIC ANTISEPTIC DRESSINGS—Absorbent Wool and Lint containing 5 and 10 p c of absolute Phenol, Gauze, 5 p c Tow, 5 p c, Ligatures; Protective Oiled Skin, Silk Sutures Fr (Gaze Phénolée), 2 to 5 p c, Belg, Gauze, 5 p c, Jap, Cotton Wool, 5 p c, Ital, Gauze, 5 p c, Wool, 2 p c, Mex, Gauze, 10 p c, Stupa Carbolisata (*B P C*), Carbolic Acid, in crystals, 5, Methylated Ether (0 720), 100, Jute Tow, dried, 95, Stupa Carbolisata Composita (*B P C*), Jute Tow, dried, 85, Tar, 1, Carbolic Acid, 10, Methylated Ether, 100

CARBOLIC SOAPS—These contain 10 p c and 20 p c of Phenol

SOLUTION DE PHENATE DE SOUDE—Phenol, 100, Solution of Caustic Soda (sp gr 1 332), 20, by weight, Water to measure, 1000 *P*

One part of this solution to 80 of Water makes a good antiseptic mouth-wash.

Liquor Sodii Carbolatis—Phenol, 8, Caustic Soda, 3 $\frac{1}{2}$, Distilled Water, 100—*Martindale*

Liquor Sodii Carbolatis. Syn. Solution of Sodium Phenate—Carbolic Acid, 8, Sodium Hydroxide, 4, Glycerin of Cochineal, 1, Distilled Water, q s, to produce 100.—*B P C*

A formula is given (*A J P '90, 109*) as representing the proprietary article sold under the name 'Phénol Sodique' Coal tar, 2 troy oz, Soda, 120 grams, Water sufficient to make 20 fl oz

ACIDUM CARBOLICUM CRUDUM A yellowish, yellowish-brown, or reddish-brown liquid having a strongly empyreumatic and disagreeable odour. It consists chiefly of **Cresylic Acid** (see p. 12) and is largely used for disinfecting drains, etc.

Foreign Pharmacopœias.—Official in Hung., Ital., Jap. and Russ. Not in the others.

PHENOSALYL.—A specialty containing Phenol and Salicylic Acid introduced as an antiseptic.

PHENOL-CAMPHOR—Carbolic Acid and Camphor will form a liquid in any proportion between Camphor 3, Carbolic Acid 1 and Camphor 1, Carbolic Acid 3, but most a still better apper to use in excess of Camphor. The formula $C_{10}H_{16}O$, attributed to this compound, corresponds with molecular weights of each, Carbolic Acid and Camphor (Carbolic Acid 2 parts, and Camphor 3 parts).

A colourless or faintly liquid with an odour of Camphor. Soluble in Alcohol (90 p.c.), Ether, Chloroform, and Oils. Insoluble in Glycerin and in Water.

Used as a local anæsthetic for toothache—*T. G.* '85, 269; *L.* '89, n. 8077. Camphor, 60, Phenol, 19, Water, 1, is not so caustic as Carbolic Acid—*Pr.* xl. 128, and xlv. 52.

Acidum Carbolicum Camphoratum (Hager)—Camphor, 3, Carbolic Acid, 1.

This has been incorporated in the *B. P. C.*

Camphora Carbolisata (Hager)—Camphor, 25, Carbolic Acid, 9; Spirit, 1.

Carbolic Acid 1, Camphor 3, has been applied in diphtheria, etc., either pure or mixed with an equal volume of Oil of Almonds.

PHENOL IODATUM (Iodised Phenol **Pigmentum Phenol Iodati**)—Iodine, 40 grains, Liquefied Carbolic Acid, 1 cc.—*Hoep. Women, and Samaritan.*

Applied on a dressed wound or forceps in chronic endometritis and endocervicitis, with or without a previous curetting. A fl. dr. diluted with 20 oz. of Water is used as a vaginal douche in midwifery—*L.* '88, n. 862.

Iodine, 10, Liquefied Carbolic Acid, to make 100—*B. P. C.*

Pigmentum Iodi Carbolicum.—Iodine, 1; Liquefied Phenol, 4.—*Guy's.*

Pigmentum Iodi Carbolisatum.—Iodine, Potassium Iodide, and Phenol, of each 4 grains (Glycerin, $\frac{1}{2}$ oz., Water, to 1 oz.—*Central Throat*

This is sometimes used at half strength.

It has been incorporated in *B. P. C.* as follows—Iodine, 1, Potassium Iodide, 1; Phenol, 1; Glycerin, 50; Distilled Water, q. s. to produce 100.

TRIBROMPHENOL (Bromol)—White crystalline powder, with a slightly aromatic odour. A sample melted at $185^{\circ} F$ ($85^{\circ} C$).

Solubility.—1 in 2 of Alcohol (90 p.c.), 1 in 1 of Ether; 1 in 2 of Chloroform, almost insoluble in Glycerin, &c. Dissolves in Caustic Alkaline Solutions, 1 in 200 of Glycerin, 1 in $7\frac{1}{2}$ of Olive Oil.

It possesses considerable antiseptic properties.

PARA-MONOCHLOROPHENOL—Occurs in crystalline needles. Soluble in Alcohol, Ether, and Fixed Oils, but practically insoluble in Water. It possesses a stronger microbicidal power than Phenol, but its employment requires careful watching—*H. M. J. E.* '95, i. 11; *J. E.* '95, n. 551; '98, i. 61; *C. D.* '95, i. 224.

5 or 10 p.c. Glycerin solution in laryngeal phthisis, by intralaryngeal injection, also $\frac{1}{2}$ to $\frac{1}{4}$ p.c. solutions for inhalations. Under the name of **Menthosol**, a mixture of Menthol and Para-chlorophenol in 5, 10 and 15 p.c. solutions has been introduced—*B. M. J. E.* '02, i. 43.

TRICHLORPHENOL.—White crystalline powder, with a pungent, somewhat tarry odour.

Solubility.—1 in 1 of Alcohol (90 p.c.); 2 in 1 of Ether; 1 in $1\frac{1}{2}$ of Chloroform, 1 in 1000 of Water, 1 in 9 of Glycerin; 1 in 8 of Olive Oil.

It forms salts with Ammonium, Potassium, Magnesium, Calcium and Lead.

It is stated to be an antiseptic and deodorant much stronger than Carbolic Acid.

SULPHAMINOL (Thio oxydiphenylamine) Yellow, odourless, tasteless, powder Insoluble in Water, soluble in Alcohol and Ether Antiseptic dusting powder Internally in doses of 3 to 4 grains = 0.2 to 0.36 gramme, three or four times a day in cystitis

SULPHOCARBOLIC ACID ($\text{H C}_6\text{H}_4\text{SO}_3$) — Phenol para sulphonic Acid is formed by the action of Sulphuric Acid upon Carbolic Acid when warm Phenol-ortho sulphonic Acid is produced in the cold

A few years ago it was revived under the name **ASEPTOL**, a syrupy liquid, mixing in all proportions with Water, Alcohol, and Glycerin

AMMONIUM, MAGNESIUM, POTASSIUM, and SODIUM SULPHOCARBOLATES all crystallise in tufts of acicular crystals more or less white, **COPPER SULPHOCARBOLATE**, in transparent light blue interlacing prisms, the **IRON** salt, in small brown micaceous crystals, the **ZINC** salt, in tabular crystals

The Sodium and Zinc Sulphocarbulates are official See **SODIUM SULPHOCARBOLATES** and **ZINC SULPHOCARBOLATES**

ACIDUM CHROMICUM.

CHROMIC ANHYDRIDE

CrO_3 , eq 99.38

FR, ACIDE CHROMIQUE CRISTALLISE, GER, CHROMSÄURE, LIQF, ANHYDRIDE CHROMICA, SPAN, ACIDO CROMICO

Small purplish red crystals, which are slightly hygroscopic even when absolutely free from Sulphuric Acid, but much more so when a trace of the latter is present They possess a strong corrosive action on animal and vegetable tissues

It should be kept in well stoppered, dark amber-tinted glass bottles

It is produced by the action of Sulphuric Acid upon Potassium Bichromate

Solubility.—About 2 in 1 of Water, Alcohol decomposes it

It is a powerful oxidising agent, and is liable to cause sudden combustion or *explosion* in contact with strong Alcohol, Ether, Glycerin, and some other organic matters

Medicinal Properties.—Disinfectant, antiseptic, deodorant It is a powerful caustic (1 in 1 of Water), and is used by means of a pointed glass rod, great care being taken to protect the adjacent parts by plaster or ointment, having moist lint ready to absorb any superfluous Acid, 100 grains to 1 oz Water is used to remove warts, lupus, and condylomata, 1 in 40 of Water may be applied to ulcers of mouth or pharynx, and 1 in 2000, or even 4000, is used as a lotion for putrid sores, leucorrhœa and ozæna

It is of great importance for its use as a caustic that Chromic Acid should be free from Sulphuric Acid

A warm concentrated solution rapidly dissolves all animal tissues

5 p.c. Solution of Chromic Acid applied with a brush to the feet after bathing gave excellent results in the German Army as a remedy for excessive perspiration — *P J* (8) xx 504

The pure Acid fused on the point of a probe has been applied with success to nasal mucous membrane in cases of hay fever and paroxysmal sneezing — *M A* '94, 817

Official Preparation Liquor Acidi Chromici

Not Official Garg. acidi Chromici, Latio Acidi Chromici and Pigmentum Acidi Chromici

Foreign Pharmacopœias Official in Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex. (Acid. Chromico), Norw., Port., Russ., Span., Swed., Swiss and U.S. (Chromii Trioxidum).

Tests.—Chromic Acid is distinguished by its melting point, which should be from 192° to 193° C. (377·6 to 379·4 F), the *B.P.* gives 192° C. (377·6 F), the *U.S.P.* 192° to 193° C. (377·6 to 379·4 F), whilst the *P.G.* does not include a melting point, the production of green coloured liquids when its aqueous solutions are mixed with reducing agents, the evolution of Oxygen when strongly heated, and the evolution of Chlorine when warmed with Hydrochloric Acid. It liberates Iodine from Potassium Iodide Solution, and this reaction has been utilised by the *U.S.P.* as a means of determining the percentage of Chromic Anhydride. The Iodine liberated when the specimen is treated with an excess of Potassium Iodide, in a solution acidified with Hydrochloric Acid, being titrated with Tenth-normal Volumetric Sodium Thiosulphate Solution; it is required to contain not less than 90 p.c. of pure Chromium Trioxide.

The more generally occurring impurity is Sulphuric Acid, which is tested for, in an acidified solution, by Barium Chloride Solution, only a slight opalescence should be afforded.

Barium Chloride or Nitrate.—An aqueous solution 1 in 50 (1 in 100 *P.G.* and *U.S.P.*) previously acidulated with Hydrobromic Acid. Should be unaffected by Barium Chloride Solution. (*P.G.* uses Barium Nitrate Solution) This test is common to *B.P.*, *P.G.* and *U.S.P.*, the *P.* test permits a slight opalescence.

Volumetric Determination—A weighed quantity of 1 gramme is dissolved in 100 c.c. of Water. A measured quantity of 8·8 c.c. of this solution is mixed with 2 c.c. of Hydrochloric Acid and about 1 gramme of Potassium Iodide and diluted with 100 c.c. of Water. The Iodine liberated should require not less than 22·5 c.c. of Tenth-normal Volumetric Sodium Thiosulphate Solution to decolorise it, using 5 c.c. of Starch Test Solution as an indicator. 1 c.c. of Tenth normal Volumetric Sodium Thiosulphate indicates 4 p.c. of pure Chromium Trioxide, *U.S.P.*

Preparation.**LIQUOR ACIDI CHROMICI.**—SOLUTION OF CHROMIC ACID.

Chromic Anhydride, 1; Distilled Water, 3.

It forms an orange-red caustic liquid, possessing an acid reaction. It is officially required to contain the equivalent of 25 p.c. of Chromic Anhydride, CrO_3 , or 29·5 p.c. of Chromic Acid, H_2CrO_4 .

Foreign Pharmacopœias Official in Belg. and Fr., Chromic Acid, 1, Distilled Water, 1, dissolve.

Tests.—The specific gravity is officially stated to be 1·185; but a solution prepared by dissolving 10 grammes of Chromic Anhydride (free from Sulphuric Acid) in 30 c.c. of Distilled Water had a sp. gr. of 1·214. As the official Chromic Acid is used in its preparation, it is naturally required to answer the tests of identity and purity given in the monograph on this Acid.

Not Official

GARGARISMA ACIDI CHROMICI—Chromic Acid, 1 grain, Water, to 1 oz.—*Lock*

This has been incorporated in the *B.P.C.* as follows—Chromic Acid, 1, Distilled Water, *q s* to produce 500

LOTIO ACIDI CHROMICI—Chromic Acid, 10 grains, Water, 1 oz.—*University and Westminster*

PIGMENTUM ACIDI CHROMICI—Chromic Acid, 10 grains, Water, to 1 oz. In chronic superficial glossitis and secondary syphilis.—*Throat*

ACIDUM CHRYSOPHANICUM.

See CHRYSAROBINUM

Not Official**ACIDUM CINNAMICUM**

$C_9H_8O_2$, eq 146.95

There are two varieties of Cinnamic Acid (1) Medicinal, (2) Artificial

Medicinal Cinnamic Acid is obtained from natural Cinnamic Acid derivatives, *e.g.*, *Styrax*, etc. Colourless, glistening crystals, having a faint, fragrant odour. Sparingly soluble in Water, soluble in Alcohol (90 p.c.), and in Ether. It is converted into Benzaldehyde on oxidation with Potassium Permanganate. Used in the form of intravenous or intermuscular injection in pulmonary tuberculosis. In 5 p.c. alcoholic solution as an application in laryngeal tuberculosis.

Artificial Cinnamic Acid is prepared synthetically by the interaction of Benzaldehyde and Acetylchloride. Colourless crystals, sometimes possessing a faint odour of Benzaldehyde. Sparingly soluble in Water, readily soluble in Ether and Alcohol. Its use is limited to the preservation of solutions, dressings, etc.

See also Sodii Cinnamas, p 1112

ACIDUM CITRICUM.

CITRIC ACID

$H_3C_6H_5O_7$, H_2O , eq 208.50

FR, ACIDE CITRIQUE, GER, CITRONENSAURE, ITAL AND SPAN, ACIDO CITRICO

Large colourless crystals, or a white crystalline powder, possessing an acid taste. Obtained principally from Lemon Juice, which may contain from 5 to 8 p.c.

Solubility—10 in 6 of Water, and measures 12½; 1 in 2 of Glycerin, 10 in 15 of Alcohol (90 p.c.), 1 in 8 of Ether, almost insoluble in Benzol and Chloroform.

The solubility of Citric Acid in Ether naturally varies with the amount of Alcohol and Water which the Ether contains. The above figure represents its solubility in Ether (sp. gr. 0.735). The figure for Ether Purus (sp. gr. 0.720) is 1 in 40.

Medicinal Properties.—Refrigerant and sialagogue, relieves thirst in fevers. Efficacious in scurvy, for which it is also prophylactic.

Citric Acid 1, dissolved in Distilled Water 12½ (or 35 grains in 1 oz.) is a substitute for Lemon Juice, but does not keep long without spoiling

17 grains of Citric Acid neutralise about	{	24½ grains Potassium Bicarbonate.
		20 " Potassium Carbonate
		20½ " Sodium Bicarbonate.
		31½ " Sodium Carbonate.
		12½ " Ammonium Carbonate
		11½ " Magnesium Carbonate.

Dose.—5 to 20 grains = 0.32 to 1.3 grammes

Prescribing Notes.—Usually given in powders to be taken with each dose of an alkaline mixture during effervescence; or in solution, directing the quantity to be taken with the alkaline mixture

Incompatibles.—Potassium Tartrate, alkaline Carbonates, Acetates, and Sulphides.

Official Preparations.—Used in the preparation of *Liquor Ammonii Citratis*, *Liquor Potassii Citratis*, *Liquor Sodii Citratis*, *Infusum Citri*, *Infusum Citri et Ammonii Citratis*, *Infusum Citri et Potassii Citratis*, *Infusum Citri et Sodii Citratis*, *Infusum Citri et Ammonii Citratis Effervescentum*, and in all the granular effervescent Citrates.

Not Official.—*Syrupus Acidii Citrici*.

Foreign Pharmacopœias.—Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Norw., Port., Russ., Span., Swed., Swiss and U.S.

Tests.—Citric Acid is distinguished by the following tests (1) the production of a white precipitate insoluble in solution of Potassium Hydroxide, but soluble in Ammonium Chloride Solution and in solution of alkali Citrates, when its neutralised solution is boiled with Calcium Chloride Solution; (2) the white precipitate soluble in Ammonia Solution, produced when the neutralised solution is treated with Silver Nitrate Solution. In contradistinction to Tartrates no mirror is produced when this ammoniacal solution is warmed. The melting point of Citric Acid is rather a variable figure (*P.J.* [3], xxi 1051) The fully Hydrated Acid melts at about 70° C. (158° F.), and the anhydrous acid at 153° C. (307.4° F.), but the crystals, and more particularly the powder, begin to dehydrate even below 70° C. (158° F.), so that intermediate figures will be obtained according to the manner in which it is heated. No melting point is given in the *B.P.*; the *U.S.P.* gives between 152° and 153° C. (305.6° and 307.4° F.), and states that at about 75° C. (107° F.) it begins to lose Water of crystallisation and becomes anhydrous at about 135° C. (275° F.).

It is officially required to indicate 99.38 p.c. of Hydrogen Citrate as ascertained by titration with Volumetric Solution of Sodium Hydroxide, Phenolphthalein Solution should be employed as an indicator of neutrality, Litmus Solution not being suitable; the *U.S.P.* requires it to contain not less than 99.5 p.c. of pure Citric Acid, the *P.G.* does not state a requisite percentage.

The more generally occurring impurities are Lead, Tartaric Acid, and mineral matter. Calcium, Iron, heavy metals, Oxalic and Sulphuric Acids may also be present. The most important and most likely impurity is Lead, and the official method of testing for

this metal has given rise to severe criticism. The *BP* directs the solution to be nearly neutralised before the addition of Hydrogen Sulphide and omits reference to limiting the quantity of Hydrogen Sulphide Solution to be employed. *PG* directs the solution to be nearly neutralised, whilst the *USP* makes the solution acid by the addition of a few drops of Hydrochloric Acid, and then requires that it shall not respond to the time limit test for heavy metals. The methods employed by the Pharmacopœias for testing for Tartaric Acid are also different, the *BP* adopting the tests with Ferrous Sulphate and Hydrogen Peroxide, and with Ammonium Molybdate and Hydrogen Peroxide, requiring that an aqueous solution of the acid should not afford a purple or violet coloration when supersaturated with Potassium Hydroxide Solution after the previous addition of a little Ferrous Sulphate Solution and a few drops of Hydrogen Peroxide Solution. The Ammonium Molybdate test is performed by mixing 1 gramme of the acid with 5 c.c. of Ammonium Molybdate Solution, and adding a few drops of Hydrogen Peroxide Solution. The test is not entirely satisfactory, as other substances besides Tartaric Acid yield a similar coloration, notably metallic particles, such as Lead, the *USP* adopts the test with Solution of Potassium Acetate. The mineral residue left on incineration with free access of air should according to the *BP* and *USP* not amount to more than 0.05 p.c. and according to *PG* 0.5 grammes should leave no weighable residue.

A standard of 5 parts per million for Lead and 1 part per million for Arsenic has been suggested (*CD* '08, 1795).

Potassium Acetate Solution—1 gramme of the powdered Acid dissolved in 5 c.c. of Solution of Potassium Acetate (1-3) should remain clear even after the addition of an equal volume of Alcohol (absence of Tartaric or Oxalic Acid). *USP*

Pure Sulphuric Acid—1 gramme Citric Acid with 10 c.c. pure Sulphuric Acid should become at most yellow in colour but not brown, when warmed in a test tube on a water-bath for 1 hour, *PG*

Ammonium Oxalate Solution—A 10 p.c. w/w aqueous solution should not be affected by Ammonium Oxalate Solution, *PG*, 5 c.c. of a 1 in 10 aqueous solution nearly neutralised with Ammonia Solution should remain clear on the addition of 1 c.c. of Ammonium Oxalate Test Solution, *USP*

Barium Chloride or Barium Nitrate—A 10 p.c. w/w aqueous solution should not be affected by Barium Nitrate Solution, indicating the absence of Sulphates, *PG*. 10 c.c. of a 1 p.c. w/w aqueous solution after the addition of a few drops of Hydrochloric Acid should not be rendered turbid within 5 minutes on the addition of 1 c.c. of Barium Chloride Test Solution, indicating limit of Sulphuric Acid, *USP*

Volumetric Determination—34.75 c.c. of a solution of 5 grammes Citric Acid in Water to measure 100 c.c., should require not less than 24.87 c.c. of Normal Volumetric Potassium Hydroxide Solution using Phenolphthalein Test Solution as indicator, which is equivalent to not less than 99.5 p.c. of pure Citric Acid, *USP*

Not Official.

SYRUPUS ACIDI CITRICI. *Syn.* Syrupus Citri:

Belg.—Citric Acid, 20, Syrup, 950, Water, 20, Spirit of Lemon, 2, Alcohol (94 p.c.), 8

Fr.—Citric Acid, 10, Syrup, 970, Alcoolature de Citron, 20

Hung.—Citric Acid, 2, Sugar, 100, Water, 50

Mex.—Citric Acid, 10, Simple Syrup, 370, Water, 20

Port.—Citric Acid, 1, Syrup of Lemons, 98, Water, 1

Russ.—Citric Acid, 3, Syrup, 150, Librosacchari Citri, 1.

Swed.—Citric Acid, 1, Syrup, 19

Swiss.—Citric Acid, 2, Spirit of Lemon, 1 5, Water, 2 5, Simple Syrup, 94

U.S.—Citric Acid, 10, Water, 10; Tincture of Fresh Lemon Peel, 10; Syrup, to make 1000

B.P.C.—Citric Acid, 3; Tincture of Lemon, 3; Syrup, *q. s.* to produce 100

All by weight except U.S. and *B.P.C.*

Not Official.

ACIDUM CRESYLICUM.

CRESYLIC ACID. CRESOL.

C_7H_8O , eq. 107.25.

A colourless or slightly yellow liquid, with a tarry odour, obtained from Coal tar. It should be preserved in well stoppered glass bottles of a dark amber colour.

There are three isomeric Cresols, but the principal constituent of the 'crude Carbohc Acid' of commerce (the source of commercial Cresylic Acid) is the 'Para cresylic Acid, with more or less of its isomers.—*Allen*.

A mixture of the three was introduced as an antiseptic under the name of **Trikresol**.

By the same process which yields Salicylic Acid from Phenol, the three isomeric Cresols yield three corresponding Cresotic or Cresotinic Acids, the Sodium salts of which have been used in Medicine.

Solubility.—1 in 80 of Water, and mixes in all proportions with Alcohol (90 p c.), Ether, Chloroform, Glycerin, and Olive Oil.

Medicinal Properties—Disinfectant and antiseptic. Used as an **inhalation** in whooping-cough, and other respiratory affections.

Prescribing Notes.—*It is far less soluble in Water than Carbohc Acid, and therefore not so convenient.*

Foreign Pharmacopœias—Official in Fr, Ger, Jap, and Swiss, *Cresolum crudum*, a yellowish liquid, Austr, *Kresolum*, acicular crystals which become yellow or brown on keeping, soluble in .38 parts of Water. Austr has also *Kresolum Liquifactum* (kresol, 100, Water, 10), and *Aqua Kresolica* (about 1 of liquefied kresol in 50). Belg., *Cresolum crudum*, yellow or brownish liquid, Dutch, *Cresolum crudum*, yellow, yellowish brown, or reddish-brown liquid, Mex, *Cresilol*, colourless fluid, Span, *Cresol*, yellowish-red liquid, U.S., *Cresol*, colourless or straw coloured liquid.

Tests.—Cresol has a specific gravity of 1.045 to 1.048, and a boiling point when pure of 203° C. (397.4° F.), but a good commercial sample may boil 10° C. lower. The *U.S.P.* specifies a sp gr. at 25° C. (77° F) of 1.036 to 1.038 and a boiling point from 195° to 205° C (383° to 401° F). Neither sp gr nor boiling point are given in *P.G.* It does not crystallise at the freezing point of Water. Its aqueous solution gives a transient blue colour with solution of Ferric Chloride

The converse of the test for Cresol (Cresylic Acid) in Phenol applies here. Equal volumes of Cresol and Glycerin should form a clear solution from which on the addition of three volumes of Water most of the Cresol should separate

The more generally occurring impurities are hydrocarbon oils.

These are readily detected by mixing equal volumes of Cresol and Sodium Hydroxide Solution (10 p c) which should form an almost clear liquid from which on standing no appreciable oily layer shall separate

Sodium Hydroxide Solution—1 c c of Cresol should dissolve in 1 c c of a 10 p c solution of Sodium Hydroxide leaving no appreciable liquid residue, *U S P*, when a volume of 10 c c of Cresol is shaken in a 200 c c stoppered graduated measure, with 50 c c of a 15 p c aqueous solution of Sodium Hydroxide and 50 c c of Water only a few flocks shall separate out. On the subsequent addition of 80 c c of Hydrochloric Acid and 10 grammes of Sodium Chloride and shaking, an oily layer collects on the top of the liquid, when allowed to remain at rest, which shall amount to 8.5 to 9 c c, *P G*

A similar test to the above is official in the *P Belg*

Ferric Chloride Solution—When 0.5 c c of Cresol is shaken with 300 c c of Water a liquid is obtained which is coloured bluish-violet by the addition of solution of Ferric Chloride—*Belg* and *P G*

LIQUOR CRESOLIS COMPOSITUS—Cresol, 50, Linseed Oil, 35, Potassium Hydroxide, 8, Water, *qs* to make 100, all by weight—*U S P*

Germicidal value stated to be greater than Carbolic Acid—*L '07*, ii 544, '08, i 576

Cresylic Acid, by weight, 50, Linseed Oil, by weight, 35, Potassium Hydroxide, 8, Alcohol, 4, Distilled Water, to produce by weight 100 *B P C*

LIQUOR CRESOLI SAPONATUS (*Ger*, *Jap* and *Swed*)—(Crude Cresol, 1, Sapo Kalinus (*vi Sapo*), 1 warm and mix to form a yellowish-brown fluid

A similar mixture is official in *Belg* and *Swiss*, under the title of Cresolum saponatum

The liquor Cresoli Saponatus of the Dutch Pharmacopœia is the same as above, but the product is finally made up to 2 with Water, and **Lysol** is given as a synonym

Aqua Cresolica (*Belg* and *Ger*)—Cresol Soap Solution, 1, Distilled Water, 9.

Cresol Soap Solution, 6, Water, 94—*Jap*

Liquor Cresolis Glycerinatus—Cresol, 50, Linseed Oil, 13, Potassium Hydroxide, 4.25, Alcohol, 2, Glycerin, 6, Distilled Water, *qs* to produce 100, all by weight—(*W J Uglow Woolcock*) *P J '07*, ii 334

This has been incorporated in the *B P C* under the title **Solutio Cresolis Saponatus**, with synonym as above

The following is understood to be the composition of the various proprietary preparations—

JEYES' FLUID—A preparation of Tar Oil containing 20 p c. The cresol saponified with resin and alkali. It forms a permanent emulsion with Water

Used in 1 or 2 p c solution, and for the same purposes as Carbolic Solutions. An injection of 1 in 400 is excellent in gonorrhœa and œzema, and in obstetric practice on account of its hæmostatic as well as its antiseptic properties. It is useful as an ointment in erysipelas

PEARSON'S ANTISEPTIC is a similar preparation to Jeyes' Fluid. The Carbolic Acid coefficient for *B. Typhosus* is 2.6—*Public Health, Dec 1903*

ARTMANN'S CREOLIN—A solution of Tar hydrocarbons in Sulphocresylic Acid. It forms a turbid liquid with Water

EUROPHEN (Di isobutyl orthocresol Iodide)—A fine light, brownish-yellow, amorphous powder, having an aromatic saffron like odour. Introduced as a substitute for Iodoform. Insoluble in Water or Glycerin, freely soluble in Absolute Alcohol, Chloroform or Ether. Applied as a dusting Powder, or 10 p c Ointment.

Losophan (Tri iodometacresol), a white or yellowish white powder, insoluble in Water, soluble 1 in 7 of Alcohol (10 p c), 1 in 4 of Ether, 1 in 6 of

Chloroform, and **Traumatol** (Iodo-resol), are compounds of Cresol and Iodine, introduced into medicine chiefly as substitutes for Iodoform.

LYSOL.—Sp. gr. 1.047. A transparent brown syrupy liquid, which forms a clear solution with Water. It is a solution in neutral Soap, of Tar Oils which distil between 187° and 200° C., and are present to the extent of about 47 p.c.

Foreign Pharmacopœias.—Official in Dutch, Mex. and Russ.

Injection of 9 to 12 c.c. of a 1 p.c. solution of Lysol into the spinal canal in cerebro-spinal meningitis. — *L.* '02, ii. 1188.

SAPROL.—Tar Oils dissolved in large excess of Hydrocarbons. Inflammable.

SOLUTOL. Sodium Cresolate in excess of Cresol, powerfully disinfectant, but caustic, and not intended for surgical purposes.

SOLVEOL.—Cresols in Sodium Cresolate, soluble in Water. Non caustic, and used for surgical purposes.

METAKALIN. A readily soluble solid preparation of Cresol. Supplied in two forms (a) in cartridges of 24 drms each, (b) in the form of tablets of 15 grains each, each tube containing ten tablets.

CRESOTINIC ACID.—There are three varieties of Cresotinic Acid, the ortho-, meta-, and para-. The only one of these which has received attention as a disinfectant is the para-cresotinic acid.

PARA-CRESOTINIC ACID occurs in long white needles or in rhombic prisms. Antiseptic, antirheumatic and antipyretic.

SODIUM PARACRESOTINATE.—The Sodium salt of Para-cresotinic acid. A white crystalline powder. Employed in doses and for purposes similar to Sodium Salicylate.

A Calcium Cresotinate is also known as a disinfectant.

Not Official.

ACIDUM FORMICUM

Formic Acid, Amebic Acid

H_2CO_2 , eq. 4 to 67.

A clear, colourless, volatile liquid, possessing an irritating odour and strongly acid taste. It is miscible in all proportions with Water.

It is a powerful stimulant of muscular action, retards fatigue, and gives a markedly increased capacity for work. In its tonic effects it is closely allied to Kola, Coca and Caffeine. It has also a diuretic effect, but not to the same extent as Theobromine. In small doses it markedly improves the appetite and general nutrition.

Dose.—2 to 5 minims = 0.12 to 0.3 c.c. in aerated Water.

The acid has been given (*B.M.J.* '08, ii. 56) in doses of from 8 to 10 drops, taken four times daily in a little Vichy or aerated Water.

It has been used in the treatment of lupus, and in cancer in the form of a subcutaneous injection in doses of 0.1 to 1.0 c.c. of a solution 1 to 100,000 to 1 in 1000, according to the age and condition of the patient.

Three hundred cases of diphtheria treated with 5 to 20 minims of 25 p.c. solution of Formic Acid 4-hourly for 10 to 14 days, plus antitoxin, the death rate from cardiac failure reduced from 86 to 2 p.c.—*Edin. Med. Jour.* '06, ii. 887.

No drug so good in chorea, as it steadies the muscular system without weakening it.—*L.* '07, ii. 1886.

Formates are stated (*L.* '05, i. 892; '07, i. 1170) to increase the power of resistance to fatigue and to promote energy. They are also slightly diuretic. 3 grammes (45 grains) of the Potassium or Sodium salt may be given daily, or a gramme and a half (23 grains) of the Lithium salt. The treatment is generally continued for ten days, followed by an interval of ten days' rest.

The acid has been given (*B M J E* '05, ii 39) in rheumatic conditions in the form of a 2½ to 3 p c solution, eight drops as an injection after injecting five to eight drops of a 1 p c solution of Cocaine as a local anæsthetic, and has been administered (*J*, '05, ii 907) in doses of 4 grammes of the normal solution in the treatment of tremor. The remedy may also prove useful in certain forms of chorea.

Foreign Pharmacopœias.—Official in Ger and Swiss

Tests.—Formic Acid has a specific gravity of 1.060 to 1.068. A white crystalline precipitate is produced when it is mixed with Lead Acetate. When either the acid itself or its neutralised solution is warmed with Silver Nitrate Solution a precipitate of metallic Silver is thrown down, when warmed with Mercuric Oxide metallic Mercury is precipitated, with Mercuric Chloride a white precipitate of Calomel is produced. On the addition of Ferric Chloride Test solution a reddish-brown solution is produced, which on heating throws down a reddish brown precipitate, when warmed with concentrated Sulphuric Acid, Carbon Monoxide gas is evolved which burns with a blue flame. The percentage of acid may be determined by titration with Normal Volumetric Sodium Hydroxide Solution, using Phenolphthalein Solution as an indicator of neutrality, 5 c c of Formic Acid should require 28 to 29 c c of the Volumetric Solution, indicating 24 to 25 p c w/w of absolute acid. When diluted with Water and acidified with Nitric Acid, it should yield no immediate precipitate or turbidity with Silver Nitrate Solution, indicating the absence of Chlorides, when neutralised with Ammonia Solution it should neither yield a precipitate nor a turbidity on the addition of Calcium Chloride Solution, nor a coloration on the addition of Hydrogen Sulphide Solution, indicating the absence of Oxalic Acid and of Lead and Copper. When heated it should be entirely volatilised without leaving a weighable residue.

ACIDUM GALLICUM.

GALLIC ACID

TRIHYDROXYBENZOIC ACID

FR, ACIDE GALLIQUE, GER, GALLUSSAURE, ITAL, ACIDO GALLICO, SPAN, ACIDO AGALLICO

White or light brownish-yellow crystalline needles or prisms, odourless, and possessing an astringent and faintly acidulous taste.

It is produced by the hydrolysis of Tannic Acid, Sulphuric Acid being the acid generally employed for this purpose. It is also present in small proportion in Galls. It should be preserved in dark amber-tinted glass bottles.

Solubility.—1 in 100 of cold Water, 1 in 3 of boiling Water, 1 in 8 of Alcohol (90 p c), 1 in 50 of Ether, 1 in 6 of Glycerin with heat. Gallic Acid 1, and Potassium Citrate 1, will dissolve in 30 of Water.

Medicinal Properties. It was at one time used as a local astringent, but it is far inferior to Tannic Acid for this purpose. As Tannic Acid is converted into Gallic Acid in passing through the circulation, the latter has been given for the purpose of arresting hæmorrhage in remote vessels, but is now generally believed to be useless in such cases.

Useless for pulmonary or renal hæmorrhage.—*B M J* '00, ii 1070

Dose.—5 to 15 grains = 0.32 to 1 gramme.

Prescribing Notes.—With twice its weight of Sugar, may be taken three times a day in Water, in powders or in cachets. It is also given in pills 30 grains of Acid and 30 grains of Gum Tragacanth will make 6 pills.

Incompatibles. Spiritus, Etheris Nitrosi, metallic salts

Not Official.—Gallanol, Galloformin, Gallobromol.

Foreign Pharmacopœias.—Official in Belg., Fr., Ital., Jap., Mex., Port., Span., Swi., and U.S. Not in the others.

Tests.—Gallic Acid dissolves in Water, forming a solution which is acid in reaction towards blue Litmus paper, and which yields a bluish-black precipitate on the addition of a few drops of Ferric Chloride Test-solution. Solutions of pure Ferrous salts are unaffected by the addition of solution of Gallic Acid, but with Ferric salts precipitation takes place as above. The U.S.P. states that at about 200° C. (392° F.) it begins to melt.

The more generally occurring impurities are excess of Water, Tannic Acid, Sulphates and mineral matter. The crystalline acid should lose 10 per cent of its weight at a temperature of 100° C. (212° F.), indicating one molecule of Water of crystallisation. This statement is common to the B.P. and U.S.P. The absence of Tannic Acid is shown by the aqueous solution of the acid failing to give a precipitate with solutions of Isinglass or Albumen. The B.P. adds or Tartarated Antimony. The U.S.P. substitutes Solution of Gelatin for Solution of Isinglass, omits the Solution of Tartarated Antimony, but includes Test-solution of Starch. It also includes tests with Calcium Hydroxide Solution and with Sodium Hydroxide Solution, which are described below. It has been pointed out (P.J. '98, ii. 684, '99, i. 58) that what is ordinarily understood as 'Gallic Acid' gives a precipitate with Tartarated Antimony Solution, contrary to the official statement.

The absence of Sulphates is ensured by the usual tests, and the absence of mineral matter by the absence of ash when the acid is ignited at a low red heat.

Residue. When incinerated with free access of air, Gallic Acid should leave no residue, B.P.; U.S.P. states that at about 200° C. it begins to melt, and at a high temperature it is gradually decomposed, being consumed at a low red heat without leaving a residue.

Sodium Hydroxide Solution. If 6 drops of Sodium Hydroxide Test Solution be added to 5 c.c. of a saturated aqueous solution of Gallic Acid on a watch glass, the liquid will gradually acquire a deep green colour, which is changed to red or brownish-red by acids. Difference from and absence of Tannic Acid, U.S.P.

Calcium Hydroxide Solution.—When Calcium Hydroxide Test Solution is added to a cold saturated solution of Gallic Acid, a bluish white precipitate forms where the test solution is temporarily in excess and disappears on shaking. When the test solution has been added in excess the precipitate no longer dissolves, and the liquid acquires a tint that is blue by reflected and green by transmitted light and becomes pink on the addition of a large excess of Calcium Hydroxide Test Solution. Distinction from Tannic Acid, U.S.P.

Not Official.

GALLANOL (Gallic Acid Anhydride).—Colourless crystals, melting at 205° C. Insoluble in Water. Introduced as a substitute for Chrysophanic Acid in psoriasis. B.M.J. '03, ii. 99, '01, i. 12; ii. 44. In oozema.—M.A. '95, 296.

GALLOFORMIN.—A compound of Gallic Acid with Hexamethylenetetramine. Glistening needles, almost insoluble in cold Water. Used externally and internally as a disinfectant.

GALLOSOMOL (*Dibromogallic Acid*) (colourless needles or prisms, or as a white crystalline powder) Soluble 1 in about 8 of Water, readily soluble in Alcohol and Ether. Used internally as a substitute for the alkali Bromides in daily doses of 2 to 3 grammes (30 to 45 grains). Also in the form of a 1 to 2 p.c. solution as an injection in gonorrhoea.

Dose —8 to 16 grains = 0.52 to 1 gramme, three times a day.

Under the name of **Gallogen**, Ellagic Acid, the astringent principle of *Diri diri*, has been introduced as an astringent.

Not Official

ACIDUM GLYCEROPHOSPHORICUM.

See CALCI GLYCEROPHOSPHAS

Not Official

ACIDUM HYDRIODICUM.

This Acid is best prepared and kept in the form of a 20 p.c. solution (sp. gr. 1.17) by passing Hydrogen Sulphide gas through four parts of Water containing one part of Iodine. The action is rather slow at first, but becomes more rapid as more Iodine is dissolved by the Hydriodic Acid formed, till the absorption becomes very rapid. When the solution is colourless, the excess of Hydrogen Sulphide may be boiled off and the liquid filtered from separated Sulphur.

Though colourless when first made, it rapidly decomposes, even in diffused light, with liberation of Iodine, but may be readily decolorised by warming with a small proportion of Hypophosphorous Acid, 60 minims to 4 oz. is usually sufficient even for a highly coloured Acid.

Acidum Hydriodicum Dilutum (U.S.) — A solution containing not less than 10 p.c. w/w of absolute Hydriodic Acid.

SYRUPUS ACIDI HYDRIODICI — Colourless Hydriodic Acid (20 p.c.), $3\frac{1}{2}$ oz., Distilled Water, 8 oz., Simple Syrup, sufficient to make up the measure to 80 oz.

An acid syrupy liquid, colourless, or of a pale straw tint. Sp. gr. 1.300. Contains 1 p.c. of absolute Hydriodic Acid, HI. The U.S.P. preparation contains the same percentage of absolute Hydriodic Acid, but is of a much lower specific gravity (1.190 at 25° C (77° F)). A test is included for a limit of free Iodine, also a confirmatory test for Hydriodic Acid by means of Test solution of Silver Nitrate, and the amount of absolute Hydriodic Acid is determined by the addition of a definite volume of Tenth-normal Volumetric Solution of Silver Nitrate, a little diluted Nitric Acid, followed by the addition of Test solution of Ferric Ammonium Sulphate. The excess of Volumetric Silver Solution is determined by titration with Tenth-normal Volumetric Solution of Potassium Sulphocyanate.

Dose —20 to 40 minims = 1.2 to 2.4 c.c., well diluted.

Foreign Pharmacopœias. —Official in U.S. Not in the others.

Diluted Hydriodic Acid (10 p.c.), 10, Water, 30, Syrup, 60, all by weight to make 100 —U.S.P.

Diluted Hydriodic Acid (10 p.c.), 10, Water, 30, Syrup, to produce 100, all by weight —B.P.C.

ACIDUM HYDROBROMICUM DILUTUM.

DILUTED HYDROBROMIC ACID

FR., ACIDE BROMHYDRIQUE DILUÉ, GER., BROMWASSERSTOFFSAURE,
ITAL., ACIDO BROMIDRICO, SPAN., ACIDO BROMHÍDRICO OFICIAL.

A clear, colourless liquid, containing 10 p.c. by weight of Hydrogen Bromide, HBr, eq. 80.35.

It may be obtained by the decomposition of Potassium Bromide by concentrated Phosphoric Acid and distillation. Considerable trouble has been experienced (*P.J.* '00, 1 310, *V.B.P.* '00, 19) in obtaining pure Hydrobromic Acid by the use of red Phosphorus, owing to the Arsenic present in the latter. The method suggested in the reference consists of blowing Sulphur Dioxide into a mixture prepared by covering a quantity of pure Bromine with six times its volume of Water. On distilling the liquid the remaining Bromine goes over first, and is easily got rid of.

It should be preserved in stoppered glass bottles of a dark amber tint, and as far as possible protected from the light.

Medicinal Properties. Sedative and hypnotic, but not so reliable as the Bromides, though producing less depression. When continued sedative action is indicated, the acid can be used to supplement or replace the Bromide salts. It is stated to be less likely to produce acne.

Dr. Fothergill stated that it prevents headache after taking Quinine and Iron, and may be given with Quinine (which it readily dissolves) for nervous exhaustion.

It is said to prevent the after effects of Morphine if given with that drug.

Dose. --15 to 60 minims = 0.9 to 3.6 c.c.

Prescribing Notes.—*Larger doses may be given, 2 to 4 fl. drms, well diluted with Water, or Syrup and Water.*

60 minims = 8½ grams of Potassium Bromide in the quantity of Bromine.

Foreign Pharmacopœias.—Official in Dutch, sp gr 1.224, Fr., Span., Swiss and U.S., 10 p.c., sp gr 1.076 to 1.077, Ger. has 20 p.c., sp gr 1.208. Not in the others.

Tests.—Diluted Hydrobromic Acid has a specific gravity of 1.077, the *U.S.P.* states 1.076 at 25° C (77° F.), *P.G.* 1.208. A solution of the neutralised acid should give with Silver Nitrate Solution a yellowish curdy precipitate, insoluble in Nitric Acid, but soluble in Potassium Cyanide Solution, and soluble with difficulty in strong Ammonia Solution; Chlorine Solution causes a yellowish or reddish coloration due to the liberation of Bromine, which dissolves on shaking with a few drops of Chloroform or Carbon Bisulphide forming a reddish solution. It is officially required to indicate 9.98 p.c. of absolute Hydrobromic Acid as determined by titration with Volumetric Sodium Hydroxide Solution, or by precipitation with Volumetric Silver Nitrate Solution. The *P.G.* Volumetric test indicates an acid containing 25 p.c. by weight, and the *U.S.P.* test not less than 9.99 p.c. by weight of absolute Hydrobromic Acid. A comparison of the methods adopted by the *B.P.*, *U.S.P.* and *P.G.* appears below under the heading of Volumetric Determination.

The more generally occurring impurities are solid residue, Arsenic, Copper, Lead and Iron; Barium, Chlorides, Phosphates, Sulphates and Sulphites, impurities which are present in the materials used in the manufacture and escape removal during the purification of the acid. Mineral residue is readily detected by evaporation to dryness. Arsenic is the most important impurity, as Phosphorus

and Phosphoric Acid are both liable to contain this substance. The *USP* introduces a special test (the modified Gutzzeit's test) for Arsenic, and also requires that this should not respond to the time-limit test for heavy metals. The *BP* does not include a test for the latter. The *PG* includes a test for Iron with Potassium Ferrocyanide Solution, which is given in the small type below.

Copper and Lead, if present, may be detected by the test with Hydrogen Sulphide given in the small type below, and if the solution be made alkaline with Ammonia the test also affords an indication of the presence of Iion. Iodine, if present, may be detected by the test described under the heading of Chloroform. Barium, Chlorides, Phosphates, Sulphates and Sulphites may be detected by the tests in small type below under the respective headings of Potassium Sulphate Solution, Silver Nitrate Solution followed by Ammonium Carbonate Solution, Magnesium Sulphate Solution, Barium Nitrate or Chloride Solution.

Distillation.—The *USP* states that on distilling it, Water and a weak acid first pass over, when the temperature of 126°C (258.8°F) is reached an acid of 48 p.c. remains, which may be distilled unchanged.

Residue.—*BP* requires that it should yield no residue on evaporation to dryness. In this test the *USP* directs that after evaporation to dryness the temperature be brought to 110°C (230°F), when 10 c.c. of the acid should leave no appreciable residue.

Chloroform.—Hydrobromic Acid when shaken with Chloroform should not impart to the Chloroform a yellow colour, nor on the subsequent addition of a drop of Ferric Chloride Solution should a violet colour be produced. *PG*. The *USP* gives 10 c.c. of the Acid and 2 c.c. of Chloroform, and the *PG* uses equal volumes. Chloroform shaken with Hydrobromic Acid previously mixed with Chlorine Water is coloured a brownish-yellow. *PG*. The *USP* directs that Chlorine Water be diluted with an equal volume of Water and added drop by drop with agitation to 10 c.c. of Hydrobromic Acid and 2 c.c. of Chloroform, previously shaken together, when the Chloroform should be coloured orange, with no trace of violet, indicating the absence of Iodine.

Hydrogen Sulphide Solution.—Diluted with 5 volumes of Water, and nearly neutralised with Solution of Ammonia, Hydrobromic Acid should be unaffected by Hydrogen Sulphide Solution. *PG*. The *USP* requires that 10 c.c. of Diluted Hydrobromic Acid should not, without further acidulation, respond to the time-limit test for heavy metals.

Barium Nitrate or Chloride Solution.—10 c.c. of the Acid should not be rendered more than slightly cloudy by the addition of 1 c.c. of Barium Chloride T.S., indicating a limit of Sulphuric Acid. *USP*, *PG* nearly neutralises with Ammonia Solution, and uses Barium Nitrate Solution.

Potassium Sulphate Solution.—10 c.c. of the Acid should yield no turbidity with 1 c.c. T.S. of Potassium Sulphate, *USP*.

Magnesium Sulphate Solution.—1 c.c. of Acid with 1 c.c. of Nitric Acid, boiled, cooled, and then supersaturated with Solution of Ammonia should be unaffected by Magnesium Sulphate Solution even after standing for some time. *PG*.

Modified Gutzzeit's Test.—5 c.c. should not respond to the modified Gutzzeit's test for Arsenic.

Silver Nitrate Solution followed by Ammonium Carbonate Solution.—If a mixture of 0.5 c.c. Diluted Hydrobromic Acid, 10 c.c. of Water, 8 c.c. Silver Nitrate Test Solution, and 6 c.c. Ammonium Carbonate Test Solution, be digested for 10 minutes on a bath of boiling Water, then cooled and filtered, the filtrate when supersaturated with Nitric Acid should not become more than slightly opalescent, *USP*.

Potassium Ferrocyanide Solution. The *P.G.* requires that 10 c.c. of Hydrobromic Acid diluted with Water (1-10) should not immediately turn blue with 0.5 c.c. Potassium Ferrocyanide Solution.

Volumetric Determination.—The *B.P.*, *U.S.P.* and *P.G.* differ in their method of determining the amount of absolute Hydrobromic Acid. The *B.P.* employs both titration with Volumetric Sodium Hydroxide Solution and precipitation with Volumetric Silver Nitrate Solution, the *U.S.P.* employs direct titration with Tenth normal Volumetric Silver Nitrate, the *P.G.* titration with Normal Volumetric Potassium Hydroxide Solution. It is officially required that 4 grammes of diluted Hydrobromic Acid should neutralise 5 c.c. (1.08) of the Volumetric Sodium Hydroxide Solution, *B.P.*, 5 c.c. of the *P.G.* Acid should require 18.7 c.c. Normal Potassium Hydroxide Solution, *P.G.*. The *B.P.* requires that 4 grammes of the dilute Acid should be completely precipitated by 50 c.c. (49.8) of the Volumetric Solution of Silver Nitrate. The *P.G.* directs that 10 c.c. of a mixture of Hydrobromic Acid and Water (3 grammes in 100 c.c.) be exactly neutralised with Ammonia Solution and a drop of Potassium Chromate Solution added, when 9.3 c.c. at most of Dec normal Volumetric Silver Nitrate Solution are necessary to produce a permanent red colour, *P.G.*, the *U.S.P.* test is similar, 10 grammes of Acid being diluted to 100 c.c., then 8.01 c.c. of this solution exactly neutralised with diluted Ammonia Water (using Litmus Test solution as indicator), and 3 drops of Potassium Chromate Test solution added, should require not less than 10 c.c. of Tenth normal Silver Nitrate Volumetric Solution to impart a permanent red tint.

ACIDUM HYDROCHLORICUM.

HYDROCHLORIC ACID

Fr., ACIDE CHLORHYDRIQUE OFFICINAL; GER., SALZSÄURE, ITAL., ACIDO CLORIDRICO CONCENTRATO, SPAN., ACIDO CLORHIDRICO.

A colourless fuming liquid, containing 31.79 p.c. by weight of Hydrogen Chloride (HCl , eq. 36.49), possessing an irritating pungent odour, and even in dilute solutions an intensely acid taste.

It may be obtained by the decomposition of a Chloride, generally Sodium Chloride with Sulphuric Acid.

Acidum Hydrochloricum *B.P.* 1865 contained 32 p.c. of Hydrogen Chloride.

Medicinal Properties.—A powerful escharotic. When diluted it is given internally, *see* Acidum Hydrochloricum Dilutum.

Treatment of ulceration of the œsophagus and stomach due to swallowing strong Hydrochloric Acid.—*B.M.J.* '01, ii. 1168, '02, i. 511.

Treatment of lupus by thoroughly rubbing crude Hydrochloric Acid over the patch previously frozen by Ethyl Chloride.—*L.* '07, ii. 81.

Incompatibles.—Salts of Silver and Lead, Tartar Emetic, Alkalies and their Carbonates.

Official Preparations.—Acidum Hydrochloricum Dilutum.* Used in the preparation of Acidum Nitro-hydrochloricum Dilutum, Apomorphinæ Hydrochloridum, Cocainæ Hydrochloridum, Extractum Cinchonæ Liquidum, Glycerinum Populæ, Liquor Arsenici Hydrochloricus, Liquor Ferri Perchloridi Fortis, Liquor Zinci Chloridi, and Podophylli Resina.

Antidotes.—In cases of poisoning by Hydrochloric Acid, the antidotes are Chalk, Magnesia, Potassium Bicarbonate, with Whites of Egg, Carron Oil, or Soap-suds, followed by enemata of Beef Tea and Brandy (with Tincture of Opium) to prevent collapse; and emollient drinks.

Foreign Pharmacopœias.—Official in Austr., 25 p.c., *sp. gr.* 1.194; Belg., *sp. gr.* 1.186, Port. and Spain, *sp. gr.* 1.180; Dutch and Swiss, 25 p.c., *sp. gr.*

1 126, Fr, 83 65 p.c., sp. gr 1.171, Jap, 80 p.c., sp. gr 1 15, Mex, 1 17, Dan, Norw and Swed, 25 p.c., sp. gr 1 127, Ger, Hung and Russ, 25 p.c., sp. gr 1 124, Ital, 35 39 p.c., sp. gr 1 18, U.S., 31 9 p.c., sp. gr 1 158 at 25° C (77° F) An **Acidum Hydrochloricum Crudum** is included in the Fr, Ital, Russ and Swed.

The Crude Acid made with Pyrites Vitriol is generally yellow, and contains considerable traces of Iron and Arsenic

Tests.—Hydrochloric Acid has a specific gravity of 1 160, the *USP* gives about 1 158 at 25° C (77° F), the *PG* 1 124 The diluted or neutralised solutions afford, when treated with Silver Nitrate Solution, a curdy white precipitate, insoluble in dilute Nitric Acid, but readily soluble in Ammonia Solution Another characteristic test for Hydrochloric Acid, which in the *PG* and *USP* is performed upon the pure undiluted or unneutralised acid, but in the *BP* appears amongst the miscellaneous collection of tests suitable for application to the neutralised acid, is that when warmed with Manganese Oxide, Chlorine gas is evolved, which may be recognised by its colour, odour, and bleaching action upon moistened Litmus paper, and by liberating Iodine when brought into contact with Potassium Iodide Solution The acid is officially required to contain 31.49 p.c. of absolute Hydrochloric Acid as indicated by titration with Volumetric Solution of Sodium Hydroxide, the *USP* test indicates 31.9 p.c. by weight of absolute Acid, and the *PG* 25 p.c. by weight The processes are compared below under the heading of Volumetric Determination

The more generally occurring impurities are mineral residue, Arsenic, Lead, Copper, Iron, Aluminium, free Chlorine, Bromine, Iodine, Sulphates and Sulphurous Acid The most important of these are Arsenic, Iron, and free Chlorine Mineral matter is readily detected by the residue left on evaporation The *BP* characteristically groups Arsenic amongst the general list of impurities, and employs the tests mentioned in the Appendix for its detection The *USP* adopts the modified Gutzeit's test, and the *PG* the test with Stannous Chloride Solution The *PG* includes a specific test for Iron with Potassium Ferrocyanide Solution, see below The three Pharmacopœias differ in their manner of testing for free Chlorine All three use the diluted acid, the *PG* in addition partially neutralising the liquid, the *BP* employs Potassium Iodide and Starch Solution as a reagent, the *PG* Zinc Iodide and Starch Solution, the *USP* uses Potassium Iodide Solution, but shakes with Chloroform, and notes the absence of a violet coloration in the chloroformic layer in preference to the Starch test A 1 to 20 dilution of the Acid almost neutralised with Ammonia Solution should not be altered by the addition of Hydrogen Sulphide Solution, indicating the absence of Lead and Copper The *USP* requires that the 1 in 20 aqueous dilution should not respond to the time limit test for heavy metals, the *PG*, that the 1 to 5 dilution, when almost neutralised with Ammonia Solution, shall not be altered by Hydrogen Sulphide Solution Bromine and Iodine, Sulphates and Sulphites may be detected by the respective tests under the headings of Chlorine Water, and Barium Chloride or Nitrate Solution

A standard of 5 parts per million for Arsenic is suggested (*C D* '08, i 795) as sufficient for a pharmaceutical acid, and 10 parts per million for Lead

Stannous Chloride.—A mixture of 1 c.c. of Acid and 3 c.c. Stannous Chloride Solution should not assume a dark colour in the course of an hour, *P G*

Modified Gutzzeit's Test.—5 c.c. of diluted Acid (1:10) should not respond to the modified Gutzzeit's test for Arsenic

Potassium or Zinc Iodide Solution.—When largely diluted with Water it should yield no blue coloration on the addition of Potassium Iodide Solution and Starch Mucilage, *B P*, the *P G* directs the Acid to be diluted with 5 volumes of Water, and nearly neutralised with Solution of Ammonia, and requires that this solution should not immediately turn blue with a Solution of Zinc Iodide and Starch. The *U S P* dilutes 1 c.c. of Acid with 5 c.c. of Water, then on the addition of 1 c.c. of Potassium Iodide T.S. and 1 c.c. of Chloroform, and the mixture agitated, the Chloroform should be free from any violet coloration

Chlorine Water. If Chlorine Water diluted with an equal quantity of Water be added cautiously, drop by drop with constant agitation, to Hydrochloric Acid diluted with an equal volume of Water, and 1 c.c. of Chloroform added, the Chloroform should be free from any yellow, orange, or violet colour, *U S P*

Barium Chloride or Nitrate Solution.—Hydrochloric Acid diluted 1 to 5 with Water and nearly neutralised with Ammonia Solution should be unaffected within 5 minutes by Barium Nitrate Solution, *P G*. The *U S P* uses Barium Chloride T.S., a few drops added to 1 c.c. of the Acid previously diluted with 5 c.c. of Water, when no turbidity or precipitate should be produced within 1 hour, nor should the addition of a few drops of Tenth-normal Iodine V.S. to the mixture produce any turbidity.

Potassium Ferrocyanide Solution.—10 c.c. Hydrochloric Acid diluted with Water (1-10) should not immediately turn blue on the addition of 0.5 c.c. Potassium Ferrocyanide Solution, *P G*

Volumetric Determination (by neutralisation).—The *B P* requires that 1 gramme diluted with Water should neutralise 8.7 c.c. of the Sodium Hydroxide Volumetric Solution, precipitation with Volumetric Silver Nitrate Solution is also adopted as a means of determining the amount of absolute Acid present, 8.7 c.c. of Volumetric Silver Nitrate Solution being required to precipitate 0.1 of a gramme of the acid. The *P G* uses Normal Potassium Hydroxide Solution, 38.5 c.c. of this solution being necessary for 5 c.c. of Acid. The *U S P* directs that 8 c.c. of Acid be accurately weighed, diluted with 5 c.c. of Water and titrated with Normal Potassium Hydroxide Solution, using Methyl Orange Test-solution as indicator. The number of c.c. required, multiplied by 3.618 and divided by the weight of Acid taken, represents the percentage of absolute Hydrochloric Acid in the sample taken

Preparation.

ACIDUM HYDROCHLORICUM DILUTUM. DILUTED HYDROCHLORIC ACID.

Dilute 6 of Hydrochloric Acid with Distilled Water to make 20.

34 minims contain about 1 minim of Strong Acid

It is a clear, colourless and odourless liquid, possessing a strong acid taste and acid reaction to Litmus

Medicinal Properties.—Stimulant, sialagogue, stomachic tonic, cholagogue. Externally and diluted it is refrigerant. Given about two hours after meals in dyspepsia due to deficient secretion of Hydrochloric Acid, given before meals in cases of acid eructation and heartburn, to prevent excessive secretion of acid, used also in gargles; given internally also to diminish night sweating.

10 to 20 drops of a 38 p.c. solution of pure Hydrochloric Acid in a little simple Syrup at the beginning of a meal in the treatment of chronic diarrhoea — *B M J E '02*, 11 7

Dose.—5 to 20 minims = 0.3 to 1.2 c.c.

Prescribing Notes.—Usually given with aromatic or bitter infusions, for children, $1\frac{1}{2}$ to 2 minims, 1 drm in 8 oz of Infusion of Roses or Decoction of Cinchona as a gargle for ulcerated sore throat

Official Preparations.—Used in the preparation of Extractum Ergotæ, Injectio Apomorphinæ Hypodermica and Liquor Morphinæ Hydrochloridi

Foreign Pharmacopœias—Austr., 12.5 p.c., sp. gr. 1.061, Belg., sp. gr. 1.037, Fr., Hung., Swiss and U.S., 10 p.c., about sp. gr. 1.049, Dutch, sp. gr. 1.037, Jap., 10 p.c., sp. gr. 1.050, Dan., Norw. and Swed., 10 p.c., sp. gr. 1.050 to 1.052, Ger., 12.5 p.c., sp. gr. 1.061, Ital., 8.07 p.c., sp. gr. 1.036, Russ., 8.2 p.c., sp. gr. 1.040, Mex., Acid 1, Water 3 Not in the others

Tests—Diluted Hydrochloric Acid has a specific gravity of about 1.052. When its neutralised or diluted aqueous solution is mixed with Silver Nitrate Solution, a curdy white precipitate insoluble in Nitric Acid, but readily soluble in Ammonia Solution and in Potassium Cyanide Solution is produced.

As the diluted Acid is directed to be prepared with the official Hydrochloric Acid, it is required to be free from the impurities mentioned under the concentrated Acid. It is officially required to contain 10.49 p.c. by weight of absolute Hydrochloric Acid, as indicated by titration with Normal Volumetric Sodium Hydroxide Solution

ACIDUM HYDROCYANICUM DILUTUM.

DILUTED HYDROCYANIC ACID

HCN, eq. 26.85

FR., ACIDE CYANHYDRIQUE DISSOUS, GER., CYANWASSERSTOFFSAURE,
ITAL., ACIDO CIANIDRICO, SPAN., ACIDO CIANHIDRICO MEDICINAL

A clear, colourless liquid, possessing a characteristic odour somewhat resembling bitter almonds. It is officially required to contain 2 p.c. by weight of Hydrogen Cyanide, and may be prepared by the interaction of Potassium Ferrocyanide and Sulphuric Acid, or when only a small quantity is required occasionally, it may be convenient to prepare it extemporaneously from dry Silver Cyanide, as in the *U.S.P.*—Silver Cyanide, 6 parts, Diluted Hydrochloric Acid (*B.P.*), 15.54 fluid parts; Distilled Water, 44.1 parts. Shake for a short time and filter. The product should contain 2 p.c. w/w of Hydrogen Cyanide.

It should be kept in dark amber-tinted, well stoppered glass bottles, in a cool and dark place, the bottles being maintained in an inverted position.

Medicinal Properties.—As this Acid is a dangerous poison, it should never be prescribed undiluted. Moreover, a diluted solution retains its strength better than a strong one.

It is sedative, antispasmodic, allays vomiting, is useful in gastrodynia, in visceral neuralgias, in dyspeptic palpitations, but

chiefly valuable in the dry resultless cough of asthma, phthisis and whooping-cough, and prevents the vomiting brought on by food in phthisis. Used externally to allay itching in urticaria, lichen, etc., if the skin be unbroken, as a **lotion**, 2 drin to 8 oz of Rose Water and Glycerin; as an **ointment**, from $\frac{1}{2}$ to 1 drin to each oz of Zinc ointment.

The **vapour** is sometimes applied to the eye, but it is more generally used as a sedative inhalation in the cough of laryngeal phthisis and in some spasmodic affections.

Dose.— 2 to 6 minims = 0.12 to 0.36 c c

Prescribing Notes.— Given in Almond Emulsion for cough, and with Sodium Bicarbonate, Bismuth Carbonate and Peppermint Water for dyspnoea.

As it is susceptible to the action of light and air, and is very volatile, it is the practice to keep it in amber-coloured bottles, stopper down wards.

Incompatibles. Silver, Copper, and Iron salts, and Mercuric Oxide.

Official Preparations.— Used in the preparation of *Imctura Chloroformi* et *Morphine Composita*.

Not Official.— *Acidum Hydrocyanicum* (Schell). Brompton Cough Mixture, *Mistura Acidi Hydrocyanici Composita*.

Antidotes.— In cases of poisoning, the antidotes are fresh air and artificial respiration, with cold affusion, the recent precipitate obtained by swallowing 10 grains of Ferrous Sulphate with 1 fl drin of Tincture of Ferric Chloride in 1 oz of Water, followed by 20 grains of Potassium Carbonate dissolved in 1 oz. of Water, this will render insoluble 110 minims of *H.P.* Acid Stimulants, Ammonia and Brandy, Hypodermic injection of Atropine, $\frac{1}{10}$ grain.

Suggested that in mines and places where Cyanide is used the following antidote should be kept ready: (1) 1 oz of a 24 p.c. solution of Ferrous Sulphate, (2) 1 oz. of a 5 p.c. solution of Potassium Hydrate, (3) 80 grains of powdered Magnesium Oxide to be added to the above in half a pint of Water — *J. OI.*, n. 197.

Injection of a 3 p.c. solution of Hydrogen Peroxide simultaneously recommended in cases of poisoning by fumes of Hydrocyanic Acid — *J.C.S.*, '01, *Abs.* n. 535.

Foreign Pharmacopœias. Official in Belg., 2.0 p.c., Dutch, 2 p.c.; Fr., 2 p.c., Jap. 2 p.c., Norw. 2 p.c., Port., strength not given, Mex. (Acido cianhidrico medicinal); U.S., 2 p.c., Span., 2 p.c. Not in the others. See also *Aqua Amygdale Amare*.

The *Brussels Conference* adopted a strength of 2 p.c. for *Acidum Hydrocyanicum Dilutum*.

Tests.— Hydrocyanic Acid has a specific gravity of about 0.997; the *U.S.P.* does not give a specific gravity; the acid is not included in the *P.G.* When Silver Nitrate Solution is added to its neutralised solution there is produced a white curdy precipitate, soluble in Potassium Cyanide Solution, in Ammonia Solution, and in Nitric Acid. A blue precipitate is produced when a mixture of Ferrous and Ferric salts in solution is added to the neutralised acid, followed by the addition of Sodium Hydroxide Solution and then an excess of Hydrochloric Acid.

The Acid is officially required to contain 1.98 p.c. by weight of absolute Hydrocyanic Acid as indicated by titration with Volumetric Silver Nitrate Solution after the liquid has been rendered alkaline by the addition of Sodium Hydroxide Solution, 1 gramme of the Acid should require 3.7 c.c. of Deci-normal Volumetric Silver Nitrate

Solution This process of titration is not altogether satisfactory, and, moreover, estimates any Chloride present. A very useful method for determining the strength of Diluted Hydrocyanic Acid is —Place 10 c.c. of Ammonia Solution in a beaker, add 40 c.c. of Water and 0.2 grammes of Potassium Iodide and 5 c.c. of the Acid to be tested, titrate with Volumetric Silver Nitrate Solution, of which 18.7 c.c. will be required for a 2 p.c. Acid. The presence of Hydrochloric Acid (a trace of which is understood to be purposely added by manufacturers to retard decomposition) will not affect the results of the test, and the end reaction is very definite.

The more generally occurring impurities are mineral residue, Sulphates and Chlorides. The mineral residue is readily determined by evaporating the fluid to dryness.

When diluted with Water and slightly acidified with Hydrochloric Acid Solution it should not yield a distinct turbidity on the addition of Barium Chloride Solution, and when acidified with Nitric Acid should not yield a distinct turbidity on the addition of Silver Nitrate Test-solution, indicating the absence of more than traces of Chlorides and Sulphates.

Volumetric Determination—A weighed quantity of 5 grammes of the Acid is diluted to 50 c.c. with Water, 26.9 c.c. (26.84) of this solution, after the addition of 5 c.c. of Ammonia Water and 3 drops of Potassium Iodide T.S., should require for the production of a slight permanent precipitate the addition of not less than 10 c.c. Dec. normal Volumetric Silver Nitrate Solution, *U.S.P.*

The *B.P.* and *U.S.P.* Acids contain not less than 2 p.c. by weight of Absolute Hydrocyanic Acid.

Not Official

BROMPTON COUGH MIXTURE—Diluted Hydrocyanic Acid, 2½ minims, Solution of Morphine Hydrochloride, 7½ minims, Syrup of Tolu, 40 minims, Acid Infusion of Roses, to make 4 fl. oz.—*Pharm. Form.*

This has been incorporated in the *B.P.C.* under the title **Mistura Acidi Hydrocyanici Composita** with the *syn.* Brompton Hospital Mixture.

ACIDUM HYDROCYANICUM (SCHEELE) *B.P.C. Formulary 1901*—A colourless liquid. Sp. gr. 0.991. It should contain 4 p.c. HCN, as volumetrically determined by Volumetric Silver Nitrate Solution, it should give no precipitate with Barium Chloride Solution, but with Silver Nitrate a white precipitate entirely soluble in boiling concentrated Nitric Acid.

Dose—1 to 3 minims = 0.06 to 0.24 c.c.

This has been incorporated in the *B.P.C.* under the title **Acidum Hydrocyanicum Fortius**.

It is known that the weaker strengths of Hydrocyanic Acid keep better than the stronger, and the only practical use for a double strength Acid is to poison dogs or cats.

Not Official.

ACIDUM HYDROFLUORICUM.

A colourless liquid, usually redistilled, containing about 80 p.c. of Hydrofluoric Acid gas, owing to its action on glass it is usually stored in gutta-percha bottles.

It is strongly corrosive. Great caution must be used in handling this Acid, as contact with the liquid or gas may result in sores difficult to heal, or permanent destruction of tissue, no pain is felt until the injury is beyond remedy. It also gives off a pungent irritating vapour.

In experiments made to determine the most suitable indicator for the titration of Hydrofluoric Acid, Phenolphthalein Solution answered well with Potassium or Sodium Hydroxide. Rosolic Acid Solution was equally useful and had the additional advantage of being capable of use with Ammonia. Cochineal and Brazil Wood Solutions answered fairly well, but Methyl Orange Solution was useless. With Litmus Solution the colour change is somewhat complicated — *P. J.* (4) xxx 701.

ACIDUM HYDROFLUORICUM DILUTUM.—Dilute the 30 p.c. Acid so as to contain 0.2 p.c., and preserve in gutta serena bottles — *B. P. C. Formulary* 1901.

Dose.—5 to 20 minims = 0.3 to 1.3 c.c.

This has been incorporated in the *B. P. C.* giving the dose 5 to 15 minims.

AMMONII FLUORIDUM.—Colourless crystals soluble in Water. Given in hypertrophy of the spleen and in goitre as a $\frac{1}{2}$ p.c. solution, in doses of 5 to 20 minims = 0.3 to 1.3 c.c.

FERRI FLUORIDUM.—A mixture of Ferric and Ferrous Fluoride. A purplish-grey powder, insoluble in Water.

Under the proprietary titles of *Antitussin* and *Fluorheumum*, bodies containing Fluorine have been introduced, the former as an application in whooping cough, the latter for rheumatism — *P. J.* '99, n. 11; '00, n. 775.

Fluoroform (CHF_3) is analogous in composition to Chloroform (CHCl_3), but contains the halogen Chlorine replaced by Fluorine (CHF_3). The pure product is at ordinary temperatures a gas, and is prepared by the action of Silver Fluoride on Iodoform, the gas being subsequently purified from Carbonic Oxide by passing through a solution of Cuprous Chloride. This gaseous Fluoroform was tested pharmacologically and proved to be very similar in action to Chloroform. The commercial article is a 2.8 p.c. aqueous solution of the gas, and it is in this form that it is generally employed. It possesses very little odour or taste, and is comparatively harmless even in large doses. It has been mostly used in cases of phthisis, lupus, and tuberculous diseases of the joints. It is administered in doses of 1 to 3 teaspoonfuls taken in Water 4 or 5 times a day.

Sodium Fluoride has been introduced in the treatment of tuberculosis and stated to possess distinct antiseptic properties. Toxic effects of same — *P. J.* '99, n. 235. The Fluorides have been used as preservatives of foods.

Solutions of **Sodium Silicofluoride** and the **Saluferbath**, which is a mixture of various silicofluorides, have been introduced as antiseptics — *B. M. J. E.* '08, i. 712.

Not Official.

ACIDUM HYPOPHOSPHOROSUM.

H_2PO_2 , eq. 65.56.

A clear, colourless liquid, possessing an acid taste and an acid reaction to Litmus. It contains 30 p.c. of absolute Hypophosphorous Acid. It should be kept in dark amber-tinted, well-stoppered bottles and in a cool place.

Dose.—2 to 5 minims = 0.12 to 0.3 c.c.

A good preservative for preparations otherwise liable to change by oxidation.

Used principally in the manufacture of the Solution and Syrup of Iron Hypophosphite, etc.

Dissolve 8 oz. of Barium Hypophosphite (containing not less than 95 p.c. $\text{Ba}_2(\text{PH}_2\text{O}_2)_2 \cdot \text{H}_2\text{O}$) in 86 fl. oz. of hot Distilled Water. Add slowly to the solution 17 fl. oz. of Diluted Sulphuric Acid, after which continue the addition, drop by drop, until no further turbidity is produced. Set aside in a warm place, and pass the clear liquid through a filter. Wash the precipitate by decantation with successive portions of hot Distilled Water, until the washings have no longer an acid reaction. Filter, unite the filtrates, and evaporate the liquid on a water-bath to the prescribed density. The product will weigh about 11½ oz.

The process is better than the treatment of Calcium Hypophosphite with Oxalic Acid. But still a pure Hypophosphorous Acid is a commercial desideratum.

Tyrer compares the Barium and Calcium methods, and decides in favour of Barium.—*P J* '96, ii 94

Used in the manufacture of the Solution and Syrup of Iron Hypophosphite, etc

Foreign Pharmacopœias.—Official in U S contains 80 p c by weight, sp gr 1.180 at 25° C (77° F)

Tests.—Sp gr 1.1867 Its strength as determined by Volumetric Sodium Hydroxide Solution corresponds to 80 p c of absolute Hypophosphorous Acid. Its aqueous solution is not precipitated by Diluted Sulphuric Acid, nor by an excess of Ammonia Solution, nor by Ammonium Oxalate Solution after neutralisation, and gives not more than a faint opalescence with Barium Chloride Solution. If Magnesium Ammonio-sulphate Solution be added after an excess of Ammonia Solution, no precipitate is produced. Calcium Chloride Solution added to a neutralised solution yields no precipitate.

Heated with excess of Mercuric Chloride Solution and a little Hydrochloric Acid to 100° C (212° F), Calomel is precipitated, from the weight of which the percentage of Hypophosphorous Acid may be calculated.

As the reaction follows the equation $H_2PO_3 + 4HgCl_2 + 2H_2O = H_2PO_4 + 4HgCl + 4HCl$, 100 parts of Calomel produced are equivalent to 7 parts of Anhydrous Acid.

Acidum Hypophosphorosum Dilutum.—Hypophosphorous Acid, 20, Distilled Water, 40, both by weight.—*USP*

Sp. gr 1.042 at 25° C (77° F) contains 10 p c by weight of absolute Hypophosphorous Acid.

Hypophosphorous Acid, 83, Distilled Water, *q s* to produce 100.—*B P C*

This is obviously intended to yield the same result as the *USP* given above, but in that case the quantities should be by weight and not by volume.

ACIDUM LACTICUM.

LACTIC ACID

FR, ACIDE LACTIQUE, GLR, MILCHSAURE, ITAL, ACIDO LATTICO;

SPAN, ACIDO LACTICO

A colourless and odourless syrupy hygroscopic liquid, possessing a purely acid taste. It should contain 75 p c of Hydrogen Lactate, $HC_2H_3O_3$, eq 89.37

It is produced by the fermentation of Lactose, and is extracted in the form of Zinc Lactate, the latter salt being subsequently decomposed. It is also obtainable by various synthetical processes.

Solubility—It is miscible in all proportions with Water, Alcohol (90 p c), and Ether. It dissolves, but is not dissolved by, Chloroform.

Medicinal Properties—It is used as a 'swab' in diphtheria, a solution (50 to 75 p c) has been used successfully for pharyngeal and laryngeal tubercle, and for lupus after scraping.

50 p c solution applied to corneal ulcers.—*L* '95, i 1452

A 2 p c solution is recommended in the treatment of laryngeal papillomata.—*B M J* '04, ii 1224

Official Preparation Syrupus Calcii Lactophosphatis

Not Official.—Calcii Lactas, Ferri Lactas, Plumbi Lactas, Sodii L., Zinci L., Bismuthi L., Acidum Lacticum Dilutum, Syr. Calcii Lactophosphatis & Ferro

Foreign Pharmacopœias.—Official in Fr, sp gr 1.24, Port and Span, sp gr 1.215, Austr., Belg., Dan., Dutch, Ger., Ital., Jap., Norw., Russ., Swed. and Swiss, sp gr. 1.21 to 1.22, U S, sp gr. 1.206 at 25° C (77° F), Mex., sp gr. 1.315

Tests.—Lactic Acid has a specific gravity of 1.210, the *U.S.P.* gives 1.206 at 25° C (77° F), the *P.G.* 1.210 to 1.220. It vaporises at a temperature above 148.9° C (300° F), giving off inflammable vapours at a temperature of 176.7° C. (350° F), which on ignition burn with a blue flame. The readily recognised odour of Aldehyde is evolved when the Acid is warmed with Potassium Permanganate. The *B.P.* and *U.S.P.* employ for this test solid Potassium Permanganate, but the *U.S.P.* warms it with a mixture of equal volumes of the Acid, Potassium Permanganate, and Sulphuric Acid, whereas *B.P.* uses Lactic Acid and Potassium Permanganate; the *P.G.* uses a Potassium Permanganate Solution and Lactic Acid. It is officially required to contain 74.18 p.c. by weight of absolute Lactic Acid, as determined by titration with Volumetric Sodium Hydroxide Solution. It will therefore be noticed that the *B.P.* statement, 'a liquid containing 75 p.c. of Hydrogen Lactate,' is at variance with the volumetric determination. In the case of the Acid the *B.P.* has not distinctly specified 'per cent. by weight,' though this is clearly intended. Using the atomic weights official in the *B.P.* 1885 in calculating the result of the volumetric test, the official figure would indicate 74.7 p.c. by weight of absolute Acid. It seems, therefore, as if this were another instance in which the *B.P.*, after adopting new atomic weights, have omitted to bring their monographs into accordance with them. The test would read better, 'each gramme should require for neutralisation 8.4 c.c. of the Volumetric Sodium Hydroxide Solution.' The *U.S.P.* acid is required to contain not less than 75 p.c. by weight, the *P.G.* about 75 p.c. by weight of absolute Acid.

The more generally occurring impurities are heavy metals, *e.g.*, Arsenic, Copper, Lead and Iron, Sacco-lactic, Malic, and Sulphuric Acids, Glycerin, Cane, Grape or Milk Sugar, Fatty Acids, organic impurities, Calcium Phosphate, Gum, Mannite, mineral residue, Chlorides, Citrates, Oxalates, Phosphates, Sulphates, or Tartrates.

Heavy metals are grouped collectively in the *B.P.*, in the *U.S.P.* they are covered by the time-limit test, and by the Hydrogen Sulphide test described below. *B.P.* and *U.S.P.* test for Sacco-lactic Acid with Copper Sulphate Solution, but no similar test is included in the *P.G.*

Tests for Malic and Sulphuric Acids are not included in the *U.S.P.* or *P.G.* The *B.P.* uses Lead Subacetate Solution as a reagent requiring that no precipitate should be produced.

The tests adopted by the *B.P.* and *U.S.P.* in examining for Glycerin are essentially the same, and consist in converting the acid into a Zinc salt, drying and extracting with Absolute Alcohol, the *P.G.* does not include a test for Glycerin.

Cane, Grape and Milk Sugars are readily detected by their reducing action on Potassio-cupric Tartrate Solution, and the method of carrying out the test is essentially the same in the *B.P.* and *U.S.P.*, the latter Pharmacopœia definitely stating the relative quantities to be employed. The Fehling test does not appear in the *P.G.*

Foreign fatty acids are tested for in an almost identical manner by the three Pharmacopœias by warming the acid and observing

the odour, as are also organic impurities by the Sulphuric Acid test, the *USP* and *PG* allowing a limit of time (15 minutes) within which no darkening in colour shall take place, and the *USP* in addition maintaining the temperature of the mixed Sulphuric and Lactic Acids at or below 15° C (59° F)

Advantage is taken of the insolubility of Calcium Phosphate, Gum, Mannite and Sugar in Ether to utilise the latter substance as a test for them in the Acid. The test appears in the *BP* and *PG*, but not in the *USP*. The three Pharmacopœias differ in the amount of mineral residue permitted. The *BP* allows 0.5 p.c., the *PG* no weighable residue from 0.5 gramme, and the *USP*, 1.0 p.c.

Chlorides, Citrates, Oxalates, Phosphates, Sulphates or Tartrates are readily detected by the tests given in the small type below under the respective headings of Silver Nitrate, Lime Water, and Barium Chloride

Warming.—When gently warmed the Acid should not evolve the odour of rancid fat. Indicating the absence of Butyric and other fatty acids, *BP*, *PG* and *USP*

Potassium Permanganate—On warming with Potassium Permanganate (Potassium Permanganate Solution, *PG*), Lactic Acid evolves the odour of Aldehyde. *BP* and *PG*, the *USP* test directs equal volumes of Lactic and Sulphuric Acids and Potassium Permanganate

Sulphuric Acid—If Lactic Acid be carefully poured on an equal volume of Sulphuric Acid in a clean test tube (previously rinsed out with Sulphuric Acid, *PG*), no darkening in colour should occur (*BP*) within 15 minutes, indicating the absence of more than traces of organic impurities, *PG* and *USP*. *USP* also directs that the temperature be maintained at or below 15° C (59° F)

Copper Sulphate Solution—Diluted with Water (1-10 *PG* and *USP*) Lactic Acid should be unaffected by Copper Sulphate T.S., indicating the absence of Sarcosine, Lactic Acid, *BP* and *USP*

Potassium cupric Tartrate Solution—Diluted with Water the Acid should give no precipitate, or only the slightest, even after prolonged boiling with Potassium-cupric Tartrate Solution, *BP*, the *USP* orders a few drops of the Acid to be added to 10 cc of the hot Alkaline Cupric Tartrate Volumetric Solution, indicating the absence of Grape, Cane and Milk Sugars

Zinc Carbonate—If Lactic Acid be heated with an excess of Zinc Carbonate and evaporated to dryness (dried at 100° C (212° F), *USP*), and if this mixture be exhausted with Absolute Alcohol, and the alcoholic liquid evaporated, no sweet residue should be left, indicating the absence of Glycerin, *BP* and *USP*

Ether.—If Lactic Acid be added drop by drop to twice its volume of Ether, the mixture should not show any permanent or transient turbidity, indicating absence of Gum, Sugar, Mannite, Calcium Phosphate, *BP* and *PG*

Volumetric Determination—One gramme neutralises 8.8 cc. of the Volumetric Sodium Hydroxide Solution, *BP*. If 5 grammes be diluted to 50 cc with Water, then 41.7 cc of this solution should require for complete neutralisation at boiling temperature not less than 37.5 cc. of Potassium Hydroxide Solution (each cc = 2 p.c. absolute Lactic Acid), Phenolphthalein T.S. being used as indicator, *USP*

Barium Chloride or Nitrate Solution.—10 cc. of an aqueous solution of a strength of 1 in 20 should be unaffected by 1 cc of Barium Chloride Test-solution, *USP*, or by Barium Nitrate Solution, *PG*, indicating the absence of Sulphates.

Hydrogen Sulphide Solution.—An aqueous solution of a strength 1 in 10 shall not be altered by the addition of Hydrogen Sulphide Solution, *P.G.*, nor should an aqueous solution of similar strength respond to the tume limit test for heavy metals, *U.S.P.*, indicating the absence of Arsenic, Copper, Lead and Iron.

Silver Nitrate Solution.—An aqueous solution of a strength of 1 in 10 shall not be altered by the addition of Silver Nitrate Solution, *P.G.*, 10 c.c. of an aqueous 1 in 100 solution should not be rendered opalescent by 1 c.c. of Silver Nitrate Solution, *U.S.P.*

Ammonium Oxalate Solution.—An aqueous 1 in 10 solution shall not be altered by the addition of Ammonium Oxalate Solution, indicating the absence of Calcium, *P.G.*

Lime Water.—An aqueous 1 in 10 solution shall not be altered by the addition of excess of Lime Water even on heating, *P.G.*

Preparation.

SYRUPUS CALCII LACTOPHOSPHATIS. SYRUP OF CALCIUM LACTOPHOSPHATE.

Precipitated Calcium Carbonate, 2½ oz.; Concentrated Phosphoric Acid, 4 fl. oz. and 262 minims, Lactic Acid, 6 fl. oz., Refined Sugar, 70 oz.; Orange Flower Water of commerce, undiluted, 2½ fl. oz.; Distilled Water, sufficient to produce 100 fl. oz. of Syrup.

The Lactic Acid is diluted with four times its volume of Distilled Water, and the Calcium Carbonate is added in small portions. As soon as the Carbonate is completely in solution the concentrated Phosphoric Acid is added and trituration continued until the precipitate at first formed redissolves. The solution is diluted with some Distilled Water, the undiluted Orange Flower Water added, and the mixture filtered. The Refined Sugar is dissolved without the aid of heat in the filtrate, strained, and sufficient Distilled Water added to produce 100 fl. oz. of Syrup.

Dose.—30 to 60 minims = 1.8 to 3.6 c.c.

The occasional change of colour in this syrup is stated to be due to inversion of the Sugar by the Acid—*P.J.* '99, 11 221, *A.J.P.* '98, 589.

Foreign Pharmacopœias.—Official in Belg., contains 1.5 p.c. Bi Calcium Phosphate, Mex., and Spain contain 1.25 p.c. by weight of Bi Calcium Phosphate; Swiss and U.S. from Calcium Carbonate, *see* below.

Not Official.

ACIDUM LACTICUM DILUTUM.—Lactic Acid, 3 fl. oz.; Distilled Water, *q.s.* to produce 20—*B.P.* 1885.

This has been incorporated in the *B.P.C.*

SYRUPUS CALCII LACTOPHOSPHATIS.—Precipitated Calcium Carbonate, 2.5, Lactic Acid, 6; Phosphoric Acid, 3.6, Orange Flower Water, 5, Sugar, 72.5, Water, *q.s.* to make 100.—*U.S.P.*

Calcium Carbonate, 1, Lactic Acid, 2.4, Diluted Phosphoric Acid, 2, Simple Syrup, 80, Water, *q.s.* to make 100. All by weight—*Swiss*.

SYRUPUS CALCII LACTOPHOSPHATIS C. FERRO.—Ferrous Lactate, 8.5, Potassium Citrate, 8.5, Water, 62.5, Syrup of Calcium Lactophosphate (*U.S.P.*), *q.s.* to make 1000—*U.S.N.F.* 1906.

The *B.P.C.* has incorporated the formula of the *U.S.N.F.* 1906, but employs *B.P.* Syrup of Calcium Lactophosphate in place of the *U.S.P.* Syrup as follows.—*B.P.* Ferrous Lactate, 0.85, Potassium Citrate, 0.85; Distilled Water, 6, Syrup of Calcium Lactophosphate, *q.s.* to make 100.

Other Not Official salts of Lactic Acid are:—**Plumbi Lactas**, a heavy white crystalline powder, soluble in Water. **Sodium Lactate**, a colourless or

light yellow liquid of a syrupy consistency and mild salty taste, readily soluble in Water, commercial samples frequently contain an undesirable excess of alkali in the form of Sodium Carbonate. **Zinc Lactate**, a white crystalline powder, or in glistening needle-shaped crystals, it has been used internally, in doses of 1 to 3 grains = 0.06 to 0.2 gramme, four or five times a day in the treatment of epilepsy.

CALCI LACTAS—White, mammillated tufts, or as a white odourless powder. Soluble 1 in 10 of Water, but solubility varies with the age of the preparation. Insoluble in Ether. Given in rachitis and scrofula, and in chilblains. As it increases the coagulability of the blood, it is given in hæmophilia, and before surgical operations on those who bleed unduly.

Dose.—3 to 10 grains = 0.2 to 0.65 gramme. Also combined with Ferri Lactas.

Foreign Pharmacopœias—Official in Belg., Ital. and Span.

FERRI LACTAS.—Pale greenish white crusts consisting of some needle-shaped crystals, or as a crystalline powder. Odourless when quite pure, but usually possessing a mild, peculiar odour and sweet, ferruginous taste. It should be kept in well stoppered bottles, as it tends to oxidise on exposure to air.

Solubility.—1 in 40 of cold Water, 1 in 12 of hot Water.

Dose.—5 to 15 grains = 0.32 to 1 gramme. In the form of a cachet or as a syrup.

Foreign Pharmacopœias—Official in all except U.S.

Tests.—Aqueous solutions of the salt give a deep blue precipitate with Potassium Ferricyanide, and a light blue precipitate with Potassium Ferrocyanide Solutions. When dissolved in diluted Sulphuric Acid and gently warmed after the addition of a little Potassium Permanganate the odour of Aldehyde is evolved.

1 gramme of the salt moistened with Nitric Acid and carefully ignited should leave a residue of Ferric Oxide amounting to not less than 0.27 gramme, indicating 27.0 per cent of Iron Oxide. This residue should not be alkaline in reaction to Litmus paper.

25 c.c. of a 1 in 50 aqueous solution of the salt after being boiled for a few minutes with 5 c.c. of diluted Sulphuric Acid, the Iron precipitated with an excess of Potassium Hydroxide Solution and filtered, the filtrate when boiled with a few drops of Potassic cupric Tartrate Solution should afford no reddish precipitate, indicating the absence of Sugar.

On trituration of a portion of the salt with strong Sulphuric Acid, no disagreeable odour should be evolved, no gas should be disengaged, nor should the mixture assume a dark colour after standing for some time. These tests show respectively the absence of fatty acids, Carbonates, and readily carbonisable organic impurities. A 1 in 50 aqueous solution of the salt should not produce more than a whitish opalescence with either Lead Acetate Solution or with Hydrogen Sulphide Solution after acidification with Hydrochloric Acid, indicating the absence of more than traces of Chloride, Citrate, Malate, Sulphate, Tartrate, and of heavy metals.

A 1 in 50 aqueous solution acidulated with dilute Nitric Acid shall yield no reaction with either Silver Nitrate Solution or with Barium Nitrate Solution, affording additional evidence of the absence of Chlorides and Sulphates.

The salt on being strongly heated evolves a caramel like odour, when more strongly heated gives off dense white fumes and finally leaves a brownish-red residue.

ACIDUM NITRICUM.

NITRIC ACID.

FR., ACIDE AZOTIQUE, GER., SALPETERSÄURE, ITAL., ACIDO NITRICO
CONCENTRATO, SPAN., ACIDO NITRICO

A clear, colourless fuming liquid, which evolves characteristic

choking fumes, and possessing even in diluted solutions a strongly acid and corrosive action.

It may be prepared by the decomposition of a Nitrate, generally Sodium or Potassium Nitrate by Sulphuric Acid.

It is officially required to contain 70 p.c. by weight of Hydrogen Nitrate, HNO_3 , eq. 62.58.

It should be preserved in well stoppered bottles, and in a cool place.

Medicinal Properties. It is strongly corrosive, and is applied as a caustic to warts, phagedenic sores, chancre, and condylomata, by means of a pointed glass rod. When diluted it is refrigerant, a stomachic tonic and cholagogue, and if very much diluted forms a drink in febrile diseases, and is used also as an injection to dissolve phosphatic calculi when of small size.

An acid of greater strength, 'Fuming Nitric Acid' (sp. gr. 1.5), is sometimes employed as a caustic.

Incompatibles. Alcohol, Alkali, Carbonates and Sulphides, Ferrous Sulphate, Lead Acetate.

Official Preparations.—*Acidum Nitricum Dilutum* and *Acidum Nitro-hydrochloricum Dilutum*. Used in the preparation of *Acidum Phosphoricum Concentratum*, *Argentum Nitratum*, *Liquor Ferri Perchloridi Fortis*, *Liquor Ferri Pernitratum*, *Liquor Ferri Persulphatis*, *Liquor Hydrargyri Nitratis Acidus*, *Spiritus Ætheris Nitrosi*, *Unguentum Hydrargyri Nitratis*.

Antidotes.—In case of poisoning by Nitric Acid, the antidotes are Chalk, Magnesia, or Carbonated Alkalis, with White of Egg, Carron Oil, or Soap-suds; followed by enemata of Beef Tea and Brandy, with Tincture of Opium to prevent collapse; emollient drinks.

Foreign Pharmacopœias.—Official in Austr., sp. gr. 1.300, Dan. and Norw., sp. gr. 1.180, Dutch, sp. gr. 1.316, B., sp. gr. 1.300, Fr., sp. gr. 1.304; Ger., Jap. and Swed., sp. gr. 1.153; Hung., sp. gr. 1.310, Ital., sp. gr. 1.400, Mex., sp. gr. 1.42, Port., sp. gr. 1.300 to 1.330, Russ., sp. gr. 1.200, Span., sp. gr. 1.31, Swiss, sp. gr. 1.151, also *Acidum Nitricum Fumans*, sp. gr. 1.45 to 1.5, U.S., sp. gr. 1.403 at 25° C (77° F.). Austr., Dan., Ger., Jap. and Norw., also *Acidum Nitrico-nitrosum*, sp. gr. 1.48 to 1.50.

Fr., Ger., Jap., Russ., Swed. and Swiss have an *Acidum Nitricum Crudum*.

Tests. Nitric Acid has a specific gravity of 1.420; the *B.P.* states 1.42, the *U.S.P.* about 1.403 at 25° C (77° F.); the *P.G.* 1.153. The boiling point should be about 120° C (250° F.); the *B.P.* states 121° C (250° F.); the *U.S.P.* 120.5° C (248° F.). It evolves dense red fumes when brought into contact with metallic Copper, it produces a dark brown coloration at the junction of the two liquids when a solution of the Acid is poured carefully upon a cooled mixture of Ferrous Sulphate and Sulphuric Acid, and when neutralised discharges the colour of a Sulphuric Acid Solution of Indigo, rapidly when warmed. The Acid is officially required to contain 69.46 p.c. of absolute Nitric Acid as indicated by titration with Volumetric Sodium Hydroxide Solution. As in the case of Lactic Acid, so here it would appear as if the atomic weights official in *B.P.* 1885 were employed in determining the number of c.c. of Volumetric Solution equivalent to the 1 gramme of Acid used, the yield of absolute Acid corresponding to 11.1 c.c. when so calculated being 69.93 p.c.

Calculating with the atomic weights of the 1898 Pharmacopœia, 11.2 cc would have been a nearer equivalent, which shows 70.08 pc of absolute Acid. The *USP* requires it to contain 68 pc by weight of absolute Acid, the *PG* 25 pc by weight.

The more generally occurring impurities are Arsenic, Copper, Lead and Iron, Bromic Acid or Bromine, Chlorides, Iodic Acid or Iodine, Sulphates and mineral residue. These are covered in the *BP* by the customary elastic expression, it should yield no characteristic reaction with the tests mentioned in the Appendix for those substances. Both *USP* and *PG* indicate the dilutions of the Acid to be employed, and in particular cases also the quantity of reagent to be used. The *USP* gives the modified Gutzeit test for Arsenic, and the time-limit test for heavy metals. A standard of 5 parts per million by weight is suggested (*CD* '08, 1795) for Arsenic, but 20 parts per million (by weight) is suggested for Lead, on account of the property of dissolving Lead from glass which this acid possesses. *PG* gives a special test for Iron, with Potassium Ferrocyanide Solution. In testing for Iodic Acid it will be noticed that the *USP* uses metallic Tin for the reduction, and the *PG* metallic Zinc.

The Pharmacopœias differ in the amount of mineral residue permitted. The *BP* states first that it shall yield no residue, and then 'not more than 0.005 pc', the *PG* omits all reference to the residue remaining after evaporation, whilst the *USP* states explicitly that 10 cc on evaporation to dryness, and further heated to 110° C (230° F), should leave no appreciable residue.

Modified Gutzeit Test—5 cc of a 1 in 10 aqueous solution of Nitric Acid should not respond to the modified Gutzeit's test for Arsenic, *USP*.

Potassium Ferrocyanide Solution—10 cc of a 1 in 10 aqueous solution should not be immediately turned blue on the addition of 0.5 cc. Potassium Ferrocyanide Solution, *PG*.

Chloroform.—Nitric Acid diluted 1-8, with a small piece of Zinc introduced for a short time, should not, on agitation with a small quantity of Chloroform, colour the Chloroform violet, *PG*.

The *USP* directs such a diluted Acid to be shaken with a few drops of Chloroform, which should remain colourless (absence of Iodine and Bromine) even after the introduction of a small piece of Tin (absence of Iodic and Bromic Acids).

Hydrogen Sulphide Solution—An aqueous 1 in 6 solution nearly neutralised with Ammonia Solution shall not be altered by the addition of Hydrogen Sulphide Solution, *PG*. When neutralised with Ammonia Solution and diluted with Distilled Water 1 to 20, the Acid should not respond to the time limit test for heavy metals.

Barium Chloride or Nitrate Solution—A 1 in 6 aqueous dilution of the Acid should not become more than opalescent within 5 minutes with Barium Nitrate Solution, *PG*. A separate portion of a 1 in 10 aqueous dilution should be unaffected by Barium Chloride Test Solution, *USP*.

Silver Nitrate Solution—A 1 in 6 aqueous dilution should not be affected by Silver Nitrate Solution, *PG*. A 1 in 10 aqueous dilution should be unaffected by Silver Nitrate Test Solution, *USP*.

Volumetric Determination—One gramme neutralises 11.1 cc of the Volumetric Sodium Hydroxide Solution, *BP*, 5 cc should require 22.9 cc of the Normal Volumetric Potassium Hydroxide Solution, *PG*. The *USP* directs that 3 cc of Nitric Acid be accurately weighed, diluted to 50 cc with Water and titrated with Normal Volumetric Potassium Hydroxide Solution,

using Methyl Orange Solution as an indicator. The number obtained by multiplying the number of c.c. of Alkali used by 6.257 and dividing this product by the weight of Acid taken represents the percentage of absolute Acid present.

Preparations.

ACIDUM NITRICUM DILUTUM. Diluted Nitric Acid

A clear, colourless acid liquid, prepared by diluting 3 fl. oz. and 7 fl. drms. of Nitric Acid with Distilled Water to make 20 fl. oz.

Dose.—5 to 20 minims = 0.3 to 1.2 c.c.

5 minims contain about 1 minim of strong Acid

Prescribing Notes.—*Usually diluted with Water or with bitter infusions and Tincture of Orange.*

Foreign Pharmacopœias.—Official in Belg., sp. gr. 1.072; Dutch, sp. gr. 1.133; Hung., sp. gr. 1.067; Ital., sp. gr. 1.1; Russ., sp. gr. 1.096; Fr., Jap. and Swiss, sp. gr. 1.056; U.S., sp. gr. 1.054 at 25° C (77° F). Not in the others, Dan., Norw. and Swed., see Acidum Nitricum.

Tests.—Diluted Nitric Acid has a specific gravity of 1.105; the U.S.P. states 1.054 at 25° C (77° F); the P.G. does not make a diluted Acid. It is officially required to contain 16.89 p.c. w/w of Hydrogen Nitrate as indicated by titration with Volumetric Sodium Hydroxide Solution; 1 gramme neutralising 2.7 c.c. The number of c.c. required to neutralise 1 gramme of the diluted Acid seems to have been based on the atomic weights official in the B.P. 1885, and using these latter would calculate to 17.01 p.c. of Hydrogen Nitrate. Each gramme should require for neutralisation 2.8 c.c. of the Volumetric Solution would have been more consistent with the statement of strength (17.1 p.c.) given in the official description of the diluted Acid.

As Nitric Acid (B.P.) is employed in its preparation, the diluted Acid is naturally required to answer the principal characteristic qualitative tests for Nitric Acid, and also be free from the impurities mentioned under the concentrated Acid.

ACIDUM NITRO-HYDROCHLORICUM DILUTUM. Diluted Nitro-Hydrochloric Acid

Nitric Acid, 3; Hydrochloric Acid, 4, Distilled Water, 25.

A clear, colourless, or pale yellow liquid, possessing a strong acid taste and faint chlorinous odour.

B.P. directs the Acids to be mixed with the Water and kept for 14 days before use; but scarcely any action takes place between the diluted Acids, free Chlorine and Nitrous Acid existing only in traces.

When the strong Acids were mixed, and after 8 days diluted, the resulting fluid liberated about fifty times as much Iodine from Potassium Iodide Solution as the B.P. preparation.

Medicinal Properties.—Cholagogue and gastric tonic. Externally as a lotion or bath, as well as by stomach administration for tropical enlargement and chronic congestion of the liver. Internally also in biliousness, in oxaluria, and in torpid conditions of stomach, intestinal glands and liver; and in catarrhal jaundice.

Nitro-Hydrochloric Acid Bath—Mix 8 oz by measure of Diluted Nitro-Hydrochloric Acid with 1 gallon of Water, temperature 96° or 98° F. Let a flannel roller of ten or twelve inches wide, and sufficient to encircle the body twice, be soaked in the fluid and then wrung, so as to remain only damp. Apply this instantly to the body, covering it with a piece of oiled silk to avoid damping the dress. It should be worn constantly, but should be changed, soaked, and wrung morning and evening. Glass, glazed earthenware, or wooden vessels should be used. Sponges and towels to be kept in Water to prevent them corroding.

The St Thomas's Hospital employ $\frac{1}{2}$ oz of the Diluted Nitro Hydrochloric Acid to the gallon for a full size bath of 25 to 30 gallons, and this has been incorporated in the *B.P.C.*

Dose—5 to 20 minims = 0.3 to 1.2 c.c.

Prescribing Notes—Usually diluted with Water and given with Tincture of Gentian or Tincture of Orange, and Tincture of Nux Vomica.

16 minims equal $1\frac{1}{2}$ minims of Nitric Acid and 2 minims of Hydrochloric Acid.

Incompatibles—Alkalis, Carbonates, Sulphides, salts of Silver and Lead.

Antidotes—See Acidum Nitricum.

Foreign Pharmacopœias—U.S. orders the undiluted—Nitric Acid, 18, Hydrochloric Acid, 82, also the diluted—Nitric Acid 4, Hydrochloric Acid, 18, Water, 78.

Norw., Nitric Acid, 1, Hydrochloric Acid, 2. By weight. *Syn* Aqua Regia.

Dublin Pharmacopœia was—Nitric Acid, 1, Muriatic Acid, 2.

Not in the other Pharmacopœias.

Tests—Diluted Nitro-Hydrochloric Acid has a specific gravity of about 1.07. 1 gramme should require for neutralisation about 2.5 c.c. of Volumetric Sodium Hydroxide Solution. When mixed with Potassium Iodide Solution, Iodine is liberated, which is readily recognised by the colour produced with Starch Solution.

ACIDUM OLEICUM.

OLEIC ACID

FR., ACIDE OLLIQUE, GER., OLEINSAURE, ITAL. AND SPAN., ACIDO OLEICO.

A pale brownish-yellow, oily liquid, which has a tendency to become rancid and to darken in colour on exposure to light and air. Pure Oleic Acid is represented by the formula $\text{HC}_{18}\text{H}_{33}\text{O}_2$, eq. 280.14, but the commercial article is usually not quite pure.

It is prepared from the Olein of fats, in which it exists as a Glyceryl ester, by saponification or hydrolysis, the former being accomplished by the Hydroxides of the fixed alkalis, the latter by the influence of superheated steam. After saponification the Oleate formed is decomposed by a mineral Acid.

It should be preserved in well-stoppered, dark amber-tinted glass bottles.

Solubility.—Mixes in all proportions with Alcohol, Chloroform, Ether, Benzol, Oil of Turpentine, and fixed Oils. Insoluble in Water.

Medicinal Properties.—Used in pharmacy for dissolving various metallic oxides and the alkaloids Morphine, Aconitine,

Atropine, Cocaine, and Veratrine, the oleates thus formed are more readily absorbed than ointments made with fats, oils, or paraffins

Official Preparation—Hydrargyri Oleas. Used in the preparation of Unguentum Atropine, Unguentum Atropine, Unguentum Cocaine, and Unguentum Veratrine. Of Mercuric Oleate, Unguentum Hydrargyri Oleatis.

Foreign Pharmacopœias—In Jap. (Acidum Oleicicum), sp. gr. about 0.9, M.P. 4.5 to 5°C. (40 to 41°F.), U.S. sp. gr. 0.895 at 25°C. (77°F.) Not in the others.

Tests.—Oleic Acid has a specific gravity of from 0.890 to 0.910; the *U.S.P.* states 0.895 at 25°C. (77°F.). The solidifying point is 4.5 to 5°C. (40 to 41°F.), subsequently melting at 13.3 to 15.5°C. (56 to 60°F.), the *U.S.P.* states that it becomes semi-solid when cooled to from 0 to 4°C. (32 to 39.2°F.) and congeals to a whitish solid on further cooling. It has a peculiar characteristic odour. The acid may be determined by titration with Volumetric Sodium Hydroxide Solution, using Phenolphthalein Solution as an indicator of neutrality. 1 gramme of the acid should require about 3.5 cc. of Volumetric Sodium Hydroxide Solution, indicating 98.0 p.c. of absolute Oleic Acid. No volumetric assay is included in either the *U.S.P.* or *B.P.*

The most likely impurities are fixed oils, Stearic and Palmitic Acids. The solubility in Alcohol (90 p.c.) detects the presence of fixed oils; though the solubility is not specifically mentioned as a test for these in the *B.P.*; advantage is taken of the comparative insolubility of Lead Stearate and Lead Palmitate in Ether to use this agent as a test for the presence of these two Acids.

The *U.S.P.* states that heated to a temperature of 95°C. (203°F.) decomposition commences, on heating to a higher temperature it is entirely dissipated.

The Acid is not official in the *P.G.*

Solubility in Alcohol. The *U.S.P.* states that an alcoholic solution of the Acid should have a feebly acid reaction on Litmus paper, and that equal volumes of Acid and Alcohol should form a clear solution at 25°C. (77°F.) without the separation of oily drops, indicating absence of fixed oils.

Lead Acetate Solution.—A weighed quantity of 1 gramme of Oleic Acid is dissolved in about 20 cc. of Alcohol (94.9 p.c.) and 2 drops of Phenolphthalein Solution added. The mixture is warmed and saponified by the addition drop by drop of a Solution of Sodium Hydroxide (1-4) until the Acid is neutralised, and the mixture after agitation remains a permanent red colour. Then gradually add Acetic Acid until the red tint is discharged, filter, and mix 10 cc. of the filtrate with 10 cc. purified Ether. This solution should not become any more than slightly turbid with 1 cc. of Lead Acetate Solution, indicating the absence of notable quantities of Stearic and Palmitic Acids, *U.S.P.*

An almost identical test is employed by the *B.P.* for the detection of more than traces of these acids.

Not Official.

ACIDUM STEARICUM Stearic Acid $\text{HC}_{18}\text{H}_{35}\text{O}_2$, eq. 282.14.—A hard white glistening solid, possessing very little odour or taste. It is an organic acid appearing commercially in a more or less impure form as Stearine. It is a monobasic acid. It is insoluble in Water, soluble in Alcohol (90 p.c.), and readily dissolves in Ether.

Tests.—Stearic Acid melts at 69.2°C. (156.6°F.). This melting point is given in the *U.S.P.*, which further states that the commercial acid should have a

melting point not lower than 56°C (132°F). The solidifying point of the commercial acid should not be lower than 54°C (129°F). It may be determined volumetrically by titration of a weighed quantity with Normal Volumetric Sodium Hydroxide Solution, using Phenolphthalein Solution as an indicator of neutrality 1 cc of the Volumetric Solution corresponding to 0.28214 gramme of pure Stearic Acid. Hydrocarbon oils and unsaponified fat are the more generally occurring impurities. If present in more than traces both are readily detected by the saponification test. If 1 gramme of the acid be saponified by boiling with a solution of 0.5 of a gramme of exsiccated Sodium Carbonate in 30 cc of Water, the resulting liquid should not be more than opalescent. It should leave no weighable residue when ignited with free access of air, indicating the absence of mineral matter, Soap, etc.

Not Official

ACIDUM OSMICUM

OSMIC ACID

Fr, ACIDE OSMIQUE, Ger, Osmiumsäure

A pale yellow crystalline substance giving off an excessively irritating vapour, which attacks the eyes and nostrils. It is more convenient in the form of 1 p.c. aqueous solution, which must be carefully protected from dust or organic matter which will reduce it and form a black deposit.

Solubility—1 in 17 Water. Should not be dissolved in Alcohol or Ether, as decomposition ensues.

Medicinal Properties—4 to 10 minims of a 1 p.c. aqueous solution of Osmic Acid or Potassium Osmate have been injected hypodermically for sciatica and other forms of neuralgia.

5 to 10 minims in two or three separate injections in certain forms of neuralgia.—L '99, ii 1250, '03 ii 970

In trigeminal neuralgia the main branches of the fifth nerve were exposed, and a few drops of a 2 p.c. solution injected at several points.—M P '04, ii 470. Injected into Gasserian ganglion.—L '07, ii 1603

Used as 1 p.c. aqueous solution for fixing and staining in histological work. Fat and nerve tissues are blackened by it.

Foreign Pharmacopœias—Official in Mex

Not Official

ACIDUM OXALICUM

Fr, ACIDE OXALIQUE, Ger, Oxalsäure, Ital, ACIDO OSSALICO

This is noticed here rather as a poison than a medicine, although it has been used in America in the treatment of amenorrhœa, and as a sedative in acute cystitis (*T G* '91, 164) in $\frac{1}{2}$ grain doses every four hours. It is used in households for cleaning brass, and removing ink stains, iron moulds, etc. It has been mistaken for Epsom Salts, which it somewhat resembles. Murrell states that death has occurred from 2 drms, but recovery from $\frac{1}{2}$ oz.

Antidotes—Chalk, Lime, or Whitening are given freely in Water. Saccharated Solution of Lime may be given in drim doses, frequently repeated, also emollient and stimulant drinks.

Foreign Pharmacopœias—Official in Mex and Port

ACIDUM PHOSPHORICUM CONCENTRATUM.

CONCENTRATED PHOSPHORIC ACID

FR., ACIDE PHOSPHORIQUE OFFICINAL., GER., PHOSPHORSÄURE, LIQ.,
ACIDO FOSFORICO SPAN., ACIDO FOSFORICO

A clear, colourless, and odourless syrupy liquid, containing 66·3 p.c. of Hydrogen Orthophosphate, H_2PO_4 , eq. 97·32

It is prepared from Phosphorus by oxidation. The official method is stated to be the oxidation, by means of Nitric Acid, of the aqueous solution of the residue from the atmospheric oxidation of Phosphorus. The more general method of production is the direct oxidation of Phosphorus by means of Nitric Acid.

It should be preserved in well stoppered glass bottles, preferably of an amber tint.

Medicinal Properties. This concentrated Acid is used in making phosphatic preparations. Only given internally in the diluted form. See Acidum Phosphoricum Dilutum.

Official Preparations. Acidum Phosphoricum Dilutum. Used in the preparation of Acidum Hydrobromicum Dilutum, Ammonii Phosphas, Syrupus Calcii Lactophosphatis, Syrupus Ferri Phosphatis, and Syrupus Ferri Phosphatis cum Quinina et Strichnina.

Foreign Pharmacopœias. Official in Austr., sp. gr. 1·12 (20 p.c.), Belg., 1·056 to 1·057 (10 p.c.), Fr. and Ital., sp. gr. 1·319 (50 p.c.), Dutch, sp. gr. 1·153 (25 p.c.), Ger. and Russ., sp. gr. 1·151 (25 p.c.), Jap., Hong., sp. gr. 1·120 (20 p.c.), Mex., 1·34, Port., sp. gr. 1·880. Spain, sp. gr. 1·35 (50 p.c.), U.S., sp. gr. not below 1·707 at 25° C. (77° F.) (85 p.c.). Not in the others.

Tests.—Phosphoric Acid has a specific gravity of 1·5; the U.S.P. acid 1·707 at 25° C. (77° F.), the P.G., 1·154. A white crystalline precipitate is produced when its diluted neutralised aqueous solution is mixed with Magnesium Ammonio sulphate Solution. A yellow precipitate soluble in Ammonia Solution is produced when its diluted aqueous solution acidified with Nitric Acid is treated with Ammonium Molybdate Solution containing free Nitric Acid. A canary yellow precipitate readily soluble in Ammonia Solution, and in cold dilute Nitric Acid is produced when Silver Ammonio-nitrate Solution is added to a dilute neutralised aqueous solution of this Acid. The Acid is officially required to indicate when assayed according to the Loid process given below, 66·3 p.c. of Hydrogen Orthophosphate; the U.S.P. Acid should contain 85 p.c. by weight of absolute Orthophosphoric Acid, the P.G. contains 25 p.c. of pure Acid. The process of determination adopted by the B.P. is a gravimetric one, and consists in converting the Phosphoric Acid into a Lead salt by means of Lead Oxide, evaporating and heating the residue to dull redness. A weighed quantity of 1 gramme of the Acid treated with 2·5 grammes of finely powdered Lead Oxide is required to yield a residue weighing 2·98 grammes. As pointed out in the 17th Edition of the Companion the percentage acidity of Phosphoric Acid may be conveniently determined by titration with standard alkali, using Phenolphthalein Solution as an indicator; the change of colour takes

place when two-thirds of the Hydrogen is replaced by alkali metal, with Methyl Orange Solution as the indicator, neutrality is reached with half the quantity of alkali, with Litmus Solution the end reaction is too indefinite. The process adopted by the *USP* is volumetric, Normal Volumetric Sodium Hydroxide Solution being employed and Phenolphthalein Test-solution used as an indicator of neutrality. A definite weight of the Acid is diluted with Water, and the quantity removed for the determination is then diluted with about an equal quantity of a cold aqueous solution containing 5 grammes of Sodium Chloride. The *PG* gives neither a gravimetric nor a volumetric process of determination.

The more generally occurring impurities are Meta- and Pyrophosphoric Acids, Phosphorous Acid, Arsenic, heavy metals (*e.g.*, Copper, Iron, and Lead), Calcium, Chlorides, Sulphates, Phosphates, and Nitrates. The *BP* are content to include most of these under the general expression it 'shall yield no characteristic reaction,' etc.

The *BP* and the *USP* employ Albumen Solution for proving the absence of Meta-phosphoric Acid, and Tincture of Ferric Chloride for proving the absence of Pyro phosphoric and Meta phosphoric Acids. The tests in each Pharmacopœia are virtually the same, requiring that when diluted with 5 volumes of Water no precipitate should be produced on the addition of Albumen Solution, nor should any precipitate be formed, even after several hours, on the addition of an equal volume of Tincture of Ferric Chloride.

Individual tests for Arsenic are given by the *USP* and *PG*, the former employing the modified Gutzeit's test, the latter Solution of Stannous Chloride. Both these Pharmacopœias employ Hydrogen Sulphide for the detection of heavy metals, the *USP* adopting the lime limit test. In testing for Nitrates both *USP* and *PG* employ equal volumes of Phosphoric and Sulphuric Acids, the former using a crystal of Ferrous Sulphate, the latter a Solution of Ferrous Sulphate. In testing for Phosphates *USP* employs a mixture of three parts of Alcohol (94.9 p.c.) and one of Ether, whilst *PG* uses Alcohol (90 p.c.) alone. No such test appears in the *BP*. A test for the absence of Silica is included in the *BP*, but not in *USP* or *PG*.

The *BP* employs Mercuric Chloride Test solution as a reagent for the detection of Phosphorous Acid, the *USP* both Mercuric Chloride Test-solution and Silver Nitrate Solution, the *PG* Solution of Silver Nitrate and gentle warming. When made alkaline with Ammonia Solution it should not give (even after long standing) a crystalline precipitate of Ammonio-magnesium Phosphate, indicating absence of Magnesium, which is present to a considerable extent in some commercial samples.

The acid when diluted with Water should yield no precipitate when allowed to remain at rest for some time, indicating the absence of Silica.

Mercuric Chloride.—The *BP* requires that, if the Acid be diluted, mixed with an equal volume of Mercuric Chloride Solution and heated, no precipitate should form, the *USP* gives 1 c.c. of Acid diluted with 5 c.c. of Water, but no

specified quantity of reagent, a similar dilution when gently warmed and with the addition of a few drops of Silver Nitrate T.S. should not be blackened, indicating the absence of Phosphorous Acid.

Silver Nitrate Solution. Phosphoric Acid (diluted with 5 volumes of Water, *U.S.P.*) should yield no precipitate with Silver Nitrate T.S., indicating the absence of Chlorides, *P.G.* and *U.S.P.* (not even on warming, indicating the absence of Phosphorous Acid, *P.G.*)

Barium Chloride or Nitrate Solution. A diluted Acid (1:1, *P.G.*) should be unaffected by Barium Nitrate Solution, *P.G.*, indicating the absence of Sulphates.

0.1 cc. of the Acid diluted with Water to 7 cc. should not afford a cloudy mass or precipitate within 30 seconds on the addition of 1 cc. of Barium Chloride Test solution, *U.S.P.*

Ammonium Oxalate Solution. A 1:1 aqueous dilution of the Acid, after the addition of excess of Ammonia Solution should not be changed by the addition of Ammonium Oxalate Solution, indicating the absence of Calcium, *P.G.*

Hydrogen Sulphide. The Acid should not be affected by Hydrogen Sulphide Solution, *P.G.*, and 10 cc. of a 1:20 dilution should not respond to the time limit test for heavy metal.

Modified Gutzzeit's Test. 5 cc. of a 1:10 aqueous dilution should not respond to the modified Gutzzeit's test for Arsenic, *U.S.P.*

Stannous Chloride Solution. The *P.G.* requires that a mixture, 1 cc. of Phosphoric Acid with 3 cc. Stannous Chloride Solution, should not assume a dark colour in the course of an hour, *P.G.*

Alcohol or Alcohol and Ether. In a mixture of 1 cc. Phosphoric Acid, 3 cc. Alcohol (94.9 pc) and 1 cc. Ether there should be no turbidity (absence of Phosphates) *U.S.P.* The *P.G.* directs that a mixture of the Acid with 4 volumes of Alcohol (90 pc) should remain clear.

Ferrous Sulphate. The *U.S.P.* requires that no white precipitate or colour should appear around a crystal of Ferrous Sulphate dropped into a cooled mixture of 1 cc. Phosphoric Acid and 1 cc. Sulphuric Acid. No coloured zone should be formed when 1 cc. Ferrous Sulphate solution is poured as a layer on a mixture of 2 cc. Phosphoric Acid and 1 cc. Sulphuric Acid, *P.G.*

Volumetric Determination. If 10 grammes of Phosphoric Acid be diluted with Water to measure 100 cc., then 9.73 cc. of this, diluted with 10 cc. of cold saturated aqueous solution containing 5 grammes of Sodium Chloride, should require 17 cc. of Normal Volumetric Potassium Hydroxide Solution for neutralisation (each cc. corresponding to 5 pc. of absolute Phosphoric Acid), Phenolphthalein T.S. being used as indicator, *U.S.P.*

Preparation.

ACIDUM PHOSPHORICUM DILUTUM. DILUTED PHOSPHORIC ACID.

A clear colourless liquid possessing an acid taste and strong acid reaction towards blue Litmus paper. It is prepared by diluting 3 of Concentrated Phosphoric Acid with Distilled Water to make 20.

Medicinal Properties.—Tonic and refrigerant, hamatinic and anhydrotic; diuretic in the phosphatic diathesis. Given with Calcium Phosphate in rickets. Quenches the craving for fluids in diabetes.

Used as a partial substitute for organic acids in cooling drinks and acidulated waters.

Dose.—5 to 20 minims = 0.3 to 1.2 c.c.

Prescribing Notes.—Usually largely diluted with Water, and given with some other and aromatic mixtures and syrups; should not be mixed with the Syrup of Iron Pyrophosphate, as the mixture becomes solid.

Incompatibles.—Lime Water and all alkalis

Foreign Pharmacopœias—Official in Norw and Port, 13·8 p.c., Russ., 12·5 p.c., Fr., Jap., Mex., Swed., Swiss and U.S., 10 p.c.

Tests—It has a specific gravity of 1·08, the *USP* diluted acid has a specific gravity of 1·057, the *PG* does not include a diluted acid. It is officially required to contain 13·8 p.c. w/w of Hydrogen Orthophosphate as gravimetrically determined by converting 1 gramme into a Lead salt by the addition of 0·5 of a gramme of Lead Oxide, heating to a dull redness, cooling and weighing the residue, which should amount to 0·6 gramme, the *USP* diluted acid is required to contain 10 p.c. w/w of absolute Ortho-phosphoric Acid as determined volumetrically by titration with Normal Volumetric Potassium Hydroxide Solution, using Phenolphthalein Test-solution as an indicator of neutrality. The quantity (4·87 gramme) of the diluted Phosphoric Acid used for the titration is diluted with 5 c.c. of a cold saturated Sodium Chloride Solution. Concentrated Phosphoric Acid answering the official description is used in the preparation of the diluted acid, and it is therefore required to answer the tests and to be free from the impurities given under the Concentrated Acid.

Not Official

ACIDUM PICRICUM

$C_6H(NO)_3OH$, eq 227·44

PICRIC ACID CARBAZOIC ACID TRINITROPHENOL.

Pale yellow crystalline scales, prepared by the action of hot Nitric Acid on Phenol sulphonic Acid.

Picric Acid, Picrates, and Mixtures of Picric Acid when in process of manufacture or when kept, conveyed, imported, or sold for any purpose, come within the Explosives Act 1875, except when it is mixed with not less than half its own weight of Water. For the dealer in these substances there are special conditions as to storing, etc.

With Ammonia, Potassium Hydroxide and Sodium Hydroxide it forms crystalline salts, which are explosive.

Solubility—1 in 90 of Water, 1 in 10 of Alcohol (90 p.c.)

Medicinal Properties—A solution (1 or 2 p.c.) of Picric Acid has been recommended as an application to scalds and burns, and also in acute eczema.—*B M J* '96, ii 651 and 1826, '97, i 331 and 457, '99, i 1152, *L* '03, ii 640, 799.

It has also been given in $\frac{1}{2}$ to 1 grain doses as a bitter tonic.

Specially useful as a first dressing in burns, has all the advantages of boric acid, plus that of relieving pain.—*B M J* '07, ii 524.

Solution for Removal of Picric Acid Stains. Sodium Benzoate, 1; Boric Acid, 1, Water, 100.

A saturated aqueous solution is a delicate test for the presence of Albumen in fluids, even in very dilute solutions a white cloud is formed at the junction of the two liquids, and in stronger solutions the Albumen is precipitated. Used in histological work.

Foreign Pharmacopœias—Official in Fr., Jap. and Mex. Not in the others.

Tests—The pure Acid melts at 122° C (241·6° F). At a higher temperature it partially sublimes, and boils, giving off bitter yellow suffocating vapours. It may be determined by titration with Volumetric Sodium Hydroxide Solution,

using Phenolphthalein Solution as an indicator of neutrality. 1 gramme of the Acid should require about 4.4 c.c. of the Volumetric Solution. A dark red liquid is produced when a solution of Picric Acid is boiled with a strong Solution of Potassium Cyanide. When boiled with a strong Solution of Calcium Hypochlorite it gives off picric acid, producing vapours. It should be free from mineral impurities, and from more than traces of Sulphates.

AMMONII PICRAS.—Yellow, odourless, glistening crystalline needles. Soluble 1 in 93 of Water 1 in 82 of Alcohol (90 p.c.) Given as a substitute for Quinine, also in exophthalmic goitre and malaria.

Dose.— $\frac{1}{2}$ to 1 gram = 0.016 to 0.06

Not Official

ACIDUM PYROGALLICUM.

PYROGALLIC ACID, PYROGALLOI.

FR., PYROGALLOL, GER., PYROGALLOL, ITAL., PYROGALLOLO.

Light, white crystalline tufts, which have a tendency to become coloured on exposure to strong light, more particularly in solution. The change is more rapid in alkaline solution. Usually prepared by heating Gallic Acid to 185° to 200° C. (365° to 392° F.)

It should be kept in well closed, dark amber-tinted glass bottles as far as possible from the light.

Solubility.—1 in 2 of Water, and measures 2 $\frac{1}{2}$, 9 in 10 of Alcohol (90 p.c.).

Medicinal Properties.—Escharotic, antiseptic, and disinfectant. Its use requires care.

Not more than 15 to 25 grains should be used in the twenty-four hours, as violent toxic symptoms may result from its absorption. *T. G.* '85, 59.

Used in the form of a 10 p.c. salve, and applied with a brush twice a day, it proved very useful in Hebra's wards in the treatment of psoriasis. The parts were then covered with cotton wadding or linen, and when very extensive were covered with flannel. *L. M. R.* '87, 377.

An ointment, Pyrogallin Acid 10, Starch 40, Vaseline 120, also a powder, Pyrogallin Acid 20, Starch 80, have been used for venereal ulcers. *L. M. R.* '82, 228, '84, 68.

Mixed with Colloodium Flexile, 40 grains to the oz., for psoriasis. — *T. G.* '88, 181.

Largely used in photography. It has also been used for bleaching the hair. 1 in 16 of Water is used with a Solution of Silver Nitrate (1 in 30 of Water).

To remove stains of Pyrogallin Acid, rub a little Ammonium Persulphate on the fingers and rinse with Water. *P. J.* '98, 1504a.

Foreign Pharmacopœias.—Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Norw., Russ., Swed., Swiss and U.S. Not in Port. or Span.

Tests.—Pyrogallin Acid melts at 131° to 132° C. (267.8° to 269.6° F.), and sublimes at a higher temperature without leaving any mineral residue. Solutions of the acid gradually absorb Oxygen from the air becoming darker in colour, and this absorption is much accelerated in the presence of alkalis, the solutions then rapidly becoming dark brown or almost black. A freshly prepared dilute Solution of Ferrous Sulphate yields an indigo blue coloration with a solution of Pyrogallin Acid, and solutions of Ferric salts a brownish-red coloration; solutions of Mercuric, or Silver salts are rapidly reduced.

UNGUENTUM ACIDI PYROGALLICI (Jarsch's Ointment) —Pyrogallin Acid, 60 grains; Lard, 1 oz.

This has been incorporated in the B.P.C. as follows.—

Pyrogallin Acid, 12, Lard, 88

UNGUENTUM PYROGALLOL COMPOSITUM.—Pyrogallie Acid, 80 to 60 grains, Ichthyol, 80 grains, Salicylic Acid, 15 grains, Soft Paraffin, to 1 oz — *Middlesex*

Pyrogallol, 20 grains, Ammonium Sulpho-ichthyolate, 20 grains, Salicylic Acid in powder, 8 grains, Soft Paraffin to 1 oz — *London*

Unguentum Pyrogalloli Compositum (Unna)—Pyrogallie Acid, 5, Salicylic Acid, 2, Ammonium Ichthiosulphonate, 5, Yellow Vaseline, 88 — *Hager, and Pharm. Form*

This has been incorporated in the *B P C* under the title **Unguentum Acidi Pyrogallici Compositum** *syn* Unna's Compound Pyrogallol Ointment, employing Soft Paraffin

Unguentum Pyrogallol Oxydati—Oxidised Pyrogallie Acid, 5, Salicylic Acid, 5, Hydrous Wool Fat, *q s* to make 100 — *B P C*

UNNA'S PYROGALLIC PLASTER MULL—Contains 40 p c of the Acid, equal to $\frac{1}{2}$ grain in each square inch of surface

ACID PYROGALLIC OXIDISED (Pyraloxin)

Some attention has been directed to this drug by its recent employment in dermatological practice. It is a brownish black powder readily soluble in Water, prepared by oxidising Ammonium Pyrogallate in a current of air. It possesses no toxic properties, nor is it liable, as a rule, to excite any dermatitis. It has been employed (*Edin Med Jour* '05, 487) in the treatment of lupus erythematosus.

In the treatment of psoriasis it stands next to Chrysarobin in efficiency. It is unsuited for the acute or rapidly extending phase, but when the disease has come to a standstill, or is showing distinct evidences of retrogression, its advantages are said to be incontestable. It may be applied as an ointment ($\frac{1}{2}$ drm to the oz), made up with Vaseline, or with the addition of 10 grains of Salicylic Acid as a mordant. A cleaner method is to employ 10 parts dissolved in 20 of Benzol and 80 of Acetone.

In lupus erythematosus applied as an ointment. Zinc Oxide, 10, Kaolin, or terra silicia, 2, Oxidised Pyrogallie Acid, 5, Vaseline, 28.

In infantile eczema of the face the most brilliant results have been obtained. It is applied to the reddened and irritable surface of the skin in the form of a thin coating of Lassar's Paste, to which 10 grains of Pyraloxin have been added.

For the eradication of ringworm of the scalp in children it is applied in the form of an ointment. Oxidised Pyrogallie Acid, 10 grains, Precipitated Sulphur, $\frac{1}{2}$ drm, Ammoniated Mercury, 15 grains, and Vaseline, 1 oz.

Eugallol (Pyrogallol mono-acetate), a brownish yellow thick syrupy liquid, **Gallacetophenone**, a yellowish brown powder, **Lenigallol** (Pyrogallol triacetate), a white powder, and **Saligallol** (Pyrogallol di salicylate), a resinous solid, are preparations which have received attention in the treatment of skin diseases.

ACIDUM SALICYLICUM.

SALICYLIC ACID

FR, ACIDE SALICYLIQUE, **GER**, SALICYLSÄURE, **ITAL**, ACIDO SALICILICO, **SPAN**, ACIDO SALICILICO

Colourless, odourless, prismatic crystals when prepared synthetically from Carboic Acid, but the Acid derived from the Oil of Wintergreen or of Sweet Buch, commonly called 'natural acid,' is usually supplied in large crystals possessing a yellowish or pinkish tint, and generally possesses a faint odour of Methyl Salicylate.

It may also occur as a light, white crystalline powder. It possesses at first a sweetish and subsequently an acrid taste.

Prepared by passing Carbonic Acid Gas into a mixture of Carboic Acid and Sodium Hydroxide at a high temperature, and decomposing the Sodium Salicylate with a mineral Acid, and subsequent purification; or by treating Oil of Wintergreen (*Gaultheria procumbens*), which is mainly composed of Methyl Salicylate, also Oil of Sweet Birch (*Betula lenta*) and *Andromeda leschenaultii* (a native of India), with a Solution of Potassium Hydroxide, and distilling it, decomposing the residue with Hydrochloric Acid, and purifying the Salicylic Acid by recrystallisation.

Salicylic may be sublimed, but there is almost certain to be some slight decomposition with liberation of Phenol.

Solubility. - About 1 in 550 of Water, 1 in 9 of boiling Water, 1 in $3\frac{1}{2}$ of Alcohol (90 p.c.), 1 in 11 of Alcohol (60 p.c.), 1 in 35 of Alcohol (15 p.c.), 1 in 2 of Ether; 1 in 55 of Chloroform; 1 in 120 of Olive Oil, 1 in 195 of Glycerin; 1 in 8 of Lard (at 180° F.). 20 grains Salicylic Acid are rendered soluble in a fl. oz. of Water by the addition of 25 grains of Borax or 10 grains of Potassium Citrate; but it is better to use Soda or Salicylate.

Medicinal Properties. Antiseptic and powerfully antipyretic; specific in acute rheumatism.

A good **preservative** of medicated solutions, such as Cocaine salts and Boric Acid, which are otherwise liable to fungoid growths, 1 in 1000 is sufficient for the purpose, but in the eye causes temporary smarting.

Used as a **lotion** (4 p.c.) in pruritus and urticaria, and some forms of eczema; as an **injection** (1 in 300) in the dysenteric diarrhoea of children; as an **ointment** (1 in 6) for pruritus (*Ringer*). With Zinc Oxide and Starch it is used as a '**dusting powder**' for infants.

In **collodion** form it is very useful when applied to hard and soft corns and warts. It softens and removes them.

The collodion is recommended in lupus. *P* 1 in '96.

The injection of Salicylic Acid in uterine cancer, recommended as a **palliative** method when the disease is too far advanced to admit of surgical extirpation. *P. J* (8) xxv 1219.

A solution in spirit, increased 1 p.c. daily from 1 to 6 p.c., applied to remove the stumps left after removal of papillomatous growths. It also forms a useful application dissolved in Sodium Sulpho ricinate solution. — *B. M. J.* '04, ii. 1221, 1224.

A daily application of a 10 p.c. solution of Salicylic Acid in Sulpho ricinate of Soda for pharyngo mycosis. This salt of soda seems to be the vehicle with which Salicylic Acid can be incorporated so as to be as unirritating as possible. — *B. M. J.* '07, i 1155, *L.* '07, i. 1248.

Recommendation of the Departmental Committee appointed to inquire into the use of preservatives and colouring matters in food. Salicylic Acid be not used in greater proportions than 1 grain per pint in liquid food, and 1 grain per lb. in solid food, its presence in all cases to be declared. *L.* '01, ii. 1643, *J. S. C. I.* '01, 1228, *P. J.* '01, ii. 620, *C. D.* '01, ii. 880, *Analyst*, '01, 882.

Salicylic Acid as a preservative for foods has been stated to be injurious, for three reasons: (1) That it is antiseptic and antifermentative, and therefore liable to interfere with the digestive processes, (2) after absorption is apt to injure the general health, (3) that it is an irritant and apt to injure the mucous membrane of stomach and intestinal canal, but the results of experiments by Macalister and Bradshaw are opposed to these conclusions, and they contend that there is no justification for them. — *L.* '02, ii. 1644; '03, i 717.

Prescribing Notes.—On account of its slight solubility in Water, it is usually given internally in the form of Sodium Salicylate, which is readily soluble, and is less irritating to the mucous membrane. It is also given in combination with Bismuth and Lithium.

Dose.—5 to 20 grains = 0.32 to 1.3 grammes

Incompatibles—Spirit of Nitrous Ether, Iron salts

Official Preparations—Sodu Salicylas, Unguentum Acidi Salicylic Used in the preparation of Injectio Cocainæ Hypodermica, Liquor Atropinæ Sulphatis, and Salol. See also Bismuthi Salicylas

Not Official.—Collenplastrum Salicylatum, Collodium Salicylicum, Collodium Lacto salicylicum, Collodium Callosum, Salicylic dressings, Glycerinum Acidi Salicylici, Lotio Acidi Salicylici Co, Parogen Salicylatum, Pulvis Salicylicus cum Talco, Pulvis Talci Salicylicus, Salicylic and Creosote Plaster Mulla, Salicylic Acid Suet, Unguentum Acidi Salicylici, Vasolimentum Salicylicum, Salacetol, Aspirin, Acetylsalicylic Acid, Agathin, Glycosal, and Salitannal

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Jap, Ital, Mex, Norw, Port, Russ, Span, Swed, Swiss and U S

Tests.—Salicylic Acid melts at 156° to 157° C (312.8° to 314.6° F), the *USP* states it begins to melt at 156° C (312° F) and is completely melted at 157° C (314.6° F), the *PG* that it melts at about 157° C (314.6° F). According to the *USP* it is gradually dissipated at a higher temperature than 157° C (314.6° F). The distinctive test is the violet colour imparted to an aqueous solution by Ferric Chloride Test-solution, and the production of the peculiar odour of Methyl Salicylate when a little of the Acid is warmed with Methyl Alcohol and strong Sulphuric Acid. The latter test is included in *USP* but not in *BP* or *PG*. The Acid is not officially required in this instance to 'afford when neutralised the reactions characteristic of Salicylates.' According to the *BP* the acid volatilises at 200 C (392° F) 'without decomposition,' but unless the Acid is very carefully heated there is almost certain to be some slight decomposition, with liberation of Phenol, which fact is noted in *PG*. The Acid may be readily determined by titration with Volumetric Sodium Hydroxide Solution, using Phenolphthalein Solution as an indicator of neutrality. Each gramme of the Acid should require about 7.3 c.c. of the Volumetric Solution, indicating 100.0 p.c. of absolute Salicylic Acid. Neither the *BP* nor *PG* includes a volumetric method of determination.

The more generally occurring impurities are unconverted Phenol, isomers, or homologues of Salicylic Acid, organic impurities, Hydrochloric Acid, Carbolates or Sulphocarbolates, and mineral residue. The test for Phenol, viz., its extraction from alkaline solution with Ether, is practically the same in the *BP*, *USP*, and *PG*, the latter Pharmacopœia giving the relative quantities to be used in performing the test. The method adopted by each Pharmacopœia is compared in the small type below, under the heading of Ether. Isomers or homologues of Salicylic Acid are detected by their influence on the melting point and by the evaporation test. The *BP* evaporates an aqueous solution, whilst *PG* and *USP* employ an alcoholic one. The test is more severe when water is employed with excess of the sample, for as pointed

out (*P.J.* (3) xxi 478), the impurities are more soluble in this fluid than the Acid, it therefore tends to magnify the proportion of impurity on solution, and to separate it on evaporation. A filtered saturated aqueous solution prepared by shaking the acid with a small quantity of Water, when evaporated to dryness is officially required to leave a white residue free from any buff coloured fringe, which according to the *B.P.* indicates the absence of Iron, organic impurities and colouring matter. Concentrated Sulphuric Acid serves to detect organic impurities, the *B.P.* requiring no colour to be developed in 15 minutes, but making no reference to the relative proportions of the two acids, the *U.S.P.* and *P.G.* giving the latter but no time limit, the *U.S.P.* employs about 0.5 of a gramme of Salicylic Acid in 10 c.c. of Sulphuric Acid, the *P.G.* requires one part of Salicylic Acid should be dissolved by 6 parts of Sulphuric Acid without coloration. A test for Chlorides is included in *U.S.P.* and *P.G.* The *U.S.P.* allows not more than 0.6 p.c. and the *P.G.* no weighable residue; the *B.P.* makes no mention of mineral residue.

The test distinguishing Salicylic Acid from Carbolates and Sulphocarbolates by means of Solution of Uranium Nitrate is peculiar to the *B.P.*; but this reaction would not detect the presence of either of the latter in a sample of Salicylic Acid. It depends upon the assumption that Uranium Nitrate Solution produces a yellowish-brown precipitate in solutions of the acid not weaker than 1 p.c., whereas solutions of Carbolates and Sulphocarbolates are not precipitated.

Evaporation. In the *P.G.* and *U.S.P.* an alcoholic solution of the Acid (1 10, *P.G.*, saturated, *U.S.P.*) is allowed to evaporate spontaneously in a place protected from dust, when a perfectly white residue should remain.

Ether. If 1 gramme of Salicylic Acid be dissolved in excess of cold Sodium Carbonate Solution and the liquid agitated with an equal volume of Ether, and the ethereal solution be allowed to evaporate spontaneously, the residue, if any, should be free from the odour of Phenol, *B.P.* and *U.S.P.* The *P.G.* test gives as quantities 0.5 gramme of Acid dissolved in 10 c.c. of a 1-10 Sodium Carbonate Solution.

Silver Nitrate. The *P.G.* and *U.S.P.* require that an alcoholic Solution of Salicylic Acid (1 10, *P.G.*, 1 20, *U.S.P.*) should be unaffected by Silver Nitrate T.S. after the addition of a few drops of Nitric Acid, indicating the absence of Chlorides.

Preparation.

UNGUENTUM ACIDI SALICYLICI. SALICYLIC ACID OINTMENT

Salicylic Acid, 1; White Paraffin Ointment, 49.

Foreign Pharmacopœias. Official in Mex. (Ponada de Acido Salicilico), Acid 1, Alcohol 2, Vaseline 9, Austr., Sodium Salicylatum (see below). Not in the others.

SODIUM SALICYLATE. *See* SODII SALICYLAS.

Not Official.

COLLEMPASTRUM SALICYLATUM (*Austr.*) - Collemplastum adhaesivum mass, 100; Acid Salicylic, 4, Petroleum Ether, 20.

COLLEMPASTRUM ADHÆSIVUM (*Austr.*) - Resin Oil, 6, purified alcohol India-rubber, 10; Petroleum Ether, 45, allow to stand with frequent

agitation until dissolved, add Balsam Copaiba and Colophony Resin, of each, 4, Adeps Lanæ, Cera Flava and Sandarach, of each, 2, powdered Orris Root, 9, and Ether, 16

COLLODIUM SALICYLICUM — Salicylic Acid, 60 grains, Flexible Collodion, 1 oz — *Guy's* and other Hospital Pharmacopœias

Salicylic Acid, 12, Acetone Collodion, q s to produce 100 — *B P C*

The *B P C Supplement* now dissolves the Acid in 30 of Acetone before making up to 100 with the Collodion

Salicylic Acid, 1, Flexible Collodion (by weight), 9 — *F'*

COLLODIUM CUM ACIDO SALICYLICO — Salicylic Acid, 20, Spirit of Ether, 20, Collodum, 60 — *Dutch*

COLLODIUM SALICYLICUM COMPOSITUM — Salicylic Acid, 60 grains, Extract of Indian Hemp, 10 grains, Flexible Collodion, to 1 oz

Collodium Salicylicum Compositum *Syn* **COLLODIUM CALLOSUM** — Salicylic Acid, 12, Extract of Indian Hemp, 2, Acetone Collodion, q s to produce 100 — *B P C*

The *B P C Supplement* now dissolves the Acid and Extract in 30 of Acetone before making up to 100 with the Collodion

COLLODIUM LACTO-SALICYLICUM — Salicylic Acid, 60 grains; Lactic Acid, 1 fl drim, Flexible Collodion, to 1 fl oz

COLLODIUM SALICYLICUM CUM ZINCI CHLORIDO Salicylic Acid, 60 grains, Zinc Chloride, 30 grains, Flexible Collodion, 1 oz — *Guy's*

SALICYLIC DRESSINGS — Gauze, Lint, and Wool, 1 p c, Jute, 4 and 10 p c Jap has Cotton 5 p c and Gauze

GLYCERINUM ACIDI SALICYLICI — Salicylic Acid, 1 part, Glycerin, 9 parts Also called Pasta Acidi Salicylici

LOTIO ACIDI SALICYLICI CUM BORACE — Salicylic Acid, 120 grains, Borax, 60 grains, Glycerin, 1 oz, Rectified Spirit, 1 oz, Distilled Water, to 10 oz — *Middlest*

PULVIS SALICYLICUS CUM TALCO (*Dan, Dutch, Ger, Jap, Norw and Swed*) — Salicylic Acid, 3, Wheat Starch, 10, Talc, 87, mix to a fine powder

Pulvis pro pedibus (*Swiss*) — Same formula as above Used in the German Army as a preventive against perspiring and sore feet It is applied dry, on a march daily, or in garrison every two or three days

Pulvis Talci Salicylicus — Salicylic Acid, 3, Boric Acid, 10, Talc in fine powder, 87 — *US N F*

This has been incorporated in the *B P C* under the title **Pulvis Acidi Salicylici Compositus**

SALICYLIC AND CREOSOTE PLASTER MULLS (*Unna*) — Contain $\frac{1}{2}$ grain of Salicylic Acid and 1 grain of Creosote to the square inch, also twice this strength Possess a solvent power on horny epidermis, the Creosote acting as an anæsthetic Also used in the treatment of lupus — *L*, '86, n 574, *B M J*, '87, n 451

Salicylic Acid and Creosote can also be applied as an ointment with Lard and Wax

SEBUM SALICYLATUM — Salicylic Acid, 2, Benzoin, 10, Mutton Fat, 98 — *Austri*

Used in the German Army for sweaty feet and soreness from riding

Salicylic Acid, 2, Benzoic Acid, 1, Prepared Suet, 97 — *Ger*

The German formula appears in the *B P C* as **Sevum Salicylatum**.

UNGUENTUM ACIDI SALICYLICI — Salicylic Acid, 30 grains, Benzoinated Lard, 1 oz, melt over a water-bath, and stir till cold

Used for eczema, psoriasis, ringworm, and for foul ulcers

VASOLIMENTUM SALICYLICUM — Salicylic Acid, 2, Liquid Vasoliment, 98 — *Huger*

Parogen Salicylatum. *Syn* SALICYLATED VASOLIMENT—Salicylic Acid, 10, Parogen, q s to produce 100—*B.P.C.*

SALACETOL Is obtained by the action of Monochloro-acetone on Sodium Salicylate. Crystallises in long needles, melting at 71°C (159.8°F), soluble 1 in 2,200 of Water, 1 in 15 of Alcohol. It is unaffected by dilute acids, but decomposed by weak alkali with liberation of Salicylic Acid. Introduced as an intestinal disinfectant, resembling Salol in its action—*B.M.J.E.* '96, i 92; *L.* '96, ii 1821

Dose. 15 to 30 grains = 1 to 2 grammes, for adults, 4 to 8 grains = 0.26 to 0.52 gramme for children

ACETYSALICYLIC ACID Aspirin $\text{C}_9\text{H}_8\text{O}_4$, $\text{C}_9\text{H}_7\text{O}_4$, eq. 178.71
Minute, white, odourless crystalline needles. Soluble 1 in 100 Water, 1 in 5 of Alcohol (90 p.c.), soluble in Ether.

Dose. 10 to 15 grains = 0.65 to 1 gramme, three times a day

Antipyretic and antirheumatic—Given as a substitute for the Salicylates in rheumatism, also in pleurisy, the advantage being that it does not produce gastric irritation nor ringing in the ears to the same extent as the Salicylates. Is best prescribed in the form of tablets or wafers—*B.M.J.E.* '99, ii 3, 68, 96, '01, i 92; *i.* 56, *L.* '99, ii 219, *P.J.* '99, ii 135, '00, ii 731, 775, '01, i 665

In various children's diseases, rheumatic affections, and in whooping cough. Action slower than Sodium Salicylate, but effect is more prolonged—*P.* lxx 111, *B.M.J.E.* '02, i 12

15 grain doses once or twice daily given with beneficial effects in cases of inoperable carcinoma—*L.* '03, i 984

In chorea, 10 to 15 grains 3 or 4 times a day—*L.* '03, i 526

Acetylsalicylic Acid should not be prescribed with alkalis or Sodium Bicarbonate—*P.J.* '03, i 2, 89

Superiority of Aceto-salicylic Acid in rheumatic fever, in certain cases when a salicylate has had a good trial—*L.* '07, i 783

In diabetes, alkalis (Soda Water, etc.) and Milk should not be taken with, or just after, the Aspirin—*P.* '07, i 139

Is stated (*L.* '05, i 81) not to possess any advantage over Salicylic Acid and the Salicylates. In some patients dyspeptic symptoms followed its use, in addition to very profuse perspiration

This drug still continues to be very largely used, and numerous references to its advantages appear in Continental literature. Two cases are recorded (*B.M.J.* '05, ii 21) in which a dose of 15 grains caused violent palpitation, difficult respiration, a feeling of extreme weakness and gradually upon lying unconsciousness with voiding of dark green urine. On continuing with 4 grain doses good results were obtained. Toxic symptoms following the administration of Aspirin (*B.M.J.* '06, ii 1692), 100 grains having been taken in all, in 10 grain doses. The acute inflammation of the middle ear attributed to the Aspirin indicates caution in the administration of the drug in any cases complicated with ear trouble. $7\frac{1}{2}$ grains suggested as a sufficiently large dose to begin with. If no unpleasant results occur after taking this amount, it can be then easily increased.

Foreign Pharmacopœias. Official in Dan., Jap. and Swiss, Vendum Acetyl Salicylicum

Tests Aspirin melts at 135°C . (275°F), when warmed with Potassium Hydroxide solution it is saponified with the formation of Potassium Acetate and Potassium Salicylate. The cooled solution when acidified with diluted Sulphuric Acid yields a crystalline precipitate of Salicylic Acid, which, when removed, carefully washed till free from mineral acid and dried, possesses the melting point and answers the test characteristic of Salicylic Acid. A portion of the filtrate when warmed with concentrated Sulphuric Acid and a little Alcohol (90 p.c.) evolves a characteristic odour of Acetic Ether. A weighed quantity of 0.1 of a gramme of Aspirin treated with 5 c.c. of Alcohol and diluted with 20 c.c. of Water should not be coloured violet on the addition of 1 drop of diluted Ferric Chloride T.S., indicating the absence of free Salicylic Acid. A weighed quantity of 0.5 of a gramme should leave no weighable residue when ignited with free access of air, indicating the absence of mineral residue.

Novaspirin, a new preparation of Aspirin, it is said to produce no unpleasant gastric symptoms. It is not so strong, and therefore can be given for longer periods and in larger doses — *B M J E* '07, i 79

AGATHIN — A compound of Salicylic Aldehyde with Methyl phenylhydrazine. Pale greenish crystals, insoluble in Water, soluble in Alcohol (90 p c) and Ether. Has been recommended as an analgesic in sciatica, rheumatic and neuralgic affections — *M A* '95, 8, 608, *Y B T* '94, 463, unreliable and dangerous — *B M J* '98, ii 1055

Dose — 5 to 10 grains = 0.32 to 0.65 grammes

GLYCOSAL (Monosalicylic Acid Glycerin Ester) — White crystalline powder, moderately soluble in Water, readily in Alcohol (90 p c). Introduced as a substitute for Salicylates. Antiseptic, antirheumatic.

Dose, — 5 to 30 grains = 0.32 to 2 grammes

SALITANNAL — A condensation product of Salicylic Acid and Gallic Acid. Introduced as an antiseptic application for wounds.

Iodo-Salicylic Acid and **Di-Iodo Salicylic Acid** are Iodine compounds of Salicylic Acid in which one or two atoms of Hydrogen respectively are replaced by Iodine — *B M J* '97, ii 734

ACIDUM SULPHURICUM.

SULPHURIC ACID

FR, ACIDE SULFURIQUE OFFICINAL, GER, SCHWEFELSAURE, ITAL, ACIDO SOLFORICO, SPAN, ACIDO SULFURICO

A heavy, colourless, odourless liquid, of oily consistence, possessing a strong corrosive action. It may be produced by the suitable oxidation of Sulphurous Anhydride, itself a product of the oxidation of Sulphur or of the combustion of pyrites. It is officially required to contain about 98 p c by weight of Hydrogen Sulphate, H_2SO_4 , eq 97.34

A fuming Sulphuric Acid is known under the title of **Nordhausen Sulphuric Acid**, and is prepared by the distillation of dry Ferrous Sulphate.

Under the name of **Solid Sulphuric Acid**, Sulphuric Anhydride has been introduced into commerce.

Medicinal Properties.—A powerful caustic, and when so used it is made into a paste with an equal quantity of charcoal. In the form of Nordhausen Sulphuric Acid it has been used in cancer (*see Michel's Paste*, p 83). When diluted it is a tonic refrigerant, exciting the appetite and promoting digestion, it is a valuable intestinal astringent, and therefore it is useful in controlling diarrhoea, it diminishes night sweating, more particularly when given with Zinc Sulphate, useful in treating chronic lead poisoning, given with doubtful success in hæmatemesis, hæmaturia and hæmoptysis.

Incompatibles — Alkalis and their Carbonates, salts of Calcium and Lead.

Official Preparations.—Acidum Sulphuricum Aromaticum, and Acidum Sulphuricum Dilutum. Used in the preparation of Acidum Hydrochloricum, Acidum Nitricum, Acidum Sulphurosum, Aether, Aether Aceticus, Cupri Sulphas, Ferri Sulphas, Liquor Ferri Persulphatis, Magnesi Sulphas, Potassii Sulphas, Sodii Sulphas, Sodii Sulphocarbolas, Spiritus Aetheris Compositus, Spiritus Aetheris Nitrosi, Zinci Sulphas and Zinci Sulphocarbolas. **Aromatic**

Sulphuric Acid is contained in Infusum Cinchonæ Acidum. **Dilute Sulphuric Acid** is obtained in Infusum Posa Acidum. Used in the preparation of A. 1. 1. 1. Hydræ, A. 1. 1. 1. Dilutum, Antimonium Sulphuratum and Atropine Sulphas.

Not Official. Tincture Acidæ, Hæmorrh. Mistura Acidæ Sulphuricæ Aromatica, Mixtura Chlorici, Vinum Acidæ, Vinum Chlorici.

Antidotes. In case of poisoning by Sulphuric Acid Magnesia is preferable to chalk. For other antidotes see Hydrochloric and Nitric Acids.

Foreign Pharmacopœias. Official in all the Pharmacopœias ranging from sp. gr. 1.83 to 1.84. *U.S.P.* sp. gr. not below 1.826 at 25° C (77° F). *Fr.* 1.84. *Ger.* 1.84. *Swed.* and *Swiss* contain also a crude Acid.

Tests. Sulphuric Acid has a specific gravity of 1.843, the *U.S.P.* states not below 1.826 at 25° C (77° F), the *P.G.*, 1.836 to 1.840. neither the *R.P.* nor the *P.G.* gives a boiling point for the acid the *U.S.P.* states 338° C (640.4° F). The distinguishing test is the production of a white precipitate, insoluble in Hydrochloric Acid, when Barium Chloride Solution is added to its diluted or neutralised aqueous solutions. It is officially required to contain 97.82 p.c. w/w of Hydrogen Sulphate as volumetrically determined by suitably diluting with Water and titrating with Volumetric Sodium Hydroxide Solution, each gramme should require 20.1 c.c., the *U.S.P.* should contain not less than 92.5 p.c., and *P.G.* 91 to 98 p.c. of absolute Acid.

The more generally occurring impurities are Arsenic and Lead, Selenium, Nitrous, Nitric and Sulphurous Acids. Unlike the *U.S.P.* and *P.G.*, the *R.P.* indicates no special test for either Arsenic or Lead, but is content to group these two important impurities with others of considerably less importance under the elastic expression 'it should yield no characteristic reaction,' etc. The *U.S.P.* employs the modified Gutzeit's test for Arsenic, whilst the *P.G.* employs the Bettendorfs test with Stannous Chloride Solution, both are given in the small type below. A standard of 5 parts per 1,000,000 for Arsenic by weight and 20 parts per 1,000,000 for Lead has been suggested — *C.D.* 08, 1795. *U.S.P.*, in their test for Lead, have adopted a time limit within which no precipitation shall occur when the Acid is carefully mixed with 4 or 5 volumes of Alcohol (91.9 p.c.). It is required to leave no appreciable residue on evaporation.

Selenium, Nitrous, Nitric and Sulphurous Acids may be detected by the tests given in the small type below under the headings of Hydrochloric Acid and Sodium Sulphite, Ferrous Sulphate and Sulphuric Acid, Potassium Permanganate Solution.

Ferrous Sulphate and Sulphuric Acid. If Ferrous Sulphate T.S. be carefully poured as a layer on Sulphuric Acid in a test tube, there should be no coloured zone at the junction of the liquids. *P.G.* and *U.S.P.*

Sulphuric Acid diluted with 20 volumes of Water should not respond to the following tests. It should yield no precipitate, nor become turbid with T.S. of Silver Nitrate, *P.G.* and *U.S.P.* It should not respond to the time limit test for heavy metals, *U.S.P.* and when nearly neutralised with Solution of Ammonia should not be affected by Hydrogen Sulphide Solution. *P.G.* When supersaturated with Ammonia Water, evaporated and ignited, no appreciable fixed residue should remain. *U.S.P.*

Potassium Permanganate Solution.—Sulphuric Acid diluted and should not, on the addition of Potassium Permanganate Solution, imme-

diately discharge its colour *PG* gives 10 c c of Acid diluted with 5 volumes of Water and 3 or 4 drops Potassium Permanganate Solution, *USP* gives 1 c c of Acid, 5 c c of Water, and 0 1 c c Potassium Permanganate Solution

Modified Gutzeit's Test—5 c c of a 1-10 dilution of Sulphuric Acid should not respond to the modified Gutzeit's test for Arsenic, *USP*

Stannous Chloride—No dark colour should be produced in the course of an hour in a mixture of cooled diluted Sulphuric Acid (1-3) and 3 c c Stannous Chloride Solution, *PG*

Hydrochloric Acid with Sodium Sulphite—Let Hydrochloric Acid containing Sodium Sulphite be carefully poured on an equal volume of Sulphuric Acid contained in a test-tube. At the junction of the liquids there should be no red coloured zone, and on warming no reddish precipitate should be formed, *BP*, *PG*, and *USP* (for Selenium), *PG* and *USP* give quantities, viz, 2 c c of each Acid and a fragment of Sodium Sulphite is dissolved in the Hydrochloric Acid

Volumetric Determination—3 c c of Sulphuric Acid are accurately weighed and diluted with 50 c c of Water. The solution is then titrated with Normal Volumetric Potassium Hydroxide Solution, using Methyl Orange Test solution as indicator. The number of c c of alkali used is multiplied by 4 8675 and divided by the weight of Acid taken, the quotient representing the percentage of absolute Sulphuric Acid present, *USP*

Preparations

ACIDUM SULPHURICUM AROMATICUM. AROMATIC SULPHURIC ACID *BP Syn*—ELIXIR OF VITRIOL

Mix gradually 6 of Sulphuric Acid with 59 of Alcohol (90 p c), add Tincture of Ginger 20, and Spirit of Cinnamon 1

Tests.—The specific gravity should be 0 922 to 0 926, and 1 gramme should require 2 84 c c of the Volumetric Sodium Hydroxide Solution for neutralisation, indicating the equivalent of 13 8 p c w/w of absolute Sulphuric Acid. No reference to an indicator of neutrality is given. The *USP* requires a specific gravity at 25° C (77° F) of about 0 933, and that when suitably titrated with Volumetric Solution of Potassium Hydroxide, with Methyl Orange Test-solution as indicator, it shall not indicate less than 20 p c of absolute Sulphuric Acid by weight partly in the form of Ethyl Sulphuric Acid

Dose—5 to 20 minims = 0 3 to 1 2 c c

Sulphovinic Acid stated to occur in Acidum Sulphuricum Aromaticum, its quantity being dependent on age of sample - *PJ '02*, n 137, *CD '02*, n 292

Foreign Pharmacopœias—Dutch and Jap (Tinctura Acida Aromatica), Cort Cinnamon 5, Rad Zingib 5, Acid Sulphurici 10, Spiritus Diluti 90. Mex (Acido Sulfurico Aromatico), Sulphuric Acid 10, Tincture of Ginger 5, Tincture of Cinnamon 5, Alcohol 80. *US* (Acidum Sulphuricum Aromaticum), Sulphuric Acid 111, Tincture of Ginger 50, Oil of Cinnamon 1, Alcohol sufficient to measure 1000, add the Sulphuric Acid gradually and with great caution to 700 of Alcohol and allow it to cool, then add to it the Tincture of Ginger and Oil of Cinnamon, and finally enough Alcohol to make the product measure 1000. Tinctura Aromatica Acida, Norw, Acid Sulph 1½, Aromatic Tincture 8½, Swed, Acid Sulph 1, Aromatic Tincture 19. Not in Ger or Russ.

Tinctura⁴ Aromatica (Dan, Norw and Swed) Cardamoms, 1, Cloves, 1, Galangal Root, 1, Ginger, 1, Cinnamon, 4, diluted Alcohol, 40

Ger, Russ and Swiss contain same ingredients, but have Ginger, 2, Cinnamon, 5, diluted Alcohol, 50

Austr., Cinnamon, 5, Ginger, 2, Zedoary, 1, Caryophyllus, 1, Cardamom, 1; Alcohol (68 p c), 50. It should not yield less than 1.5 p c of solid residue. Jap., Cloves, 2, Cinnamon, 10; Cardamom, 2, Ginger, 5, Dilute Alcohol, 100, extract in the cold for seven days, press, filter, and to the filtrate add Spirit of Lemon, 5.

U.S.N.F. preparation is practically identical with that official in *P.G.*

See also below *Liquor Acidus Halleri*

ACIDUM SULPHURICUM DILUTUM. DILUTED SULPHURIC ACID

Mix gradually 4 of Sulphuric Acid with 40 of Distilled Water, and when cold add more Distilled Water to make 48½ of Dilute Acid at 60° F.

A clear, colourless liquid, possessing a strong acid reaction

As great heat is developed in mixing strong Sulphuric Acid and Water, it is always safer to add the Acid to the Water than the Water to the Acid. When Acid 1, Water 1, were mixed the temperature rose to 270° F (132.2° C.)

12 minims contain about 1 minim of strong Sulphuric Acid

Dose.—5 to 20 minims = 0.3 to 1.2 c.c.

Prescribing Notes. *Prescribed, much diluted, in mixtures; or in cough liniments, with Squill, Poppies, and Syrup of Mulberry, also to dissolve Quinine*

Foreign Pharmacopœias.—Official in Austr., Acid 1, Water 4 76, sp. gr. 1.12; Ital., Acid 1, Water 4, sp. gr. 1.180 Dutch, sp. gr. 1.124, Ger. and Russ., Acid 1, Water 6, sp. gr. 1.110 to 1.114, Dan. and Norw., Acid 1, Water 7, sp. gr. 1.081 to 1.085, Belg., 1:1; Hung., Jap. Port. and Span., Acid 1, Water 9; Fr., Swed., Swiss, 10 p c, U.S., 10 p c, sp. gr. about 1.067 at 25° C. (77° F.). All by weight.

Tests.—Diluted Sulphuric Acid is officially required to possess a specific gravity of 1.094, and to contain 13.63 p c of Hydrogen Acetate, as officially determined by titration with Volumetric Solution of Sodium Hydroxide, the *U.S.P.* diluted acid is required to have a specific gravity of about 1.067 at 25° C. (77° F.), and to contain not less than 10 p c w/w of absolute Sulphuric Acid as determined by titration with Normal Volumetric Potassium Hydroxide Solution, using Methyl Orange Test-solution as an indicator, that of the *P.G.* has a specific gravity of 1.110 to 1.114, and contains from 15.6 to 16.3 p c. w/w of pure acid

The Diluted Acid should not fail to respond to the tests of identity and purity given under *ACIDUM SULPHURICUM*, but *B.P.* does not say so, the *U.S.P.*, on the other hand, duly notes this.

Not Official.

LIQUOR ACIDUS HALLERI. *Syn.* ACIDUM SULPHURICUM ALCOHOLICUM, MISTURA SULPHURICA ACIDA, AQUA RABELLI, AQUA RABELII, AQUA DE RABEL, EAU DE RABEL.

Austr., Ger., Hung., Mex., Port., Russ., Span. and Swiss.—Sulphuric Acid, 1, Alcohol (90 p c), 3

Dan., Dilute Sulphuric Acid, 1; Syrup of Raspberries, 9; Distilled Water, 40.

Fr., Sulphuric Acid, 1, Alcohol (95 p c), 3; Poppy Petals, 0.04.

Dutch, Ital. and Norw.—Sulphuric Acid, 1; Alcohol, 1.

All by weight.

MISTURA ACIDI SULPHURICI AROMATICA.—Aromatic Sulphuric Acid, 10 minims, Red Mixture, to 1 oz.

MYNSICHT'S ELIXIR OF VITRIOL.—Cinnamon, Ginger and Cloves, of each 3, Calamus Aromaticus, 8, Galangal, 12, Sage, 4, Peppermint, 4, Cubebs, 2, Nutmeg, 2, Aloes Wood, 1, Lemon Peel, 1, Sugar Candy, 32, Alcohol (90 p c), by weight, 144, Sulphuric Acid, by weight, 96. Digest for three weeks.

Dose.—5 to 10 minims = 0.3 to 0.6 gramme

MICHEL'S PASTE.—Nordhausen Sulphuric Acid, 3, by weight, Asbestos, finely powdered, 1. Should be prepared fresh as required.

ACIDUM SULPHUROSUM.

SULPHUROUS ACID

FR, ACIDE SULFUREUX, GER, SCHWELFIGSAURE, ITAL, ACIDO SOLFOROSO

A colourless liquid, with a strong characteristic odour of burning Sulphur, officially required to contain 6.4 p c of Hydrogen Sulphite, H_2SO_3 , eq 81.46

It is prepared by the oxidation of Sulphur or by the reduction of Sulphuric Acid by boiling with Carbon or Copper.

Medicinal Properties.—It is a powerful deoxidising agent, disinfectant and antiseptic. In 1 dram doses, freely diluted, it is valuable in vomiting depending on fermentation in the stomach, and as an intestinal antiseptic in enteric fever. Diluted with 1 or 2 parts of Water, it is used as a **spray** in diphtheria and follicular tonsillitis, mixed with equal parts of Glycerin, as an **application** in erysipelas, ringworm, and other parasitic skin diseases. Also for chapped hands and chilblains, very effectual in **chapped nipples**, as a **lotion**, 1 or 2 drms to 1 oz of Water, for **verrucae**, cuts, ulcers, and bed-sores, as an **inhalation** in nasal catarrh and influenza, 60 minims in 20 oz of Water at 60° to 100° F.

Pfeiffer found that 0.5 to 1 p c aqueous solution caused excessive and extensive gastritis. Even 20 minims largely diluted caused irritation of the digestive organs (*A J P*, '90, 626). Brunton, however, strongly recommends 1 dram doses thoroughly diluted, in gastric fermentation, 20 to 30 minims every two or three hours, stated (*B M J* '04, 11 1450) to check fermentative changes in the bowel in enteric fever.

Dose.— $\frac{1}{2}$ to 1 fl dram = 1.8 to 3.6 c c

Foreign Pharmacopœias.—Official in Port, Soluto de Gaz Sulfuroso, U S, 6.0 p c, SO_2 .

Tests.—Sulphurous Acid has a specific gravity of 1.025; the *U S P* gives not less than 1.028 at 25° C (77° F), it is not official in the *P G*. The distinguishing tests are its strong sulphurous odour, its power of decolorising Iodine Solution (which is utilised in its quantitative determination), the production of Hydrogen Sulphide when reduced by Hydrochloric Acid and Zinc, and its bleaching action on certain vegetable colouring matters.

It is officially required to contain 6.4 p c of Hydrogen Sulphite, as determined by titration with Volumetric Solution of Iodine, using Starch Mucilage as an indicator.

The most likely impurities are an undue amount of Sulphate due to oxidation on keeping and the presence of other Sulphur compounds,

notably Hydrogen Sulphide and mineral residue. The presence of Sulphate is guarded against by tests with Barium Chloride Solution, and the mineral residue by the fact that it is required to leave no residue on evaporation.

Mercurous Nitrate Solution—The gas, evolved on gently heating a few c.c. of the Acid in a test-tube, blackens a strip of paper moistened with T.S. of Mercurous Nitrate, *U.S.P.*

Lead Acetate Solution.—The gas, evolved on gently heating a few c.c. of the Acid in a test tube, does not affect a strip of paper moistened with T.S. of Lead Acetate, *U.S.P.*

Barium Chloride Solution. It is officially required to yield only a slight precipitate with Barium Chloride Solution, but if the Sulphurous Acid be oxidised by the cautious addition of Chlorine Solution it yields on the addition of Barium Chloride Solution a copious white precipitate. The *U.S.P.* test gives quantities, 1 c.c. Sulphurous Acid diluted with 99 c.c. of Water, 1 c.c. diluted Hydrochloric Acid, and then 1 c.c. Barium Chloride T.S. yielding not more than a slight turbidity at once.

Volumetric Determination. 1 gramme of the Acid diluted with about 100 c.c. of Water requires 15 c.c. of Volumetric Iodine Solution, *B.P.* 2 c.c. of the Acid are accurately weighed in a stoppered weighing bottle. To this are added 50 c.c. of Decinormal Volumetric Iodine Solution, and the mixture is allowed to stand for 5 minutes. Tenth normal Volumetric Sodium Thiosulphate Solution is now slowly added until the mixture is just decolorised. Subtract the number of c.c. of the Tenth-normal Volumetric Sodium Thiosulphate Solution used from 50, and multiply the difference by 0.118, and divide this product by the weight of the Acid taken, the quotient represents the percentage of absolute Sulphurous Acid in the latter, *U.S.P.*

Not Official.

SULPHUR DIOXIDE LIQUEFIED—This is also commonly known as **Liquefied Sulphurous Acid Gas**. It is supplied in siphons, and in tinned iron vessels with soft lead exit tube.

Disinfecting with Sulphur.—This is usually done with liquid Sulphur Dioxide. The room to be disinfected should be sealed up so as to prevent any ventilation, by blocking up the fireplace and pasting paper over the cracks of the windows. The small leaden exit-tube of the vessel is cut in the room, so as to allow the gas to escape somewhat slowly, and the operator retires quickly, shuts the door and papers up the cracks of the door so as to complete the sealing of the room. The room is allowed to remain closed for 12 hours, and then opened cautiously. About 20 oz. gas is required for a room of a size 1700 cubic feet. When the liquefied gas is unobtainable, Sulphur which is sold in the form of Sulphur Candles can be used as a substitute, but the gas is much more effectual.

In order to obtain the maximum disinfecting power of the Sulphur Dioxide it is necessary to introduce moisture, and this may be done by placing open pans of steaming water in the room, or by injecting steam.

ACIDUM TANNICUM.

TANNIC ACID.

B.P.Syn.—TANNIN.

$C_{14}H_{10}O_9$, eq. 319.66

Fr., TANNIN OFFICINAL, GER., GEBEHALLE, ITAL., ACIDO TANNICO; SPAN., ACIDO TANICO.

B.P. gives the formula as $C_{14}H_{10}O_9$, $2H_2O$, but the $2H_2O$ is discountenanced by most of the standard works on chemistry.

A pale buff-coloured, micro-crystalline powder, possessing an acid reaction and a characteristic astringent taste. It is obtained from Nut Galls.

Solubility.—10 in 5 of Water, 10 in 6 of Alcohol (90 p.c.), 3 in 1 of Absolute Alcohol, 1 in 3 of Glycerin, or if warmed, 1 in 1, sparingly in Olive Oil, almost insoluble in Benzol, in Chloroform, and in Ether.

These solubilities were made with Tannic Acid which was very soluble, but different samples vary in solubility.

Commercial Tannic Acid frequently contains some proportion of Gallic Acid, which when dissolving in Water is the last portion to go into solution, and which may be detected by the Potassium Cyanide test mentioned under Gallic Acid.

Medicinal Properties.—Styptic and local astringent. 60 grains in 10 oz. of Rose Water are used as a **spray** for relaxed sore throat, the same strength is also used as an **injection** in leucorrhœa and in chronic gonorrhœa with advantage, 3 grains to the oz. is used as a **nasal douche**, 60 grains to the oz. as an **ointment**, the powder has been used as a **snuff** in epistaxis. Internally for gastric and intestinal hæmorrhage acting as a direct styptic. A dose of 1 drim. is often successful in hæmorrhage from gastric ulcer. For **suppositories** and **pessaries**, see p. 87. The **glycerin** is used as a **paint** in relaxed throat, and for nasal discharges, also locally as a styptic.

Equal parts of Glycerin of Tannin and Glycerin of Alum form a good application for relaxed throat.

As an injection into nasal polypi — *L* '87, i. 543.

Warm Tannin enemata were given with success in the cholera at Naples — *L* '85, i. 352.

Tannic Acid is no doubt a local styptic by its albumen-coagulating power. But the careful researches of Stockman have demonstrated the futility of using it as a remote astringent — *B M J* '00, ii. 1070.

A solution, 2 in 10 of spirit, the best application in alveolar pyorrhœa, loose teeth becoming tight, and regaining their power of mastication, also in dental neuralgia, applied to the gums and round the teeth — *B M J E* '07, ii. 12.

Dose.—2 to 5 grains = 0.13 to 0.32 gramme.

Prescribing Notes.—*Prescribed in Water, and may be combined with the Ferrous (but not with the Ferric) salts of Iron. Can be given in cachets or Compressed Tablets. 4 grains with ½ minim of Glycerin make a nice pill. 60 grains to 1 oz. of Chalk with 30 grains of Powdered Soap make an astringent dentifrice.*

Incompatibles.—Mineral Acids, Alkalis, Antimony salts, Lead and Silver, Ferric salts, the vegetable alkaloids, and Gelatin.

Official Preparations.—Glycerinum Acidî Tannici, Suppositoria Acidî Tannici, and Trochiscus Acidî Tannici.

Not Official.—Crayons de Tannin, Gargarisma Acidî Tannici, Lotic Acidî Tannici, Sulphureosa, Nebula Acidî Tannici, Pessary or Vaginal Suppository, Schuster's Pastilles, Suppositorium Acidî Tannici c. Opio, Supp. Ac. Tann. et Belladonnæ, Supp. Ac. Tann. et Morphine, Unguentum Acidî Tannici, Unguentum Acidî Tannici c. Opio, Tannic Wool, Tannalbin, Honthin, Glutanol, Tannigen, Tannoform, Tanocol, and Tannone.

Foreign Pharmacopœias.—Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Norw., Port., Russ., Span., Swed., Swiss and U.S.

Tests.—The distinguishing test for Tannic Acid is its behaviour with Ferric Chloride Test-solution, which yields a bluish black

colour or precipitate. The *U.S.P.* states that a 1 p.c. w/v aqueous solution of Tannic Acid yields on the addition of a small quantity of Calcium Hydroxide Test-solution a pale bluish-white flocculent precipitate which is not dissolved on shaking, and which becomes more copious and of a deeper blue on the addition of a moderate excess of Calcium Hydroxide Test-solution, a large excess imparting a pale pinkish tint.

Tannic Acid may be distinguished from Gallic Acid by its aqueous solution yielding precipitates with solutions of Isinglass, Albumen or alkaloids. The *U.S.P.* states that it may be distinguished by the test with Calcium Hydroxide Test-solution given above, and by the fact that its aqueous solution produces precipitates with most alkaloids and glucosides, and with Test-solutions of Gelatin, Albumen and Starch. The *B.P.* states Tartarated Antimony, but it has been shown that the latter reagent produces a precipitate in Gallic Acid Solutions also; the *U.S.P.* omits reference to Tartarated Antimony.

Mineral acids and certain mineral salts precipitate Tannic Acid from solution, and the filtrates obtained possess nostringency; the *P.G.* states that it is precipitated from its 1 to 5 aqueous solution by the addition of Sulphuric Acid or by Sodium Chloride.

The most likely impurities are Gum or Dextrin, resinous substances and mineral matters. Traces of Gallic Acid may also be present. Both *U.S.P.* and *P.G.* include specific tests for Gum or Dextrin and resinous substances, which are described in the small type below under the heading of Alcohol and Ether, or Alcohol. Gallic Acid may be detected by the Potassium Cyanide test mentioned under Gallic Acid. No appreciable residue should be left on ignition with free access of air. *U.S.P.* requires it to leave not more than 0.2 p.c., and *P.G.* that 0.5 gramme should not leave a weighable residue. Austr. and *P.G.* require that the Acid shall not lose more than 12 p.c. by weight on drying at 100° C (212° F), indicating two molecules of Water of crystallisation.

Alcohol and Ether, or Alcohol. A mixture of 2 c.c. of an aqueous solution of the Acid and 2 c.c. of Alcohol (90 p.c.) should remain clear, also on the further addition of 1 c.c. of Ether, *P.G.* The *U.S.P.* dissolves 2 grammes in 10 c.c. of boiling Water, 5 c.c. of which solution when cooled and diluted with 10 c.c. of Alcohol (94.9 p.c.) should produce no turbidity; or (for resinous substances) when diluted with 10 c.c. of Water.

Preparations.

GLYCERINUM ACIDI TANNICI. GLYCERIN OF TANNIC ACID.

Tannic Acid, 1; Glycerin, sufficient to produce 5. (1 in 5)

Foreign Pharmacopœias - Official in Belg., 8 and 17; Port., 1 and 9; U.S., 1 and 4; Fr. and Mex., 1 and 5 of Glycerin of Starch. Not in the others.

SUPPOSITORIA ACIDI TANNICI. TANNIC ACID SUPPOSITORIES

Contains 3 grains = 0.2 gramme of Tannic Acid in each suppository, mixed with Oil of Theobroma.

TROCHISCUS ACIDI TANNICI. TANNIC ACID LOZENGE

$\frac{1}{2}$ grain Tannic Acid in each, with Fruit Basis

Dose —1 to 6 lozenges

Foreign Pharmacopœias—Official in Jap, $\frac{3}{4}$ grain each, U S, about 1 grain each with Sugar and Orange Flower Water

Not Official

CRAYONS DE TANNIN (*F*)—Tannin, 20, Gum Acacia, 1 (both in powder), mix and make into a mass of pilular consistence by means of equal parts Glycerin and Water, then roll into cylinders of the size required

GARGARISMA ACIDI TANNICI—Glycerin of Tannic Acid, 1 fl oz, Water, to 10 fl oz—*St Thomas's*

This has been incorporated in the *B P C*

Glycerin of Tannic Acid, 1 fl drim, Water, to 1 fl oz—*Charing Cross, London and St Bartholomew's*

LOTIO ACIDI TANNICI SULPHUROSA—Glycerin of Tannic Acid, 1, Sulphurous Acid, 1, Distilled Water, to make 8 *St Bartholomew's*

NEBULA ACIDI TANNICI—Glycerin of Tannin, 1 fl drim, Distilled Water, to 1 fl oz—*City of London Chest*

Glycerin of Tannin, 40 minims, Water, to 1 oz—*Throat*

Glycerin of Tannin, 1, Distilled Water, *q s* to produce 10—*B P C*

PESSARY OR VAGINAL SUPPOSITORY—Tannic Acid, 10 grains Stearin, or Oil of Theobroma, sufficient to make 2 drim, for one pessary Used in leucorrhœa

This has been incorporated in the *B P C*

SCHUSTER'S PASTILLES—Tannic Acid, 30 grains, Opium, 1 grain, Glycerin, *q s* to form suitable cylinders for the male urethra

SUPPOSITORIUM ACIDI TANNICI C OPIO Tannic Acid, 3 grains, Powdered Opium, 1 grain, Stearin, or Oil of Theobroma, 11 grains

SUPPOSITORIA ACIDI TANNICI ET BELLADONNÆ—Tannic Acid, 3 grains, Extract of Belladonna (*B P '85*), $\frac{1}{2}$ grain, Oil of Theobroma, to 15 grains—*St Bartholomew's*

SUPPOSITORIA ACIDI TANNICI ET MORPHINÆ—Tannic Acid, 8 grains, Morphine Hydrochloride, $\frac{1}{2}$ grain, Oil of Theobroma, to 15 grains—*Westminster*

UNGUENTUM ACIDI TANNICI—Tannic Acid, 20, Glycerin, by weight, 20, Ointment, 60—*U S P*

This has been incorporated in the *B P C*, but the simple ointment of the *U S P* is different from the *B P C*, which resembles *B P 1885*

UNGUENTUM ACIDI TANNICI C OPIO Tannic Acid, 30 grains, Powdered Opium, 30 grains, Lard, 1 oz

TANNIC WOOL—Dissolve 2 of Tannic Acid in 60 of Water, and with it thoroughly moisten 8 of Absorbent Cotton-Wool, press so as to remove 30 of the fluid, then dry the Wool in a warm chamber When dry remove any discoloured portion. This is sold as **Wool for cigarettes**.

TANNALBIN A light brown, tasteless powder, insoluble in Water A combination of Tannic Acid with albumin, which by a special treatment has been so altered that it is insoluble in the gastric juice, ordinary Albumin Tannate being readily soluble

Tannalbin and Bismuth Subnitrate given early in the morning, as astringents in treatment of catarrhal ulcers of the large intestine—*B M, J B '99, i 59*

It has been introduced as an intestinal astringent.

Adult Dose.—15 grains = 1 gramme, given at intervals of one or two hours

Foreign Pharmacopœias—Official in Austr., Belg., Dutch and Swed. Not in the others.

Tests.—When shaken with Water and filtered, the filtrate affords with Ferric Chloride Test-solution a bluish-black coloration. When boiled with Water, cooled, and filtered, the filtrate gives a precipitate with Albumin Solution. When shaken with solution of Sodium Hydroxide (15 p.c.) the mixture gelatinises. When further heated to the boiling point, cooled, and supersaturated with Hydrochloric Acid, an odour of Sulphuretted Hydrogen is evolved, and a white precipitate is thrown down.

The Austr. Ph. gives the following test: 1 gramme of Tannalbin digested for 4 hours at 10° C. (25° F.) with 0.1 gramme of Pepsin, 50 c.c. of Water and 1.5 gramme of Dilute Hydrochloric Acid leaves a residue which after washing with 30 c.c. of water and drying at 100° C. (212° F.) shall not weigh more than $\frac{1}{2}$ gramme. The Dutch Ph. requires that it shall not yield more than 1 p.c. of ash.

HONTHIN (Albumin Tannate). Greenish-brown tasteless odourless powder. Insoluble in water.

Dose. 10 to 30 grains = 0.65 to 2 grammes, three to five times a day for adults; 5 grains = 0.32 gramme, for children.

GLUTANOL. Combination of Tannic Acid with vegetable fibrin. Similar in action and properties to Tannalbin. Administered in powder form.

Dose. 5 to 15 grains = 0.32 to 1 gramme.

TANNIGEN (Di-acetyl Tannin).—A greyish-white tasteless powder. Practically insoluble in Water, but readily in alkaline solutions. Recommended in diarrhoea, principally of children, but also in that of adults. It passes through the stomach unchanged, but on entering the alkaline intestinal tract it breaks up and acts as an astringent.

Dose.—1 to 3 grains = 0.06 to 0.18 gramme for children, and 5 to 10 grains = 0.32 to 0.65 gramme for adults. Small doses can be mixed with an equal quantity of Milk Sugar, and larger doses for adults can be taken in *cachets*.

Tests. When shaken with Water and filtered, the filtrate is coloured bluish-black by Ferric Chloride Test-solution. When warmed with Potassium Hydroxide Solution, cooled, mixed with diluted Sulphuric Acid and a little Alcohol (90 p.c.) and warmed, the odour of Acetic Ether is evolved. It should leave not more than 1 p.c. of mineral residue when ignited at a dull red heat.

TANNOFORM (Methyl Ditannin).—A light, pinkish-brown, odourless and tasteless powder. A condensation product of Tannic Acid and Formic Aldehyde. It is claimed to possess the astringent effects of Tannin with the antiseptic and drying properties of Formaldehyde. Used as an application in skin diseases, and to wounds, either alone or mixed with Starch, or diluted 1 to 4 with French Chalk, as a dusting powder.

As a 10 p.c. ointment in eczema. —*B.M.J.E.* '99, ii, 48; *M.I.* '00, 182.

Rubbed into the chest for night sweats in phthisis. —*B.M.J.E.* '01, ii, 50.

Foreign Pharmacopœias—Official in Swed. and Swiss.

TANOCOL. A white or nearly white odourless and tasteless powder, a combination of Gelatin and Tannic Acid. Insoluble in Water. Stated to be useful as an intestinal astringent.

Dose.—10 to 15 grains = 0.65 to 1 gramme, for an adult; 5 grains = 0.32 gramme, for children. —*L.* '03, i, 1039.

TANNONE.—A condensation product of Tannic Acid and Hexamethylene tetramine. A light brown tasteless powder, almost insoluble in Water and weak Acids, and dissolves slowly in weak alkalis.

Dose.—15 grains = 1 gramme for adults, children, 8 to 5 grains = 0.52 to 0.32 gramme.

ACIDUM TARTARICUM.

TARTARIC ACID

FR, ACIDE TARTRIQUE, GFR, WEINSAURF, ITAL, ACIDO TARTARICO, SPAN, ACIDO TARTRICO

Colourless and odourless, translucent monoclinic prisms, possessing a strongly acid taste

It is a di-basic acid prepared from Argol or crude Tartar, and is chemically a Di-oxy-succinic or Di-hydroxy-succinic Acid

Solubility.—10 in 8 of Water, and measures 14, 1 in $2\frac{1}{2}$ of Alcohol (90 p.c.), 1 in $4\frac{1}{2}$ of Glycerin, 1 in 40 of Ether, 1 in 5 of Absolute Alcohol, nearly insoluble in Benzol and Chloroform

The solubility of this acid in Ether naturally varies with the amount of Water and Alcohol contained in the Ether. The above figure represents the solubility in *B.P.* Ether (sp. gr. 0.735), but the figure for Ether Purus (sp. gr. 0.720) is 1 in 195

Medicinal Properties —The same as Citric Acid

Dose —5 to 20 grains = 0.32 to 1.3 grammes

Incompatibles —Salts of Potassium, Calcium, Mercury and Lead, Alkaline Carbonates, and the vegetable astringents

Official Preparations —Used in the preparation of Pulvis Sodæ Tartaricæ Effervescent, Sodii Citro-Tartras Effervescent, and the other granular effervescent preparations

Foreign Pharmacopœias —Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Jap., Ital., Mex., Norw., Port., Russ., Span., Swed., Swiss and U.S.

Tests —The distinguishing test for Tartaric Acid is the formation of a white crystalline precipitate on the addition of Potassium Acetate Solution to its aqueous solution, the precipitate being soluble in Ammonium Chloride Solution or in Sodium Hydroxide Solution, also the mirror test with Silver Nitrate Solution in its neutralised solutions. Its aqueous solution is officially required to be dextro-rotatory. It is officially required to contain 99.0 p.c. of Hydrogen Tartrate, as determined by titration with Volumetric Sodium Hydroxide Solution, 1 gramme when dissolved in Water neutralises 13.3 c.c. of Volumetric Sodium Hydroxide Solution. *U.S.P.* requires it to contain not less than 99.5 p.c. of pure Tartaric Acid, the *P.G.* does not mention a requisite percentage, the *U.S.P.* states that Phenol-phthalein Test solution is to be used as an indicator of neutrality. Tartaric Acid may be distinguished from Citric Acid, and its presence detected in the latter by its power of decolorising a weak solution of Potassium Chromate, upon which Citric Acid has no action (Alcohol and other reducing agents must be absent). The Pusch's test (*P.J.* [3] xv 693) with Sulphuric Acid at 100° C (212° F) which easily detects 1 p.c. of Tartaric Acid in Citric Acid. The Resorcinol Sulphuric test (*C.D.* '91, 16) is also a delicate test for Tartaric Acid, but in the presence of a large proportion of Citric Acid the red colour is

rather obscure, and in that case it offers no advantage over Pusch's test

The more generally occurring impurities are Arsenic, Calcium, Copper, Iron and Lead, Oxalates and Sulphates. The most important impurity is Lead.

A standard of 10 parts per 1,000,000 for Lead, and 1 part per 1,000,000 for Arsenic has been proposed (*C.D.* '08, i. 795). Arsenic, Copper, Iron and Lead may be detected, if present, by the Hydrogen Sulphide test, Calcium by the test with Ammonium Oxalate Solution; Oxalates and Sulphates by the tests with Calcium Sulphate Solution and the Barium Chloride or Nitrate test. Each of these tests is given under its respective heading in the small type below.

When ignited with free access of air it should leave not more than 0.05 p.c. of mineral matter. This is the requirement of both the *B.P.* and the *U.S.P.*; the *P.G.* requires that 0.5 of a gramme of the acid should leave no weighable residue. The *B.P.* standard is considered (*C.D.* '08, i. 795) as too severe, and a limit of 0.1 p.c. of ash is suggested.

Melting Point. 135°C (275°F), *U.S.P.* When kept at a temperature of 100°C. (212°F) for some time, the powdered crystals do not suffer a sensible loss of weight, *U.S.P.*, at a temperature above 135°C. (275°F) the acid chars, emitting an odour resembling that of burning sugar, *P.G.* and *U.S.P.*

Potassium Acetate Solution.—A (1-3) aqueous solution yields with Potassium Acetate Solution a crystalline precipitate, soluble in Ammonium Chloride Solution and in Sodium Hydroxide Solution; the solution in Sodium Hydroxide gelatinises on warming, but becomes fluid again on cooling, *P.G.* The *U.S.P.* Potassium Acetate test is made with a (1-2) aqueous solution and a (1-3) Potassium Acetate solution, and the crystalline precipitate obtained is soluble in solutions of the alkalis and mineral acids, but not in Acetic Acid.

Hydrogen Sulphide.—There should be no darkening in colour within 5 minutes in a solution of 10 grammes of Tartaric Acid in 20 c.c. of Water nearly neutralised with solution of Ammonia and sufficient saturated solution of Hydrogen Sulphide added to produce 100 c.c., *B.P.*

It should not, after the addition of a few drops of Hydrochloric Acid, show any colour when submitted to the time-limit test for heavy metals, omitting the subsequent addition of Ammonia Water, *U.S.P.*

5 grammes dissolved in 10 c.c. of Water, and solution of Ammonia added until only faintly acid, should be unaffected by Hydrogen Sulphide Solution, *P.G.*

Barium Chloride or Barium Nitrate.—A (1-10) aqueous solution of Tartaric Acid should be unaffected by Barium Nitrate Solution, *P.G.*, by Barium Chloride T.S. after acidulation with a few drops Hydrochloric Acid, *U.S.P.*

Ammonium Oxalate.—A (1-10) aqueous solution of the acid should be unaffected by Ammonium Oxalate Solution, *P.G.*, *U.S.P.* allows a faint turbidity in 10 c.c. of a solution (1-10) acidulated with Ammonia Water on the addition of Ammonium Oxalate T.S.

Calcium Sulphate Solution.—A (1-10) aqueous dilution should be unaffected by Calcium Sulphate T.S. after nearly but not quite neutralising with Solution of Ammonia, *P.G.* and *U.S.P.*

Volumetric Determination.—3.73 grammes should require not less than 49.8 c.c. normal Potassium Hydroxide Volumetric Solution (each c.c. corresponding to 2 p.c. of pure Tartaric Acid), *U.S.P.* Phenolphthalein Test-solution is used as the indicator.

Not Official.

ACONITI FOLIA.

ACONITE LEAVES

The fresh leaves and flowering tops of *Aconitum Napellus*, L., gathered when about one-third of the flowers are expanded, from plants cultivated in Britain.

This plant and the Extract from the fresh herb were formerly official, but are now omitted.

Foreign Pharmacopœias—Official in Fr, Mex, Port, Russ and Span. Not in the others.

Descriptive Notes.—The leaves only of the plant having flowers shaped like a shallow or navicular helmet should be used, since in some districts *Aconitum paniculatum*, Lam., is cultivated for sale on account of giving a smoother and less resinous extract. It differs from *A. Napellus* chiefly in the helmet being twice as deep as broad and in the more branched inflorescence, and as it does not contain Aconitine, and consequently does not produce the characteristic tingling and numbing sensation when chewed, the leaves should not be used in medicine for that drug. The leaves are most active when about one-third of the flowers are expanded.

Aconite leaves are rarely used in the dried state. The lower leaves are long-stalked and have five or seven lobes, each of which is pinnatifid with linear acute segments. The upper leaves have three to five lobes, they are quite smooth, and paler beneath. The leaves are most active before the flowers are fully formed.

For microscopical detail see *Vogl Anat Atlas Tab 16*.

The dried leaves imported from Germany should not be used since it is impossible to distinguish the active and inactive leaves when mixed, and unless the flowers are present there can be no certainty as to the species collected.

ACONITI RADIX.

ACONITE ROOT

FR, TUBERCULE D'ACONIT, GER, EISENHUTKNOLLEN, ITAL, TUBERO DI ACONITO, SPAN, ACONITO

The root collected in the autumn from *Aconitum Napellus*, L., cultivated in Britain, and dried.

The *USP* orders 'root collected in autumn, containing not less than 0.5 p.c. of Aconitine', *PG* states 'collected at the end of flowering time and requires it to yield not less than 0.5 p.c. of alkaloid reckoned as Aconitine'. *BP*, *USP* and *Ger* all specify the root of *Aconitum Napellus*. *BP* does not give a standard of alkaloid.

Medicinal Properties—Anodyne, antiphlogistic, antipyretic, diaphoretic. Externally it relieves the pain of acute and chronic rheumatism, facial neuralgia, and of itching, as in erythema. Given internally it lessens the frequency and tension of the pulse, relieves pain and high temperature, and is thus useful in all acute local inflammations (not advanced), such as those of pneumonia, eruptive fevers, erysipelas, tonsillitis, peritonitis, and painful neuralgic affections, contra indicated when valvular disease of heart is present, or when fever is prolonged as in typhoid.

Beneficial in lowering blood pressure in acute uræmia.—*B.M.J.* '06, ii. 1450.

It is better given in small doses and very frequently, $\frac{1}{4}$ to 1 minim of Tincture every ten minutes or quarter of an hour for two hours, then hourly.—*Ringer*

Five minims of Tincture given every three or four hours, increasing the dose to 20 minims, succeeded in curing a case of neuralgia in the face, when every other remedy tried had failed

Ph. Ger. maximum single dose, 0.1 gramme; maximum daily dose, 0.3 gramme

Antidotes.—In case of poisoning by Aconite, use emetics, Apomorphine $\frac{1}{16}$ grain, Alcoholic stimulants, Atropine or Belladonna, Digitalis, Amyl Nitrite

Atropine is antagonistic to the action of Aconitine on the heart

Official Preparations.—Lanimentum Aconiti and Tinctura Aconiti Used in the preparation of Aconitina

Not Official.—Extractum Aconiti Radicis Alcoholicum, Chloroformum Aconiti, Lanimentum Aconiti et Chloroformi, Lanimentum Aconiti Compositum, Pastillus Aconiti, Pigmentum Iodi cum Aconito, Tinctura Aconiti Fortior and Trochisci Aconiti

Foreign Pharmacopœias.—Official in Belg., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Port., Russ., Span., Swiss and U.S. Not in the others

Descriptive Notes.—The Aconite root met with in commerce varies considerably in quality and appearance. The root cultivated in Britain is either dried whole or split into two or three longitudinal segments. The latter form enables the soundness of the root to be seen, but the structure is not so easily observed as in the roots dried whole. When collected in autumn the root is solid, brownish externally and white and starchy within; but if collected in summer when in full flower, the old root to which the flowering stem is attached is spongy and porous or hollow, being exhausted by the flowering process, such roots are excluded by the *B.P.* The root dried entire exhibits, when broken across the centre, a seven-angled portion or pith, with a small group of vessels visible at each angle, and well-marked dark cambium line, and is, if carefully dried, white and starchy, but if overheated it has a resinous fracture. It is about $2\frac{1}{2}$ to $3\frac{1}{2}$ in. (62 to 87 mm) long, and $\frac{3}{8}$ in. to $\frac{7}{8}$ in. (15 to 22 mm) in diameter at the widest portion. If cautiously applied to the tongue, it should cause a numbing sensation after a short interval; the *Aconitum pauciflorum*, Lam., does not do so. The root collected in autumn consists of the new root, and may be recognised by having only leaf scales at the apex, and not any portion of stem. The *B.P.* requires the root to be crowned with the remains of an undeveloped bud, and therefore excludes the German root, which is usually collected when the plant is in flower, and consequently crowned with the base of the stem; it is also collected indiscriminately by peasants from any blue-flowered species, and therefore varies considerably in strength. Japanese root is shorter, grey-brown externally, conical, and tapering abruptly to a point; it is obtained from a different species, stated to be *A. Fischeri*, Reicht.

Tests.—Both *U.S.P.* and *P.G.* require the root to yield a definite content of alkaloid; the *U.S.P.* stipulating that it shall yield not less than 0.5 p.c. of Aconitine; the *P.G.* that it shall contain not less than 0.5 p.c. of alkaloid calculated as Aconitine. The process adopted by the *U.S.P.* is essentially as follows.—A weighed quantity of 10 grammes of the root is treated in an Erlenmeyer flask

with 75 c c of a mixture of 7 parts of Alcohol (94.9 p c) and 3 parts of Water, and shaken at intervals for five hours. The contents of the flask are then transferred to a small glass percolator, and after the liquid has passed through the percolation is continued with more of the above mixture of Alcohol and Water until 150 c c of percolate is obtained. The percolate is then evaporated at a temperature not exceeding 60° C (140° F), and 5 c c Tenth-normal Volumetric Sulphuric Acid Solution and 10 c c of Distilled Water added. The liquid is filtered into a separator, the dish and filter being washed with about 40 c c of Distilled Water and the washings added to the separator, 25 c c of Ether and 2 c c Animonin Solution are added, and the mixture agitated for one minute. The lower stratum is drawn off, the Ether-solution is filtered. The lower stratum is returned to the separator and shaken with 15 c c of Ether for one minute, the process of drawing off being repeated. The lower stratum is washed with two further portions of 10 c c each of Ether. The combined Ether-solutions are evaporated to dryness, and the residue dissolved in 3 c c of Tenth-normal Volumetric Sulphuric Acid Solution, and titrated back with Fiftieth normal Volumetric Potassium Hydroxide Solution until a violet colour is produced, 5 drops of Cochineal Test-solution being used as an indicator of neutrality.

The process of the *P G* is essentially as follows.—A weighed quantity of 12 grammes of root, dried at 212° F (100° C), and in a moderately coarse powder, is treated with a mixture of 90 grammes of Ether and 30 grammes of Chloroform, after brisk agitation 10 c c of a mixture of 2 parts by weight of Sodium Hydroxide Solution (15 p c) and one part by weight of Water is added, and the mixture allowed to stand for three hours, shaking well at frequent intervals. Add 10 c c, or at any rate sufficient Water to cause the powdered root to agglomerate on shaking and the supernatant liquid to clear completely. After standing for one hour 100 grammes of the clear Chloroform-Ether Solution is filtered through a dry, well-covered filter into a flask and about one-half distilled off. The remaining Chloroform-Ether Solution is introduced into a separator, the flask washed three times with a mixture of 3 parts by weight of Ether and 1 part by weight of Chloroform, and the mixed liquids well shaken with 25 c c of Centi-normal Volumetric Hydrochloric Acid Solution. After the addition of sufficient Ether to cause the Chloroform-Ether Solution to float on top of the acid liquid and after the fluids have become completely clear, the acid liquid is filtered through a small filter paper previously moistened with Water, into a flask holding about 100 c c. The Chloroform-Ether solution is shaken three times in succession with 10 c c of Water, passing the washings through the same filter paper, the latter is washed with Water and the mixed fluids diluted with Water to 100 c c. A measured quantity of 50 c c is removed, 50 c c of Water and sufficient Ether to form a layer of 1 cm. are added, and after the addition of 5 drops of Iodococci Solution, Centi-normal Volumetric Potassium Hydroxide Solution is added until the lower aqueous layer assumes a pale red coloration, shaking vigorously after each addition. Not more than 8.5 c c of

Centi-normal Potassium Hydroxide Solution should be required to effect this.

Preparations.

LINIMENTUM ACONITI. LINIMENT OF ACONITE

Powdered Aconite Root percolated with Alcohol (90 p.c.) to produce a liquid, of which 30 represents 20 of root and contains 1 of Camphor (1 in 1½)

This liniment was introduced by Peter Squire, who made it 1 in 1, and it was kept this strength in *B.P.* '64 and '67. It was diluted to 1 in 1½ in *B.P.* '85, but more recent experiments (*P.J.* '03, i 158) show that it can be made 1 in 1 and practically contain all the alkaloid.

Applied with a camel's hair pencil, alone, or mixed in equal proportions with Soap Liniment or Ammoniated Camphor Liment, and rubbed on the part (but not upon an abraded surface), relieves acute neuralgia.

TINCTURA ACONITI. TINCTURE OF ACONITE

Fr., TINCTURE D'ACONITE; Ger., ACONIT TINKTUR; Ital., TINTURA DI ACONITO; Span., TINTURA ALCOHOLICA DE ACONITO

1 of Aconite Root, in No. 40 powder, percolated with Alcohol (70 p.c.) to yield 20. (1 in 20)

Dose. 5 to 15 minims = 0.3 to 0.9 c.c.; if very frequently repeated, 2 to 5 minims = 0.1 to 0.3 c.c.

Ph. Ger. maximum single dose, 0.5 gramme, maximum daily dose, 1.5 grammes; of the 1 in 10 Tincture

Tests.—Tincture of Aconite has a specific gravity of about 0.890, it contains about 1.0 p.c. w/v of total solids and about 70 p.c. w/v of Absolute Alcohol

Dr. Fleming's Tincture of Aconite (sometimes known as *Tinctura Aconiti Fortior*) was much stronger, being about the same strength as the present Liniment, 1 in 1½, but without the Camphor. **Dr. Turnbull's Tincture of Aconite** was rather weaker than Fleming's.

Foreign Pharmacopœias—Official in Mex. and Hung., 1 Root and 5 Fr., Alcoholure, 1 fresh Leaves and 1, also 1 Root in 10. Ger. and Jap., 1 Root and 10. Ital., 1 Root and 5. Port., 1 dried Leaves and 5, also 1 Root and 5, and 1 fresh Leaves and 1. Span., 1 Root in 10. All by weight. U.S., Root 10, Alcohol to measure 100. U.S. has also Fluidextractum Aconiti, 1 in 1, standardised to contain 0.4 p.c. w/v of Aconitine.

Dutch, Root percolated with Alcohol (70 p.c.) to produce a tincture containing 0.025 p.c. of alkaloids.

The *Brussels Conference* adopted a standard of 0.05 p.c. of total alkaloids, the tincture being prepared with Alcohol (70 p.c.). Belg., Fr. and Swiss adopt the *Brussels Conference* standard.

Not Official.

EXTRACTUM ACONITI RADICIS ALCOHOLICUM.—Aconite Root in powder, percolated with Alcohol (90 p.c.), and the product evaporated to a pilular consistence.

Dose.—¼ to ½ grain = 0.01 to 0.03 gramme

This must not be confounded with *Extractum Aconiti, B.P.* '85, which was made from the herb and was much weaker.

Foreign Pharmacopœias.—Official in Fr., Hung. and Russ., use 70 p.c. Alcohol; Mex., 60 p.c. Alcohol; Ital., standardised to contain not less than 0.5 p.c. of alkaloid.

CHLOROFORMUM ACONITI —Powdered Root, 20, Chloroform, to percolate, 20 Painted on with a camel's hair brush, relieves neuralgia in almost every form The above formula was that introduced by Peter Squire about fifty years ago It is preferably prepared by a similar method to that given under Chloroform Belladonna, by mixing the root in No 40 powder with Slaked Lime and powdered Ammonium Carbonate and percolating with sufficient Chloroform to produce a 1 in 1 percolate The *B P C* process employs Ammonia Solution, necessitating the use of Absolute Alcohol to allow the Chloroform to exert its full solvent action Squire's original process yielded a product having a specific gravity of 1.479, and contained 1.09 p c w/v of total solids When assayed according to the process recommended by the *U S P* for the assay of Aconite, it yielded gravimetrically 0.09 p c w/v of Aconite alkaloids yielding the same figure on titration, when assayed according to the process recommended by Farr and Wright it yielded a similar figure both gravimetrically and volumetrically Samples of the preparation prepared by the modified Squire process and by the process of the *B P C* (which consists in moistening 100 of the root in No 60 powder with 25 of Ammonia Solution, and percolating with a sufficient quantity of a mixture consisting of 1 of Absolute Alcohol to 7 of Chloroform to produce a 1 in 1 product) to some extent confirmed the results published by Farr and Wright (*P J '07*, ii 107), and showed that the former yielded a lower percentage of Aconite alkaloids than the latter A better idea of the relative efficiency of the two processes is obtained by employing the method adopted by the 8th Decennial Revision of the *U S P* for the assay of Aconite When assayed by the *U S P* process, a Chloroform of Aconite prepared by the modified Squire process showed on gravimetric determination 0.16 p c of Aconite alkaloids, which gave 0.163 p c on titration The *B P C* product assayed by the *U S P* process showed 0.264 p c by gravimetric determination and 0.266 p c on titration, when assayed by Farr and Wright's process Chloroform of Aconite prepared by the modified Squire process showed gravimetrically 0.183 p c and 0.153 p c by titration, Chloroform of Aconite prepared by the *B P C* process showed 0.26 p c gravimetrically and 0.268 p c by titration Chloroform of Aconite by the modified Squire process had a specific gravity of 1.472 and contained 0.73 p c w/v of total solids, Chloroform of Aconite prepared by the *B P C* process had a specific gravity of 1.412 and contained 1.67 p c of total solids

LINIMENTUM ACONITI COMPOSITUM (*Squire*) —Chloroform of Aconite, 1, Liniment of Aconite, 7 Sprinkled on impermeable Pline and applied for neuralgia

Linimentum Aconiti et Chloroformi —Chloroform, 12.50, Liniment of Aconite, q s to produce 100 —*B P C*.

LINIMENTUM ACONITI COMPOSITUM *Syn* A B C Liniment —Aconite Liniment, Belladonna Liniment, Chloroform Liniment, equal parts —*Guy's*

Liniment of Chloroform contains Olive Oil, which will not dissolve in the other Liniments, but it is useful as a lubricant for rubbing Some prescribers prefer to use Chloroform in place of Chloroform Liniment as follows Aconite Liniment, 2, Belladonna Liniment, 2, Chloroform, 1.

This form has been included in *B P C*.

PIGMENTUM IODI CUM ACONITO —*See* Iodine

TROCHISCI ACONITI —Each lozenge contains $\frac{1}{2}$ minim Tincture of Aconite

Dose —One Lozenge every half hour or hour in tonsillitis and febrile affections of the throat

Pastilles of Aconite are made of two strengths, $\frac{1}{2}$ minim of Tincture of Aconite and 1 minim of the Tincture Prescribers should indicate the strength required.

Emplast. Aconiti, also **Emp. Aconiti et Belladonnæ**, are made in rubber combination

ACONITINA.

ACONITINE

$C_{34}H_{47}NO_{11}$, eq 642.53

A crystalline Alkaloid, obtained from Aconite Root. It forms colourless or white odourless hexagonal rhombic prisms, which should be preserved in well-stoppered glass bottles of a dark amber tint.

Solubility.—Almost insoluble in Water, 1 in 35 of Alcohol (90 p.c.); 1 in 45 of Ether, 1 in 1 of Chloroform, soluble in Oleic Acid.

Medicinal Properties.—It relieves acute nervous pain when rubbed on the part in the form of **ointment**, producing a tingling sensation followed by numbness. Care must be taken that it does not come in contact with a mucous surface, such as the conjunctiva, or with abraded skin.

It has been applied with marked benefit in trigeminal neuralgia, and to relieve the pain of *acute* rheumatism and gout.

Dose.—As a pure crystalline Aconitine would probably be fatal to an adult in a dose of 3 milligrammes ($\frac{1}{2}$ grain), the maximum dose should not exceed $\frac{1}{10}$ milligramme ($\frac{1}{666}$ grain) *pro dosi*, or $\frac{1}{10}$ milligramme ($\frac{1}{10}$ grain) per diem, and the commencing dose should be smaller.

Solutions of the alkaloid are prone to decomposition, aqueous or alcoholic solutions should therefore be slightly acidified with **Hydrochloric Acid**, or crystallised **Aconitine Nitrate** (official in *Fr.*) should be used.

Two new Aconitines, extracted from Aconite roots indigenous to India, have formed the subject of lengthy papers in the *J. C. S. Trans.* '05, 1621, 1636. Indaconitine is the alkaloid of *Aconitum chasmanthum*, Stapf, and Bikhacointine, the alkaloid of *Aconitum speciosum*, Stapf. The pharmacology of these two alkaloids has been studied, and the conclusions arrived at (*L.* '05, n 1347) that Indaconitine and Bikhacointine may be substituted for Aconitine and Pseudaconitine for internal use. Indaconitine is admissible in the same dose as Aconitine from 4 *Napellus* and Bikhacointine in proportion of 0.75 of the unit dose of Aconitine, whilst for local application they may be used as constituents of ointments in similar proportions to the Aconitine of 1 *Napellus*.

Official Preparation.—Unguentum Aconitinum.

Not Official.—Oleatum Aconitinum.

Foreign Pharmacopœias.—Official in *Fr.*, m p 184° C.; *Ital.*, m p 186° C.; *Mex.*, m p not given; *Span.*, m p 183°; *U.S.*, m p. see below, all are crystalline products, *Hung.* specifies 'German Aconitine,' a powder, m p. 85°; *Port.*, a powder, m p. 85°. Not in the others.

Pseudaconitine.—A highly toxic crystalline alkaloid obtained from *Aconitum ferox*; only slightly soluble in Water, but readily in Alcohol and Chloroform, less readily in Ether. Dunstan gives m.p. as 201° C.—*J.C.S. Trans.* '97, 858.

Tests.—Aconitine melts at 188.5° C. (371.3° F.), 189° to 190° C. (372.2° to 374° F), *B.P.* It is distinguished by the characteristic sensation of tingling and numbness which is produced on moist mucous surfaces by extremely dilute solutions of the alkaloid or its

salts The solution of the alkaloid in Alcohol (90 p c) is dextrogyrate, whilst solutions of the salts are lævogyrate. A dilute aqueous solution of the alkaloid rendered faintly acid by the addition of Acetic Acid yields a characteristic red crystalline precipitate when Potassium Permanganate Solution is added in slight excess. On saponification Aconitine yields Acetic and Benzoic Acids and Aconine. The preparation of the Aurichloride and a determination of its melting point have been recommended as a means of identifying the alkaloid, but *BP* makes no reference to these characteristics. The melting point of pure Aconitine Aurichloride is 135.5°C (275.9°F). Aconitine is distinguished from Pseudoaconitine, Veratrine and Atropine by not yielding any violet-red coloration when the residue left on the evaporation of a small quantity with a few drops of Nitric Acid is moistened with one or two drops of an alcoholic solution of Potassium Hydroxide.

Melting Point— 388°F (195°C) on rapidly heating, *USP*, when slowly heated it decomposes and melts at 182°C (359.6°F), and on ignition it leaves no residue, *USP*.

Sulphuric or Nitric Acid—No colour is produced when Aconitine is dropped upon Sulphuric Acid or Nitric Acid, but an orange colour is produced when it is rubbed with Sulphuric Acid containing a crystal of Ammonium Vanadate, *USP*.

Potassium Permanganate Solution—Dilute solutions (up to 1-4000) of the alkaloid, when faintly acidulated with Acetic Acid, give a red crystalline precipitate with a few drops of 1 p c w/v Potassium Permanganate Solution, *BP*, the *USP* uses a 1-1000 dilution with 1 drop of Tenth normal Potassium Permanganate Solution and does not acidulate. Aconitine containing decomposition products (Amorphous Aconitine) produces this precipitate only in solutions of not less than 1-200, while Cocaine, Hydrastine and Papaverine yield similar precipitates, but only when in more concentrated solutions, *USP*.

Mercuric Potassium Iodide T.S., Tannic Acid T.S., and Gold Chloride T.S. give precipitates with dilute solutions of Aconitine, but Platonic Chloride T.S., Mercuric Chloride T.S., and Picric Acid T.S. only in concentrated solutions, *USP*.

Preparation

UNGVENTUM ACONITINÆ ACONITINE OINTMENT

Dissolve 10 grains of Aconitine in 80 grains of Oleic Acid by the aid of gentle heat, and mix with 410 grains of Lard (1 in 50).

Not Official

OLEATUM ACONITINÆ.—Aconitine, 2 grains, Oleic Acid, 98 grains, dissolve.

Dr Shoemaker states that this has a slight local action, and it can be used in mild cases of neuralgia.—*BMJ* '84, ii 750.

This has been incorporated in the *BP C* under the title **Oleinatium Aconitinæ**, *syn* Oleate of Aconitine.

ACTÆA RACEMOSA.

See CIMICIFUGÆ RHIZOMA.

ADEPS.

LARD.

FR, ANGEF, GER, SCHWEINSCHMALZ, ITAL, GRASSO SUINO, SPAN, GRASA DE CERDO

A soft white solid having a characteristic though not rancid odour and a bland taste. It is the purified abdominal fat of the Hog, *Sus scrofa*.

Adeps Induratus is Lard deprived of its oil by pressure, and the oil is known as **Lard Oil**.

Solubility.—1 in 22 of Ether, and 1 in 16 of Oil of Turpentine; almost insoluble in Alcohol (90 p.c.)

Medicinal Properties. Emollient. Added to poultices to prevent them drying and sticking to the skin.

Official Preparation. Adeps Benzoatus. Used in the preparation of Emplastrum Cichorii, Elixir Phosphoricum and the following Ointments: Acornutina, Atropine, Cocaine, Iodine, Mercury, Mercurio Sulfurico, Rosaceum and Veratrine.

Foreign Pharmacopœias. Official in Austr. (Auringia Poter.), Belg., Dan., Dutch, Fr., Ger., Hun., Ital., Jap. (Adeps, Surtinus), New (Auringia), Mex. (Manteca de Cerdo), Port. (Banha), Russ., Span., Swed., Swiss and U.S.

Tests.—The distinguishing tests for Lard are its physical appearance, melting point, specific gravity, the percentage of Potassium Hydroxide absorbed in saponification, and its Iodine absorption. *B.P.* and *P.G.* include the melting point, but no specific gravity. Melting point and specific gravity are both included in *U.S.P.* Lard melts at from 35 to 45° C. (95 to 113° F.), the *B.P.* states that it fuses at 37.8° C. (100° F.) yielding a clear liquid at a somewhat higher temperature; the *U.S.P.* gives 38 to 40° C. (100.4 to 104° F.), the *P.G.* 36 to 42° C. (96.8 to 107.6° F.). It has a specific gravity at 99° C. (210.2° F.) compared with Water at 15.5° C. (60° F.) of about 0.860, the *U.S.P.* states about 0.917 at 25° C. (77° F.) and about 0.904 at 40° C. (104° F.) compared with Water at 25° C. (77° F.). It has a Saponification value of 192 to 196.5. It has an Iodine value of 52 to 62, and should contain but a trace of free acid. Samples examined in the author's laboratory possessed a Saponification value of 192 to 197, and an Iodine value of 50 to 56. Neither *B.P.*, *U.S.P.* nor *P.G.* include the percentage of Potassium Hydroxide absorbed on saponification, the *Austr.* gives a Saponification value of 194 to 197. *P.G.*, *Ital.* and *Austr.* include an Iodine absorption, *P.G.* not less than 46 p.c. nor more than 66 p.c.; *Ital.*, 55 p.c. to 60 p.c., *Austr.*, 48 p.c. to 60 p.c., the *U.S.P.* does not include this constant.

The more generally occurring impurities are Water, Salt, an undue proportion of free Acid, Cotton Seed Oil, Beef Stearin, and Starch. No official test is given for Beef Stearin, but the Lard is required to be entirely soluble in Ether. The amount of Water may be determined by heating a weighed quantity of 5 grammes of the sample in a flat-bottomed porcelain dish at a temperature of about

105° C (221° F) A rough idea of the amount of Water may be obtained by the behaviour of the sample when shaken with Carbon Bisulphide Salt, if present, is shown by the Silver Nitrate test described below Cotton Seed Oil may be detected by the test with Alcoholic Silver Nitrate Solution given in the small type below The *BP*, *USP* and *PG* methods of determining the free acid are essentially the same, and require that when a weighed quantity of 10 grammes of the Lard is dissolved in 10 c c of Chloroform and mixed with 10 c c of Alcohol of the strength required by the respective Pharmacopæias, after the addition of 2 drops of Phenolphthalein Test solution not more than 0.2 c c of Volumetric Sodium Hydroxide Solution should be required to produce a permanent red colour This indicates a limit of 0.56 p c calculated as Oleic Acid

The test given for Cotton Seed Oil in the *BP* and *PG* is the Becchi's Silver Nitrate test, and it is still included in the *USP* for determining the presence of more than about 5 p c of Cotton Seed fats The test is preferably performed on the fatty acids and not on the Lard direct Mr F J Bevan has informed the author that a test which will readily detect even 1 p c of Cotton Seed Oil consists in heating in a salt bath for about half an hour 3 c c of the Lard with 1 c c of a 1 p c solution of Sulphur in Carbon Disulphide This test slightly modified has been included in the Eighth Decennial Revision of the *USP* to prove the absence of Cotton Seed Oil and certain other fats For the detection of Beef Stearin the microscopical appearance of the crystals separating out from the ethereal solution of the Lard is generally relied upon A portion of the sample when boiled with Water, cooled, and a few drops of Iodine Solution added, should yield no blue coloration, indicating the absence of Starch

Silver Nitrate Solution.—Distilled Water boiled with Lard, filtered, and acidulated with Nitric Acid should yield no white precipitate soluble in Ammonia Water, with T.S. of Silver Nitrate, *USP*

Alcoholic Silver Nitrate Solution.—If 5 c c of melted and filtered Lard be thoroughly mixed with a solution prepared by dissolving 0.1 gramme Silver Nitrate in 10 c c Alcohol (94.9 p c) and 2 drops of Nitric Acid, and then heated for 5 minutes on a water bath and vigorously shaken, the fatty layer on separation should not have assumed a dark reddish or brown colour, nor should there be any dark colour at the junction of the two liquids, *USP* The *BP* test is essentially the same as the *USP*, except that the *BP* prepares the 5 c c of Silver Nitrate Solution by dissolving 0.05 gramme of Silver Nitrate in 5 c c of Alcohol (90 p c) The *PG* test is made with 5 grammes of melted Lard and a solution of 0.05 gramme Silver Nitrate in 2 grammes of Ether and 10 grammes Alcohol, and the mixture is warmed for 15 minutes on the water bath

Sulphur in Carbon Bisulphide.—2 c c of melted and filtered Lard are mixed with 1 c c each of Amyl Alcohol and a 1 p c solution of Sulphur in Carbon Disulphide in a test tube The test tube is immersed to one-third or half its depth in boiling salt Water No reddish colour should develop in the mixture in from 10 to 15 minutes, *USP*

Saponification.—A mixture of 2 parts Lard, 3 parts Potassium Hydroxide Solution, and 2 parts of Alcohol, when boiled until it clarifies, should produce, on the addition of 50 parts of Water and 10 parts of Alcohol, a clear or only faintly opalescent liquid, *PG*.

Preparation.**ADEPS BENZOATUS. BENZOATED LARD**

Digest 210 grains of Benzoin in 16 oz of melted Lard on a water-bath for two hours, strain, and stir whilst cooling (1 in 33)

Benzoated Lard should not be used for **eye ointments** as it is irritating

Benzoated Suet (*Sevum Benzoatum*) *Ind* and *Col Add* should be used in India, in place of Benzoated Lard

Official Preparations.—Following Ointments: *Belladonna*, *Cantharides*, *Chrysarobin*, *Iodide*, *Mercuric Oleate*, *Mercurous Chloride*, *Potassium Iodide*, *Stavesacre*, *Sulphur*, *Sulphur Iodide*, and *Zinc*.

Foreign Pharmacopœias Official in Dan, Dutch, Ital. (*Grasso con Benzoino*), Norw., Swed and U.S., Benzoin 2, Lard 100, Russ., Benzoin 2, Lard 100, dried Sodium Sulphate 5, Mex. (*Pomada Benzoadæ*), Tincture of Benzoin 5, Lard 100, Fr., Benzoin 3, Lard 100, Ger. and Jap., 1 Acid Benz. in 100; Swiss, Lard 100, Benzoin 1, Dried Sodium Sulphate 6; or Lard 10, Ethereal Tincture of Benzoin 1. Not in the others.

Not Official.

UNNA'S SALVE MULLS. The bases of these are hog's lard and beef suet (singly or combined), with which are incorporated various medicaments, spread on muslin

ADEPS LANÆ.**WOOL FAT**

Fr., *GRAISS DE LAINE*, Ger., *WOLLEFETT*, Ital., *LANOLINA*, Span., *LANOLINA*

A pale yellow, tenacious, unctuous product possessing a faint characteristic odour. It is the purified fat of sheep's wool, consisting chiefly of Cholesterol, Iso cholesterol, and their Esters.

Solubility Readily soluble in Chloroform and Ether, but only partially so in Alcohol (90 p.c.) Its own weight of Water can be incorporated with it.

Medicinal Properties.—Emollient, is very readily absorbed by the skin, and thus promotes the action of remedies combined with it.

Official Preparation *Adeps Lanæ Hydrostus*.

Not Official.—*Unguentum Lanolin*, *Unguentum Adipis Lanæ*, *Adeps Lanæ cum Oleo*.

Foreign Pharmacopœias Official in Austr., Dan., Dutch, Fr., Ger., Ital. (*Lanolina*), Jap., Russ., Span., Swed., Swiss and U.S. Not in the others.

Tests.—The distinguishing tests for *Adeps Lanæ* are the melting point, which should be about 40° C. (104° F.), and the formation of the purple-red colour of Cholesterol when its solution in Chloroform is poured gently on to the surface of Sulphuric Acid. It is preferable to use an acid containing a trace of Water for performing this test.

The *B.P.* gives the melting point as 40° to 44·4° C. (104° to 112° F.); the *U.S.P.* and the *P.G.* about 40° C. (104° F.); the *U.S.P.* states that at a higher temperature it vaporises and burns with a luminous

sooty flame, the *P G* that Wool Fat burns with a luminous very smoky flame

The percentage of Potassium Hydroxide required for saponification, as based upon Helbing's saponification test, affords a good criterion of the purity of the sample, but no official mention is made of this test. A thoroughly purified Wool Fat will combine with about 8 to 9 p c of Potassium Hydroxide, Glycerin Fats give much higher figures (Lard, 19.5 p c, Olive Oil, 18.0 p c, Cocoa Nut Fat, 26 p c), while Petroleum bases, being unsaponifiable, do not consume any.

The more generally occurring impurities are mineral matter, an undue amount of free acid, and nitrogenous organic matter. The *BP*, *USP* and *P G* all require that the residue left on ignition shall not be alkaline to Litmus, but differ in the amount of mineral residue permissible. *BP* and *USP* state not more than 0.3 p c, *P G* allows, at the highest 0.5 p c. The *BP* does not allow more than 0.28 p c of free Acid calculated as Oleic Acid, *P G* not more than 0.14 p c, and *US* not more than 0.7 p c. In carrying out the determination of the free acid, the *BP* uses 25 c c Ether as a solvent for the 10 grammes of Wool Fat and employs Volumetric Sodium Hydroxide Solution, of which not more than 0.1 c c should be required, the *USP* and *P G* use 2 grammes of the Wool Fat for the determination, employing 10 c c of Ether as a solvent, the *USP* uses Normal Volumetric Potassium Hydroxide Solution for the titration and the *P G* Tenth-normal Volumetric Potassium Hydroxide Solution, the *USP* stipulates that only 1 drop of the Normal Volumetric Solution shall be required, the *P G* 0.1 c c of Tenth normal Volumetric Potassium Hydroxide. The *BP* does not include a test for the absence of Glycerin, but such a test is included in both the *USP* and *P G*, as well as a test for ensuring the absence of Chlorides, due to Chlorine substitution products formed during the bleaching process. In carrying out the test for Glycerin both the *USP* and the *P G* work upon the filtrate obtained by shaking the Wool Fat with boiling Water, both Pharmacopœias employing 10 grammes of the Wool Fat and 50 c c of Water, and requiring that the clear separated aqueous liquid shall not yield a residue of Glycerin on evaporation, nor vapours of Ammonia when boiled with a solution of an alkali Hydroxide, the *USP* employing Potassium Hydroxide T.S., the *P G* Calcium Hydroxide Solution, the latter portion of the test is intended to detect nitrogenous organic matter. In carrying out the test the *BP* boils the Wool Fat itself with Sodium Hydroxide Solution. The *P G* tests another portion of 10 c c of the clear separated aqueous liquid with 2 drops of Potassium Permanganate Solution (0.1 p c w/w), requiring that the mixture shall maintain its red colour. This test is intended as confirmatory evidence of the absence of Glycerin and other readily oxidisable organic impurities. The absence of Chlorides is determined by the test with Alcoholic Silver Nitrate Solution given in the small type below.

Sulphuric Acid.—If a solution of Wool Fat in Chloroform (1.50 *P G* and *USP*) be poured as a layer over Sulphuric Acid, a zone of deep brownish red

colour gradually appears at the line of contact of the two liquids, *P.G.* and *U.S.P.* (the *B.P.* gives no quantities and states simply in colour), it attains its deepest shade after about 24 hours, *P.G.*

Alcoholic Silver Nitrate Solution.—1 gramme of Wool Fat boiled with 20 c.c. Alcohol, and filtered, yields a filtrate which on cooling should not be rendered turbid by alcoholic Solution of Silver Nitrate (1-20), *P.G.*, *U.S.P.*, or a turbidity disappearing on warming, *P.G.*

Preparation.

ADEPS LANÆ HYDROSUS. **HYDROUS WOOL FAT**

A nearly white, or yellowish white, unctuous mass prepared by incorporating 3 of Distilled Water with 7 of Wool Fat by rubbing together in a warm vessel. Used as a basis for ointments. It does not become rancid. Mixes with about half its weight of Water. It is better for ointments when mixed with an equal weight of Soft Paraffin.

Official Preparations. Used in the preparation of Unguentum Comi, and Unguentum Hamamelidis.

Foreign Pharmacopœias. Official in Anti (Adeps Lanae Hydrosus), Norw (Lanolinum Hydratum), Ital and Mex (Lanolina), Dan., Dutch, Ger., Jap and Russ (Adeps Lanae cum Aqua), Swed (Adeps Lanae), Swiss (Lanoline), U.S. Not in the others.

Tests.—Hydrous Wool Fat melts at about 40° C. (104° F.) separating into two layers, an upper oily layer and a lower aqueous layer. It is officially required to yield not less than 70 p.c. of residue when dried till constant in weight at a temperature of about 100° C. (212° F.), thus indicating a loss of not more than 30 p.c. This is also the *U.S.P.* limit, the latter Pharmacopœia adding in addition that the yellowish tenacious unctuous mass remaining should be completely soluble in Ether or Chloroform, and only sparingly soluble in Alcohol, should respond to the tests given under Adeps Lanæ. The *P.G.* requires that at the temperature mentioned it shall not lose more than 26 p.c. of its weight, and that the residue remaining after the separation of the Water shall answer the tests for Wool Fat and may be tested for its purity by similar methods to those employed for the anhydrous fat.

Not Official.

UNGUENTUM LANOLINI.—Hydrous Lanoline, 2, Soft Paraffin, 1

UNGUENTUM ADIPIS LANÆ (*Ger.*) -- Wool Fat (anhydrous), 20, Water, 5, Olive Oil, 5. All by weight.

An improvement on this is the following:—

ADEPS LANÆ CUM OLEO. Hydrous Wool Fat, 9, Almond Oil, 1.

This has been incorporated in the *B.P.C.* as follows:—Hydrous Wool Fat, 10, Olive Oil, 10, under the title Unguentum Adipis Lanæ.

Not Official.

ADHATODA.

The fresh and the dried leaves of *Adhatoda Vasica*, are official in *Ind* and *Col Add* for India and the Eastern Colonies as are also **Extractum Adhatodæ Liquidum** (1 in 1), dose 20 to 60 minims=1·2 to 3·6 c.c., **Succus Adhatodæ**, the freshly expressed and strained juice of the bruised fresh leaves, dose 1 to 4 fl. drms=8·6 to 14·2 c.c., and **Tinctura Adhatodæ** (1 in 8), dose 30 to 60 minims=1·8 to 3·6 c.c.

Not Official.

ADONISThe leaves and stalks of *Adonis vernalis*, L

Medicinal Properties—A cardiac tonic Useful in mitral and aortic regurgitation, relieving intracardiac pressure and præcordial pain—*L* '88, 11 1012 A useful adjunct to bromides in epilepsy—*L* '94, 11 1288, *B M J E* '95, 1 12, and '98, 1 44

Dose—2 to 6 grains=0.13 to 0.4 gramme in powder, or the equivalent of an infusion, tincture, or fluid extract

Foreign Pharmacopœias—Official in Ital, Russ, Span and Swiss Not in the others

ADONIDIN—A glucoside, very deliquescent, soluble in Water and Alcohol (90 p c)

Dose— $\frac{1}{2}$ to $\frac{1}{2}$ grain=0.01 to 0.03 gramme Generally given in pill.

ADRENALIN—*See* SUPRARENAL GLAND.

ETHER.**ETHER**

FR, ETHER, GER, AETHER, ITAL, ETHERE, SPAN, ETHER

A light, colourless, volatile, mobile liquid, possessing a strong characteristic odour and containing not less than 92 p c by volume of Ethyl Oxide ($C_2H_5)_2O$, eq 73.52 It is also known as Ethyl Ether, and Sulphuric Ether It is very volatile, and gives off a very inflammable and very heavy vapour

It is prepared by the action of Sulphuric Acid upon Alcohol, and subsequent distillation and rectification of the product

This product contains both Alcohol and Water, but *Æther Purificatus* (*see* below) is almost free from both

Solubility.—1 in 10 of Water, mixes in all proportions with Alcohol (90 p c)

B P states that it is miscible in all proportions with Chloroform, but the mixture forms a turbid liquid, owing to the presence of Water in the Ether

Water dissolves a tenth of its volume of Ether, and reciprocally Ether takes up about the same proportion of Water

Ether dissolves Corrosive Sublimate, Red Mercuric Iodide, Iodine and Bromine freely, Sulphur and Phosphorus sparingly It is also a solvent of the volatile and fixed oils, many resins and balsams, caoutchouc, and most of the organic vegetable alkaloids It does not dissolve Potassium or Sodium Hydroxides, in which respect it differs from Alcohol

Medicinal Properties.—It is a rapid and powerful diffusible stimulant, antispasmodic and carminative, and is of great use in syncope or heart-failure from any cause, dyspnoea, gastralgia, flatulence, spasmodic asthma and angina pectoris It excites secretion from the mucous surfaces of the alimentary tract, and, as it stimulates the pancreas, it is sometimes given with Cod Liver Oil

As an anæsthetic, *see* *Æther Purificatus* and *Æther Methylicatus*.

Dose.—For repeated administration, 10 to 30 minims = 0·6 to 1·8 cc; for a single administration, 40 to 60 minims = 2·4 to 3·6 cc

When used hypodermically for heart failure the dose is 15 to 30 minims = 0·9 to 1·8 cc

Prescribing Notes.—*Best prescribed as Spirit of Ether, which mixes readily with Water. 'Perles' are prepared*

Official Preparations. Ether Purificatus, Spiritus Ætheris, Spiritus Ætheris Compositus. It is the preparation of Colloidium, Extractum Filicis Jaquandii. Ether Purificatus is used in the preparation of Extractum Staphylini, and Spiritus Ætheris in Tinctura Lobeliae Ætherea

Not Official. Ether Methylatus, Mistura Ætheris cum Ammonia, Sirop d'Ether, Spiritus Ætheris Muraticus

Foreign Pharmacopœias. See under Ether Purificatus.

Tests.—The distinguishing tests for Æther are its volatility as indicated by its boiling point, the specific gravity, and the odour. It has a boiling point of about 40° C (104° F); the *BP* gives the boiling point as below 40·5° C (105° F). Æther sp. gr 0·735 has been official in Great Britain for many years, but Foreign Pharmacopœias only recognise the fluid which is official in the *BP* as Ether Purificatus, see below

The more generally occurring impurities are an undue amount of Acid, or of Alcohol, extractive matter, and organic impurities produced during its manufacture and which have escaped separation during the process of rectification

It should not possess an acid reaction towards blue Litmus paper, indicating the absence of acidity. When shaken with Water the volume should not be decreased by less than one-tenth, indicating the absence of excess of Alcohol. It should be completely volatilised without leaving a residue, indicating the absence of extractive matter; when mixed with an equal volume of Sulphuric Acid, the mixture kept well cooled, it should yield little or no coloration, indicating the absence of organic impurities

ÆTHER PURIFICATUS. PURIFIED ETHER

A colourless, transparent, very volatile, mobile and inflammable liquid from which the greater part of the Alcohol has been removed by washing with Water, and the Water by distillation over a dehydrating agent. *U.S.P.* describes it as containing about 96 p.c. by weight of Ethyl Oxide

It is the *Æther pro narcosi* of the German and Swedish Pharmacopœias and the official Æther of the *U.S.*

Medicinal Properties.—Used for producing general anæsthesia by inhalation.

It has also been used as a spray for obtaining local anæsthesia in minor surgery, and to relieve severe neuralgic pain, but as the lower the boiling point of the Ether the more complete is the anæsthesia, Methylated Ether, sp. gr. 0·717 (see below), is preferable for use with the spray.

Æther was first used as an anæsthetic for capital operations in 1846, and

Purified Ether is preferred by some to Chloroform, as it has a less depressing effect upon the heart, vessels, and respiratory centre. It is used also in conjunction with Nitrous Oxide for minor operations in dentistry and surgery.

Official Preparation—Used in the preparation of *Extractum Strophanthi*.

Foreign Pharmacopœias—Official in Austr., sp gr 0.720, Russ., sp gr 0.725, Belg., Dutch, Fr., Ger. and Jap., sp gr 0.720, Fr., also sp gr 0.724, Hung., sp gr 0.724 to 0.728, Port., sp gr 0.728, Span. (Ether), sp gr 0.720, Dan., Norw., Ital. (Ether), Swed. and Swiss, sp gr 0.720 to 0.722, U.S., sp gr 0.716 to 0.717 at 25° C (77° F), Mex. (Ether Sulfurico), sp gr 0.720.

Tests.—The distinguishing tests for Æther Purificatus are its boiling point, its specific gravity, its peculiar odour and physical appearance. The *BP* does not give a boiling point, but requires that it should not commence to distil below 34.5° C (94.1° F), the *USP* gives the boiling point at 35.5° C (96° F), the *PG* as 35° C (95° F). The specific gravity given in the *BP* is from 0.720 to 0.722, that of the *USP* 0.716 to 0.717 at 25° C (77° F), that of the *PG* 0.720.

The more generally occurring impurities are Methylc Ether, extractive matter, excess of Water, Aldehyde, acid, organic impurities, and Hydrogen Peroxide. Methylc Ether may be detected, if present, by the lowering of the boiling point. Both the *USP* and the *PG* require that Ether shall leave no residue on evaporation, indicating the absence of extractive matter. The *PG* states that when allowed to evaporate at ordinary temperature it leaves a damp ring which should not redden blue Litmus paper. The three Pharmacopœias differ considerably in their methods of testing for Aldehyde, Hydrogen Peroxide, and excess of Water. All three employ Potassium Hydroxide as a test for Aldehyde, the *BP* and *PG* use the solid form, *USP* the solution. The *BP* gives neither a time limit within which no coloration shall be produced, nor quantities, *USP* uses 10 of Ether to 1 of Potassium Hydroxide Solution and a time limit of 'within one hour,' whilst *PG* states no quantity for the test, but requires that no yellow colour shall be produced within six hours, the mixture being protected from the light.

In testing for Hydrogen Peroxide, *BP* uses Potassium Bichromate acidified with Sulphuric Acid, requiring that the ethereal liquid shall not develop a blue colour, the *PG* employs Potassium Iodide Solution and protects the mixture from the light, no coloration should be produced within one hour, whilst the *USP* does not include a test for Hydrogen Peroxide. Excess of Water is officially detected by mixing equal volumes of Ether and Carbon Bisulphide, when a clear solution should be obtained, in the *USP* the test is performed with Ether-saturated Water, and is made quantitative by employing equal volumes of the menstruum and Ether, and noting the decrease in volume of the ethereal liquid, 20 c.c. of the sample shaken with 20 c.c. of Ether-saturated Water should not measure less than 19.2 c.c. The *PG* does not include a test for excess of Water.

Odorous impurities, if present, may be detected by the odour imparted to clean, odourless filter paper when the Ether is allowed to spontaneously evaporate. Neither the *BP* nor the *PG* states the quantity to be used for the test, the *USP* evaporates 10 c.c. in

portions, all three Pharmacopœias require that the filter paper, after the evaporation of the Ether, shall possess no odour.

Evaporation Clean, odourless filter paper moistened with Ether, and the Ether allowed to spontaneously evaporate, should be free from any foreign odour when the Ether has evaporated, *B P*, the *P G.* and *U S P* allow 10 c.c. to evaporate.

Preparations.

SPIRITUS ÆTHERIS. SPIRIT OF ETHER The *HOFFMANN'S* ANODYNE of the Continental Pharmacopœias.

Ether, 1, Alcohol (90 p.c.), 2 (1 in 3)

Specific Gravity.—0.806 to 0.811.

Dose. For repeated administration, 20 to 40 minims = 1.2 to 2.4 c.c.; for single administration, 60 to 90 minims = 3.6 to 5.4 c.c.

Foreign Pharmacopœias Official in Austr., Dan., Ger., Hung., Jap., Norw., Swed. and Switz., 1 and 3, Belg. (Æther Sulphuricus Alcoholicus), 468 in 1000, Dutch (Æther cum Spiritu), 1 and 1, sp. gr. 0.777 to 0.782, Fr. (Æther Alcoholici), 1 and 1, sp. gr. 0.783; Ital. (Liquore Anodino di Hoffmann), 1 and 1, Mex. (Licor de Hoffmann), Æther 1, Alcohol 90 p.c., 1, Port. (Æther Alcoholizado), 7 and 3; Russ., 1 and 2, sp. gr. 0.800, Span. (Eter Sulfurico Alcoholizado), 4 and 1; U.S., $3\frac{1}{2}$ in 10. All by weight, except U.S.

Dan., Norw. and Swed. include also Æther Spirituosus Camphoratus, containing 15 p.c. of Camphor.

SPIRITUS ÆTHERIS COMPOSITUS. COMPOUND SPIRIT OF ETHER *B P Syn* - *HOFFMANN'S ANODYNE*

Ether, $5\frac{1}{2}$; Alcohol (90 p.c.), 38; and an undefined quantity of ethereal liquid, obtained by the action of 36 of Sulphuric Acid on 40 of Alcohol (90 p.c.), and subsequent treatment.

The official directions are founded on the formula of the old Dublin Pharmacopœia.

Dose For repeated administration, 20 to 40 minims = 1.2 to 2.4 c.c., for a single administration, 60 to 90 minims = 3.6 to 5.4 c.c.

Foreign Pharmacopœias Official in U.S., Ether, 325, Alcohol, 650; Ethereal Oil, 25. Not in the others.

Tests - The distinguishing tests are the sp. gr. which should be about 0.810, and the production of an opalescent mixture on the addition of Water. The more generally occurring impurities are those of an empyreumatic nature, having their origin in the process of manufacture, and which may be detected by any objectionable odour imparted to the residue left on the spontaneous evaporation of a few c.c. of the sample.

Not Official.

ETHER FROM METHYLATED SPIRIT. *Syn* Æther Methy-
latus, METHYLATED ETHER—Sp. gr. 0.717. It can be purified to such an extent by washing and redistillation as to be scarcely distinguishable from that made from pure Spirit. The Methylæ Ether being so extremely volatile is almost wholly lost during the purification.

An Ether, sp gr 0.715, can be obtained in limited quantity by careful working, occasionally samples are drawn over at 0.713, in cold weather

Medicinal Properties—It is largely employed as a **spray** for local anæsthesia, as well as for **inhalation**. As in the case of 'Methylated Chloroform,' the impurities from the Wood Spirit, employed in the manufacture, can be completely eliminated

Ether can be made more volatile for use with the **spray** by the addition of 20 per cent of a light Petroleum Ether

Ether from Methylated Spirit, sp gr 0.720 washed and redistilled, is also supplied for **inhalation**. It is *not* so suitable as the above for the **spray** because it volatilises less rapidly

MISTURA ÆTHERIS CUM AMMONIA—Spirit of Ether, 30 minims, Aromatic Spirit of Ammonia, 30 minims, Distilled Water, to 1 fl oz—*St Thomas's*

This has been incorporated in the *B P C*

Mistura Ammoniae et Ætheris—Aromatic Spirit of Ammonia, 30 minims, Spirit of Ether, 30 minims, Chloroform Water, to make 1 oz—*St Mary's*

SIROP D'ETHER SIROPUS CUM ÆTHERE—Ether (sp gr 0.720), 2, Distilled Water, 28, Alcohol (90 p c), 5, Syrup, 70, all by weight—*Fr*

This has been incorporated in the *B P C* under the title **Syrupus Ætheris Compositus**

SPIRITUS ÆTHERIS MURIATICUS *Syn*—*SP* **SALIS DULCIS**, CLUTTON'S FERRIFUGÆ SPIRIT

A colourless liquid Sp gr 0.860

A very old preparation, still prescribed for pyrexia, and cold in the head

Dose—30 to 60 minims = 1.8 to 3.6 c c

Foreign Pharmacopœias—Official in Norw (*Æther Chloratus Spirituosus*)

ÆTHER ACETICUS.

ACETIC ETHER

FR, ACÉTATE D'ETHYLE, *GER*, ESSIGÄTHER, *ITAL*, EIFFRE ACETICO, *SPAN*, ÉTER ACÉTICO

A transparent, colourless, volatile, inflammable liquid, possessing a characteristic ethereal odour and taste. It consists almost entirely of Ethyl Acetate, $C_2H_5C_2H_3O_2$, eq 87.40, with a small quantity of Ethylic Alcohol, Water and possibly traces of organic impurities

A good commercial specimen should contain 90 p c of Ethyl Acetate and about 10 p c of Ethylic Alcohol

It should be kept in well stoppered, amber-tinted bottles, and in a cool atmosphere

Solubility.—About 1 in 9 of Water. Pure Acetic Ether is miscible in all proportions with Alcohol (90 p c), and with Ether, but Acetic Ether of *BP* specific gravity is not soluble in all proportions in Chloroform, but if such Ether be dehydrated over Calcium Chloride or Potassium Carbonate it will then mix with Chloroform in all proportions, but the purified product has a specific gravity of 0.895.

Medicinal Properties. — Antispasmodic, stimulant, and carminative. It is also used as a sedative **inhalation** in irritation of the larynx, 30 minims in a pint of Water.

Dose. For repeated administration, 20 to 40 minims = 1 2 to 2 4 c.c., for a single administration, 60 to 90 minims = 3 6 to 5 4 c.c.

Official Preparation. — Used in the preparation of Liqueur Epispasticus

Foreign Pharmacopœias Official in Austr., Belg., Dan., Dutch, Ger., Jap., Norw., and Russ., sp. gr. 0·900 to 0·904, Hung., sp. gr. 0·900; Belg., sp. gr. 0·890. Fr., sp. gr. 0·920. Ital. (Ethere Aceticæ), sp. gr. 0·900 to 0·904, Mex. (Ether Aceticæ) sp. gr. 0·920; Port., sp. gr. 0·920, Span., sp. gr. 0·915, Dan. and Swed., sp. gr. 0·902 to 0·906, Swiss, sp. gr. 0·904; U.S., sp. gr. 0·883 to 0·885 at 25° C. (77° F.)

Tests The distinguishing tests for Acetic Ether are its sp. gr. of about 0·900, its boiling point, which should be about 162° C. (323·6° F.), and the limits of temperature between which it distils, 165° and 172° F. (73·9° and 77·8° C.)

It is officially required to have a specific gravity of 0·900 to 0·905; the *U.S.P.* gives 0·883 to 0·885 at 25° C. (77° F.), the *P.G.* 0·900 to 0·904. The official Acetic Ether is the fraction boiling between 73·9° and 77·8° C. (165° and 172° F.), the *U.S.P.* gives the boiling point of Acetic Ether from 72° to 77° C. (161·6° to 170·6° F.), the *P.G.* 74° to 76° C. (165·2° to 168·8° F.).

The more generally occurring impurities are Ethylic Alcohol, Water, free Acetic Acid, readily carbonisable organic impurities, and Ethers other than Acetic derived from impurities in the Ethylic Alcohol used in the process of manufacture. Except by inference the *B.P.* omits a test for excess of Ethylic Alcohol and Water, but both *U.S.* and *P.G.* stipulate that it shall not contain more than 10 p.c., as ascertained by the decrease in volume of the ethereal layer or the increase in volume of the aqueous layer, when a saturated aqueous solution of Acetic Ether is shaken with an equal volume of the specimen under examination. A free acid test performed either with Litmus Solution or paper is common to all three Pharmacopœias, as is also a test with Sulphuric Acid for readily carbonisable organic impurities. The latter test is included in all three Pharmacopœias, but in performing it the *B.P.* simply directs the liquids to be mixed, the *U.S.P.* and the *P.G.* direct that the Acetic Ether be carefully poured as a layer on the acid, and no coloured zone should be produced at the point of contact.

The *B.P.* and *P.G.* require that when evaporated from filter paper no odour shall remain, but do not mention the specific impurities indicated by the test. *U.S.*, on the other hand, state that the final odour should not resemble that of propyl ether, meaning the absence of Butylic and Amylic Ethers. It should be completely volatile, and should leave no weighable residue on evaporation.

ÆTHERIS NITROSI SPIRITUS.

See SPIRITUS ÆTHERIS NITROSI

Not Official.

ÆTHYL BROMIDUM

ETHYL BROMIDE HYDROBROMIC ETHER

FR, BROMURE D'ETHYLE, GER, ÄTHYLBROMID, ITAL, BROMURO DI ETILF,
SPAN, ÉTER BROMHÍDRICO C_2H_5Br , eq 108 17

A heavy, colourless, mobile and very volatile liquid, which should be preserved in well stoppered dark amber tinted bottles. It is best prepared by acting upon Potassium Bromide with Sulphuric Acid in the presence of Alcohol. Its liability to decomposition may be prevented by exclusion of light and air, and by the addition of Alcohol, which lowers the sp gr.

Shown that the process recommended in the *Companion* (17th edit) is the correct one. 60 p.c. of the commercial samples stated to be quite unfit for use — *P J* '02, i 491

Solubility — 1 in 120 of Water, but will vary with sp gr of sample, it mixes in all proportions with Alcohol (90 p.c.) and Ether.

Medicinal Properties — It is a local and general anæsthetic, more rapid in its action than Chloroform, and occasionally used in conjunction with it. It is useful in minor surgery, also in obstetric practice and in dental operations.

It should be administered in the same manner as Ether, it is very prompt in its action. It should not be given in prolonged operations or in renal disease. Has been used as a spray to produce local anæsthesia.

Strongly recommended in dental operations.

Recommended as a general anæsthetic in short operations. Action rapid, and particularly well adapted for children. Dangerous when administered with air, or if administration is protracted. Amount required varies up to 3 fl drms = 10 6 c.c. — *L* '99, ii 850, *B M J* '02, ii 589

Administered by inhalation in a single dose of from 15 to 80 grammes was free from risk, but prolonged administration of repeated doses was dangerous. More than one warning, however, has been given that 80 grammes (6 fl drms) is too large and may occasionally give rise to unpleasant symptoms — *L* '03, ii 745

A solution, 1 in 200 of Water, in angina pectoris, dose $\frac{1}{2}$ to 2 oz = 14 2 to 56 8 c.c. — *M A* '87, 24

Foreign Pharmacopœias — Fr (Bromure d'Ethyle), Dutch and Swed (Brometum Aethylicum), Belg, Ger and Swiss (Äther Bromatus), Ital (Bromuro di etile), Mex and Span (Éter Bromhídrico), Jap and Russ (Æthylum Bromatum). Not in the others.

Tests — Pure Ethyl Bromide has sp gr 1 473. Sp gr given in *P G* is 1 458 to 1 457. A very pure sample sold as containing 1 p.c. of Alcohol had sp gr 1 461, but ordinary samples may run as low as 1 94.

The boiling point of pure Ethyl Bromide is 101 8° F (38 5° C)

Boiling point of a sample sp gr 1 45 was 38 5° C (101° F), and dissolved in 120 parts of Water.

It should give no reaction with pure Sulphuric Acid, or no more than a yellow colour after an hour, indicating the absence of organic Sulphur compounds, Amyl and Ethylene compounds. When evaporated should leave no residue, indicating the absence of fixed residue. When shaken with an equal volume of Water it should be a little, if anything, decreased in volume, indicating the absence of more than a trace of Alcohol, and when the aqueous layer is separated it should not be acid in reaction towards Litmus paper, nor should an immediate turbidity be produced on the addition of a few drops of Silver Nitrate Solution, indicating the absence of Hydrobromic Acid, etc. When 1 c.c. of Ethyl Bromide is warmed with 8 drops of Aniline and 2 c.c. of Alcoholic Potassium Hydroxide Solution the characteristic odour of Carbylamine should not be evolved, indicating the absence of Chloroform. Its vapour should have a pleasant ethereal odour.

ÆTHYLENE BROMIDE, $C_2H_4Br_2$ — A heavy, colourless, somewhat volatile liquid, obtained from the hydrocarbon Ethylene. Boils at 264 2° F. (129° C.), sp gr 2 17. Given in epilepsy.

Dose — 1 to 2 minims = 0 06 to 0 18 c.c., dissolved in oil.

Not Official.

ÆTHYL CHLORIDUM.

ETHYL CHLORIDE HYDROCHLORIC OR MURIATIC ETHER

Fr, CHLORURE D'ETHYLE, GER., CHLORÄTHYL, ITAL, CLORURO D'ETILE

A colourless ethereal, inflammable liquid, which is supplied in glass capsules closed by a screw or spring cap.

It has a characteristic ethereal and somewhat agreeable odour and a sweetish burning taste.

It is produced by the action of Hydrochloric Acid gas on absolute Ethylic Alcohol.

On account of its highly inflammable and volatile nature it should be preserved in hermetically sealed glass tubes, and should not be opened when near a naked flame.

Medicinal Properties. Used for producing local anaesthesia in minor surgery and dentistry and as an analgesic in neuralgic and rheumatic pains - - *T* '03, '93, '87, '91, 119. See also Methyl Chloride.

Description of an apparatus for administering volatile anæsthetic agents, such as bromide and chloride of ethyl. A mask which hermetically seals the mouth and nose of patient - *L* '02, n 19. Caution required in the use thereof, such volatile bodies are depressants, and their capacity for danger culminates when mouth and nose are hermetically sealed - *L* '02, n 171.

A few cases of ethyl chloride narcosis. Its use recommended in place of nitrous oxide gas - *L* '01, n 699, '01, n 123. Treatment of lupus with ethyl chloride - *B M J* '01, n 76, *T G* '01, 603.

Review of 150 cases in which it was used as a general anæsthetic, with no trouble during narcosis ascribable to the drug itself - *L* '03, n 952.

A record of 100 successful administrations each of Ethyl Chloride and of Scornnoform alone, and in mixture with Nitrous Oxide. The dose was generally determined by the amount of operative work necessary in each individual case, the largest dose given being 6 c.c. - *L* '05, n 1176. A dose of 5 c.c. may be trusted (*B M J* '05, n. 616) to give at least 5 minutes' anæsthesia in midwifery cases, and gives great command over uncontrollable pains at the end of the second stage.

As an anæsthetic for young children aged from 5 days old and upwards, it is regarded (*L* '05, n 1542 1922) as one of the best means of procuring an anæsthesia of from 5 to 15 minutes. A celluloid inhaler is used, and the dose employed for infants of a few days or a few weeks old is 3 c.c., for those of 6 months and upwards 5 c.c.

An examination recorded (*L* '05, n 1691) of seven makes of this liquid obtainable in London showed that all the branded samples were pure, as was also one of the unbranded samples. One branded and one unbranded sample were found to contain traces of impurity, but the former was not intended for general anæsthesia. The boiling point of the pure product is 12.5° C (54.5° F.). It should be free from Water from foreign chlorides, from acids, from aldehydes, from Ether or Alcohol, and from organic substances.

The death of a patient (*L* '06, n 544 *B M J* '06, n. 544) while under its influence for the purpose of having four teeth removed gave rise to considerable discussion regarding its safety. The statistics published (*B M J* '06, n 616) indicate that it is not so innocuous as previous observations appeared to indicate. The dangers seem formidable (*B M J* '06, n 1007) but should not blot out its undeniable advantages. It occupies a distinct place in the armamentarium of the anæsthetist, it conveniently and safely leads up to Ether narcosis and may take the place of Nitrous Oxide when this is not available, not efficacious or unsatisfactory. The dose recommended is 2 or 3 c.c. for a child, 3 or 4 c.c. for a woman or weakly man, and 4 or 5 for a man. Minimal dosage and not too great deprivation of air when anæsthesia is complete are the patient's safeguards.

It is stated (*L* '05, n 1026) to occupy a position as an anæsthetic midway between Nitrous Oxide and Ether. It is an ideal preliminary to etherisation,

and more especially for great smokers, alcoholics, and nervous patients. Patients with obstructed breathing are regarded as bad subjects for its administration. Mixtures of Ethyl Chloride, Ethyl Bromide, etc., appear to possess no advantages.

Although in point of safety (*L* '05, ii 1922), Ethyl Chloride, when administered by skilled hands, as a general anæsthetic, comes between Ether and Chloroform, it is far from being an absolutely innocuous anæsthetic.

A record of twenty two fatalities which have occurred under Ethyl Chloride — *L* '06, i 1233.

A remarkable uniformity (*L* '06, ii 106) is noticed in the qualitative effects of Ethyl Bromide, Chloride, and Iodide. Their physiological action differs in degree only, depending simply on the volatility of the drugs. Their action on the circulatory system appears to be almost directly upon the heart.

Acid intoxication following Ethyl Chloride anæsthesia — *L* '04, i 284.

Tests — Sp gr 0.921 at 0° C (32° F). It is but slightly soluble in Water, but mixes in all proportions with Alcohol (90 p.c.), Chloroform, and Ether. It boils at 12° C (53.6° F). On ignition it burns with a green edged, smoky flame producing Hydrochloric Acid gas. It should volatilise completely at ordinary temperatures without leaving a residue, and if allowed to evaporate from pure filter paper should leave no unpleasant odour. Its aqueous or alcoholic solution should have no acid reaction towards blue Litmus paper, nor should a turbidity be produced by the addition of Silver Nitrate Solution.

U.S.P. requires that no odour of Aldehyde shall be developed when the aqueous layer, which remains after shaking 10 c.c. of Ethyl Chloride with 10 c.c. of cold Water and spontaneously evaporating the Ethyl Chloride layer, is treated with Potassium Dichromate and diluted with Sulphuric Acid, indicating the absence of Alcohol.

Foreign Pharmacopœias — Austr (Aethylum Chloratum), Belg and Swiss (Æther Chloratus), Dutch (Chlorietum Aethylicum), Fr (Chlorure d'Éthyle), Ital (Cloruro d'Etil), U.S.

NARCOTILE (Methylene bichloride). A transparent, colourless, mobile, highly volatile and inflammable liquid. Introduced as a new general anæsthetic — *L* '03, i 1091.

SOEMNOFORM — Stated to be a mixture of Ethyl Bromide 1, Ethyl Chloride 12, and Methyl Chloride, 7, a rapid, safe and easily eliminated anæsthetic for use in dentistry — *L* '03, ii 635, *P.J.* '03, i 872.

Two fatal cases have been recorded in connection with Soemnoform, and it is stated (*L* '04, ii 1408) that, although the mixture was employed for the object of testing its effect, its use was not likely to be repeated.

Kelene is a proprietary article stated to consist of pure Ethyl Chloride, and put up in tubes fitted with patented automatic stopper. Useful for producing local anæsthesia. For general anæsthesia it is put up in graduated tubes.

Anæsthy and **Coryl** are stated to be mixtures of Ethyl and Methyl Chlorides.

Not Official **ÆTHYL IODIDUM**

ETHYL IODIDE HYDRIODIC FLUID

C₂H₅I, eq 154.72

A colourless, volatile, heavy and non inflammable liquid, with an agreeable ethereal odour and pungent taste.

It is produced by the action of resublimed Iodine on pure Ethylic Alcohol in the presence of amorphous Phosphorus. The coloured product is freed from uncombined Iodine by shaking with a solution of Sodium Bisulphite and purified by digestion over fused Calcium Chloride and redistillation.

It should be kept in well stoppered glass bottles of a dark amber tint and in a cool place.

It soon acquires a reddish-brown colour on exposure to light, but if no deeper than a pale wine colour it may be disregarded

The change of colour can be prevented by putting in the bottle a globule of Mercury

Solutions which have already become discoloured may be shaken with some finely-powdered Sodium Bisulphite, filtered and redistilled

Solubility—1 in 440 of Water, mixes in all proportions with Alcohol (90 p.c.).

Medicinal Properties—Antispasmodic It is used as an inhalation; 15 to 20 drops inhaled through the nose from a wide-mouthed bottle is more accurate and economical than dropping it on a handkerchief It is said not to weaken the digestive organs but rather to have a tonic effect It has been inhaled with success to relieve the dyspnoea in chronic bronchitis and asthma, also in secondary and tertiary syphilis as an adjunct to the administration of Potassium Iodide, the Iodine being very rapidly absorbed—*Squibb*, *B M J* '89, 11 1216; *P J* (8) xix 46

Prescribing Note—Can be obtained in glass capsules, 5 minims - 0.3 c.c. in each

Foreign Pharmacopœias—Mex (Eter Yodhidrico) Not in the others

Tests—Sp. gr. at 15.5° C (60° F) 1.943 Boiling point 71° to 72° C (159.8 to 161.6° F) It should leave no residue upon evaporation When shaken with an equal volume of Water and a little fuming Nitric Acid free Iodine is liberated, recognised by the reddish-brown colour produced The aqueous layer remaining after shaking together equal volumes of Ethyl Iodide and Water shall yield no turbidity with Silver Nitrate Solution (absence of Hydriodic Acid)

Not Official.

AGARICUS ALBUS.

AGARIC OF THE LARCH WHITE OR PURGING AGARIC

A species of mushroom, found growing on old Larches in Southern and Central Europe

Medicinal Properties—Has been used with success in night sweating of phthisis, checking cough and promoting sleep, also in hæmoptysis It has a strong cathartic action—*P* xxix 321, *M T* '81, 11 442, *T G* '88, 41, 371.

Dose—5 to 30 grains = 0.32 to 2 grammes of the powder given in jam

Foreign Pharmacopœias—Official in Fr, Ital (Agarico Bianco), Mex (Agarico Blanco), Port (Agarico Branco), Span and Swiss Not in the others.

Descriptive Notes—This fungus is not a true agaric, but belongs to the *Polyporei* in which the gills are replaced by slender tubes, giving a porous appearance to the under surface or the cap or pileus The commercial article consists of the fleshy part or stroma of the fungus deprived of the brown ringed white cuticle of the upper surface and, almost entirely, of the short tubular portion or hymenium of the lower surface It grows on various species of Larch, from Central Europe to Siberia, chiefly on *Larix Sibirica*, Led., and comes to England *via* Hamburg It varies in size from 3 to 8 inches (7.5 to 20 cm.) or more in diameter It is whitish, spongy and friable Although normally of the form of a rounded cone, it is often broken up into irregular pieces The taste is sweetish at first and afterwards bitter and acid, but it has no characteristic odour It can be rubbed to powder in a sieve, but becomes flattened when pounded in a mortar The active principle Agaricin is official in the *P.G.* Under the microscope the drug is seen to consist of slender hyphal threads, mixed with minute calcareous concretions

AGARICIN (Agaricic Acid)—A white crystalline powder. Melts at 138° C. (280.4° F)

Solubility—1 in 140 of Alcohol (90 p.c.); practically insoluble in Water and in weak Alcohol

Dose — $\frac{1}{4}$ to $1\frac{1}{2}$ grains = 0.016 to 0.1 gramme Generally given with Dover's Powder in a pill

Ph Ger maximum single dose, 0.1 gramme

It should not be given hypodermically —*L M R* '84, 118

In pill form $\frac{1}{12}$ grain very successful in night sweats of phthisis —*T G*, '94, 627

Foreign Pharmacopœias —Official in Dan, Ger, Ital, Jap, Mex and Norw Not in the others

ALCOHOL ABSOLUTUM.

ABSOLUTE ALCOHOL

FR, ALCOOL EMPHYRIQUE, GER, ABSOLUTER ALKOHOL, ITAL, ALCOOL ASSOLUTO SPAN, ALCOHOL ANHIDRO

A clear colourless, mobile, hygroscopic liquid, volatile and inflammable. It possesses a spirituous odour and a burning taste, and contains Ethyl Hydroxide, C_2H_5OH , eq 45.70, with not more than 1 p.c., by weight, of Water. It is obtained by the dehydration and rectification of Ethylic Alcohol of weaker strengths. It is possible to rectify Alcohol up to 98 p.c., beyond this dehydrating agents are necessary.

On account of its hygroscopic nature and its inflammability it should be preserved in well-stoppered bottles in a cool place.

Foreign Pharmacopœias —Official in Ital, sp gr 0.800, Span, sp gr 0.794, Dutch, sp gr 0.794 to 0.799, Austr, Belg, Dan, Ger and Jap, sp gr 0.796 to 0.800, Fr, sp gr 0.79433, Swed, sp gr 0.7955 to 0.8005, Swiss, sp gr not higher than 0.796, Mex (Alcohol Vinico), sp gr 0.790, U.S., sp gr not higher than 0.797 at 15.6° C (60° F), or 0.790 at 25° C (77° F). Not in the others.

Official Preparations —Used in the preparation of Chloroform, Liquor Ethyl Nitritus, and Liquor Sodii Ethylatis.

ALCOHOL (90 p.c.) —This is described under the heading *Spiritus Rectificatus*, as are also the weaker strengths of Alcohol, which are prepared from it.

Tests —The distinguishing tests for Absolute Alcohol are the sp. gr. which should be about 0.794, and the boiling point 78.5° C (173.3° F), the latter is not included in *BP* or *USP*, the *PG* gives 78.5° C (173.3° F).

The official figure for the sp. gr. is 0.794 to 0.796, the *USP* gives not higher than 0.797 at 15.6° C (60° F), or 0.790 at 25° C (77° F), the *PG* 0.796 to 0.800.

The more generally occurring impurities are excess of Water, extractive matter, substances of an oily or resinous nature, Amylic Alcohol, Fusel Oil, organic impurities, Aldehyde, and Tannic Acid. Absolute Alcohol is required to be neutral to blue Litmus paper by *US* and *PG*, but *BP* makes no mention of its reaction.

BP uses 1 to 2 p.c. of anhydrous Copper Sulphate as a test for excess of Water, requiring that when mixed with this quantity of the reagent and shaken occasionally within 2 or 3 hours the salt shall not become decidedly blue, but *USP* relies upon the sp. gr. alone.

All three Pharmacopœias agree that no fixed residue shall be left

upon evaporation, and that it shall mix with Water without any turbidity, indicating the absence of oily and resinous substances.

The *BP* and *USP* require that it shall leave no unpleasant or foreign odour when allowed to evaporate from clean filter paper, indicating the absence of Fusel Oil and allied impurities, the *PG* states that the Alcohol itself should possess no foreign odour.

The *BP* and *USP* differ in their method of testing for Amylic Alcohol, and in the quantities used for the test. *BP* indicates 100 c.c. of Absolute Alcohol and 2 c.c. of Volumetric Silver Nitrate Solution, decanting the supernatant liquid from the black precipitate formed during the first 24 hours' exposure to bright light, and requiring that the liquid shall undergo no further change when exposed to the light after the addition of more Volumetric Silver Nitrate Solution, *USP* employs 20 c.c. of Absolute Alcohol for the test and 1 c.c. of Silver Nitrate Test-solution, stipulating that no more than a faint opalescence nor more than a faint brownish tint shall be acquired when exposed for six hours to diffused daylight. The *PG* employs 10 c.c. of the Alcohol and 5 drops of Silver Nitrate Solution, requiring that it shall neither become turbid nor coloured on warming. The *PG* includes a test for Fusel Oil by evaporating a mixture of 10 c.c. of Absolute Alcohol and 0.2 c.c. Potassium Hydroxide Solution (15 p.c. w/w) to one-tenth its volume, and supersaturating the residue with Sulphuric Acid; when no odour of Fusel Oil should be developed.

The *PG* performs the test for readily carbonizable organic impurities on the Absolute Alcohol direct, without evaporation. The *USP* directs the spontaneous evaporation of the Alcohol (carefully protecting the liquid from dust during the evaporation) and the application of a few drops of colourless Sulphuric Acid to the residue. Both Pharmacopœias require that no red coloration should be produced.

USP and *PG* give practically the same test for limit of Aldehyde.

The Ammonia test for Tannic Acid and excess of Aldehyde is common to *BP* and *PG*, but is omitted from *USP*. The *BP* requires that no immediate coloration shall be produced on the addition of Ammonia Solution, the *PG* that no coloration shall be yielded on the addition of Ammonia Solution.

The *USP* includes a test for the absence of not more than 2 p.c. of Methyl Alcohol which does not appear in either *BP* or *PG*. It depends upon the oxidation of the Methyl Alcohol by means of Copper wire, and a test for Formaldehyde in the oxidised liquid by the Resorcin test. The Acetaldehyde produced by the oxidation of the Ethylic Alcohol is previously removed by boiling. The test is given in the small type under Spiritus Rectificatus, under the heading of Copper Wire and Resorcin.

The *PG* requires that the red coloration produced in a mixture of 10 c.c. of Absolute Alcohol and 1 c.c. of Potassium Permanganate Solution (0.1 p.c. w/w), shall not change to yellow within 20 minutes, the test is intended to detect the presence of Aldehyde or Tannic Acid, Fusel Oil and other organic impurities. This latter Pharmacopœia also requires that Absolute Alcohol shall not be

coloured by Hydrogen Sulphide Solution, indicating the absence of Copper and Lead

Except so far as strength is concerned, both *BP* and *USP* require Absolute Alcohol to respond to the respective tests given under 'Spiritus Rectificatus'

Not Official

ALCOHOL METHYLICUM

METHYLIC ALCOHOL

Syn—RECTIFIED PYROXYLIC SPIRIT

A colourless liquid, with a peculiar spirituous odour, and which has been submitted to various processes of rectification. It is produced by the destructive distillation of wood.

Its vapour forms explosive mixtures with air, and as it is very volatile it should be kept in well stoppered bottles and in a cool atmosphere.

Solubility—It mixes readily with Water, Ethylic Alcohol, Chloroform, and Ether. It dissolves Fats and volatile Oils.

Medicinal Properties—Narcotic, sedative, and anti emetic. It palliates the cough and lessens the febrile excitement of phthisis. It has been mixed with Chloroform for use as an anæsthetic (Regnault's Anæsthetic Mixture). *See CHLOROFORM*

In cases of poisoning, the use of the stomach pump and rectal injections are recommended (*BMJ* '05, i 262) to get rid of the poison. Stimulants and application of heat to the body and extremities. The treatment of the amaurosis is unsatisfactory. In the early stages, Pilocarpine and Potassium Iodide are indicated, and in the later stages Strychnine hypodermically or by the mouth.

The deodorised product has received considerable attention on account of its poisonous properties. Injected in small and continuous doses, its effect is far more deadly than grain Alcohol. The fumes are a distinct menace to eyesight and general health, and its external use is also objected to.—*L* '04, ii 1255

Tests.—Sp gr about 0.803. Boiling point about 55° to 66.5° C (131° to 151.7° F). It should be without action on Litmus paper, and should not be rendered turbid by admixture with Water. It should leave no empyreumatic odour on evaporation, and should be free from fixed residue. It should yield little or no reaction for Iodoform when tested with Potassium Hydroxide Solution and Iodine (absence of Acetone).

Dose—5 to 10 minims = 0.3 to 0.6 cc

Wood Spirit, Wood Naphtha, Pyroxylic Spirit are names applied to the crude article of commerce, which may contain from 75 to 90 p.c. of real Methylic Alcohol.

METHYLATED SPIRIT—*See SPIRITUS METHYLATUS*

METHYLIC ETHER—It is gaseous at ordinary temperatures, but is condensed by cold and pressure to a liquid boiling at -20° C (-4° F). A solution of this in Ethylic Ether is useful for producing local anæsthesia.

Not Official

ALETRIS

STAR GRASS COLIC ROOT

A perennial plant indigenous to U.S. The root was formerly included in the U.S. secondary list. It is stated to be useful as a uterine tonic, and has been employed with asserted benefit in colic, dropsy, and in chronic rheumatism.

Descriptive Notes—The rhizome occurs in pieces about 1 to 2 inches (25 to 50 mm) long, rarely branched, $\frac{1}{4}$ to $\frac{1}{2}$ inch (4 to 12.5 mm) in diameter,
1 2

impressed, covered with the brownish-grey scaly remains of leaves, and root-fibres, so that its outer surface is hidden. The transverse section is yellowish-white, spongy and porous, exhibiting here and there glistening points. The taste is mucilaginous and then bitter. It contains much starch, and unless kept in a bottle it is liable to be attacked by insects. It is derived from *Aletris* (Cannoe), L. and belongs to the nat. ord. Hamodoraceæ.

EXTRACTUM ALETRIDIS LIQUIDUM—A 1 in 1 fluid extract of the root prepared by percolation. The Alcohol is removed by distillation from the greater portion of the percolate, the residue is dissolved in the reserved portion, and sufficient of the menstruum (Alcohol 45 p.c.) added to produce the required volume. *B.P.C. Formulary* 1901.

This has been incorporated in the *B.P.C.*

ELIXIR ALETRIDIS.—Fluid Extract of Aletridis, 1; Fluid Extract of Liquorice, $\frac{1}{2}$; Tincture of Orange, $\frac{1}{2}$; Syrup, $1\frac{1}{2}$; Distilled Water, to yield 4.—*B.P.C. Formulary* 1901.

Dose.—30 to 60 minims = 1.8 to 3.6 c.c.

Elixir Aletridis Liquid Extract of Aletris, 25; Liquid Extract of Liquorice, 6; Simple Elixir, 45; Distilled Water, q.s. to produce 100.—*B.P.C.*

ALOES.

FR., ALOES; GER., ALOE, ITAL., ALOE, SPAN., ACIBAR

Both Aloe Barbadosensis and Aloe Socotrina are official in *B.P.* and *U.S.P.* *P.G.* has the African varieties only. See below.

Medicinal Properties.—Bitter tonic, purgative, acting chiefly on the large intestine, the slowest of purgatives, taking ten to fifteen hours to act. Stomachic bitter in very small doses. A good tonic cathartic in habitual constipation and in that associated with amenorrhœa and anæmia. Emmenagogue; should not be given during advanced pregnancy nor in inflammatory conditions of the pelvic organs. Small doses relieve, large doses aggravate hæmorrhoids. Used as an enema it is anthelmintic.

The aqueous extract is more active than is the resinous portion of Aloes, and the Barbados Aloes, containing a larger amount of aqueous extract than the Socotrine, is the more powerful; thus, 2 grains are equal to 3 grains of Socotrine.

Dose.—2 to 5 grains = 0.13 to 0.32 gramme.

Prescribing Notes.—Can be made into pills with a small quantity of diluted Alcohol; rarely prescribed alone.

1 grain with $\frac{1}{2}$ grain Extract of Nux Vom. is an excellent pill to obtain the stomachic effect, and to relieve habitual constipation. The *Pilula Aloes et Ferri*, and *Pilula Aloes et Myrrhæ* are given in amenorrhœa associated with chronic dyspepsia and constipation.

Official Preparations.—Of Barbados Aloes, *Extractum Aloes Barbadosensis*, *Pilula Aloes Barbadosensis*, *Pilula Aloes et Ferri*. Contained in *Pilula Cambogiæ Composita*, *Pilula Colocyntidis Composita*, and *Pilula Colocyntidis et Hyoscyami*. Used in the preparation of *Aloumum*. Of the **Extract**, *Decoctum Aloes Compositum*, *Extractum Colocyntidis Compositum*, *Tinctura Aloes*. Of **Socotrine Aloes**, *Pilula Aloes et Asafetidæ*, *Pilula Aloes et Myrrhæ*, *Pilula Aloes Socotrinæ*. Contained in *Pilula Rhei Composita*, *Tinctura Benzoini Composita*. Also used in the preparation of *Aloumum*.

Not Official.—Aloe Capensis, *Decoctum Aloes Compositum* 'Squire,' *Pilula Aloes Diluta*, *Pilula Aloes et Belladonnæ*, *Pilula Aloes et*

Nucis Vomicae, Pilula Aloes Composita, Pilula Aloes et Myrrhae, Pilula Aperientes Stahlii, Pilula Guttæ Aloeticæ, Pilula Laxativæ Composita, Pulvis Aloes et Canellæ, Tinctura Aloes Composita, Tinctura Aloes et Myrrhae, and Vinum Aloes

The distinguishing tests for Barbados and Socotrine Aloes will be found under their official headings. The African varieties are official in the *P G*, and the Descriptive Notes and Tests are given here.

South African Aloes is the evaporated juice of the leaves of the African varieties of the genus 'Aloe,' and forms a dark brown mass possessing a characteristic odour and bitter taste. It easily breaks into large pieces with a conchoidal fracture and sharp edged reddish splinters which are translucent and of a reddish or light brown tint, but do not possess any crystalline character under the microscope.

Descriptive Notes—There are three forms of Aloes imported from British South Africa. First, the vitreous blackish Aloes with a conchoidal fracture, and greenish brown translucent splinters, commonly known in this country as Cape Aloes, which give the reactions described in the *P G*. Second, an opaque or 'Hepatic' Cape Aloes, giving an orange brown powder, imported of recent years from Mossel Bay under the name of 'Uganda' Aloes, and manufactured from the leaves of *Aloe ferox*, L., and dried by sun heat alone, in the form of square bricks about four inches square and one inch thick. Third, an opaque Aloes very brittle and giving a pale greenish brown powder. It is rarely imported, and comes from Port Natal, but is remarkable for giving a permanent crimson colour with Nitric Acid and a bluish colour when Sulphuric Acid is added to it and the vapour of Nitric Acid blown over the mixture. It should perhaps be called Hepatic Natal Aloes, since a translucent Aloes is also prepared from *Aloe platy-lepis*, J. G. Baker, near Pietermaritzburg in Natal, and usually passes in commerce for Cape Aloes and gives the same chemical reaction as that prepared from *Aloe ferox*, L. The botanical source of Hepatic Natal Aloes is unknown.

Tests—The distinguishing test for African Aloes is that if a particle be treated with Nitric Acid no red but only a pale greenish zone shall be formed within three minutes (differing thus from Barbados Aloes).

About 40 p.c. should be soluble in cold Water, and it should be completely soluble 1 in 5 (by weight) of warm Alcohol (90 p.c.), the solution remaining clear even after cooling.

5 parts of Aloes treated with 60 parts of boiling Water should yield an almost clear solution, from which about 3 parts again separate on cooling, *P G*.

Aloes dissolved in hot Water produces with Concentrated Solution of Borax a greenish fluorescence, *P G*.

It should impart to boiling Chloroform and Ether only a very faint yellow colour, and Ether so coloured should leave only a very slight residue, *P G*.

Thoroughly dried Aloes is used for the preparation of Powdered Aloes. The powder should not agglutinate at 100° C (212° F) nor alter in colour, *P G*.

ALOE BARBADENSIS. BARBADOS ALOES

FR., ALOES DES BARBADES, GER., BARBADOS ALOE, ITAL., ALOE VFRA., SPAN., ACIBAR BARBADO.

They are obtained principally from the leaves of *Aloe vera*, L., and *Aloe chinensis*, Steud., in the West Indian Islands, and sold as Barbados or Curaçao Aloes.

Solubility.—Water dissolves about 75 p.c. It is almost entirely soluble in Alcohol (60 p.c.).

Dose.—2 to 5 grains = 0.13 to 0.32 gramme.

Foreign Pharmacopœias.—Official in Belg., Dutch, Fr., Ital., Jap., Port., Spain and U.S., Mex (Acibar). Not in the others.

Descriptive Notes.—Barbados or Curaçao Aloes as imported varies considerably in colour, consistence, and degree of opacity, and

may be in the form of a stiff yellowish-brown paste, a mass of pitchy character, or hard and solid, but it always has a comparatively smooth surface, when dried it varies in colour from chocolate brown to black, or rarely exhibiting more or less translucent pieces, which become opaque on keeping. It has a characteristic somewhat nauseous odour, more evident when freshly broken, or powdered, and a very bitter taste. The best qualities conform to the requirements as to solubility given under Tests. Such Aloes as present a chocolate brown colour and freedom from air vesicles are of the finest quality and should be chosen for medicinal use, those characters indicating evaporation of the fresh, not fermented, juice by steam heat, black vesicular samples being of inferior quality, prepared from fermented juice and evaporated over a naked fire.

Aloes are now rarely imported from Barbados, and then only in small quantity, coming almost exclusively from the Dutch West Indian Islands of Curaçao, Bonaire, and Aruba.

Tests.—The distinguishing test for Barbados Aloes is the crimson colour imparted to Nitric Acid by the powder.

The more generally occurring impurity is an undue amount of insoluble matter. This is guarded against by the requirement that not less than 70 p.c. shall be soluble in Water, and that it should be almost entirely soluble in a mixture containing Alcohol (90 p.c.) diluted with half its volume of Water.

Barbados Aloes yields about 2 p.c. of ash, and 3 p.c. should not be exceeded.

1 **Borntrager's test**—Shake out with Benzene, and treat separated Benzene with Ammonia, pink colour on standing.

2 **Klunge's test**—Warm with Copper Sulphate and a little Sodium Chloride, yellow colour, changing to red or violet. Fair test for West Indian Aloes, but not much good for the other varieties.

3 **Flückiger's test**—Sulphuric Acid and Nitric Acid Vapour, deep blue colour. Specific test for Natal Aloes.

3 **Bainbridge's test**—Nitric Acid, red colour, changing to green. Distinguishes it from Cape Aloes.

5 **Cripp's and Dymond's test**.—Triturate 1 grain of sample with 16 drops Sulphuric Acid and 4 drops Nitric Acid and dilute with an oz. of Water. A deep orange to crimson colour is developed, intensified by the addition of Ammonia. This appears to be the best general test for Aloes.—*J. J.* (8) xv 633. The reaction is also given by all bodies containing or yielding Chrysanthemum Acid, but these yield a pink colour with Ammonia alone while Aloes gives a yellow.

ALOE SOCOTRINA. SOCOTRINE ALOES

FR, ALOES SOCOTRIN, GER, SOCOTRINISCHE ALOE, ITAL, ALOE DI SOCOTORA; SPAN, ACIBAR SOCOTRINO

Socotrine or Zanzibar Aloes, obtained from *Aloe Perryi*, J. G. Baker, and possibly other species. Imported principally through Bombay.

Solubility.—Water dissolves about 50 p.c.; the residue is pretty well inert, almost entirely soluble in Alcohol (60 p.c.)

Dose.—2 to 5 grains = 0.13 to 0.32 gramme

Foreign Pharmacopœias—Official in Belg., Ital., Mex., Port., Spain and U.S., U.S. has also Aloe Purificata, which is Socotrine Aloe dissolved in Alcohol, strained and evaporated to dryness. Cape Aloe is official in Austria, Belg., Dan., Dutch, Fl., Ger., Hung., Ital., Norw., Port., Russ., Spain, Sweden and Swiss.

Descriptive Notes—Socotrine Aloe is usually imported in barrels, in a semi-liquid or pasty condition, and sometimes in a fermented or more or less fetid state. When dried it presents an extractiform or irregular surface, is opaque, and if of good quality is of a dark brown colour and gives an orange-brown powder. It possesses a not unpleasant odour. Inferior qualities are black and vesicular and have a rancid or butyric odour, and are unfit for medicinal use. Zanzibar Aloe is imported in skins, containing several pounds, packed in rectangular cases. It is usually of better quality than the Socotrine Aloe, and is commonly sold as 'Hepatic' Aloe, the opaque fractured surface being of a liver colour. Samples of which the splinters are garnet red and translucent are now rarely met with in either the Socotrine or Zanzibar varieties. These Aloes should conform to the requirements as to solubility given under Tests, and also the reactions with Nitric Acid. An East African Aloe met with in commerce is sold as Socotrine which does give a crimson colour with Nitric Acid, and therefore is excluded by the *B P* test, whilst its geographical source prevents its inclusion under Barbados Aloe; this kind exhales a faint odour like that of Curaçao Aloe, when freshly broken or powdered. There is also an Aloe, which comes *via* Bombay, from Jafferabad and other parts on the Arabian coasts, which does not give a crimson colour with Nitric Acid, but this kind yields a powder of a dull brown, not of an orange-brown colour like the Zanzibar and Socotrine Aloes, and possesses hardly any odour. The official description does not exclude Jafferabad Aloe, except in so far as that name is not used.

Tests—The distinguishing test for Socotrine Aloe is the reddish or yellowish-brown colour produced when the powder is treated with a drop or two of Nitric Acid.

The more generally occurring impurities are leaves of *Calotropis* and stones, and an undue proportion of insoluble matter, but the opaque Natal Aloe might be mistaken for it, although its powder has a greenish-brown hue, not the orange-brown tint of Socotrine and Hepatic Aloe. The distinction of Barbados Aloe from Natal Aloe is ensured by the official requirement that no blue coloration shall be produced when the vapour of Nitric Acid is blown over the powder, previously moistened with Sulphuric Acid, the absence of the other impurities by the fact that *B P* requires about 50 p.c. to be soluble in Water, and that it should be almost entirely soluble in a mixture of Alcohol (90 p.c.) with half its volume of Water. The *U S P* fixes a standard for moisture, which should not exceed 10 p.c.

Socotrine Aloe yields about 2 p.c. of ash, and 3 p.c. should not be exceeded.

ALONUM. ALOIN $C_{16}H_{16}O_7, 3H_2O$, eq 371.36

A yellow crystalline powder possessing a faint odour of Aloes and a very bitter taste. It is a neutral, non-glucosidal, bitter principle, obtained chiefly from Barbados Aloes.

It may be assumed that commercial 'Alon' is α -Barbaloin. Its formula is $C_{16}H_{16}O_7$, with about three molecules of Water of crystallisation.

Solubility—1 in 120 of Water, 1 in 18 of Alcohol (90 p.c.), freely soluble in hot Water, nearly insoluble in Ether.

B.P. states sparingly soluble in cold Water, *U.S.P.* gave the figure as 1 in about 65 at 25° C (77° F), but this was subsequently altered in the list of corrections and additions to 1 in 120, 3 samples obtained (1903) from different manufacturers yielded a solution at 1 in 120.

Dose.— $\frac{1}{2}$ to 2 grains = 0.03 to 0.13 gramme.

Prescribing Note—Generally given in pills or in cachets with other ingredients. 'Diluted Glucose' is a good excipient for Alon in pills.

Not Official—*Pilula Aloini Composita*, *Pilula Aloini et Podophylli*.

Foreign Pharmacopœias—Official in U.S. Not in the others.

Aloins may be classified as follows—

BARBALOINS—Yielding on oxidation Chrysammic, Aloetic, and Picric Acid.

α -barbaloin, which gives a red colour with cold Nitric Acid (1.42), obtained from Barbados and Curaçao Aloes.

β -barbaloin, which requires either fuming Nitric Acid, or a hot Acid of ordinary strength to give the red coloration. This variety is yielded by Jafferabad, and by some varieties of Socotrine and Zanzibar Aloes, see p. 119.

NATALOIN—Yields on oxidation Picric but not Chrysammic Acid. This is a distinct species, from Natal Aloes only, having a formula $C_{24}H_{20}O_{10} \cdot H_2O$. Softens at 180° C., and melts at 210° C.

Tests.—The distinguishing tests for Barbaloin are its melting point, which, when anhydrous, should be 147° C (296.6° F), and the red coloration produced on the addition of Nitric Acid. Both *U.S.P.* and *B.P.* state that Alon is rapidly affected in alkaline solutions, but only slowly in neutral or acidified solutions.

B.P. gives no tests for impurities, but those more generally occurring are mineral residue, Aloins derived from Natal or Cape Aloes, and Emodin. Mineral matter is detected by the ash left on ignition, whilst Emodin is detected by treating the 10 p.c. Benzene Solution with an equal volume of 5 p.c. Ammonia Water. It should leave no weighable residue when ignited with free access of air. In testing for Emodin a weighed quantity of Alon is shaken with 10 c.c. of Benzene for 1 minute and filtered, the filtrate should not impart more than a faint pink colour to an equal volume of Ammonia Solution (5 p.c.) when shaken with it. Its distinction from Nataloin, Socaloin and Capaloin is carried out by the colour tests mentioned below.

Colour reactions of the *U.S.P.* (a) The solutions in Ammonia and the Alkalis are yellow, turning red with a greenish-red fluorescence. (b) Nitric Acid gives with Curaçao Alon a cherry-red solution (distinction from Nat. Soc.

and Capaloin) (c) Sulphuric Acid with a minute quantity of Aloin forms a yellowish-red solution, which with a small crystal of Potassium Dichromate added becomes olive green, then dark green, and finally blue on standing, with a larger amount of Potassium Dichromate, the yellowish red solution first turns purple, then brown, and finally green (d) Bromine Water colours an aqueous solution pink (e) Gold Chloride T S to carmine-red, turning to violet (f) Ferric Chloride T S with an alcoholic solution gives a brownish green colour (g) Copper Sulphate T S gives with a dilute aqueous solution of Curaçao Aloin a bright yellow colour, this mixture with a few drops concentrated solution of Sodium Chloride gives a red colour, and on further adding a little Alcohol the colour becomes violet (distinction from Nataloin and Capaloin)

Preparations

DECOCTUM ALOES COMPOSITUM COMPOUND DECOCTION OF ALOES *N O Syn* —BAUME DE VIE

An aqueous solution prepared by boiling together for five minutes Extract of Barbados Aloes 1, Myrrh $\frac{1}{2}$, Potassium Carbonate $\frac{1}{2}$, Extract of Liquorice 4, and Distilled Water 40 Immediately after the boiling is finished add Saffron $\frac{1}{2}$, and, when the liquid has cooled down, Compound Tincture of Cardamoms 30, and more Distilled Water to make 100 of product (1 of Extract in 100)

Dose — $\frac{1}{2}$ to 2 fl oz = 14.2 to 56.8 c c

Tests —Decoction of Aloes, *B P*, has a specific gravity of about 1.005, contains about 5.5 p c w/v of total solids and about 20 p c w/v of Absolute Alcohol

DECOCTUM ALOES COMPOSITUM 'SQUIRE' Made with Socotrine Aloes and the Fluid Extract of Liquorice

Dose — $\frac{1}{2}$ to 2 fl oz = 14.2 to 56.8 c c

The fluid extract is much better than the solid extract for covering the taste of Aloes, there is a marked difference in the taste of the two preparations, even when they practically contain the same amount of Liquorice This suggestion has been adopted in *B P* in the case of Tincture of Aloes, but not in that of the Compound Decoction where it is of more importance

Tests —Squire's Decoction of Aloes has a specific gravity of about 1.009, it contains about 10 p c w/v of total solids and about 22 p c w/v of Absolute Alcohol

EXTRACTUM ALOES BARBADENSIS.—EXTRACT OF BARBADOS ALOES

An aqueous Extract, of which about $\frac{3}{4}$ grain is equal to 1 grain of the Aloes

Dose.—1 to 4 grains = 0.06 to 0.26 gramme

Foreign Pharmacopœias —Extract of Aloes is Official in Austr, Dan, Dutch, Ger, Hung, Ital, Jap, Norw, Russ, Swed, Swiss and U.S Not in the others

PILULA ALOES BARBADENSIS PILL OF BARBADOS ALOES.

4 of the pill is about equal to 2 of Barbados Aloes, 1 of Hard Soap, $\frac{1}{2}$ of Oil of Caraway, and 1 of Confection of Roses

Dose.—4 to 8 grains = 0.26 to 0.52 gramme

PILULA ALOES SOCOTRINÆ. PILL OF SOCOTRINE ALOES.

4 of the pill is about equal to 2 of Socotrine Aloes, 1 of Hard Soap, $\frac{1}{8}$ of Oil of Nutmeg, and 1 of Confection of Roses

Dose.—4 to 8 grains = 0.26 to 0.52 gramme

Foreign Pharmacopœias—Official in Fr (Pilules d'Aloes et de Savon), Jap and US (Pilulæ Aloes), Aloes and Soap, equal parts, Mex (Pildoras de Acibar), Aloes 10, Soap 2, Swiss (Pilula Aloetica), Aloes 10, Soap 1, Glycerin 8 drops, Spirit $q\ s$. Not in the others

PILULA ALOES ET ASAFETIDÆ. PILL OF ALOES AND ASAFETIDA

4 of the pill is about equal to 1 of Socotrine Aloes, 1 of Asafetida, 1 of Hard Soap, and 1 of Confection of Roses

Dose.—4 to 8 grains = 0.26 to 0.52 gramme.

Foreign Pharmacopœias—Official in US, 1 in 3, Jap, equal parts of Aloes, Asafetida, Soap and Honey. Not in the others

PILULA ALOES ET FERRI. PILL OF ALOES AND IRON.

$4\frac{1}{2}$ of the pill is about equal to 1 of Barbados Aloes, $\frac{1}{2}$ of Exsiccated Ferrous Sulphate, $1\frac{1}{2}$ of Compound Powder of Cinnamon, and $1\frac{1}{2}$ (by weight) of Syrup of Glucose

Dose—4 to 8 grains = 0.26 to 0.52 gramme.

Foreign Pharmacopœias—Official in US, Purified Socotrine Aloes 1, Exsiccated Ferrous Sulphate 1, Aromatic Powder 1, Confection of Roses $q\ s$, Ger, Cape Aloes 1, Exsiccated Ferrous Sulphate 1, Sp Saponis $q\ s$, Jap, equal parts of Aloes and Spirit $q\ s$, Swiss, Aloes 5, Ferrous Sulphate 5, Soap 1, Glycerin 5 drops, Alcohol $q\ s$. Not in the others

PILULA ALOES ET MYRRHÆ. PILL OF ALOES AND MYRRH.

$4\frac{1}{2}$ of the pill is about equal to 2 of Socotrine Aloes, 1 of Myrrh, and $1\frac{1}{2}$ (by weight) of Syrup of Glucose

The composition of this pill, known also as Pil Rufi, remained much the same for about 300 years, but in 1898 the *BP* omitted the Saffron, the proportions of Aloes and Myrrh remaining the same.

Dose.—4 to 8 grains = 0.26 to 0.52 gramme

Foreign Pharmacopœias—Official in Port and US, with Aromatic Powder in place of Saffron, Purified Aloes 13, Myrrh 6, Aromatic Powder 4, in grammes, Syrup $q\ s$ to make 100 pills. Not in the others

TINCTURA ALOES. TINCTURE OF ALOES

Extract of Aloes, 1, Liquid Extract of Liquorice, 6, Alcohol (45 p.c.), $q\ s$ to make 40 (1 Extract in 40)

Dose.— $1\frac{1}{2}$ to 2 fl drms = 5.4 to 7.1 c.c., when repeated, $\frac{1}{2}$ to 1 fl. drms = 1.8 to 3.6 c.c.

Foreign Pharmacopœias—Official in Belg, 1 in 5; Dutch, Fr., Ger, Ital, Jap, Russ, Span, Swiss, 1 and 5, Hung. and Port, 15 in 100, US, 1 in 10. All are by weight, except US

Tests.—Tincture of Aloes has a sp. gr. of 0.970 to 0.980; it contains from 7 to 8 p.c. w/v of total solids and about 40 p.c. w/v of Absolute Alcohol

Not Official

ALOE CAPENSIS (Cape Aloe) —A translucent variety See p 117

Official in all the Foreign Pharmacopœias

DECOCTUM ALOES COMPOSITUM 'SQUIRE'—See p 121

ENEMA ALOES —Aloes 40 grains, Carbonate of Potassium 15 grains, Mucilage of Starch 10 fl oz —*B P* 1885

Aloes 0.75, Potassium Carbonate 0.25, Glycerin 10, Mucilage of Starch *q s* to produce 100 — *B P C*

PILULA ALOES DILUTA —Marshall Hall's Pill Barbados Aloe 4, dissolve in Water and strain, then add Extract of Liquorice 4, Treacle 4, thinly sliced Hard Soap 4, mix and evaporate to a pilular consistence

Dose —3 or 4 grains = 0.2 or 0.26 gramme

This has been incorporated in the *B P C* as a 4-grain pill

PILULA ALOES ET BELLADONNÆ —Extract of Aloe, 1 grain, Extract of Belladonna, $\frac{1}{2}$ grain

PILULA ALOES ET NUCIS VOMICÆ —Extract of Aloe, 1 grain; Extract of Nux Vomica, $\frac{1}{2}$ grain

Barbados Aloe, 2 grains, Extract of Nux Vomica, $\frac{1}{2}$ grain; Alcoholic Extract of Belladonna, $\frac{1}{2}$ grain, in each pill —*St Thomas's*

This has been incorporated in the *B P C*, using Alcohol (60 p c) as an excipient

PILULA ALOINI COMPOSITA —Aloin, Extract Nucis Vomice, Ferri Sulphatis, Pulv Myrrhæ, Saponis, ana $\frac{1}{2}$ grain —*L '87*, 1.2 (Sir Andrew Clark's Laver Pill)

This has been incorporated in the *B P C*

PILULÆ APERIENTES STAHLII (*Swed*) —Extract Aloe, 6, Extract Rhei Co., 3, Reduced Iron, 2, Rad Althææ, 2, Alcohol (64 p c) and Simple Syrup, *q s* to make 100 pills

PILULÆ ALOES COMPOSITÆ *Syn* BAIRD'S PILLS —Barbados Aloe, in powder, 30, Ipecacuanha Root, in powder, 6, Scammony, 30, Green Extract of Hyoscyamus, 30, Syrup of Glucose, *q s*, in 100 parts. Mix to form a mass and divide into pills weighing 4 grains each —*P J F* and *B P C*

Dr Mair's Pills —Ipecacuanha Powder, 25 grains, Scammony, in powder, 2 drms, Extract of Aloe, 2 drms, Extract of Hyoscyamus, 2 drms, make a mass and divide into 5-grain pills —*Pharm Form*

Aloes Pilulæ Composita —*Belg*, Aloe 10, Scammony 3, Jalap 3, Ginger 4, Soap 10, *Ital*, Aloe 3, Jalap 3, Soap 3

Pilulæ Aloes et Jalap —Equal parts of Aloe, Jalap, Soap and Liquorice —*Jap*

PILULÆ ALOES ET MASTICHES —Purified Aloe, in fine powder, 13 grammes, Mastic, in fine powder, 4 grammes, Red Rose, in powder, 3 grammes, Alcohol (49 p c), *q s* to make 100 pills —*U S P*

Each pill will weigh about 3 grains. They are in imitation of Lady Webster's Dinner Pills, and one of them may be given as a laxative at bedtime or before a meal

Barbados Aloe, in powder, 65, Mastic, in powder, 20, Confection of Roses, 15, in 100 parts. Divide into pills weighing 4 grains each —*B P C*

In Gray's Supplement these pills are given as 3 grains each

PILULA ALOINI ET PODOPHYLLI COMPOSITA —Aloin 2, Capsicin 1, Jalapin 2, Podophyllum Resin 4, Green Extract of Hyoscyamus 1, Extract of Nux Vomica 1, dose of the mass, $\frac{1}{2}$ to 2 grains —*P J F*

Aloin 2, Oleoresin of Capsicum 1, Jalap Resin 2, Podophyllum Resin 3, Extract of Nux Vomica 1, Green Extract of Hyoscyamus 1; in 10 parts. Divide into pills weighing $\frac{1}{2}$ grain each —*B P C*

Little Antibilious Pills. —Podophyllum, 8 grains, Aloin, 6 grains, Jalapin, 6 grains, Capsicin, 8 grains, Ipecacuanha Powder, 3 grains, Extract of

Hvoscjarius 3 grains Extract of Nux Vomica, $2\frac{1}{2}$ grains; Glycerin Tragacanth, $q\ s$ to make a mass. Divide into 60 pills — *Pharm Form*

PILULÆ LAXATIVÆ COMPOSITÆ — Aloin, 1 3, Strychnine, 0 05, Extract of Belladonna Leaves, 0 8, Ipecac, in powder, 0 4, Glycyrrhiza, 4 6, in grammes, Syrup, $q\ s$ to make 100 pills — *U S P*

A modification of this has been incorporated in the *B P C* as follows —

Pilulæ Aloini et Strychninæ Compositæ — Aloin, 50, Strychnine, 5, Green Extract of Belladonna 25, Ipecacuanha, 12 50, Milk Sugar, $q\ s$, Syrup of Glucose, $q\ s$, in 100 parts, divide into $\frac{1}{2}$ -grain pills — *B P C*

PIL GUTTÆ ALOETICÆ (*Swed*) — Aloes, 7; Camboe, 3, Gum Arabic, 3, Galbanum, 4, Carvone, 1 5, Syrup, $q\ s$ to make 100

PULVIS ALOES ET CANELLÆ (*Hiera Picta*) — Powdered Socotrine Aloes, 4, Powdered Canella Bark, 1

This has been incorporated in the *B P C*.

TINCTURA ALOES COMPOSITA *Syn* ELIXIR AD LONGAM VITAM.—
Ger — Aloes, in coarse powder, 3, Gentian, cut middling fine, 0 5; Rhubarb, cut middling fine, 0 5, Zedoary, cut middling fine, 0 5; Saffron, 0 5, Alcohol (70 p c), 100

This has been incorporated in the *B P C*, but with the Alcohol by volume instead of by weight

Austr — Aloes, 30, Gentian, 5, Rhubarb, 5, Zedoary, 5, Saffron, 5; Alcohol, (68 p c), 1000

Fr — Aloes, 25, Agaric, 2 5, Gentian, 2 5, Rhubarb, 2 5, Zedoary, 2 5, Saffron, 2 5, Alcohol (60 p c), 1000.

Ger and *Jap* — Aloes, 30, Gentian, 5, Rhubarb, 5; Zedoary, 5; Saffron, 5, Alcohol (68 p c), 1000

Mex — Aloes, 8, Gentian, 1, Rhubarb, 1, Saffron, 1, Agaric, 1, Treacle, 1, Alcohol (60 p c), 400

Russ — Aloes, 45, Gentian, 5, Rhubarb, 5, Saffron, 5, Alcohol (70 p c), 1000.

Swiss — Aloes, 6, Saffron, 1, Agaric, 1, Myrrh, 1, Gentian, 1, Rhubarb, 1; Zedoary, 1, Alcohol (68 p c), 200

All are by weight

TINCTURA ALOES ET MYRRHÆ — Purified Aloes, 1, Myrrh, 1, Powdered Liquorice Root, 1, Alcohol (94 p c), 75, and Water, 25, mixed $q\ s$ to make 10 — *U S P*

Socotrine Aloes, in powder, 10, Saffron, 5, Tincture of Myrrh, 100 — *Edin Ph* 1841 *Syn* Elixir Proprietatis — *PL* 1721, *B P C*

VINUM ALOES — Socotrine Aloes, $1\frac{1}{2}$ oz, Cardamom Seeds, bruised, 80 grains, Ginger, in coarse powder, 80 grains, Sherry, 2 pints — *B P* 1835

This has been incorporated in the *B P C* as follows —

Socotrine Aloes, crushed, 3 75, Cardamom Seeds, bruised, 0 50, Ginger, in coarse powder, 0 50, Sherry, sufficient to produce 100

Not Official

ALSTONIA.

The dried bark of *Alstonia Scholaris*, R Br, and of *Alstonia Constricta*, F Mull Infusum Alstoniæ (1 in 20), dose $\frac{1}{2}$ to 1 fl oz = 14 2 to 28 4 c.c., and Tincture Alstoniæ (1 in 8), dose 30 to 60 minims = 1 8 to 3 6 c.c., are official in *Ind* and *Col Add.* for India and the Australian and Eastern Colonies.

Not Official.

ALTHÆÆ RADIX.

MARSHMALLOW ROOT.

Fr, GUIMAUME, *Ger*, EIBISCHWURZEL, *Ital*, ALTEA; *Span*, ALTEA.

Descriptive Notes — The root of the *Althæa officinalis*, Linn. Marsh-mallow root occurs in commerce in two forms, viz — (1) The natural root dried,

and (2) the root with the outer bark removed. The former is usually sold by herbalists, the latter by pharmacists. The natural root bears some resemblance to Liquorice root, in its external characters, the surface having short transverse scars, the bark being tough and finely fibrous. It is, however, white internally (Liquorice is yellowish-white) and finely fibrous and has a mucilaginous instead of a sweet taste. The decorticated root is often larger than the natural root, and deeply grooved longitudinally. The larger decorticated roots are probably often derived from the allied species *A. Narbonensis*, L. Both are very mucilaginous. It is necessary to preserve the root in a dry place, or the syrup prepared from it will turn yellowish and have a disagreeable odour. Lozenges made of the powdered root with gum and flavoured with orange flower water are sold as *Pastilles de Gumaueve*. The powder is also used in pill masses.

Medicinal Properties—It is much employed on the Continent as a demulcent in irritation and inflammation of the mucous membranes of the mouth and pharynx.

Official in all the Foreign Pharmacopœias

The two substances **Asparagin** and **Betain** have been extracted from *Althæa* root.

Asparagin dissolves Mercuric Oxide, but the Oxide must be freshly precipitated. A solution is best prepared by precipitating Mercuric Chloride Solution, washing the precipitated Oxide and dissolving it in solution of **Asparagin**. The solution has been employed as a hypodermic injection in the treatment of syphilis.

DECOCTUM ALTHÆÆ—*Althæa* Root, 1, Water, 30, boil to 20. This has been incorporated in the *B P C*.

SYRUPUS ALTHÆÆ—Macerate 3 of *Althæa* Root in 40 of Water for twelve hours, strain, press, and filter until 32 have passed through, to this add 64 of Sugar, dissolve warm, and heat the Syrup to boiling, when cold, skim and strain through flannel.

This has been incorporated in the *B P C*.

Foreign Pharmacopœias—Official in all except Belg, Fr and U S.

TROCHISCI ALTHÆÆ—About 1 gram in each lozenge. Demulcent. Valuable after excision of tonsils or uvula.

Foreign Pharmacopœias.—Official in Ital, Mex. (*Pastillas de Altea*), Span. Not in the others.

ALUMEN.

$\text{Al}_2(\text{SO}_4)_3, \text{K}_2\text{SO}_4, 24\text{H}_2\text{O}$, eq 941.94

$\text{Al}_2(\text{SO}_4)_3, (\text{NH}_4)_2\text{SO}_4, 24\text{H}_2\text{O}$, eq 900.16

FR, ALUN DE POTASSIUM, GER, KALIALAUN, ITAL, SOLFATO DI ALLUMINIO E DI POTASSIO, SPAN, SULFATO ALUMINICO-POTASSICO

Both salts are official, Potash Alum (Aluminium and Potassium Sulphate), and Ammonia Alum (Ammonium and Aluminium Sulphate). They are practically alike in appearance, occurring in large colourless octahedral crystalline masses, possessing a sweetish and very astringent taste.

Solubility. -1 in 11 of Water, 3 in 1 of boiling Water; Potash Alum, 1 in 3 of Glycerin, Ammonia Alum, 1 in 1½ of Glycerin. Insoluble in Alcohol (90 p.c.) *

Alum when heated melts in its own Water of crystallisation.

Medicinal Properties—Astringent, used as a gargle, mouth-wash, or spray for tonsillitis, aphthous conditions of the mouth, and pharyngitis, 10 grains in 1 oz of Water, as an injection in leucorrhœa and gonorrhœa, 60 grains in a pint of Water, as a nasal douche in chronic ozœna, 4 grains in 1 oz of Water, as a snuff in epistaxis, 6 grains mixed with 1 grain of Starch, as a lotion in purulent ophthalmia, 2 to 6 grains in 1 oz of Water. 10 to 15 grains three times a day have been given for internal hæmorrhage, such as that of typhoid or gastric ulcer, also for menorrhagia, and in cases of lead poisoning, arrests excessive secretion in dysentery, diarrhœa and night sweats; vomiting caused by the cough of phthisis is sometimes checked by 6 to 10-grain doses of Alum. A saturated solution of Water forms an excellent styptic for hæmorrhage of rectum, bleeding hæmorrhoids, epistaxis, etc., the glycerin of alum is used in inflamed tonsils. 60 grains have been recommended as an emetic in croup. Dried Alum is escharotic, used for warty growths and to stimulate indolent ulcers, and to destroy exuberant granulations and to remove nævi.

Dose—5 to 10 grains = 0.32 to 0.65 grammes

Prescribing Note—*Mostly used in aqueous or Glycerin solution*

Incompatibles.—Alkalis and their Carbonates, and Tannic Acid.

Official Preparations—Glycerinum Aluminis, Alumen Exsiccatum

Not Official—Alum Rose Gargle, Alumina, Aluminis, Aluminium Acetate Solution, Aluminium Aceto-Tartrate, Aluminium Chloride, Aluminium Nitrate, Aluminium Nitrate, Aluminium Oleate, and Aluminium Sulphate, Pessus Alu., and Zinc, Pulvis pro Pedibus

Foreign Pharmacopœias—Official in Austr., Bel., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex. (Sulfato de Aluminio y Potasio), Norw., Port., Russ., Span. (Sulfato Aluminico-Potasio), Swed., Swiss and U.S. All of them use Potash Alum only

Tests.—The distinguishing tests for Alum are that it shall yield, when dissolved in Water, a white gelatinous precipitate with Ammonia Solution or with Potassium or Sodium Hydroxide Solution, the white precipitate produced by Ammonia Solution is practically insoluble in excess of the reagents, whilst that produced by solution of Potassium or Sodium Hydroxide dissolves and is again reprecipitated by sufficient Ammonium Chloride Solution, indicating the presence of Aluminium. When boiled with Potassium or Sodium Hydroxide Solution it evolves a strong ammoniacal odour, and the issuing gas has a strongly alkaline reaction towards moistened red Litmus paper, indicating the presence of Ammonia, or a saturated aqueous solution yields with Tartaric Acid Solution or Sodium Bitartrate Solution a white crystalline precipitate within half an hour, indicating the presence of Potassium. It yields a white precipitate, insoluble in Hydrochloric Acid, on the addition of Barium Chloride Solution, indicating the presence of Sulphates.

The more generally occurring impurities are Calcium, Copper, Iron, and Lead.

The aqueous solution should, when faintly acidified with Hydrochloric Acid, be unaffected by Hydrogen Sulphide Solution, indicating

the absence of Copper and Lead, and when this solution is rendered alkaline by the addition of a sufficient excess of Ammonia Solution it should not materially darken in colour, indicating the absence of more than traces of Iron. The *P G* and *U S P* include a separate test for Iron which is given under the heading of Potassium Ferrocyanide Solution in the small type below, it should not afford a distinct turbidity on the addition of Ammonium Oxalate Solution, indicating the absence of more than traces of Calcium.

In *U S P* and *P G* only the Potash Alum is official. The *U S P* requires that it shall contain not less than 99.5 p.c. pure Aluminium Potassium Sulphate, and it shall lose 45.55 p.c. of its weight when all of its Water of crystallisation is driven off.

Potassium Ferrocyanide Solution—20 c.c. of a solution (1-20) should not be coloured blue immediately by 0.5 c.c. Potassium Ferrocyanide T.S., *P G* and *U S P*.

Preparations

GLYCERINUM ALUMINIS. GLYCERIN OF ALUM

Powdered Alum, 1 oz., Distilled Water, 3 fl. dm., Glycerin, *q s*
to make 6 oz. (1 in 6)

Pure Alum should and does dissolve clear in Glycerin, but commercial Pulv. Aluminis, as a general rule, will not dissolve without residue except after prolonged boiling.

A powerful local astringent. When diluted with Water it forms a useful gargle.

Sometimes prescribed with an equal quantity of Glycerin of Tannic Acid.

ALUMEN EXSICCATUM. EXSICCATED ALUM *Syn*—ALUMEN USTUM

Potash Alum, deprived of its Water by heat. It yields about 55 p.c. of product.

Foreign Pharmacopœias—Official in Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Norw., Port., Russ., Span., Swiss and U.S.

Not Official

ALUM ROSE GARGLE—Broken Rose petals, 3 drms., Diluted Sulphuric Acid, 3 fl. drms., cold Distilled Water, 10 fl. oz., digest for two hours, and strain 8 fl. oz., then add Alum, 2 drms., Sugar, 4 dm., Alcohol (90 p.c.), 4 fl. drms., dissolve. This kept well for seven years. To be mixed with an equal bulk of Water before use.

Gargarisma Aluminis—Alum, 2, Acid Infusion of Roses, *q s* to produce 100.—*B P C*

GOSSYPIUM ALUMINIS—Contains about 30 p.c. of Alum.

PESSUS ALUMINIS.—Alum, 15 grains, Oil of Theobroma, 2 drms.—*Westminster*

This has been incorporated in the *B P C*.

PESSUS ALUMINIS ET ZINCI—Exsiccated Alum, 5 grains, Zinc Sulphate, 5 grains, Opium, in powder, 1 grain, Basis, 60 grains.—*London*
Alum, 5 grains, Zinc Sulphate, 5 grains, Basis, 120 grains.—*B P C*

ALUMINIUM ACETATE SOLUTION (*Austr., Belg., Dutch, Ger., and Russ.*)—A clear colourless liquid, with an acid reaction and a faint odour of Acetic Acid, obtained by double decomposition between Aluminium Sulphate and Calcium Acetate. Sp. gr. 1.044 to 1.048. Contains $7\frac{1}{2}$ to 8 p.c. Aluminium Acetate.

This has been incorporated in the *B P C*

Swiss, sp gr 1 055 to 1 059 Contains 10 p c

It is also known as **Burow's Solution**.

A good antiseptic, preferred by some to Carbolic Acid for dressing lacerated wounds

ALUMINIUM ACETO-TARTRATE — Crystals soluble in their own weight of Water Official in Dutch

A powerful, non-poisonous antiseptic, also an astringent caustic

A solution has been sold under the name **Alsol** — *P J* '01, 1 665

A solution containing 10 p c is official in *Swiss*

30 to 60 grains in a pint of Water make a useful gargle or douche.

ALUMINIUM CHLORIDE — A colourless, crystalline mass, giving off fumes of Hydrochloric Acid gas, and becoming damp on exposure to air The crystals form a crystalline powder, chiefly of a yellow colour owing to the presence of iron as an impurity

Dose — 5 to 8 grains = 0 32 to 0 52 gramme

The use of Aluminium Chloride in doses of 5 grains = 0 32 gm. upwards several times a day has proved remarkably efficacious in ataxia — *L* '99, 11 1826

Hydrated Aluminium Chloride is official in *Russ*

Under the names of **Chloralum** and **Chloralum Powder**, preparations containing Aluminium Chloride have been introduced as disinfectants

ALUMINIUM CHLORIDE SOLUTION — Obtained by dissolving Aluminium Hydrate in Hydrochloric Acid A pale yellow liquid. Sp. gr. 1 250 Gargle 12 minims to 1 oz of Water, Spray, 3 minims to 1 oz, Paint, 15 minims to 1 oz Astringent and antiseptic

ALUMINIUM NITRATE — A solution (4 or 6 grains in 1 oz of Water) has been used with success in pruritus vulvæ

ALUMINIUM NAPHTHOL-SULPHONATE (Alumzol) — A whitish powder, readily soluble in Water, introduced as an antiseptic — *P J* (3) xxiii. 605, *C D* '93, 1 94

In treatment of metrorrhagia Used as an intra-uterine injection, with Tincture of Iodine (Alumzol, 2 5, Tincture of Iodine, 25, Absolute Alcohol, 25) by means of an intra-uterine syringe — *M A* '99, 408

Dose — 4 to 8 grains = 0 26 to 0 52 gramme, as an astringent.

ALUMINIUM OLEATE. — A powder Mixed with oil of Lemon, used as a styptic and antiseptic, in checking the progress of eczema — *L* '84, 11 123

ALUMINIUM SULPHATE — White crystalline cakes, or in a white powder, having a sweetish and somewhat astringent taste It is soluble 1 in 1 of Water, insoluble in Alcohol (90 p c) Astringent and antiseptic.

Foreign Pharmacopœias — Official in Austr, Belg, Dan, Dutch, Fr., Ger, Jap, Russ, Swed, Swiss and U S

Tests — Aluminium Sulphate dissolves readily in Water, forming a solution which has a strong acid reaction towards blue Litmus paper, this solution yields with Ammonia Solution a white precipitate practically insoluble in excess of the reagent, with Potassium Hydroxide Solution it yields a white gelatinous precipitate soluble in excess of the reagent, but which is again precipitated on the addition of Ammonium Chloride The solution yields with Barium Chloride Solution a white precipitate insoluble in Hydrochloric Acid It should contain about 99 p c of pure crystallised Aluminium Sulphate, and shall lose not more than 45 7 p c of its weight when deprived of its Water of crystallisation

It should yield no odour of Ammonia when boiled with Potassium Hydroxide Solution, indicating the absence of Ammonium salts When slightly acidified with diluted Hydrochloric Acid the aqueous solution should not afford an appreciable darkening in colour or a turbidity, on the addition of Hydrogen Sulphide, indicating the absence of more than the slightest traces of Copper

Lead, nor should it be materially darkened in colour on the subsequent addition of Ammonia Solution in slight excess, indicating the absence of more than a trace of Iron

A clear filtered aqueous 10 p c w/v solution of the salt should not become more than faintly opalescent within 5 minutes upon the addition of an equal volume of Tenth-normal Volumetric Sodium Thiosulphate Solution, indicating the limit of free acid

Aluminium Caseinate—A yellowish white, tasteless powder Insoluble in Water Introduced as an intestinal astringent

Dose—5 grains = 0.32 gramme

Salumin Insoluble (Aluminium Salicylate), **Salumin Soluble** (Aluminium and Ammonium Salicylate), **Alkasal** (Aluminium Potassium Salicylate), **Boral** (Aluminium Borotartarate), **Cutol** (Aluminium Borotannate), are preparations containing Aluminium, which have been noticed in medical literature

CIMOLITE—The mineral has yielded on analysis Alumina, 23, Silica, 63, Ferric Oxide, 1.25, Water, 12

A proprietary Toilet article, which is a silicate in very fine powder, is sold under the name 'Cimolite'

FULLER'S EARTH has yielded on analysis Alumina, 10, Silica, 53, Lime, 0.5, Magnesia, 1.25, Ferric Oxide, 9.5, Water, 24

SOAPSTONE, CRETA GALLICA, is a Silicate of Aluminium and Magnesium Is used in prungeo and as a dusting powder for infants, alone or mixed with equal parts of Zinc Oxide or Calamine

AMMONIACUM.

AMMONIACUM

FR, GOMME AMMONIAQUE, GER, AMMONIAGUMMI, ITAL, GOMMA AMMONIACO, SPAN, GOMA AMONIACO

A gum-resin, obtained from *Dorema Ammoniacum*, D Don, and probably other species

It is collected in Persia

Solubility—Sparingly in Water, but forms with it a nearly white emulsion, when 50 grains were digested in 2 oz of Alcohol (90 p c), 40 grains were dissolved, with Alcohol (60 p c) 30 grains were dissolved

Medicinal Properties.—Antispasmodic, stimulant, expectorant, useful in chronic bronchitis and asthma of old people, either in mixture or in pill, as a plaster to promote absorption in chronic synovitis and glandular swellings

Dose.—5 to 15 grains = 0.32 to 1 gramme

Prescribing Notes—Generally given as *Mistura Ammoniaci*, may be combined with *Tincture of Squill*, or *Fetid Spirit of Ammonia*

Official Preparations—*Emplastrum Ammoniaci cum Hydrargyro* and *Mistura Ammoniaci* Contained also in *Emplastrum Galbani*, in *Pilula Scillæ Composita*, and *Pilula Ipecacuanhæ cum Scillâ*

Not Official—*Pilula Ammoniaci Opiatæ*, *Emplastrum Gummi Resinosum*

Foreign Pharmacopœias.—Official in Austr, Belg, Dan, Dutch, Ger, Hung, Ital, Jap, Mex (*Goma resina Ammoniaco*), Norw, Port, Russ, Span., Swed, and Swiss, Fr., purified by 60 p c Alcohol

Descriptive Notes—Commercial Ammoniacum is imported from Persia, and is believed to be obtained also from *D. Aucheri*, Boiss. It occurs generally in the form of rounded nodules or tears varying in size up to 1 inch (25 mm) in diameter, although averaging only about $\frac{1}{2}$ inch (12 mm). When recently collected the tears are yellowish-white or nearly white, dull externally and opaque internally with a white, slightly polished, fracture, and have an acid, slightly bitter, characteristic taste. Occasionally masses consisting of tears welded together are imported, but these usually contain more or less impurity. When the drug has been long kept the tears assume a brownish-yellow tint.

The official description allows the use of both pale yellow and brownish tears, which may be either white or brownish yellow internally, and they may vary in size from $\frac{1}{4}$ to 1 inch (6 to 25 mm). The odour must not be alliaceous.

Tests—The tests for Ammoniacum are its physical properties, of a Salicylic Acid reaction with Ferric Chloride Solution, a yellow to a brown coloration with Potassium Hydroxide Solution, and an orange-red coloration with Chlorinated Soda Solution.

BP has not yet adopted the determination of the Acid and Saponification values as a means of detecting gums and gum-resins. Notwithstanding the difficulty experienced in sampling and the wide variations between the figures yielded by different specimens, a determination of these constants may often afford a valuable criterion of the purity of a sample. Good commercial Ammoniacum has an Acid value of 92 to 105, and a Saponification value of 145 to 162 according to Dieterich. A sample of good commercial 'tear' Ammoniacum examined in the author's laboratory had an ash limit of 2.15, and gave an Acid value of 106.7, a Resin value of 153.03, a Gum value of 23.87, and a Saponification value of 176.9. A sample of 'mass' Ammoniacum showing an ash limit of 2.55 p.c., gave an Acid value of 101.04, a Resin value of 144.61, a Gum value of 21.06, and a Saponification value of 165.67; 2 samples of powdered Ammoniacum yielding respectively 1.3 and 7.05 p.c. of ash, gave in each instance Acid values of 101.01, Resin values respectively of 150.22 and 153.03, Gum values of 18.26 and 9.83, and Saponification values of 168.48 and 162.86. Dieterich gives the Resin value of commercial varieties as 99.1 to 155.4, the Gum value as 7 to 46.2, and ash of not over 10 p.c.

The more generally occurring impurities are excess of mineral matter and an excessive proportion of matter insoluble in Alcohol (90 p.c.). The absence of Umbelliferone serves to distinguish it from Asafoetida and Galbanum. The *BP* method of performing this test by heating the gum-resin strongly in a dry test tube, cooling, boiling with Water, diluting the resulting liquid largely with Water and making alkaline with Ammonia, is considered unsatisfactory, the result of the test depending greatly on the manner in which the gum-resin is heated. The *PG* test is a more scientific one and is

capable of detecting 2 p c of Galbanum with certainty. The Ammoniacum is boiled with three times its weight of strong Hydrochloric Acid for a quarter of an hour, whereby the Umbelliferone is split off from its natural Ester, the fluid is filtered, and the filtrate supersaturated with Ammonia Solution. It should not exhibit a blue fluorescence when examined by reflected light.

The *B P* gives no indication of the limit of matter insoluble in Alcohol (90 p c), nor of the amount of mineral matter. *P G* on the other hand specifies that the insoluble matter remaining after complete exhaustion of the gum-resin with boiling Alcohol (90 p c) shall amount at the highest to 40 p c, and fixes the ash limit at not more than 5 p c, which is somewhat low. A limit of 7.5 p c of ash has been suggested. The average of a number of good commercial samples examined in the author's laboratory was 6 p c.

Preparations

EMPLASTRUM AMMONIACI CUM HYDRARGYRO. *See* HYDRARGYRUM

As the value of this preparation depends chiefly upon the Mercury it contains, the formula is given under Hydrargyrum.

MISTURA AMMONIACI. AMMONIACUM MIXTURE

Ammoniacum, in coarse powder, $\frac{1}{4}$ oz, Syrup of Tolu, 4 fl drms,
Distilled Water, $7\frac{1}{2}$ fl oz (1 in 32)

Dose — $\frac{1}{2}$ to 1 fl oz = 14.2 to 28.4 cc

Foreign Pharmacopœias — Official in Spain (Emulsion), 1 in 33 with White Wine. Not in the others.

Not Official

PILULÆ AMMONIACI OPIATÆ (*Swed*) — Ammoniacum, 10, Myrrh, 5, Squills, 2, Opium, 1, Water, *q s* to make 100 pills.

EMPLASTRUM GUMMI RESINOSUM — Is official in *Dan* and *Norw*. *Swiss* containing 6 p c of Ammoniacum, *Port* (Emplastio Gummo resinoso) containing 2 p c of Ammoniacum. Made with Emplastrum Plumbi.

AMMONIÆ LIQUOR FORTIS.

STRONG SOLUTION OF AMMONIA

A transparent, colourless, very alkaline liquid, with an overpowering pungent smell, containing 32.5 p c (or more correctly 32.35 p c) by weight of Ammonia, NH_3 , eq 16.94.

It should be preserved in well-stoppered glass bottles, which should be kept in a cool atmosphere. Great care should always be exercised in dealing with the liquid.

It may be prepared by the decomposition of an Ammonium salt, usually the Chloride, with Calcium Hydroxide, the resulting gas being dissolved in Water.

In commerce Liquor Ammoniae Fortis is generally sold of sp gr 0.880

K 2

Medicinal Properties.—Usually given in the more diluted form of Solution of Ammonia See below

Official Preparations—Of **Liquor Ammoniae Fortis**, Liquor Ammoniae, Spiritus Ammoniae Fetidus Contained in Linimentum Camphorae Ammoniatum, Linimentum Hydrargyri, and Tinctura Guaiaci Ammoniatum Used in the preparation of Ammonii Benzoas, Ammonii Bromidum, Ammonii Phosphas, Spiritus Ammoniae Aromaticus, and Spiritus Ammoniae Fetidus Of the **Liquor Ammoniae**, Linimentum Ammoniae Contained in Tinctura Ergotae Ammoniatum, Tinctura Opii Ammoniatum, Tinctura Quinine Ammoniatum, Tinctura Valerianae Ammoniatum Used in the preparation of Liquor Bismuthi et Ammonii Citratis, and the scale preparations of Ison

Not Official—Alcohol Ammonia, Lotio Crinalis, Oleate of Ammonia, Liquor Ammoniae Detergens, and Tinct Ammon Comp (Eau de Luce)

Antidotes.—Acetic Acid or Vinegar well diluted with Water, demulcent drinks

Foreign Pharmacopoeias—Official in Belg (Ammonium Hydricum Solutum), sp gr 0.935, 17 p.c., Fr (Ammoniaque Officinale), sp. gr. 0.925, 'U. S. P.' sp gr 0.925, 20 p.c., Mex (Ammoniac), sp gr 0.920, 'U. S. P.' (liquida), sp gr 0.916, Spain (Ammoniac), sp gr. 0.923, U.S. (Aqua Ammoniae Fortior), sp gr 0.897 at 25° C (77° F), 28 p.c., see also Liquor Ammoniae

Tests.—The distinguishing tests are the powerful ammoniacal odour combined with the specific gravity and the volumetric determination figure The *BP* specific gravity is 0.891 at 15.5° C (60° F), the *USP* is 0.897 at 25° C (77° F) It is officially required to indicate 32.35 p.c. by weight of Ammonia (NH_3) as ascertained by titration with Normal Volumetric Solution of Sulphuric Acid It is officially described as containing 32.5 p.c. by weight of NH_3 The *BP* does not mention an indicator; the *USP* gives the choice of Litmus or Methyl Orange Solution

So far as impurities are concerned Liquor Ammoniae Fortis should respond to the tests given under Liquor Ammoniae, *qv*

Aqua Ammoniae Fortior *USP* when diluted with twice its volume of Distilled Water should respond to the *USP* volumetric test given under Liquor Ammoniae The *PG* recognises only the dilute Ammonia

LIQUOR AMMONIAE. SOLUTION OF AMMONIA.

A clear, colourless liquid, containing 10 p.c. by weight of Ammonia, NH_3 ; prepared by mixing 1 of strong Solution of Ammonia with 2 of Distilled Water

It possesses a characteristic pungent odour, a powerfully caustic taste, and strongly alkaline reaction

It should be preserved in well-stoppered bottles, which should be kept in a cool atmosphere

Medicinal Properties—A general stimulant Externally (applied to the nostrils) in syncope, an excellent application to the sting of a wasp or the bites of insects On the skin it is a powerful rubefacient, and in embrocations it is used as a counter-irritant for pain, stiffness of joints, bronchitis, etc Was at one time used by injection as an antidote to snake bites, but Potassium Permanganate is now considered a better antidote.

Dose —10 to 20 minims = 0·6 to 1·2 c c, well diluted

Prescribing Note —*Ammonia is more generally prescribed internally in the form of Spiritus Ammonia Aromaticus or of Ammonium Carbonate*

Official Preparations —*Linimentum Ammonia* Used in the preparation of *Ammonii Benzoas*, *Ferri et Ammonii Citras*, *Ferri et Quininae Citras*, *Ferrum Tartaratum*, *Liquor Bismuthi et Ammonii Citratis*, *Tinctura Opii Ammoniata*, *Tinctura Quininae Ammoniata*

Not Official —*Liquor Ammonii Anisatus*, *Spiritus Ammonii Anisatus*, *Spiritus Ammonia Foeniculi* *utis*, *Spiritus Ammonia*

Foreign Pharmacopœias —Official in Austr., Dan., Dutch, Fr. (*Ammoniaque Diluée*), Ger., Hung., Jap., Norw., Russ., Swed., Swiss, 10 p c, U.S. (*Aqua Ammonia*), 10 p c, sp gr 0·958 at 25° C (77° F), Belg., Fl., Ital., Mex., Port., Span. and U.S., see *Ammon. Liq. Fort.*

Tests —The distinguishing tests for *Liquor Ammonia* are the pungent ammoniacal odour, the sp gr at 15·5° C (60° F), which should be 0·959 [0·958 at 25° C (77° F)], *USP*, 0·960, *PG*], and that it is officially required to indicate 10 p c by weight of Ammonia (NH_3) when titrated with Normal Volumetric Sulphuric Acid Solution. Neither *BP* nor *PG* make any reference to the indicator of neutrality to be used, the *USP* states Litmus or Methyl Orange Test-solution, the latter is usually employed, Phenolphthalein Solution being useless.

The *BP* volumetric test indicates 10·0 p c by weight of Ammonia (NH_3), the *PG* 9·95 p c to 10·0 p c by weight. *USP* defines it as containing 10 p c by weight of Ammonia gas.

When a glass rod moistened with Hydrochloric Acid is brought near Ammonia Solution dense white fumes of Ammonium Chloride are given off. Ammonia Solution when sufficiently highly diluted yields on the addition of Potassio-mercuric Iodide (Nessler's) Solution a characteristic brown coloration, which in the presence of much Ammonia changes to a brown or reddish-brown precipitate.

The more generally occurring impurities are empyreumatic and mineral matter, heavy metals, *eg*, Arsenic, Iron, Lead, and Zinc, Ammonium Carbonate or Carbamate, Calcium Carbonates, Chlorides, and Sulphates. The *BP* specifically mentions a test for absence of tarry matters, requiring that no colour or odour should be produced on the addition of a slight excess of Hydrochloric Acid to a mixture of equal volumes of Ammonia and Water, but is content to group the remainder without any regard to their relative importance under the expression 'it shall yield no characteristic reaction for,' etc. When rendered faintly acid by the addition of Hydrochloric Acid it should be unaffected by Hydrogen Sulphide Solution, indicating the absence of Arsenic and Lead. On subsequently rendering the solution again alkaline by the addition of Ammonia Solution no perceptible darkening in colour or turbidity should be produced, indicating the absence of more than a faint trace of Iron or Zinc. The solution should not effervesce on the addition of diluted Hydrochloric Acid, indicating the absence of Carbonates, when almost neutralised with Hydrochloric Acid it should not yield an opalescence on the addition of Ammonium Oxalate Solution, indicating the absence of Calcium. When super-saturated with Nitric Acid it shall yield little or no turbidity on the

addition of Silver Nitrate Solution, nor on the addition of Barium Chloride Solution, indicating the absence of more than traces of Chlorides and Sulphates. The *USP* and *PG* require the neutralised acid to yield, on evaporation, a residue which is completely volatilised on ignition, the *PG* also requires the residue to be colourless. No reference to fixed or volatile character of the residue left on evaporation occurs in the *BP*. The *PG* requires that when diluted with 4 times its volume of Calcium Hydroxide Solution it should show only a faint turbidity after the lapse of one hour, indicating the absence of Ammonium Carbonate and Carbamate. No test similar to this appears in the *BP*. The test with Decinormal Volumetric Potassium Permanganate Solution for readily oxidisable organic impurities is peculiar to the *USP*. If 0.1 c.c. of Tenth-normal Volumetric Potassium Permanganate Solution be added to 10 c.c. of Ammonia Solution, slightly supersaturated with diluted Sulphuric Acid, the pink colour should not be completely destroyed within 10 minutes.

Volumetric Determination.—1 gramme neutralises 59 cc of VS of Sulphuric Acid, *BP*, 5 cc should require 28 to 28.2 cc Normal VS. of Hydrochloric Acid, *PG*, the *USP* gives the following directions for making the determination —Introduce into a stoppered weighing bottle 3 cc of Ammonia Water and weigh accurately Dilute with 50 cc of Distilled Water and titrate with normal VS of Sulphuric Acid, using Litmus or Methyl Orange TS as indicator Multiply the number of cc of the VS of Sulphuric Acid consumed by 1.693, and divide this product by the weight of the Ammonia Water taken, the quotient represents the percentage of Ammonia gas

Preparations.

LINIMENTUM AMMONIÆ. LINIMENT OF AMMONIA.

Solution of Ammonia, 1, Almond Oil, 1, Olive Oil, 2	Mix by
shaking	(1 in 4)

Cotton Seed, Sesame and Nut Oils have each been recommended, but Cotton Seed is the only Oil which makes a satisfactory and permanent Emulsion

Foreign Pharmacopœias.—Official in Austr, Dutch, Hung and Jap, 1 and 4 Sesame Oil, Belg, 1 and 9 Medicinal Oil, Fr, 1 and 9 Olive Oil, Ger, Liq Am 1, Olive Oil 3, Poppy Oil 1, Ital, 1 and 4 Olive Oil, Mex, 1 Sesame Oil 9, also 1, sesame Oil 4; Port, 1 and 4 Almond Oil, Russ, Liq. Am 1, Olive Oil 3 Sesame Oil 1, Span, 1 and 9 Olive Oil, Swed, 1 and 3 Olive Oil, Swiss, 1 and 3 Sesame Oil, U S, Am 35, Alcohol 5, Cotton Seed Oil 57, Oleic Acid, 3. Not in Norw. All by weight, except U S.

SPIRITUS AMMONIÆ AROMATICUS. See AMMONII CARBONAS.

SPIRITUS AMMONIÆ FETIDUS FETID SPIRIT OF AMMONIA

Asafetida, $1\frac{1}{2}$, strong Solution of Ammonia, 2, Alcohol (90 p c),
to make 20. (14 in 20)

Nervine stimulant and antispasmodic, useful in hysteria

Dose.—For repeated administration, 20 to 40 minims = 1·2 to 2·4 c c , for a single administration, 60 to 90 minims = 3·6 to 5·3 c c .

Tests.—A clear, almost colourless liquid, possessing a pungent

ammoniacal and alliaceous odour. It has a specific gravity of 0.848, and it is officially required to contain 2.88 grammes of Ammonia (NH_3) per 100 c.c. as indicated by titration with Normal Volumetric Sulphuric Acid Solution, using Methyl Orange Solution as an indicator of neutrality. The *B.P.* does not include a figure for specific gravity, but gives the volumetric test, it, however, does not state what indicator of neutrality is to be employed.

Not Official

ALCOHOL AMMONIA—Absolute Alcohol saturated with Ammonia gas. It contains about 14 p.c. of NH_3 .

It is used in filling and renovating Smelling Salt bottles.

LOTIO CRINALIS—Ol. Amygdal., 1 fl. oz., Liq. Ammon. Fort., 1 fl. oz., Sp. Rosmar., 4 fl. oz., Aq. Mellis, 2 fl. oz.

This has been incorporated in the *B.P.C.* as follows—

Almond Oil, 12.50, Strong Solution of Ammonia, 12.50, Oil of Rosemary, 0.50, Alcohol, 50, Honey Water, *q.s.* to produce 100.

SPIRITUS or LIQUOR AMMONII ANISATUS

Austr. and *Ger.*—Anethol, 1, Alcohol, 24, Solution of Ammonia, 5.

Belg. (Ammonia Spiritus Anisatus)—Anethol, 8, Alcohol, 77, Solution of Ammonia, 20.

Hung. and *Russ.*—Oil of Anise, 1, Alcohol, 24, Solution of Ammonia, 6.

Ital. and *Span.*—Oil of Anise, 1, Alcohol, 24, Solution of Ammonia, 5.

Dan., *Norw.* and *Swed.*—Oil of Anise, 1, Alcohol, 32, Solution of Ammonia, 7.

Dutch.—Oil of Anise, 1, Alcohol, 19, Solution of Ammonia, 5.

Swiss.—Oil of Anise, 3, Alcohol, 77, Solution of Ammonia, 20.

All by weight.

B.P.C. (Liquor Ammonia Anisatus)—Anethol, 3.50, Solution of Ammonia, 16.50, Alcohol, *q.s.* to produce 100.

Spiritus Ammonia Foeniculatus—Oil of Fennel, 3, Alcohol, 80, Ammonia Water, 17—*Jap.*

Spiritus Ammonia—Stronger Ammonia Water, 250, Alcohol, *q.s.* to make the product contain 10 p.c. by weight of Ammonia Gas—*U.S.*

OLEATE OF AMMONIA—Oleic Acid, 1 oz., Spirit, 1 oz., Solution of Ammonia, 7 oz., Distilled Water, to 16 oz. Pour the acid into a bottle, mix the Spirit and Ammonia, and pour into the bottle. Cork tightly, and allow to stand a week or more until saponification is complete. This is suitable for adding to Solution of Ammonia (1 to 8) to make a household article—*Pharm. Form.*

Liquor Ammonia Detergens *Syn.* Household Ammonia—Strong Solution of Ammonia, 30, Oleic Acid, 6, Alcohol, 6, Distilled Water, *q.s.* to produce 100—*B.P.C.*

Note—If a 'cloudy' preparation be desired, about half of the Distilled Water in the above formula should be replaced by hard tap Water, the exact proportion depending upon the amount of total solids in the hard Water—*B.P.C.*

TINCTURA AMMONIAE COMPOSITA EAU DE LUCE—Mastic, 2 drms., Alcohol (90 p.c.), 9 fl. drms., Ol. Lavand., 14 minims, Liquor Ammonia Fortis, 20 fl. oz.

This has been incorporated in the *B.P.C.* as follows—

Mastic, 1.25, Alcohol, 5.50, Oil of Lavender, 0.15, Strong Solution of Ammonia, *q.s.* to produce 100.

Stimulant, antispasmodic. Has been used in tropical countries as an application to snake bites.

Dose.—5 to 10 minims = 0.3 to 0.6 c.c., in Water.

AMMONII BENZOAS.**AMMONIUM BENZOATE**

FR, BENZOATE D'AMMONIUM, GER, AMMONIUMBENZOAT, ITAL, BENZOATO DI AMMONIO, SPAN, BENZOATO AMONICO

Fine, white laminar crystals, or a crystalline powder, odourless or possessing a faint odour of Benzoin, and a saline taste. It is produced by the combination of Benzoic Acid with Ammonia. It gradually loses Ammonia on exposure to air.

Solubility—1 in 6 of Water, 1 in 22 of Alcohol (90 p.c.), 1 in 8 of Glycerin.

It will not quite dissolve 1 in 5 of Water, as sometimes stated.

Medicinal Properties.—Valuable in chronic vesical catarrh with alkaline urine and phosphatic deposit, and in chronic bronchial catarrh with much secretion. It is more soluble than Benzoic Acid, and therefore should be preferred, and is less irritant to the alimentary canal.

An intestinal antiseptic in typhoid—*M A '94*, 555

Dose.—5 to 15 grains = 0.32 to 1 gramme

Prescribing Note.—*Usually given in solution*

Incompatibles.—Acids, Liquor Potassæ, and Ferric salts

Foreign Pharmacopœias—Official in Jap, Mex, Port, Russ, Span, Swiss and U.S.

Tests.—The distinguishing tests for Ammonium Benzoate are the odour of Ammonia, which is evolved when its aqueous solution is heated with Solution of Potassium or Sodium Hydroxide, the yellowish-brown coloration, produced when its sufficiently diluted solution is mixed with Potassio-mercuric Iodide (Nessler's) Solution, and the buff-coloured precipitate thrown down when its sufficiently concentrated aqueous solutions are acidified with a mineral acid, and the characteristic buff-coloured precipitate produced on adding Test-solution of Ferric Chloride to its aqueous solution. The *U.S.P.* requires that it should contain not less than 98 p.c. of pure Ammonium Benzoate, but does not state a method of determination.

The more generally occurring impurities are mineral matter, shown by a residue being left on ignition, free Benzoic Acid, indicating imperfections in the process of manufacture, and detected by the reaction of its cold aqueous solution towards blue Litmus paper or Solution, it should be neutral or only slightly acid, Chlorides and Sulphates, which indicate Toluene or Hippuric Acid as its probable source, and which are detected by the usual tests for Chlorides and Sulphates after removal of the Benzoic Acid. The 10 p.c. w/v aqueous solution is acidified with diluted Nitric Acid, and the precipitated Benzoic Acid is separated by filtration, the filtrate should be unaffected by the addition of either Silver Nitrate or Barium Chloride Solution. The *B.P.* includes tests for all these impurities. *U.S.P.* includes heavy metals as a likely impurity, and requires that the

acidulated, filtered 5 p c aqueous solution of the salt shall respond to the time-limit test for heavy metals. It also requires that the Benzoic Acid prepared from the salt shall answer the tests and be free from the impurities given under Benzoic Acid. No such requirement appears in the *BP*, either under this heading or under Sodium Benzoate.

Residue—On strongly heating it emits vapours having the odour of Ammonia and Benzoic Acid, and is finally volatilised, *USP*, at a red heat it leaves no residue, *BP*.

Not Official

AMMONII BORAS

A crystalline salt, with an alkaline reaction

Solubility—1 in 15 of Water

Medicinal Properties—Has been used with success in renal and vesical calculi

For renal colic, 20 grains = 1.3 grammes, every two hours until free passage of urine takes place, then 15 grains = 1 gramme, three times a day—*TG* '87, 623

AMMONII BROMIDUM.

AMMONIUM BROMIDE

NH_4Br , eq 97.29

Fr, Bromure d'Ammonium, Gr, Ammoniumbromid, Ital, Bromuro di Ammonio, Span, Bromuro Amonico

Small, colourless and odourless, prismatic crystals, or a white crystalline powder possessing a pungent saline taste

It is prepared by the neutralisation of Hydrobromic Acid by Ammonia

Solubility.—1 in $1\frac{1}{2}$ of Water, and measures 2, 1 in 15 of Alcohol (90 p c)

Medicinal Properties—An excellent nervine sedative and depressant, especially useful for sleeplessness, the result of worry or mental anxiety and fatigue, anaphrodisiac, given in epilepsy, with Chloral in acute alcoholism, in acute mania and nymphomania, and in many other conditions in which the Potassium salt is used. Not so apt to produce Bromism as the Potassium salt, and less depressing. Relieves headache, especially in migraine, and neuralgic pain. Sedative in pharyngeal and laryngeal irritation. Useful in whooping-cough and asthma.

Reference to the use of this salt in the treatment of epilepsy appears in *L* '05, 1710. If benefit does not follow a daily dose of from 45 to 60 grains of one or a combination of the Bromide salts in epilepsy, some other remedy or method of treatment should be sought. In confirmed epilepsy with mental deterioration, all that can be expected from the continuous use of the Bromides is diminution in the number and perhaps in the severity of the seizures. In serial epilepsy and the status epilepticus Chloral in combination with the Bromides forms the most effective remedy.

Dose.—5 to 30 grains = 0.32 to 2 grammes

Incompatible—spirit of Nitrous Ether

Not Official Preparations—Ammonium Bromide Effervescent, Elixir Ammonii Bromidi, Pastilles Ammonii Bromidi, Trochisci Ammonii Bromidi

Foreign Pharmacopœias—Official in Austr., Dan., Dutch, Fr., Ger., Ital., Jap., Mex (Bromuro de Amonio), Norw., Russ., Span., Swed., Swiss and U.S. Not in the others

Tests.—The following tests for Ammonium Bromide are that an aqueous solution of the salt shall, when heated with Sodium or Potassium Hydroxide Solution, evolve Ammonia, the latter is readily recognised by its odour or its immediately turning a piece of moistened red Litmus paper blue, the sufficiently diluted aqueous solution yields a yellowish-brown coloration with Potassio-mercuric Iodide (Nessler's) Solution. The aqueous solution of the salt should yield with Silver Nitrate Solution a yellowish-white precipitate insoluble in Nitric Acid, practically insoluble in dilute Ammonia Solution, but soluble in Potassium Cyanide Solution. On the addition of Chlorine Solution to an aqueous solution of the salt, Bromine is set free, which on shaking with a little Chloroform or Carbon Bisulphide yields a reddish solution. It is officially required to contain not less than 99.43 p.c. nor more than 100.79 p.c. of pure Ammonium Bromide, 0.5 gramme of the salt requiring, when dissolved in Water, not less than 51.1 c.c. nor more than 51.8 c.c. of Volumetric Silver Nitrate Solution. The *U.S.P.* requires it to contain not less than 97 p.c. of Ammonium Bromide, the *P.G.* not more than 100.98 p.c. The volumetric determination adopted by the *B.P.* is carried out on the dry salt, but no indication of the limit of Water permissible is given.

The *P.G.* also employs a salt dried at 212° F (100° C) in carrying out the volumetric determination. The *U.S.P.* does not direct the salt to be dried.

The more generally occurring impurities are heavy metals, *e.g.*, Copper, Lead and Iron, Barium, Bromates, Chlorides, Iodides and Sulphates. A 5 p.c. aqueous solution of the salt when slightly acidified with Hydrochloric Acid should be unaffected by Hydrogen Sulphide Solution, indicating the absence of Copper and Lead. The *U.S.P.* and the *P.G.* include a separate test for Iron with Potassium Ferrocyanide Solution, which is given in the small type below. Barium, Bromates, Iodides and Sulphates may, if present, be detected by the tests given under the respective headings of Potassium Sulphate Solution, Diluted Sulphuric Acid, Chlorine Water, Chloroform and Barium Nitrate Solution. The precipitate produced on the addition of Silver Nitrate Solution to an aqueous solution of the salt should be practically insoluble in Ammonia, and the filtered ammoniacal liquid should yield little or no opalescence when supersaturated with Nitric Acid, indicating the absence of more than a trace of Chlorides. The salt should be entirely volatilised on heating leaving a weighable residue, indicating the absence of fixed matter.

Chlorine Water and Chloroform.—If Chloroform be added to an aqueous solution of the salt (1 c.c. Chloroform and 10 c.c. of a (1-20) solution, *U.S.P.* and Chlorine Water (diluted with an equal volume of Water, *U.S.P.*) be

carefully introduced with constant agitation, the Chloroform is coloured reddish brown, *P G*, yellow to orange, *U S P*, free from any violet tint, *U S P*

Diluted Sulphuric Acid.—A small quantity of the salt spread out on a porcelain slab should not at once assume a yellow colour on the addition of a few drops of diluted Sulphuric Acid (test for Bromate), *P G* and *U S P*

The aqueous solution (1 in 20) should be unaffected by diluted Sulphuric Acid, *P G*

Barium Nitrate Solution—The aqueous solution should be unaffected by Barium Nitrate Solution, *P G*

Potassium Sulphate Solution—There should be no turbidity in 10 c c of a (1-20) aqueous solution acidulated with Acetic Acid, on the addition of 1 c c Potassium Sulphate Solution, *U S P*

Potassium Ferrocyanide Solution—20 c c of an aqueous solution (1-20) should not be immediately turned blue on the addition of 0.5 c c Potassium Ferrocyanide Solution, *P G* *U S P* uses a 1-100 solution of the salt, but does not state test quantities

Volumetric Determination—10 c c of a solution of 3 grammes in 100 c c of Water, with the addition of a few drops Potassium Chromate Solution (1 drop, *P G*) should require not more than 30.9 c c (*P G*), 31.6 c c (*U S P*), of the Deci normal Volumetric Solution of Silver Nitrate to produce a permanent red colour, the *U S P* directs the salt itself to be used for titration without drying, the *P G* uses the salt previously dried at 100° C (212° F)

Not Official

AMMONII BROMIDUM EFFERVESCENS, is made of 2 strengths containing 5 and 10 grains in 60 grains

ELIXIR AMMONII BROMIDI—Ammonium Bromide, 85, Citric Acid, 4, Aromatic Elixir (*U S P*), *q s* to make 1000—*U S N F* 1896

In *U S N F* 1906 the formula remains the same without the Citric Acid, which is omitted

Contains 5 grains of Ammonium Bromide in each fl dr m
Ammonium Bromide, 10, Citric Acid, 0.50, Aromatic Elixir, *q s* to produce 100—*B P C*.

Contains about 5½ grains in each fl dr m

The *B P C* appears to contain twice as much Compound Spirit of Orange as does the *U S P*, but as the *B P C* Compound Spirit is half the strength, the flavouring of the two Elixirs is about the same. The alterations in the *B P C Supplement* leave the result much the same

LOZENGES, containing 2 grains=0.13 gramme, of Ammonium Bromide in each. Useful in whooping cough

Dose—1 to 3 lozenges

Pastilles containing 1 grain in each with Glyco gelatin Basis

AMMONII CARBONAS.

AMMONIUM CARBONATE

FR, CARBONATE (SESQUI) D'AMMONIAQUE, GER, AMMONIUMCARBONAT, ITAL, CARBONATO DI AMMONIO, SPAN, CARBONATO AMONICO

A mixture of Ammonium Hydrogen Carbonate, NH_4HCO_3 , with Ammonium Carbamate, $\text{NH}_4\text{NH}_2\text{CO}_2$

Hard, transparent, crystalline masses, possessing a strong ammoniacal, but not empyreumatic, odour and strong alkaline reaction. It effloresces when exposed to the air, and becomes covered on the surface with a white powder. On this account it should be kept in

well-stoppered bottles and in a cool atmosphere Only the translucent portions of the mass should be used for dispensing purposes

Solubility.—1 in 4 of Water; 1 in 200 of Alcohol (90 p c), 1 in 5 of Glycerin

Medicinal Properties.—Gastric, cardiac, and general stimulant, a valuable expectorant, frequently combined with Ipecacuanha in acute and chronic bronchitis when the phlegm is tough and scanty Rarely as an emetic in $\frac{1}{2}$ drm doses

Has been recommended in full and continuous doses in cholera, in the place of alcoholic stimulants

Dose.—3 to 10 grains = 0.2 to 0.65 gramme

Prescribing Note.—15 grains dissolved in Water are taken with 17 grains of Citric Acid to form a saline draught

Incompatibles.—Acids, Acid salts, Iron salts, Lime Water, and salts of the alkaline earths and of the alkaloids

Official Preparations.—Used in the preparation of Ammonii Chloridum, Bismuthi Carbonas, Ferri Carbonas Saccharatus, Liquor Ammonii Acetatis, Liquor Ammonii Citratis, and Spiritus Ammoniae Aromaticus

Not Official.—Linctus Ammoniae Compositus, Linctus Ammonii Acetatis Fortior, Liquor Ammonii Citratis Fortior, Liquor Volcani Cervi or Spiritus of Hartshorn, Mistura Ammoniae cum Senega, Hartshorn and Oil, and Ammonium Bicarbonate

Foreign Pharmacopœias.—Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Port., Russ., Span., Swiss and U.S.

Tests.—The distinguishing tests for Ammonium Carbonate are its strong ammoniacal odour and alkaline reaction, when heated, either alone or with Potassium or Sodium Hydroxide Solution, it evolves Ammonia, its sufficiently diluted aqueous solution yields a yellowish-brown coloration with Nessler's reagent (Potassio-mercuric Iodide Solution), it effervesces with dilute mineral acids, evolving a gas which causes a white precipitate with Lime Water, and its aqueous solution yields with Barium Chloride Solution a white precipitate, soluble with effervescence in diluted Hydrochloric Acid

Each gramme is officially required to neutralise not less than 18.7 c.c. of Volumetric Sulphuric Acid Solution, corresponding to 97.25 p.c. of a salt of the pharmacopœial composition This figure is considered too high even for the best specimens, and it has been suggested (*P.J.* '01, 1775) that the figure should be altered to 18.0 c.c. The *U.S.P.* requires that it should contain not less than 97 p.c. of a mixture of Acid Ammonium Carbonate and Ammonium Carbamate, and that it should yield not less than 31.58 p.c. of Ammonia gas. The method adopted by the *U.S.P.* for its volumetric determination is given in the small type below

The more generally occurring impurities are empyreumatic and mineral matter, Lead, Copper, and Iron, Chlorides, sulphates and Thiosulphates

The presence of empyreumatic or non-volatile matter is detected by the appearance and odour of the residue left on the evaporation of the neutralised salt, and by any residue left upon gentle ignition. The test with Silver Nitrate Solution for Thiosulphate and limit of

Chloride is peculiar to the *P G* and *U S P*. A 1 in 20 aqueous solution of the salt when rendered faintly acid by the addition of Hydrochloric Acid should not be affected by Hydrogen Sulphide Solution, indicating the absence of Lead and Copper, nor on the subsequent addition of Ammonia Solution should it be darkened in colour, indicating the absence of Iron. A standard of 5 parts per 1,000,000 has been suggested (*C D* '08, 1795) as a standard for Lead, Arsenic not having been found in this chemical. Chlorides, Sulphates and Thio-sulphates may be detected, if present, by the tests with Silver Nitrate Solution and Barium Nitrate or Chloride Solution given in the small type below. The *P G* includes a test for Calcium, and requires that a 1 in 20 aqueous solution should be unaffected by Ammonium Oxalate Solution. It also gives a test with Ferric Chloride Solution, requiring that a 1 in 20 aqueous solution of the salt should not be coloured red on the addition of Ferric Chloride Test-solution.

Residue—On heating, Ammonium Carbonate is volatilised, and should leave no residue, *B P*, *P G*, and *U S P*. If an aqueous solution (1 gramme of the salt, *P G* and *U S P*) be supersaturated with Nitric Acid, and evaporated to dryness, the residue should be colourless and odourless, *B P*, *P G*, and *U S P*, and on gentle ignition should be completely volatilised, *P G* and *U S P*.

Silver Nitrate Solution—An aqueous solution (1–20) of Ammonium Carbonate should neither assume a brown colour, nor become more than slightly opalescent within two minutes, on the addition of Silver Nitrate Solution and subsequent supersaturation with Nitric Acid, indicating the absence of Thio sulphate and limit of Chloride, *P G* and *U S P*.

Barium Nitrate or Barium Chloride Solution—An aqueous solution (1 in 20) should be unaffected by Barium Nitrate Solution, *P G*, or by Barium Chloride Solution, *U S P*.

Volumetric Determination—2 grammes of the unaltered translucent salt, dissolved in a mixture of 50 c c each of Water and Normal V S Sulphuric Acid, and then boiled for a few minutes to expel the liberated CO_2 , should, when the solution is cooled, require not more than 12.7 c c of Normal V S Potassium Hydroxide for exact neutralisation, Litmus T S being used as indicator, *U S P*.

Preparations

SPIRITUS AMMONIÆ AROMATICUS AROMATIC SPIRIT OF AMMONIA *B P Syn*—SPIRITUS AMMONIÆ COMPOSITUS SPIRIT OF SAL VOLATILE

A clear, almost colourless liquid, possessing a strong ammoniacal odour and taste. It gradually darkens on exposure to light, and on this account should be kept in well-stoppered bottles of a dark amber tint and in a cool atmosphere.

It is prepared by mixing Oil of Nutmeg, $4\frac{1}{2}$ fl drms, Oil of Lemon, $6\frac{1}{2}$ fl drms, Alcohol (90 p c), 120 fl oz, and Distilled Water, 60 fl oz, and distilling until 140 fl oz has been collected. This portion is reserved and a further 9 fl oz is distilled, this second distillate is transferred to a strong, well stoppered bottle, mixed with 8 fl. oz of Strong Ammonia Solution and 4 oz of Ammonium Carbonate, and allowed to stand at 60°C (140°F) until the Ammonium Carbonate is dissolved, when the solution is filtered into the distillate first reserved. The official directions are that 149 fl oz should be distilled, collecting separately and reserving the last 9 fl oz passing

over, but it is more convenient to dissolve the Ammonium Carbonate and Ammonia in 9 fl oz of Water while the distillation is proceeding, and not to carry it past 140 fl oz

Medicinal Properties.—Similar to those mentioned under Ammonium Carbonate. A domestic remedy for nervous headache, more useful when combined with Ammonium Bromide

Dose.—20 to 40 minims = 1.2 to 2.4 c.c., for repeated administration, for a single administration, 60 to 90 minims = 3.6 to 5.3 c.c.

Foreign Pharmacopœias—(*Spiritus Ammonia Aromaticus*) Jap., Ammonium Carbonate 40, Ammonia Water 100, Oil of Lemon 8, Oil of Cloves 1, Oil of Lavender 1, Alcohol 650, Distilled Water 200, U.S., Ammonium Carbonate 84, Ammonia Water 90, Oil of Lemon 10, Oil of Lavender 1, Oil of Cloves 1, Alcohol 700, Distilled Water, *qs* to make 1000. Neither are distilled. Port (*Esprit Ammoniacal Aromatique*), *distilled*, contains Carbonate Austr., Dan., Dutch, Ger., Hung., Ital., Norw., Russ., Span., Swed. and Swiss, have Liquor or Spiritus Ammonii Anisatus, a mixture of Oil of Anise, Spirit, and Liq. Ammon., but in slightly different proportions, Belg., a mixture of Anethol, Spirit and Liq. Ammon. See p. 135

Tests.—The distinguishing tests for Spiritus Ammonia Aromaticus are its strong ammoniacal odour and taste, the specific gravity, which should be between 0.888 and 0.893. The addition of 16 c.c. of Barium Chloride Solution to 20 c.c. of the spirit should yield a precipitate, becoming more copious on heating to 71° C (160° F), and the filtrate from this precipitate should, on the addition of a further quantity of Barium Chloride Solution and again warming, again yield a precipitate.

The above test with Barium Chloride Solution is generally considered unreliable. It has been shown (*P.J.* '00, i 147) that the precipitation of Barium Carbonate in the presence of Ammonium salts by Barium Chloride does not form a satisfactory basis for the determination of Ammonium Carbonate in the aromatic spirit, and the somewhat complicated method of measuring the Carbonic Acid gas in a nitrometer is suggested. The necessity for resorting to this latter method can be, however, obviated, as it has been pointed out (*P.J.* '00, ii 105) that the addition of Ammonium Chloride to the solution alters the character of the precipitate altogether. A weighed quantity of 5 grammes of solid Ammonium Chloride is added to the 20 c.c. of aromatic spirit, and after vigorous agitation the requisite quantity of Barium Chloride Solution is added. The mixture is warmed to 71.1° C (160° F), cooled to the normal temperature and filtered. The filtrate, on the addition of more Barium Chloride Solution and warming, gives no further precipitate.

It is officially required to contain about 2.4 p.c. by weight of Ammonia gas, equivalent to 2.16 grammes in 100 c.c., as ascertained by titration with Volumetric Solution of Sulphuric Acid. The *B.P.* does not state the indicator of neutrality to be used; Methyl Orange Solution is suitable, 20 c.c. of the Spirit neutralises 25 c.c. of the Volumetric Acid.

The official test for total alkalinity is shown (*P.J.* '00, i 145) to make no allowance for deterioration of the spirit during the process

of manufacture or during storage, the latter obviously being a variable quantity, depending upon a number of variable conditions. The addition of a few c c per litre of the strong Solution of Ammonia is suggested in the same reference as a means of sufficiently raising the total alkalinity.

LIQUOR AMMONII ACETATIS. SOLUTION OF AMMONIUM ACETATE

1 of Ammonium Carbonate dissolved in 10 of Distilled Water, neutralised with Acetic Acid, and diluted with Distilled Water to make 20

This dilute solution is now prepared direct from Ammonium Carbonate as recommended in the *Companion* 1894, and the concentrated solution is omitted.

Medicinal Properties—Diaphoretic, diuretic and slightly antipyretic. A mixture of this medicine with Spirit of Nitrous Ether forms one of the oldest remedies for febrile conditions, and, there being no risk of its producing collapse, one of the safest. Given in full doses for alcoholism.

Dose—2 to 6 fl drms = 7 l to 21 3 c c

Incompatibles—Potassium and Sodium Hydroxides, and alkaline Carbonates.

Foreign Pharmacopœias—Official in Port, sp gr 1 029, Fr, sp gr 1 036, Mex and US, all made with Carbonate, Austr, sp gr 1 030, Ital, 1 034, Norw, sp gr 1 035 to 1 040, Belg, Dutch, Ger, Hung, Jap, Russ and Swiss, sp gr 1 032 to 1 034, Span, sp gr 1 036 all made with Caustic Ammonia.

Tests—A clear, almost colourless fluid possessing a faint acetous odour and faint saline, acidulous but not empyreumatic taste. It should have a specific gravity of about 1 018. The *B.P.* states that a small quantity of the liquid, when deprived of its Carbonic Anhydride by heating in a test-tube, shall possess a neutral reaction to test-papers. Solution of Cochineal affords a more useful means of determining the neutrality of the solution, and obviates the necessity of boiling off the Carbonic Anhydride.

LIQUOR AMMONII CITRATIS — SOLUTION OF AMMONIUM CITRATE

Citric Acid 5, dissolved in Distilled Water 25, neutralised with Ammonium Carbonate, and diluted with Distilled Water to make 40

Medicinal Properties—Similar to Liquor Ammonii Acetatis

Dose—2 to 6 fl drms = 7 l to 21 3 c c

Tests—A clear, almost colourless and odourless liquid possessing a saline taste. It should have a specific gravity of about 1 057. The remarks upon the method of determining the neutrality of the solution appearing upon Liquor Ammonii Acetatis apply equally here.

Not Official.

LINCTUS AMMONIÆ COMPOSITUS — Ammonium Carbonate, $\frac{1}{2}$ grain, Ipecacuanha Wine, 2 minims, Tincture of Squill, 5 minims, Essence of Anise, 1 minim, Mucilage of Acacia, 20 minims, Water, to 1 fl. drms — *Royal Chest.*

LIQUOR AMMONII ACETATIS FORTIOR.—Carbonate of Ammonium, 15½ oz, Acetic Acid, 50 fl oz or *q s*, Distilled Water, *q s* to make 60 fl oz.
B P 1885

This has been incorporated in the *B P C* as follows —

Ammonium Carbonate, 25, Acetic Acid, *q s* to neutralise, Distilled Water, *q s* to make 100

LIQUOR AMMONII CITRATIS FORTIOR —Citric Acid, 12 oz, Strong Solution of Ammonia, 11 fl oz or *q s*, Distilled Water *q s* Neutralise the acid with the Ammonia, adding sufficient Distilled Water to make 24 fl oz —*B P* 1885.

This has been incorporated in the *B P C*

LIQUOR VOLATILIS CORNU CERVI, or SPIRIT OF HARTSHORN —Solution of Carbonate of Ammonia of the old Pharmacopœias, distilled from Hartshorn, but is now more generally represented by Liquor Ammoniac
B P

MISTURA AMMONIÆ CUM SENEGA — Ammonium Carbonate, 4 grains, Ipecacuanha Wine, 10 minims, Infusion of Senega, ½ fl oz; Water, to 1 fl oz —*St Thomas's*

This has been incorporated in the *B P C*, using Ammonium Carbonate 5 grains in the place of 4

Ammonium Carbonate, 5 grains, Tincture of Squill, 12 minims, Spirit of Chloroform, 10 minims, Infusion of Senega, to make 1 fl. oz —*Royal Rec*

HARTSHORN AND OIL —1 of Sp Hartshorn and 3 of Oil of Almonds

AMMONIUM BICARBONATE —White, crystalline powder Soluble 1 in 5 of water, insoluble in Alcohol (90 p c) It is formed when Ammonium Carbonate is exposed to the air Employed in powders and pastilles as a substitute for Ammonium Carbonate

AMMONII CHLORIDUM.

AMMONIUM CHLORIDE

N O Syn —AMMONIUM CHLORATUM, CHLORETUM AMMONIUM

FR, CHLORURE D'AMMONIUM, GER, AMMONIUMCHLORID, ITAL, CLORURO DI AMMONIO, SPAN, CLORURO AMONICO

NH_4Cl , eq 53 13

White, odourless crystalline powder possessing a cooling saline taste It is permanent in the air

Solubility.—1 in 3 of Water, 1 in 55 of Alcohol (90 p c).

Medicinal Properties —Stimulating expectorant in bronchitis by inhalation, or by allowing it to dissolve slowly in the mouth in the form of lozenge or tablet, is a hepatic, gastric and intestinal stimulant, diaphoretic and diuretic In neuralgia, lumbago and migraine, in doses of 20 to 30 grains three times a day, it frequently relieves after four or five doses Useful in sciatica, gout and chronic rheumatism, in acute and chronic congestion of the liver, said to counteract the tendency to albuminoid degeneration

Recommended in advanced cases of pulmonary phthisis to facilitate expectoration —*L* '95, n 1624

Dose.—5 to 20 grains = 0.32 to 1.3 gramme

Prescribing Notes —Generally taken in solution, can be dispensed in the form of mixtures, powders, or Compressed Tablets Lemon and Chloroform make it more palatable See below, *Haustus*

Fluid Extract of Liquorice has been recommended, but many persons object to the taste of Liquorice

10 grams in a claret-glassful (3 fl oz) of cold Water, sipped frequently, allays distressing fits of coughing in bronchitis

The vapour is also largely employed in naso-pharyngeal and eustachian catarrh, various kinds of inhalers have been introduced for mixing the vapours of Hydrochloric Acid and Ammonia. In the absence of such an inhaler, heat a small quantity of the solid salt in an iron spoon or any convenient dish over a spirit lamp and inhale the fumes

Incompatibles—Alkalis and their Carbonates, alkaline earths, Lead and Silver salts

Official Preparation.—Used in the preparation of *Liquor Ammoniae Fortis*

Not Official.—Draught, Lotion and Lozenges

Foreign Pharmacopoeias—Official in Austr, Belg, Ger, Hung, Jap, Russ and Swiss (*Ammonium Chloratum*), Dan, Dutch, Norw and Swed (*Chloretum Ammonicum*), Fr (*Chlorure d'Ammonium*), Ital (*Cloruro di Ammonio*), Mex (*Cloruro de Amonio*), Port. (*Chloreto de Ammonio*), Span (*Cloruro Amonico*), US (*Ammonii Chloridum*)

Tests.—The distinguishing tests for Ammonium Chloride are the evolution of Ammonia when the salt is heated with Potassium or Sodium Hydroxide Solution and the production of a yellowish-brown coloration when a sufficiently diluted solution of the salt is treated with Potassio-mercuric Iodide (Nessler's) Solution, the depth of colour varying with the dilution of the solution, the formation of a white curdy precipitate, insoluble in Nitric Acid, but soluble in Ammonia Solution or Potassium Cyanide Solution, when Silver Nitrate Solution is added to its aqueous solution. When heated it evolves dense white fumes and volatilises completely

Neither the *BP* nor the *PG* records a volumetric method for the determination of the salt, but a process which is described below is given in the *USP*, the latter Pharmacopoeia stipulates that the salt shall contain not less than 99.5 p.c. of the pure salt

The more generally occurring impurities are Calcium, Copper, Iron, Lead, Carbonates and Sulphates. These impurities may be detected, if present, by the tests given in the small type below under the respective headings of Ammonium Oxalate Solution, Hydrogen Sulphide, Barium Nitrate or Chloride Solution, and Diluted Sulphuric Acid. The *USP* and *PG* include a separate test for Iron, which is described in the small type under the heading of Potassium Ferrocyanide Solution. It may also contain Thiocyanates. The test for the latter is carried out with Ferric Chloride Test-solution, using according to the *BP* an aqueous solution, according to the *USP* and *PG* an aqueous solution acidulated with Hydrochloric Acid.

A standard of 5 parts of Lead per 1,000,000 is suggested (*CD* '08, 1.795) and 2 parts per 1,000,000 as a standard for Arsenic

Hydrogen Sulphide—An aqueous solution (1-20 *PG*) should not be affected by Hydrogen Sulphide Solution, neither should it respond to the time-limit test for heavy metals, *USP*

Barium Nitrate or Chloride Solution.—An aqueous 1 in 20 solution should be unaffected by Barium Nitrate Solution *PG*, by Barium Chloride T.S., *USP*.

Diluted Sulphuric Acid An aqueous 1 in 20 solution should be unaffected by diluted Sulphuric Acid, *P G* and *U S P*

Ammonium Oxalate Solution—An aqueous 1 in 20 solution should be unaffected by Ammonium Oxalate Solution, *P G* and *U S P*

Potassium Ferrocyanide Solution—20 c c of a 1-20 solution should not immediately turn blue with 0.5 c c Potassium Ferrocyanide Solution, *P G*, *U S P* uses 5 drops of the reagent

Volumetric Determination—10 c c of a solution obtained by dissolving 1 gramme of Ammonium Chloride in sufficient Water to measure 100 c c, should, after the addition of 5 drops Potassium Chromate T S, require not less than 18.7 c c of Tenth-normal Volumetric Silver Nitrate Solution to produce a permanent red colour, *U S P*

Not Official

HAUSTUS AMMONII CHLORIDI.—Ammonii Chloridi, gr. xv, Tinct. Limon., m. xlv, Sp. Chloroformi, m. x, Aquæ, ad 3 iiss

LOTIO AMMONII CHLORIDI—1 oz with 1 fl oz Alcohol (90 p c.) and 10 fl oz Water. Vinegar is sometimes added, to be applied as a dressing for bruises

TROCHISCI AMMONII CHLORIDI—2 grains = 0.13 gramme, in each, with Black Currant Paste, are much used for bronchitis

Dose—2 to 4 lozenges

These have been incorporated in the *B P C*

Foreign Pharmacopœias—Official in Belg., Dutch and U S

Each lozenge contains about 2 grains of Ammonium Chloride with Black Currant Paste—*Throat*

Ammonium Chloride, 10, Extract of Glycyrrhiza, 20, Tragacanth, in fine powder, 2, Sugar, 40, in grammes, Sugar of Tolu, q s to make 100 troches—*U S P*

Trochisci Ammonii Chloridi cum Glycyrrhiza—Ammonium Chloride, 3 grains, Liquorice Extract, 3 grains in each—*Martindale*

This has been incorporated in the *B P C*

Not Official.

AMMONII IODIDUM.

AMMONIUM IODIDE

FR, IODURE D'AMMONIUM, GER, AMMONIUM JODATUM, ITAL, YODURO DI AMMONIO, SPAN, YODURO AMMONICO

A white granular deliquescent salt, or in cubical crystals, readily becoming yellow on exposure to air

The salt possesses practically no odour unless highly coloured, when a faint odour of Iodine is perceptible, and it has a sharp saline taste

When deeply coloured, it is advisable in dispensing to remove the colour by shaking it in a bottle with a piece of Ammonium Carbonate. It has been pointed out that the resulting Iodide could be decomposed by the Hydrochloric Acid of the stomach, and result in the re-formation of free Iodine, but as the quantity would generally be very small it may be disregarded

The *U S P* uses Ammonium Sulphide Test-solution for decolorising a deeply coloured salt. Sufficient of the solution to decolorise it being added to a concentrated solution, the liquid filtered and evaporated to dryness

It should be kept in well-stoppered glass bottles of a dark amber tint

Solubility—4 in 3 of Water, 1 in 3 of Alcohol (90 p c.), 3 in 4 of Glycerin.

Medicinal Properties—Similar to the Potassium Iodide, but less depressing

Dose —2 to 5 grains = 0.13 to 0.32 gramme, three times a day, but much larger doses can be given

Foreign Pharmacopœias —Official, in Fr, Mex, Port, Russ, Span Swiss and U S Not in the others

Tests —The salt answers the usual distinguishing tests for Ammonium salts, it evolves Ammonia when heated with Potassium of Sodium Hydroxide Solution, and yields a brownish yellow coloration on the addition of Potassio mercuric Iodide (Nessler's) Solution to its extremely dilute aqueous solutions. The addition of Chlorine water to its aqueous solution liberates Iodine, and a violet-coloured solution is given when this aqueous liquid is shaken with Carbon Bisulphide. Silver Nitrate Solution produces a curdy yellow precipitate, which is insoluble in Nitric Acid, practically insoluble in Ammonia Solution, but soluble in Potassium Cyanide Solution.

The more generally occurring impurities are heavy metals, *eg*, Arsenic, Copper and Lead, Barium, Iron, excess of free Iodine, and excess of Chlorides or Bromides. The presence of heavy metals is readily detected by Hydrogen Sulphide Solution, Barium by means of a solution of Potassium Sulphate. A limit of Iron is fixed by the requirement that the addition of Potassium Ferrocyanide Solution to an aqueous 1 in 150 solution of the salt should not immediately produce a blue colour. An aqueous 1 in 150 solution when shaken with 1 c.c. of Chloroform should not impart a violet colour to the chloroformic liquid, indicating the absence of excess of free Iodine. A 5 p.c. aqueous solution when acidified with Nitric Acid should neither yield a turbidity or precipitate on the addition of either Silver Nitrate or Barium Chloride Solution, indicating the absence of Chlorides and Sulphates.

In testing for excess of Chlorides or Bromides the *USP* dissolves 0.25 gramme of the salt, dried at 100° C (212° F), in 5 c.c. of Ammonia Solution, shakes with 16.9 c.c. of Deci-normal Volumetric Solution of Silver Nitrate and saturates the filtrate with 5 c.c. of Nitric Acid. The absence of a cloudiness within 10 minutes indicates the absence of more than 3 p.c. of Chlorides and Bromides.

AMMONII PHOSPHAS.

AMMONIUM PHOSPHATE

$(\text{NH}_4)_2 \text{HPO}_4$, eq 131.20

White, odourless, glistening, prismatic crystals, having a saline taste

It may be prepared by neutralisation of Orthophosphoric Acid with Ammonia Solution, the presence of the requisite amount of Ammonia being ensured by the addition of solid Ammonium Carbonate when necessary during the evaporation. It should be preserved in well-stoppered bottles.

Solubility —1 in 2 of Water, and measures 2½, insoluble in Alcohol (90 p.c.)

A salt corresponding to the official formula has been stated by some authorities to have a solubility of 1 in 0.76, the true figure, however, for the normal *BP* salt is 1 in 2, and this figure was given in the *Companion* from the 1st edition to the 15th (1890) — *C D*, '03, i 914, *P J*, '03, i 65

Medicinal Properties —Given in chronic rheumatism and in the gouty and uric acid diathesis to render the Sodium Bicarbonate more soluble, and to prevent formation of Uric Acid calculi.

Dose —5 to 20 grains = 0.32 to 1.3 grammes

Prescribing Notes. —It is given 3 or 4 times a day in Water, but should

not be prescribed in too condensed a form when tinctures form part of the mixture, on account of its sparing solubility in spirituous menstrua

Foreign Pharmacopœias—Official in Port Not in others

Tests—The distinguishing tests for Ammonium Phosphate are that it evolves Ammonia when heated with Potassium or Sodium Hydroxide Solution, its aqueous solution when sufficiently diluted yields a yellowish-brown coloration with Potassio-mercuric Iodide (Nessler's) Solution, an aqueous solution yields with Silver Ammonio-nitrate Solution a pale yellow precipitate readily soluble in Ammonia Solution and in cold diluted Nitric Acid, Ammonium Molybdate Solution when added to an aqueous solution containing an excess of Nitric Acid yields a yellow precipitate soluble in Ammonia Solution, and Magnesium Ammonio-sulphate Solution added to its aqueous ammoniacal solution affords a white crystalline precipitate soluble in dilute mineral acids. The latter test forms the basis of the *B P* method for the gravimetric determination of the salt, and it is required that when 2 grammes are precipitated with Magnesium Solution, the precipitate washed with Ammonia Solution, with an equal volume of water, suitably dried and heated to redness, shall weigh 1.680 grammes. This corresponds to 99.68 p.c. of Di-ammonium Mono-hydrogen Ortho-phosphate. It must be pointed out that unless the precautions mentioned at the commencement of the monograph on this article are observed, a salt yielding this amount of precipitate will not be obtained. Most 'commercial' samples are mixtures of Di-ammonium Mono-hydrogen Ortho-phosphate (the official salt) and Mono-ammonium Di-hydrogen Ortho-phosphate (the Acid Ammonium Phosphate).

Six commercial samples examined in the author's laboratory, when assayed by the process described in the *B P*, yielded precipitates varying in weight from 1.686 grammes to 1.818 grammes, the former being the only one of the six that approximated a salt of the Pharmacopœia formula. Greenish and F. A. Upsher Smith, from an examination of two commercial samples, neither of which yielded the official weight of precipitate, concluded (*P J* '01, 1.777) that it appeared unlikely that an absolutely normal salt could be found in commerce and accepted the second sample for the determination of its solubility, as the best that could be furnished commercially. Later (*P J* '03, 1.948), whilst confirming the investigations into the composition of commercial samples of the salt recorded in the author's paper (*C D* '02, 1.944, *P J* '03, 1.65), Greenish's further experiments have convinced him that there is no material difficulty in preparing a salt of the composition demanded by the Pharmacopœia.

The more generally occurring impurities, other than the Acid Phosphate, are Arsenic, Copper and Lead, Iron, Chlorides, and Sulphates. Of those the most important and the most likely are Arsenic and Lead, the former is readily detected by the modified Gutzeit's test, the latter by Hydrogen Sulphide Solution.

A standard of 5 parts per 1,000,000 for Arsenic and 10 parts per 1,000,000 for Lead is suggested (*C D* '08, 1.795). A 1 in 20 aqueous

solution when acidified with diluted Nitric Acid should yield no turbidity on the addition of Silver Nitrate Solution, indicating the absence of Chlorides. A solution of similar strength when acidified with Hydrochloric Acid should yield no turbidity on the addition of Barium Chloride Solution, indicating the absence of Sulphates

Not Official

AMMONIUM SALICYLATE—White, odourless, crystalline powder, or in odourless white needle shaped crystals. It may be prepared with either the natural or the physiologically pure Salicylic Acid. It should be kept in well-stoppered glass bottles of a dark amber colour and kept in a cool atmosphere. Antipyretic and antirheumatic, but is largely superseded by the Sodium salt.

Dose—5 to 15 grains = 0.32 to 1 gramme

Foreign Pharmacopœias—Official in Dutch, Russ and U.S. Not in the others.

Tests—It evolves Ammonia when warmed with Potassium or Sodium Hydroxide Solution, and its dilute aqueous solution yields with Ferric Chloride Test solution a deep violet coloration.

A small quantity of the salt warmed with concentrated Sulphuric Acid and a few c.c. of Methyl Alcohol evolves the characteristic odour of Methyl Salicylate.

Its sufficiently concentrated aqueous solution yields a white crystalline precipitate when acidified with a mineral acid, the precipitate when washed and collected should possess the melting point 156° to 157° C (312.8° to 314.6° F) of pure Salicylic Acid, and should otherwise conform to the tests for purity of the acid.

The more generally occurring impurities are heavy metals, *e.g.*, Copper and Lead, which are likely to be present in Salicylic Acid and mineral matter. The presence of heavy metals is readily detected by adding Hydrogen Sulphide Solution to the acidified, filtered, aqueous solution, impure Salicylic Acid is indicated by the melting point above described, and absence of mineral matter by the complete volatilisation of the salt on heating.

AMMONIUM VALERIANATE—Colourless, deliquescent, flat prismatic crystals, possessing a sweetish taste and a strong odour of Valerianic Acid.

It should be kept in well stoppered glass bottles of a dark amber colour and in a cool atmosphere.

Readily soluble in Water and Alcohol, soluble in Ether.

Stated to be useful in hysteria, epilepsy and neuralgia.

Dose—1 to 3 grains = 0.065 to 0.2 gramme, several times daily. Given in form of pills or in solution.

Foreign Pharmacopœias—Official in Fr., Mex., Span., Swiss and U.S. Not in the others.

Tests—The salt evolves Ammonia when heated with Potassium or Sodium Hydroxide Solution, when heated it fuses, evolving an odour of Ammonia and of Valerianic Acid, and when heated to a still higher temperature, it is completely volatilised, when warmed with diluted Sulphuric Acid the odour of Valerianic Acid is emitted. The U.S.P. requires that it shall contain not less than 98 p.c. of pure Ammonium Valerianate.

The more generally occurring impurities are heavy metals, *e.g.*, Lead and Copper and Acetates. The presence of the former is readily detected by adding Hydrogen Sulphide Solution to the acidified aqueous solution, the presence of the latter by supersaturating the aqueous solution with Ferric Chloride Test solution and filtering, the filtrate should not possess a red colour. Solutions of the salt exhibit an acid reaction to blue Litmus paper.

AMMONIUM VALERIANATUM SOLUTUM (Liquor Ammonii Pierlot), *Siems*—Valerianic Acid, 3, Extract Valerian, 2, Water, 95, Ammonium Carbonate, sufficient to neutralise.

In hysteria and epilepsy 6 to 80 drops in sweetened Water. Given in the form of the above solution in the treatment of the morphine habit.—L '01, n. 363.

AMYGDALA AMARA.**BITTER ALMOND**

FR, AMANDES AMÈRES, GER, BITTERE MANDELN, ITAL, MANDORLE AMARE; SPAN, ALMENDRA AMARGA

The ripe Seed of *Prunus Amygdalus*, Stokes, var *amara*, Baillon

Introduced only as a source of Almond Oil, and from which the commercial product is chiefly obtained

Foreign Pharmacopœias—Official in all the Foreign Pharmacopœias except Dutch, Port (Amendoas Amargas)

Not Official.—Aqua Amygdalæ Amaræ, Mistura Amygdalæ Amare, Oleum Amygdalæ Amaræ Essentiale, and Oleum Amygdalæ Persici Part of the Essential Oil, Spiritus Amygdalæ Amaræ, Syrupus Amygdalæ

Descriptive Notes.—The bitter almonds of commerce are chiefly obtained from Barbary (Morocco) and Sicily, and are distinguished by their bitter taste and the characteristic odour of the aqueous emulsion. The *USP* gives the measurement of the seed as 20 to 30 mm long, and oblong, lanceolate or ovate in form, and the *PG* as 2 cm long and 1 to 2 cm broad, and states that the seed should not have a rancid taste

Apricot and peach kernels which are imported for making an inferior almond oil are much smaller than bitter almonds, which they resemble in taste

AMYGDALÆ OLEUM. ALMOND OIL

The fixed oil expressed from the Bitter or Sweet Almond, the yield being between 40 and 45 p c

Descriptive Notes.—A clear pale yellow, odourless oily liquid possessing a bland, nutty taste. The almond oil of commerce is obtained chiefly from the bitter almond by expression, and is known in commerce as English oil. The oil formerly sold under the name of Ol Amygd Exot, but now as Ol Amygd Persic, is derived from Peach and Apricot kernels, recently Oil of Poppy Seed has been offered under the name of Peach Kernel Oil

Solubility—Only slightly soluble in Alcohol (90 p c), entirely soluble 1 in 2½ of Ether, and in all proportions of Chloroform

Medicinal Properties.—Emollient, demulcent and laxative. As an enema in impaction of fæces or obstruction of bowel, 1 to 3 pints

Dose—1 to 4 fl. drm = 3·6 to 14·2 c c

Prescribing Notes—1 fl oz of Oil, with ½ fl oz Mucilage, ¼ oz Sugar, and 6 fl oz of Distilled Water, makes a nice cough mixture

A mixture of equal parts of this Oil and Lime Water, with a small proportion of Glycerin, secreted with Lemon, has been commonly sold under the title **Glycerin** and Lime Juice

Official Preparations.—Contained in Linimentum Ammoniac, Oleum Phosphoratum, Unguentum Aquæ Rosæ, and Unguentum Catapla.

Used in preference to Olive Oil, as it makes a whiter ointment and is less liable to become rancid.

Foreign Pharmacopœias.—Official in Austr., Belg., Dan., Dutch, Fr (Huile d'Amande), Ger (Mandelöl), Hung, Ital (Olio di Mandorle Dolci), Jap., Mex., Norw., Port., Russ., Span (Aceite de Almondas Dulces), Swed., Swiss and U S

Tests.—The distinguishing tests for Almond Oil are the specific gravity which should be from 0.915 to 0.920, the congealing point which is about -20°C (-4°F). These tests, with an Elaidin test for Peach Kernel and other fixed Oils, are as far as the official volume takes us. The above specific gravity is given by *BP* and *PG*, the *USP* gives 0.910 to 0.915 at 25°C (77°F). The *USP* and some of the recent editions of the Continental Pharmacopœias include figures for the Saponification value and Iodine absorption. The Saponification value is the number of milligrammes of Potassium Hydroxide Solution required to neutralise 1 gramme of the oil. The Iodine absorption is the percentage of Iodine which the oil absorbs. The Austr. Ph. requires a Saponification value of 190–195 and an Iodine absorption of 94–100 p.c., the Belgian Ph., a Saponification value of not less than 185, and an Iodine absorption of 92–102 p.c. The *USP*, a Saponification value of 191–200 and an Iodine absorption of not less than 95 nor more than 100, the Dutch Ph. omits the Saponification value, but gives an Iodine absorption of not less than 95 nor more than 101. Twelve good commercial samples examined in the author's laboratory showed a Saponification value of 190.4 to 196.4, and an Iodine absorption of 95.3 to 100.3.

The more generally occurring impurities are Peach and Apricot Kernel Oils (which much resemble Almond Oil, and are known commercially as Ol. Amygdalæ Persicæ), and other fixed oils, e.g., Arachis, Cotton Seed, Olive and Sesame. The Elaidin test for these, which is given in small type below under the heading of Nitric Acid, is common to *BP*, *USP* and *PG*. The two latter Pharmacopœias, moreover, include an additional, almost identical, test for the detection of fixed oils other than Almond Oil, which is given in small type below under the heading of Saponification, and which depends upon the production of a clear solution when the saponified alcoholic solution is diluted with Distilled Water, the Oleic Acid obtained from this solution on acidification, when washed and clarified, is required to remain liquid at 15.5°C (60°F), and when mixed with an equal volume of Alcohol of the respective pharmacopœial strengths to yield a clear solution which does not deposit at 15°C (60°F) nor become turbid on a further addition of one volume of Alcohol.

Nitric Acid.—If 2 c.c. of the Oil be well shaken with 1 c.c. of fuming Nitric Acid and 1 c.c. of water, a whitish, not brownish, red mixture should be formed which, after standing for 6 hours at about 50°F (10°C) (for 2 or at most 6 hours *PG*, for some hours *USP*), should separate into a solid white mass and a nearly colourless liquid, *BP*, *PG*, and *USP*. The *USP* states that the fixed Oils of Peach and Apricot kernels give a red colour and Sesame and Cotton Seed Oils give a brown colour.

Saponification.—If 10 c.c. of the Oil be mixed with 15 c.c. of a Sodium Hydroxide Solution (1-G, *USP*, sp. gr. 1.168 to 1.172, *PG*), and 10 c.c. of Alcohol, and the mixture be allowed to stand (at a temperature of 35° to 40°C (95° to 104°F)) with occasional agitation, (*USP*) until it becomes clear, and if then diluted with 100 c.c. of Water, the clear solution thus obtained upon the

subsequent addition of an excess of Hydrochloric Acid will set free a layer of Oleic Acid. This when separated from the aqueous liquid, washed with warm Water, and clarified by heating on a water-bath will remain clear if cooled to 15° C (59° F), *P G* and *U S P*. 1 volume of this Oleic Acid when mixed with 1 volume of Alcohol should yield a clear solution which at 15° C (59° F) should not deposit any fatty acids, nor become turbid upon the further addition of 1 volume of Alcohol, *P G* and *U S P*.

Iodine Absorption—If 0.3 gramme of expressed Oil of Almonds be dissolved in 10 c.c. of Chloroform in a 250 c.c. flask and 25 c.c. of a mixture of equal volumes of Alcoholic Iodine T.S. and Alcoholic Mercuric Chloride T.S. added, and if, after standing for four hours protected from light, 20 c.c. of Potassium Iodide T.S. be introduced and the mixture diluted with 50 c.c. of Water, on titrating the excess of Iodine with V.S. of Tenth-normal Sodium Thiosulphate an Iodine value of not less than 95 nor more than 100 should be obtained, *U S P*. The *P G* test uses 0.5 gramme of Oil, and directs the addition of 1.5 grammes of Potassium Iodide and 100 c.c. of Water before titration.

Not Official.

AQUA AMYGDALÆ AMARÆ—Prepared by crushing Bitter Almonds and expressing the fixed Oil, and then distilling the residual cake with Water so that it shall contain the proper quantity of Hydrocyanic Acid ordered in any particular Pharmacopœia.

Ph. Ger. maximum single dose, 2 grammes, maximum daily dose, 6 grammes.

Foreign Pharmacopœias—Official in the following, the percentage of Hydrocyanic Acid also given: Dan (Conc), 0.1 p.c., (Dil) 0.005 p.c., Ger, Hung, Ital, Jap, Russ and Swed, 0.1 p.c., Norw, 0.1 p.c., Port, not standardised, U.S., not standardised, 1 Volatile Oil in 1000, Austr, Belg and Swiss use Laurocerasi Water when Bitter Almond Water is prescribed. Not in the others.

The *Brussels Conference* adopts a strength of 0.1 p.c. for Aqua Amygdalæ Amaræ.

MISTURA AMYGDALÆ AMARÆ.—Made in the same proportions as Mistura Amygdalæ.

Useful in cough, and as a lotion to allay itching of the skin. It was a favourite vehicle for giving Tartarated Antimony, in doses of $\frac{1}{2}$ grain = 0.008 gramme, as a sedative expectorant in the first stage of acute bronchitis or pneumonia. The mixture contains a variable amount of Hydrocyanic Acid.

Dose— $\frac{1}{2}$ to 1½ fl. oz = 14.2 to 42.6 c.c.

Mistura Amygdalæ Amaræ—Bitter Almonds, 8, Distilled Water, q.s. to produce 100.—*B P C*.

OLEUM AMYGDALÆ AMARÆ ESSENTIALE—A clear, colourless or pale yellowish, highly refractive liquid, with a characteristic odour, and a bitter and somewhat burning taste. Obtained from Bitter Almonds by macerating with Water the cake from which the fixed Oil has been expressed, and subsequent distillation.

It should be kept in well-stoppered glass bottles of a dark amber colour, and as far as possible from contact with air.

Chiefly used as a flavouring agent, when the oil 'sine Acido Hydrocyanico' should be employed.

Oil Amygdal Essent Persic is prepared by a similar process to Bitter Almond Oil, from the kernels of the Apricot and Peach.

Solubility—Sparsely in Water; mixes in all proportions with Alcohol (90 p.c.) and Ether.

Foreign Pharmacopœias—Official in Belg (Aldehydum Benzœicum), Fr. Mex (Acete Volatil de Almendras Amargras), Port, Span and U.S. U.S. has also Benzaldehyde. Not in the others.

U.S. has also Spiritus Amygdalæ Amaræ, 1 in 100.

Tests.—The distinguishing tests for Bitter Almond Oil are the strong and distinctive odour, the high refraction, the specific gravity which after removal of Hydrocyanic Acid should be from 1.045 to 1.050, the boiling point, which should be 179° to 180° C (354.2° to 356° F), and its optical inactivity. The Oil is converted into a crystalline compound when shaken with a saturated Solution of Sodium Bisulphite, and this reaction may be utilised as a means for its quantitative determination, the non aldehydic constituents can be measured or weighed. The *U S P* process is essentially as follows.—A measured quantity of 10 c c of purified Kerosene is introduced into a tared 150 c c flask and the exact weight recorded, 12 drops of the Oil are then added and the weight again recorded, 20 c c of Distilled Water and 6 drops of Rosolic Acid Test solution are added and the mixture exactly neutralised with Tenth-normal Volumetric Sodium Hydroxide Solution, agitating the flask thoroughly. A 1 in 5 aqueous solution of Sodium Sulphite alternated with Half-normal Volumetric Hydrochloric Acid Solution is added until 10 c c of the Sodium Sulphite Solution have been added, and sufficient Half-normal Volumetric Hydrochloric Acid Solution to maintain the neutrality of the mixture, after the addition of a few drops of Rosolic Acid Test-solution, the flask is agitated frequently, allowed to stand for 2 hours to ensure a permanent condition of neutrality, and the number of c c of Half normal Volumetric Hydrochloric Acid Solution required noted. A blank test is carried out alongside of the determination, the number of c c of Half-normal Volumetric Hydrochloric Acid Solution is noted, the number of c c used in the latter is subtracted from that required in the former, the difference is multiplied first by 0.0526 and the product by 100 and divided by the weight of Oil taken yields a percentage of Benzaldehyde present in the sample.

The more generally occurring impurities are acidity, Hydrocyanic Acid, artificial Benzaldehyde, and Nitrobenzine. Acidity may arise from atmospheric oxidation of Benzaldehyde to Benzoic Acid, and may be determined with Deci-normal Volumetric Sodium Hydroxide Solution. If the Oil contains a crystalline deposit of acid it should not be used.

Hydrocyanic Acid can be detected by shaking 10 or 15 drops of the Oil with 2 to 3 drops of Potassium or Sodium Hydroxide Solution, adding a few drops of Ferrous Sulphate Solution containing a drop or two of Test-solution of Ferric Chloride, warming and slightly acidifying with dilute Hydrochloric Acid, when a blue precipitate will be produced if this acid be present.

Hydrocyanic Acid may be estimated volumetrically by weighing 1 gramme into a small flask, adding a sufficiency of freshly precipitated (Chloride free) Magnesium Hydroxide and Water, several drops of Potassium Chromate Solution and Deci-normal Volumetric Solution of Silver Nitrate until a permanent red coloration is produced. The oil generally employed in this country is free from this acid, but *U S P* allows not less than 2 p c nor more than 4 p c. The presence of Chlorine compounds is generally held to be indicative of artificial Benzaldehyde, but the failure to find them does not necessarily imply that the specimen is free from 'artificial Benzaldehyde' as the latter is now produced commercially of very fine quality.

Chlorine compounds are examined for as follows.—A folded strip of filter paper saturated with oil is placed in a small porcelain capsule standing within a larger one and ignited. A large beaker, the sides of which have been moistened with Water, or preferably containing filter paper (free from Chlorides) moistened with Water, is inverted over the burning Oil. The products of combustion condense on the moistened surface of the beaker or on the filter paper, and can be washed on to a filter with a little Distilled Water. The filtrate should show no turbidity on the addition of Silver Nitrate Solution, or if a turbidity is produced it should disappear on warming. The presence of Nitrobenzene (now an unlikely impurity) may be detected by diluting the Oil with 20 times its volume of Alcohol (90 p c), diluting the solution with Water until a turbidity is produced, adding Zinc and Sulphuric Acid, allowing the solution to remain at rest several hours, filtering, evaporating the Alcohol, and treating the remaining solution with a drop of Potassium Bichromate Solution. The production of a violet colour indicates the presence of Aniline.

SPIRITUS AMYGDALÆ AMARÆ—Oil of Bitter Almond, 1, Alcohol (95 p c), 80, Distilled Water, q.s. to make 100.—*U. S. P.*

This spirit contains a trace of Hydrocyanic Acid and should always be used with care

This has been incorporated in the *B P C* as follows —

Oil of Bitter Almond (sine Acid Hydrocyanic), 1, Alcohol (90 p c), 85,
Distilled Water, *q s* to produce 100

SYRUPUS AMYGDALÆ—Spirit of Bitter Almond, 1, Orange Flower
Water, 10, Syrup, *q s* to make 100—*U S P*

This has been incorporated in the *B P C*

AMYGDALA DULCIS.

SWEET ALMOND

FR, AMANDES DOUCES, GER, SÜSSE MANDFELN, ITAL, MANDORLE DOLCI,
SPAN, ALMENDRO DULCE

The ripe Seed of *Prunus Amygdalus*, Stokes, var *dulcis*, Baillon
Commonly known as the Jordan Almond

Medicinal Properties.—Demulcent and nutrient Biscuits are made of Jordan and Valencia Almonds for diabetic patients, as a substitute for bread or starchy food Almonds do not contain starch

The Mistura Amygdalæ is a good vehicle for cough medicines, and for suspending insoluble powders

Official Preparations—Mistura Amygdalæ and Pulvis Amygdalæ Compositus

Foreign Pharmacopœias—Official in all, Fr, Ital, Mex (Almendra Dulce), Port (Amendoas Doces), Span

Descriptive Notes.—Almonds are met with in commerce either in the shell or endocarp, or in the form of seed only Sweet Almonds vary in size and shape, those of Valencia and Sicily being broad and flattened, those of Barbary irregular in shape owing to two seeds often occurring in one endocarp and becoming misshapen by pressure The Valencia Almonds are usually free from Bitter Almonds, those of Barbary and Sicily are often mixed with them The Jordan Almond, which is alone official, is imported from Malaga in Spain It is longer, narrower and more convex in proportion than the other varieties, being 2·5 to 3 cm (about an inch) in length, and about 1·25 cm ($\frac{1}{2}$ inch) in width and 0·5 cm ($\frac{1}{4}$ inch) in thickness It has a bland taste and triturated with Water forms a white emulsion without any marked odour, indicating the absence of Bitter Almonds For forming emulsions, Almonds are first deprived of their skins or 'blanched' by dipping them in boiling Water for a minute or two, when slight pressure between the fingers will separate the testa The variety official in the *U S P* appears to be the Valencia Almond as it is stated to be broader than the Bitter Almond The variety official in Germany is stated to be unsymmetrically ovate and flattened, 2·25 cm long and 1·5 cm broad, and at the rounded end more than 1 cm broad. This appears to indicate the Sicilian or Valencia Almonds, since the Jordan Almonds are rarely more than 1·25 cm broad.

Preparations

MISTURA AMYGDALÆ. ALMOND MIXTURE

Compound Powder of Almonds, 1, Distilled Water, 8

Rub the powder to a smooth cream with a suitable quantity of Water, and add gradually the remainder, strain

Dose — $\frac{1}{2}$ to 1 fl oz = 14 2 to 28 4 c c

Foreign Pharmacopœias — Official as Emulsio in Austr, Dan, Fr, Hung, Ital, Norw, Port and Swed US Emulsum A, there is much variation in the proportions Swed has also Emulsio Hydrocyanata, Ayrngdalin, 1, Almond Emulsion, 80 Not in the others Belg, Fr, Ger and Swiss have Syrups

PULVIS AMYGDALÆ COMPOSITUS — COMPOUND POWDER OF ALMONDS

Sweet Almonds, 8, Powdered Refined Sugar, 4, Powdered Gum Acacia, 1 Remove the skins of the Almonds after softening them in Water, and dry the Almonds by a cloth and exposure to the air until brittle (*Comp* 1894), so that they will rub to a paste which is not too moist and with which the Sugar and Gum, previously mixed, can be incorporated to form a moderately coarse powder

Dose — 60 to 120 grains = 4 to 8 grammes

AMYL NITRIS.

AMYL NITRITE

FR., AZOTITE D'AMYLE, GER, AMYLNITRIT, ITAL, NITRITO D'AMILE, SPAN, NITRITO DE AMILO

A pale yellow, volatile liquid, with a characteristic ethereal odour and pungent aromatic taste It consists principally of Iso-Amyl Nitrite, $C_5H_{11}NO_2$, eq 116 25, which is present in variable quantity, together with other Nitrites It may be produced by the action of Nitrous Acid upon that fraction of the higher Alcohols distilling between 127 7° and 132 2° C (262° and 272° F) Should be stored in well-stoppered glass bottles of an amber colour, or preferably in glass capsules of a dark amber tint

Solubility — Insoluble in Water Soluble in Alcohol (90 p c), Ether and Chloroform

Medicinal Properties. — Antispasmodic Very useful in angina pectoris, aneurismal pain, hæmoptysis, dyspnoea of bronchitis and spasmodic asthma, has been used with advantage in epilepsy, in trifacial neuralgia, in migraine and sea-sickness, and hemicrania, if these conditions be accompanied by facial pallor, also in laryngeal spasm, in hepatic, intestinal and renal colic, in spasmodic forms of dysmenorrhœa and in eclampsia, a restorative in cardiac failure from Chloroform or Nitrous Oxide anæsthesia or other cause, has been found useful as an antidote to Strychnine

In angina, where a rapid fall of arterial tension is required, the

B.P. Amyl Nitrite contains Iso-butyl Nitrite, is best, but in other cases, such as in the disease, when the prolonged action is required, pure Nitrite is more effective. As some persons are peculiarly susceptible to its action, its use demands caution.

A description of 77 cases of pneumonia treated by the inhalation of large doses—*B.M.J.* '95, ii 96, *T.G.* '96, 49.

Promptly effective and safer than Morphine in hæmoptysis, and can be used at earliest possible moment by patient himself—*L.* '08, i 565.

The most efficient and expeditious remedy in hæmoptysis—*L.* '07, i 679, *T.G.* '07, 323, *L.* '06, ii 1685, '07, i 939, '08, i 427, 504.

Successful in postpartum hæmorrhage (*B.M.J.* '06, ii 1125), and in menorrhagia—*L.* '08, ii 418.

Inhalations have been recommended (*L.* '05, i 800) in deep-seated hæmorrhage. It has also been used with success in tuberculous hæmoptysis.

Dose—For inhalation, the vapour of 2 to 5 minims = 0.12 to 0.3 cc.

Prescribing Notes—It can be obtained in small glass capsules covered with cotton wool and silk, each containing from 2 to 5 minims. The covered capsule is placed in a handkerchief, then carefully broken across, and the escaping vapour is inhaled.

In mixtures to be swallowed, dose, $\frac{1}{2}$ to 1 minim dissolved in Alcohol (90 p.c.) and diffused through Water by means of Tragacanth (in powder) 2 grains to the fl. oz., to be used with caution.

Should be handled carefully, as even smelling it causes violent flushings.

Not Official—Iso-butyl Nitrite, Tertiary Amyl Nitrite, Amyl Valerianate and Mistura Amyl Nitritus.

Foreign Pharmacopœias—Official in Austr., Dutch, Ger., Jap., Russ. and Swed., sp. gr. 0.870 to 0.880, boils at 97° to 99° C., Belg., sp. gr. 0.870 to 0.900, boils at 99° C., Fr., sp. gr. 0.88, boils at 96° to 99° C., Mex. (Ester Amilnitroso), sp. gr. 0.877, boils at 95° C., Ger., Russ. and Swed., boils at 97° to 99° C., Hung., sp. gr. 0.900, boils at 96° to 99° C., Ital. (Nitrito amilico), sp. gr. 0.87 to 0.89, boils at 97° to 99° C., Swiss, sp. gr. 0.870 to 0.900, boils at 97° to 99° C., U.S., sp. gr. 0.865 to 0.875 at 25° C. (77° F.).

Tests.—The distinguishing tests for Amyl Nitrite are its odour; the peculiar flushing of the face and strange sensation of fullness in the head produced by its inhalation, the specific gravity which should be from 0.870 to 0.880, the temperature [90° to 100° C. (194° to 212° F.)] at which the greater portion of the liquid passes over when distilled with the bulb of the thermometer not touching the surface of the residual liquid, the production of Iso-valerianate when it is dropped gradually on to fused Potassium Hydroxide. The *B.P.* and the *P.G.* give the specific gravity as 0.870 to 0.880; the *U.S.P.* gives 0.865 to 0.875 at 25° C. (77° F.). The *B.P.* requires that 70 p.c. should pass over between the temperatures indicated above, the *P.G.* states that it boils at 97° to 99° C. (206.6° to 210.2° F.), the *U.S.P.* has deleted the boiling point. The *B.P.* requires that only a pale yellow colour shall be produced in the aqueous liquid when the Nitrite is shaken with an equal volume of Potassium Hydroxide Solution, the *U.S.P.* and *P.G.* require that Silver Nitrate Solution should not turn brown or black. The *U.S.P.* and the *P.G.* both adopt a test for the limit of acidity, which is given below under that heading. The *B.P.* requires it to yield not less than 6 times its volume of Nitric Oxide gas, the *U.S.P.* requires it to

contain about 80 p c of Amyl Nitrite, chiefly Iso-amyl Nitrite, as determined gasometrically by the process given below under the heading of Gasometric Determination. When a measured quantity of 5 cc of a 5 p c solution of the Nitrite in Alcohol (90 p c) is intermittently shaken for 5 minutes in a nitrometer containing saturated brine solution, with 5 cc of strong Potassium Iodide Solution and 5 cc of Diluted Sulphuric Acid, and the level of the liquid in the two limbs of the nitrometer adjusted to the same level, it should yield a volume of gas not less than 30 cc, adjusted to the normal temperature and pressure. The number of cc of gas evolved multiplied by 5 (4.98) gives the weight in milligrammes of Amyl Nitrite in the quantity operated upon. The operation may be conducted in two parts, the Potassium Iodide Solution being first run into the nitrometer, followed by the Diluted Sulphuric Acid. The measure of the gas first liberated affords a criterion of the acidity of the sample. The *USP* neutralises any acidity by first treating the Amyl Nitrite with Potassium Bicarbonate and weighs the Nitrite instead of measuring it. The temperature at which the readings are taken is 25° C (77° F) and a correction is made for each degree above or below. A correction is also made for the barometric pressure above or below 760 mm of Mercury.

The more generally occurring impurities are Water and Aldehyde. All three Pharmacopœias adopt the method of cooling the specimen to the temperature of melting ice, in testing for Water, if water be absent it will remain clear. Aldehyde in the *BP* is examined for by Potassium Hydroxide Solution, no quantities being given, in the *USP* and *PG* by Silver Nitrate Solution rendered slightly ammoniacal by the addition of a few drops of Ammonia Solution, both Pharmacopœias carefully stating the quantities to be employed in the test, the *USP* uses Alcohol (94.9 p c) for diluting, the *PG* Absolute Alcohol.

Acidity—5 cc Amyl Nitrite should not overcome the alkaline reaction of 0.1 cc Solution of Ammonia with 1 cc of Water, *PG*. If 5 cc be agitated with a mixture of 1 cc Normal Potassium Hydroxide Solution and 10 cc of Water with a drop of Phenolphthalein T S, the red tint of the aqueous layer should still be perceptible, *USP*.

Silver Nitrate Solution—1 cc Amyl Nitrite should not turn brown or black a mixture of 1.5 cc Silver Nitrate Solution, 1.5 cc Alcohol and a few drops of Solution of Ammonia on gently warming (test for Aldehyde), *PG* and *USP*. The *PG* uses Absolute Alcohol in the place of Alcohol.

Gasometric Determination—Transfer about 3 cc of Amyl Nitrite, which has been previously shaken with 0.5 gramme of Potassium Bicarbonate and carefully decanted, to a tared 100 cc measuring flask, and weigh it accurately. Add sufficient Alcohol (94.9 p c) to bring the volume to exactly 100 cc and mix thoroughly. Introduce into a nitrometer exactly 10 cc of the alcoholic solution, followed by 10 cc of Potassium Iodide T S, and afterwards by 10 cc of Volumetric Sulphuric Acid Solution. When the volume of gas has become constant (within 30 to 60 minutes), note the volume of gas collected. Multiply this volume in cc by 4.8, and divide the product by the original weight of the Amyl Nitrite, the quotient will represent the percentage of Amyl Nitrite in the liquid at standard temperature and pressure. Correction for temperature and pressure. The temperature correction is one-third of one per cent of the total percentage just found for each degree, additive if the temperature is below, and subtractive if it is above 25° C (77° F). The barometric correction is four-

thirtieths of 1 p c for each mm, additive if it is above, and subtractive if it is below 760, *U S P*

For comments see above in large type

Not Official.

MISTURA AMYL NITRITIS—Amyl Nitrite, 2; Alcohol (90 p c), 16; mix and add to Powdered Tragacanth, 1, contained in a dry phial, then add gradually Distilled Water to 240, shake well **Dose**—1 or 2 dr (3 5 to 7 c c)
—*Martindale*

Amyl Nitrite, 1½ minims, Alcohol, 12 minims, Tragacanth, 1 grain; Syrup, 80 minims, Distilled Water, to 4 fl dr—*B P C*

ISO-BUTYL NITRITE—Its action and uses are similar to those of Amyl Nitrite

TERTIARY AMYL NITRITE (Bertoni's Ether)—Prepared from tertiary Amylic Alcohol (Amylene Hydrate) It possesses all the properties of the official Nitrite, but it can be taken in larger quantities without danger, and it does not cause flushing of the face

The tertiary Nitrites have a more powerful influence generally than the secondary or primary

Dose—5 drops on sugar, or in capsules

AMYL VALERIANAS—A colourless liquid, possessing a strong fruity odour Sedative and antispasmodic

Dose.—2 to 3 minims = 0 13 to 0 2 c c. in capsules

Not Official.

AMYLENE HYDRATE.

TERTIARY AMYLIC ALCOHOL DIMETHYL-ETHYL CARBINOL

$C_5H_{12}O$, eq 87 43

A clear, colourless, oily liquid, with a strong characteristic odour and taste

Solubility—1 in 8 (or rather less) of Water, in all proportions of Alcohol (90 p c).

Medicinal Properties.—Hypnotic Has no unpleasant after-effects, and its taste is less objectionable than that of Paraldehyde Successful in mania (especially morphinomaniac, *M A* '94, 426), delirium tremens, and in severe forms of epilepsy where bromides are found useless

Recommended where hypnotics are required for a long period.—*Y B T*, '94, 74.

1½ grammes Amylene Hydrate repeated in two hours gave six hours' uninterrupted sleep in a case recovering from the morphia habit—*L*, '01, 11 366.

Dose—30 to 60 minims = 1 8 to 3 6 c c

Prescribing Notes—Dissolved in Water or Alcohol (90 p c), also given in capsules, sometimes given as an enema

Cannot be employed subcutaneously owing to pain produced.—*B. M. J. E.*, '94, 11 64

Foreign Pharmacopœias—Official in Dan, Ger, Norw. and Swiss (Amylenum Hydratum) Not in the others

Tests—It should possess a specific gravity of 0 812 to 0 814 at 15° C (point of 99° C (210 2° F) to 103° C (217 4° F) 1 c c dissolved in 20 c c. of water should not within 10 minutes either decolorise 2 drops of a 1 in 1000 Potassium Permanganate Solution, indicating the absence of Ethyl or Amyl Alcohol, or blacken Silver Nitrate Solution at 100° C (212° F.), indicating the absence of Aldehyde.

AMYLUM.

STARCH

FR, AMIDON DE BLE, GER, WEIZENSTARKE, ITAL, AMIDO, SPAN, ALMIDON

A white, odourless, tasteless, impalpable powder, or irregular, angular or columnar masses, procured from the Fruits or grains of wheat, *Triticum sativum*, Lam, maize, *Zea Mays*, L, and rice, *Oryza sativa*, L

Medicinal Properties—Protective, absorbent A good application to the skin when irritable or inflamed, or in trivial burns It has been given in powder for diarrhoea, and is a very good antidote for Iodine poisoning, followed by an emetic Mucilage of Starch, 1 in 40, is useful as a basis for enemas In the form of Violet Powder it is useful to prevent the chafing and excoriation of the skin of infants Glycerin of Starch is a good application for chilblains and chapped hands, and as a protective in certain skin diseases

Official Preparations.—Glycerinum Amyli Used in the preparation of Pulvis Tragacanthæ Compositus

Not Official—Mucilage of Starch, Test Solution of Starch and Pulvis Viola

Foreign Pharmacopœias—Official in Austr, Wheat and Rice, Belg, Arrowroot, Maize, Potato, Rice and Wheat, Fr, Ger, Hung, Ital, Mex, Norw, Port, Russ, Span and Swed, all Wheat Starch Dan, Arrowroot and Wheat, Dutch, Arrowroot, Potato, Rice and Wheat, Jap, Katakuri, Kuzu and Potato, Port allows several other Starches, Swiss, Rice and Wheat Starch, U S, Maize Starch Fr has also Potato Starch

Descriptive Notes—Starch is met with in commerce in irregular columnar or pseudocrystalline masses, which may be white or coloured slightly blue, or in powder The starches most commonly used for food are those of Maize, Rice and Potato, although a number of others are met with, descriptions of which with measurements and excellent illustrations are given in Greenish's *Anatomical Atlas*, pl 1-ix, pp 6-22, and in Tschurch and Oesterle's *Anatomische Atlas* (1900)

The official Starch includes those of Wheat, Maize and Rice, and may be either in the columnar form or in powder, but should be white and inodorous Wheat Starch is described as consisting of large and small granules, the larger being lens-shaped and faintly striated concentrically, with a nearly central hilum, Maize Starch as frequently polygonal, more uniform in size, and somewhat smaller than the large granules of Wheat Starch, with a distinct hilum but no striæ, and Rice Starch as consisting of extremely minute granules nearly uniform in size, polygonal, and without evident hilum or striæ Potato Starch, by reason of its cheapness, is employed for many technical purposes and may be expected to occur as an adulteration of other Starches It should be noted that the lenticular grains of Wheat Starch when seen edgewise under the microscope appear elliptical or almost linear, and might be mistaken for the flattened grains of Zingiberaceous Starches, that a hilum is rarely evident

Arrowroot, obtained from *Maranta arundinacea*, was formerly

official, like all other Starches it is apt to absorb the odour and flavour of any drugs or perfumes near which it is placed and should consequently be kept in jars or tins

The commercial Starches may to some extent be distinguished by the different tints assumed by them when placed under a bell glass around a crystal of Iodine, and differ also in the character of the jelly they form with the same proportion of Water or Glycerin. In the *P G* only the Starch of Wheat is official, the measurements of the grains are given as 0.015 to 0.045 mm broad, and 0.002 to 0.008 mm in diameter. In the *USP* Maize Starch is alone official and the diameter of the grain is given as 0.010 to 0.025 mm.

Tests.—The distinguishing tests for Starch are the production of a translucent colourless gelatinous solution when boiled with water; the production of a deep blue colour when Iodine Solution is added to this solution when cold, the ready hydrolysis with the formation of products having a strong reducing action upon Fehling's Solution (Potassio-cupric Tartrate Solution) when the gelatinised solution is treated at a temperature of 100° F (37.7° C), with an active solution of an amylolytic enzyme.

The more generally occurring impurities are free alkali and an excessive amount of mineral matter. The *BP* includes as the official Starches, Wheat, Rice and Maize, the *USP*, Maize Starch, the *P G*, Wheat Starch only. Both *BP* and *USP* requires that when triturated with cold Water it shall yield a mixture having neither an acid nor an alkaline reaction to test papers, the *P G* stipulates that 1 part by weight of Starch boiled with 50 parts by weight of Water shall yield a mucilage which does not alter Litmus paper. Neutral Starch is, however, seldom obtained, it is, as a rule, faintly alkaline.

The *BP* makes no reference to the amount of ash permissible, the *USP* and *P G* state that not more than 1 p.c. of residue shall remain after complete incineration.

The *USP* requires that when freed from Water by careful drying in a current of warm air, Starch should show not less than 95 p.c. of hydrolysable carbohydrates.

Preparation.

GLYCERINUM AMYLI. GLYCERIN OF STARCH

Starch, 1, Glycerin, 6½, Distilled Water, 1½; stir them together whilst sufficient heat is applied to burst the Starch granules, and form a homogeneous mass.

The operation should be conducted as quickly as possible, to avoid excessive loss of Water, and to prevent carbonisation from overheating, the use of an oil-bath is recommended.

This formula has been altered in each successive edition of *B.P.* In 1867 the formula was Starch 1, Glycerin 8, in 1885, Starch 1, Glycerin 5, Distilled Water 3, and the proportions are now as that given above.

Foreign Pharmacopœias—Official in Belg, Starch 10, Water 15, Glycerin 90, Fr. (Glycéré d'Amidon), Starch 1, Water 1, Glycerin 18; Ital (Glicerolato d'Amido), Starch 7, Water 8, Glycerin 90; Mex. (Glicera de Almidon), Starch 2.4, Glycerin 80; Port. (Glicerado Com-

mum), Starch 1, Water 2, Glycerin 17, Span (Glicerolado de Almidon), Starch 1, Water 2, Glycerin 8, US (Glyceritum Amyli), Starch 1, Water 1, Glycerin 8 The following are called Unguentum Glycerini, Austr, Starch 1, Water 2, Glycerin 10, Dan, Starch 3, Water 3, Glycerin 14, Ger and Jap, Starch 10, Water 15, Glycerin 90, Hung, Tragacanth 1, Alcohol 5, Glycerin 50 (no Starch), Norw and Swed, Starch 1, Glycerin 15½, Russ, Starch 1, Water 1, Glycerin 14, Swiss, Starch 7, Water 7, Glycerin 93 All by weight

Not Official

MUCILAGE OF STARCH—A recently prepared solution containing approximately 2 p c w/v of Starch prepared by first rubbing 1 gramme of Starch to a smooth paste with Water, and adding a further sufficient quantity of Water to produce 50 c c, after boiling for a few minutes the mixture is cooled

PULVIS VIOLÆ—Orris Rhizome, in fine powder, 12 lb, Oil of Bergamot, 1 fl oz, Otto of Rose, 144 minims, Tincture of Musk (Squire), 8½ fl oz, Starch, in powder, 112 lb—*Squire*

Orris Rhizome, in fine powder, 12 50, Oil of Bergamot, 0 25, Oil of Neroli, 0 02, Starch, in powder, q s to produce 100—*B P C*

TEST SOLUTION OF STARCH—*See Appendix*

Not Official

AMYLUM IODATUM

Iodine, 5, Starch, 95, Distilled Water, q s Triturate the Iodine with a little Distilled Water, add the Starch gradually, and continue triturating until the compound assumes a uniform blue colour approaching black Dry at a temperature not exceeding 40° C (104° F) and rub it to a fine powder

This has been incorporated in the *B P C*

A teaspoonful thrice daily for lupus erythematosus—*B M J '80*, 1 652

Not Official

ANALGEN.

BENZANALGEN, QUINALGEN, ORTHOETHOXY-ANA-MONOBENZOYLAMIDOCINOLIN.

A white crystalline powder, inodorous and tasteless

This is similar in chemical composition and properties to Phenacetin, but with the Phenol ring replaced by the Quinoline ring

Solubility—Insoluble in Water, sparingly soluble in cold, more so in hot Alcohol, fairly soluble in Chloroform, almost insoluble in Ether

Medicinal Properties—Has been recommended in neuralgia, hemicrania, and bronchitic asthma, but it is not without unpleasant effects, the urine is frequently coloured red, toxic action and dangers—*B M J '98*, 11 1055

It has given relief in sciatica—*M A '94*, 9, *B M J E '93*, 11 87, *M P '94*, 621, *L '97*, 1 1227

Dose—7½ to 15 grains = 0.5 to 1 gramme

Prescribing Notes.—*Usually given in cachets, or Compressed Tablets.*

Tests—Analgen melts at a temperature of 208° C (406.4° F), and should leave no residue on ignition The cold saturated aqueous solution should yield a yellow coloration with Ferric Chloride Test solution It dissolves in cold concentrated Sulphuric Acid, forming a bright yellow coloured liquid, and on dilution with Water a lemon yellow coloured precipitate is thrown down The cold saturated aqueous solution reduces Silver Nitrate Solution in the cold or on warming.

ANETHI FRUCTUS.

DILL FRUIT.

FR, ANETH, GER, DILLSAMEN, ITAL, ANETO, SPAN., ENELDO.

The dried ripe Fruit of the *Peucedanum graveolens*, Benth and Hook f.

Cultivated in Britain or imported from Central and Southern Europe

Descriptive Notes.—Two varieties of Dill are met with in commerce, viz, the European and the Indian. The former only is official. The fruits are oval, flat, about $\frac{1}{8}$ inch (4 mm) long, $\frac{1}{8}$ inch (2 to 3 mm) broad, brown, with the two outer ridges developed into a pale marginal wing. A transverse section shows 6 vittæ. The odour and taste are aromatic.

The Indian Dill is narrower, more elliptical, more convex, and of a greyish tint, and is usually not so free from fruit-stalks as the European drug. The oil obtained from it differs in containing Dill Apioi, and less Carvone, as well as in chemical and physical characters, from that of European Dill. The plant yielding it is *Peucedanum Soua*, Benth and Hook f, considered by some botanists as only a variety of *P. graveolens*, but the *BP* description excludes the use of the Indian drug. The Dill Apioi separates during distillation, forming a layer at the bottom of the receiver.

Medicinal Properties.—Stomachic and carminative; chiefly given to children in cases of flatulency, sometimes given with Sodium Bicarbonate, the taste of which it covers well.

Official Preparations.—Aqua Anethi and Oleum Anethi.

Foreign Pharmacopœias.—Official in Mex (Eneldo), Port (Endro). Not in the others.

AQUA ANETHI. DILL WATER

Dill Fruit, 1, Water, 20, distil, 10. (1 in 10)

Not in the other Pharmacopœias

Dose.— $\frac{1}{2}$ to 1 fl oz. = 14.2 to 28.4 c.c., for children, 60 minims = 3.6 c.c.

OLEUM ANETHI. OIL OF DILL

A pale yellow, thin, oily liquid having a characteristic odour resembling Caraway, and possessing at first a sweetish and aromatic and subsequently a sharp, burning taste.

The Oil distilled from Dill Fruit.

Yield 3 to 4 p.c.

It darkens in colour on exposure to air and light and should be preserved in well-stoppered bottles of a dark amber tint. It contains about 40 to 60 p.c. of Carvone, and a terpene Limonene, but no Anethol.

Solubility.—Readily soluble in Alcohol and Ether.

Dose.— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 c.c.

Not in the other Pharmacopœias

Tests.—The distinguishing tests for Dill Oil are the strong characteristic odour, the specific gravity, which should be 0.905 to 0.920, the optical rotation, which should be from $+70^{\circ}$ to $+80^{\circ}$, in a tube of 100 mm length. It should yield a clear solution in from 6 to 8 parts of Alcohol (80 p.c.). Not less than 15 p.c. should distil below 185°C (365°F), and not less than 40 p.c. above 220°C (428°F). The abstraction of Carvone from the oil is indicated by a decrease in the specific gravity, and a diminution in the amount distilling above 220°C (428°F).

Not Official

ANILINE

$\text{C}_6\text{H}_5\text{N}$, eq. 92.40

* An oily liquid, colourless when freshly distilled, but very prone to become yellow or brown on exposure to air.

It should be kept in well stoppered bottles of a dark amber tint and protected as far as possible from the air.

Solubility—1 in 27 of Water, 5 in 4 of Alcohol (60 p.c.), mixes in all proportions with Alcohol (90 p.c.), Ether and Glycerin.

As a vehicle for dissolving Cocaine, for the production of local anaesthesia of the ear, 10 to 15 minims of a 5 p.c. solution of Cocaine made by dissolving Cocaine Hydrochloride 5 in dilute Alcohol 50, Aniline Oil 50—*L* '00, 1 1125, '01, 1 698.

Dose—Not more than 7 minims = 0.5 c.c.—*L* '00, 1 1127.

Several cases of poisoning from boots to which a black material containing an Aniline dye had recently been applied—*L* '02, 1 463.

Tests—It should possess a specific gravity of 1.020 to 1.026, and a boiling point of 183° to 184°C (361.4° to 363.2°F). An aqueous solution of Aniline treated with a solution of Chlorinated Lime yields a dirty violet blue coloration changing to Indigo blue on the addition of Ammonia Solution. A few drops of Aniline warmed with an alcoholic solution of Potassium or Sodium Hydroxide and a drop or two of Chloroform evolve the characteristic, disagreeable, poisonous odour of Phenyl Isonitrile.

ANISI FRUCTUS.

ANISE FRUIT

Fr, ANIS VLRT, GER, ANISSAMEL, ITAL, ANICF, SPAN, ANIS

The dried ripe Fruit of *Pimpinella Anisum*, L.

Medicinal Properties—Stomachic and aromatic, carminative, slightly expectorant, used to relieve flatulence, and to diminish the griping of purgative medicines.

Official Preparations—Aqua Anisi and Oleum Anisi.

Foreign Pharmacopœias—Official in Aust, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex (Anis Comun), Norw, Port, Russ, Span, Swed, Swiss and U.S.

Descriptive Notes.—Anise fruit occurs in commerce in several varieties, differing considerably in size and colour, and in degree of freedom from impurity. It possesses an aromatic and characteristic

odour, and has a sweet taste. The official drug is limited to such varieties as are about $\frac{1}{2}$ inch (5 mm) long, and $\frac{1}{16}$ inch (2 mm) broad, and therefore includes the Maltese, Alicante and German varieties. Anise fruit is greyish-brown, *BP* (also greyish or greenish-grey, *USP*), ovate, stalked, with the two carpels united, and rough with minute 1-celled hairs, a transverse section exhibits numerous vittæ. The German variety is brownish and that of Alicante greenish, South Russian Anise is similar in size to *Conium* fruit. *Conium* has sometimes occurred mixed with Anise fruit in Italy. Its presence may be detected by the mouse-like odour developed when rubbed with a few drops of *Liquor Potassæ*. It differs from Anise in being without hairs, and having the ridges distinctly crenate, and the flat surface deeply grooved as seen in transverse section, and in being without vittæ in the mature fruit.

North Russian Anise is small and dark green or brownish, and it is used as a cheap source of the essential oil. The Syrian and Chilean varieties are usually very inferior and mixed with more or less foreign matter, and are consequently reserved for veterinary medicine. The varieties richest in essential oil are the Italian, Spanish and South Russian. The residue after distillation is valued as an ingredient for cattle foods. Under the microscope the distinguishing features are the simple, thick-walled, short, erect, straight or slightly curved hairs, with a minutely warty surface, and the striated surface of the flattened polygonal cells of the outer epidermis.

AQUA ANISI. ANISE WATER

Anise Fruit, 1, Water, 20, distil, 10 (1 in 10)

Dose.— $\frac{1}{2}$ to 1 fl oz = 14.2 to 28.4 c.c.

Foreign Pharmacopœias.—Official in Belg., from the Spirit, Fr., Jap., Port and Span., from Fruits, and U.S. from Oil. Not in the others.

OLEUM ANISI. OIL OF ANISE

Fr., Essence d'Anis, Ger., Anethol, Ital., Essenza di Anice, Span., Esencia de Anis.

At temperatures above 15°C (59°F) it is a colourless or pale yellow refractive liquid, with a pleasant aromatic odour and very sweet taste, below 15°C (59°F) it becomes a white crystalline solid. It is obtained by distillation from the fruits of the official variety, or from the fruit of *Illicium Verum* or Star Anise.

It should be kept in amber-coloured well-stoppered glass bottles.

Solubility.—1 of Pimpinella Oil in 3 of Alcohol (90 p.c.); 1 of Illicium Oil in 4 of Alcohol (90 p.c.), a slight rise in temperature greatly increases the solubility in Alcohol (90 p.c.), both oils dissolve in all proportions of Absolute Alcohol, 1 of Pimpinella Oil in 200 of Alcohol (60 p.c.), at which point the Illicium Oil is distinctly turbid.

These variations in solubility seem to arise from the presence in the Illicium Oil of a small proportion of a much less soluble Oil, which is absent in the Pimpinella.

Dose.— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 c.c.

Prescribing Notes—*May be taken on Sugar Before dispensing an oil which has become partly solidified, it should be completely liquefied by warming, and well mixed by shaking*

Official Preparation—Spiritus Anisi Contained in Tinctura Camphoræ Comp and Tinctura Opi Ammoniata

Not Official—Aniseed Cordial, Elixir Anisi, Essentia Anisi, Tinctura Anisi, Anisic Acid, Sodium Anisate and Anethol

Foreign Pharmacopœias—The following are from *Pimpinella* Dan, Dutch, Fr, Ital, Norw and Russ, sp gr 0 980 to 0 990, Hung, sp gr 0 978 to 0 984, Port, sp gr 0 977 to 0 983, Mex, sp gr 0 982, Span, sp gr 0 984 to 0 986, Swiss, sp gr 0 984 to 0 994, U S, sp gr 0 975 to 0 985 at 25° C (77° F) The following permit the use of both kinds Mex, Port and U S See also Anethol

Tests.—The distinguishing tests for Anise Oil are its distinctive odour, its sweet taste, the specific gravity, which at 20° C (68° F) should be from 0 980 to 0 990, its optical rotation, which should be -1° to -2° in a tube of 100 mm length, the melting point, which should not be below 15° C (59° F), the solidifying point, which should not be below 15° C (59° F)

The *BP* gives the sp gr at 20° C (68° F) as 0 975 to 0 990, the *PG* at 25° C (77° F) as 0 984 to 0 986, the *USP* at 25° C (77° F) as 0 975 to 0 988 The melting point given in the *BP* is from 10° to 15° C (50° to 59° F), the *USP* states that it should not be below 15° C (59° F) and gives the method outlined below for its determination

80 to 90 pc of the oil should distil between 225° and 235° C (437° to 455° F), indicating a due percentage of Anethol Neither *BP* nor *USP* make any reference to either the boiling point or to fractionation

The *Pimpinella* Oil is readily distinguished from that of *Star Anise* by giving a deep blue colour on the addition of saturated solution of Hydrochloric Acid gas in Alcohol, but Schimmel and Co state that the two varieties can only be distinguished by the odour and taste, and that the reaction with alcoholic Hydrochloric Acid does not give reliable results The balance of opinion seems to be that it does afford a means of distinction

The more generally occurring sophistications are Fennel Oil, or its stearoptene, volatile oils containing Phenols, Alcohol, the fluid portion remaining after the extraction of the Anethol, and Petroleum Fennel Oil or its stearoptene are detected by the optical rotation of the sample, both these adulterants being dextrogyrate, volatile oils containing Phenols are detected by a blue or brownish colour produced by the addition of Ferric Chloride Test solution to an alcoholic solution of the oil, Alcohol by the decrease in volume when the oil is shaken in a graduated measure with Water, the fluid portion remaining after the extraction of Anethol, by the alteration in the melting and solidifying point, and Petroleum by the Alcohol solubility—the pure oil dissolves 1 in 3 of Alcohol (90 pc), an oil containing 5 pc of Petroleum will not dissolve 1 in 10 The oil undergoes oxidation by exposure to air, and its characters are greatly changed. Rise of specific gravity and lowering of the melting point are the principal indications as to the extent of oxidation.

Melting Point.—In the *USP* the following method is given to determine the congealing point, which should be below 15°C (59°F). Transfer about 10 c.c. of the Oil to a test-tube placed in Water cooled with Ice, insert a thermometer at once into the Oil and allow it to remain undisturbed until its temperature has fallen to about 6°C (42.8°F). Induce crystallisation either by rubbing the inner wall of the test-tube with the thermometer or by the addition of a particle of Solid Anethol, remove the test-tube from the bath, and stir constantly during the solidification of the Oil. The highest temperature reached during the crystallisation is regarded as the congealing point.

Preparation.

SPIRITUS ANISI. SPIRIT OF ANISE

Oil of Anise, 1, Alcohol (90 p.c.), *q.s.* to make 10 (1 in 10)

Dose.—5 to 20 minims = 0.3 to 1.2 c.c.

Half the strength of *BP* '85.

Foreign Pharmacopœias.—*Fr.* Oil in 100, *Fr.* 1 Oil in 50, *US*, Spirit, 1 Oil in 4, *Span.* has Alcohol de Anis Amoniacal, Oil 1, Liquid Ammonia 5, Alcohol (95 p.c.) 24. All by weight, except *US*. Not in the others.

Not Official.

ELIXIR ANISI. *Syn.* ANISEED CORDIAL.—Anethol, 3.5, Oil of Fennel, 0.5, Spirit of Bitter Almond (*USP*), 12, Alcohol (95 p.c.), 240, Syrup (*USP*), 625, Water, 125, Purified Talc (*USP*), 15. Average Dose for infants, 1 c.c. (15 minims).—*USNF*

Anethol, 0.35, Oil of Fennel, 0.05, Spirit of Bitter Almond, 1.25; Alcohol (90 p.c.), 24, Syrup, 62.50, Magnesium Carbonate, 1.50, Distilled Water, *q.s.* to produce 100.—*BP C*

ESSENTIA ANISI—Oil of Anise, 1, Rectified Spirit, 4.—*BP* 1885
This has been incorporated in the *BP C*

TINCTURA ANISI—(*Ital*, *Mex* and *Russ*)—Anise Fruit, 1, Alcohol, 5

ANISIC ACID ($\text{H}_2\text{C}_6\text{H}_3\text{O}$)—It occurs in colourless, shining acicular crystals obtained by the oxidation of Oil of Anise or Anethol

Solubility—Almost insoluble in cold Water, 1 in 700 boiling Water, 1 in 36 of Alcohol (90 p.c.), 1 in 50 of Ether

SODIUM ANISATE—In rhombic crystals, or a crystalline powder, frequently efflorescent, with a slight aromatic odour

Solubility—1 in 5 of Water, 1 in 24 of Alcohol (90 p.c.)

Anisic Acid and its Sodium salt have been stated to possess antiseptic and antipyretic properties, similar to Salicylic Acid

Dose—5 to 15 grains = 0.32 to 1 gramme

ANETHOL ($\text{C}_{10}\text{H}_{12}\text{O}$)—The Stereoptene separated from either of the Anise Oils. It is said to have a finer flavour than the Oil, being free from the acidity pertaining to the non-freezing portion of the Oil. A white crystalline mass possessing a strong characteristic Anise-like odour and sweetish taste. When melted it forms a highly refractive, almost colourless liquid

Foreign Pharmacopœias—Official in Austr, Belg, Dutch, Ger., Jap. and Swed. Not in the others

Tests.—It has at 25°C (77°F) a sp. gr. of 0.954 to 0.966, a melting point of 22.5° to 23°C (72.5° to 73.4°F), and a boiling point of 232° to 234°C (449.6° to 453.2°F). It should form a clear solution in 3 parts of Alcohol (90 p.c.).

ANTHEMIDIS FLORES.

CHAMOMILE FLOWERS

FR, CAMOMILLE ROMAINE, GTR, ROMISCHE KAMILLE, ITAL, CAMOMILLA ROMANA, SPAN, MANZANILLA ROMANA

The dried expanded Flower heads of the common or Roman Chamomile, *Anthemis nobilis*, L., collected from cultivated plants

Medicinal Properties—Stomachic, tonic and carminative In large doses, emetic Useful in atonic dys-pepsia, externally it is employed as a fomentation for bruises and contusions

Prescribing Notes—*The Extract or Oil is frequently added to Rhubarb and aperient medicines as a corrective A little Soap added in the case of the Oil, makes a good pill mass*

Official Preparations—Extractum Anthemidis, and Oleum Anthemidis The Oil is contained in the Extract

Not Official—Aqua Anthemidis, Decoctum Anthemidis et Papaveris, Oleum Chamomillæ Infusum, Infusum Anthemidis, Infusum Anthemidis Concentratum, Liquor Anthemidis et Papaveris, and Tinctura Anthemidis

Foreign Pharmacopœias—Official in Austr, Belg, Dutch, Fr, Ital, Jap, Mex, Port, Span, Swiss and U S Not in the others Also *Matricaria* in Austr, Dan, Dutch, Ger, Hung, Ital, Jap, Mex, Norw, Russ, Span (*Manzanilla ordinaria*), Swed and Swiss

Descriptive Notes—The drug is met with in commerce chiefly in two forms, known respectively as English and exotic The official description as well as that of the *USP* applies to the former The flower-heads are hemispherical, 10 to 20 mm ($\frac{1}{2}$ to $\frac{3}{4}$ inch) in diameter, and nearly white in colour The florets are ligulate, suddenly tapering in the lower half and about 1 cm ($\frac{1}{2}$ inch) long, a few tubular florets usually remaining in the centre There is no pappus, and the solid conical receptacle is covered with narrow membranous bracts or paleæ, visible when the florets are removed. The involucre scales are also membranous and obtuse, with a green central nerve The exotic Chamomile flowers, chiefly imported from Belgium and France, differ in being rather larger and in the florets being broader and all ligulate In Scotland the single wild Chamomile flowers are often sold under the name of Scotch Chamomiles These differ in having only one row of ligulate florets, all the centre consisting of yellow tubular florets Scotch Chamomiles are sometimes preferred, on the supposition that the central contain more oil than the ligulate florets, but the single Chamomiles are excluded from use in dispensing by the *BP* description

The Chamomile flowers (Flores Chamomillæ) official in the *PG*, are the single flower-heads of *Matricaria Chamomilla*, L These are much smaller than those of *Anthemis nobilis*, averaging only $\frac{1}{2}$ inch (5 mm) in diameter, and have a portion of the fruit-stalk attached to them The receptacle is nearly conical, but hollow, and has no paleæ The odour resembles that of the *BP* Chamomile, but is weaker

If Chamomile flowers have a brownish tint they have either been damaged by rain, or not carefully dried, or have become brownish by

keeping. In either case they must be regarded as of inferior quality and unfit for medicinal purposes. The taste of Chamomile flowers is bitter and strongly aromatic.

The double flowers of *Chrysanthemum Parthenium*, Bernh., which have occasionally been found mixed with Chamomile flowers have a slightly convex, not conical, solid receptacle, and the few paleæ sometimes present are lanceolate and acute.

Preparations

EXTRACTUM ANTHEMIDIS. EXTRACT OF CHAMOMILE.

An aqueous extract of the Flowers treated by decoction, to which Oil of Chamomile is added just before completion of the evaporation, in the proportion of 15 minims of Oil to each pound of the Flowers employed.

The double Flowers yield about 30 p.c. of Extract.

Dose.—2 to 8 grains = 0.13 to 0.52 gramme.

Foreign Pharmacopœias—Official in Ital., from both, Dan. and Swed., from Matricaria, Mex. (Extracto de Manzanilla). Not in the others.

OLEUM ANTHEMIDIS. OIL OF CHAMOMILE.

A pale blue oily liquid, of an aromatic characteristic odour and slightly bitter taste, distilled from the dried Flowers of *Anthemis nobilis*. On exposure to light and air the Oil acquires a greenish or yellowish-brown colour, and should therefore be kept in well-stoppered glass bottles of a dark amber colour, and exposed as little as possible.

Solubility—Scarcely in Water, 10 in 3 of Alcohol (90 p.c.)

Dose.— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 c.c.

Foreign Pharmacopœias—Official in Belg., from Anthemis, Fr., from Anthemis, Ital. and Swiss, from Matricaria. Not in the others.

Tests.—Oil of Chamomile has a specific gravity of about 0.910. The optical rotation should be between $+1^{\circ}$ and $+3^{\circ}$ in a tube of 100 mm. length. The optical rotation is not given in the B.P.

Not Official.

AQUA ANTHEMIDIS—Flowers 1, Water 20, distil 10. (1 in 10)

Foreign Pharmacopœias—Official in Austr., 1 in 10; Belg., 8 of the Spirit in 100, Port., 1 in 4. Ital., Matricaria, 1 in 2, Anthemis, 1 in 2 $\frac{1}{2}$. All distilled. Port., from Anthemis, Austr., from Matricaria, Ital., from both. Not in the others.

Oleum Chamomillæ Infusum—Chamomile Flowers, 1, Olive Oil, 10; digest in a water-bath for 2 hours, strain, press and filter.

Foreign Pharmacopœias—Official in Fr. and Port., 1 in 10; Span., 1 in 8, from Anthemis. Ital., 1 in 4, from Anthemis and from Matricaria. Belg. (Oleum Chamomillæ Camphoratum), 1 of Oil with 999 of Camphorated Oil. Span. (Aceite de Manzanilla Alcanforado), 1 of Camphor with 9 of Oil Cham. Infus.

DECOCTUM ANTHEMIDIS ET PAPAVERIS—Chamomile Flowers, 10; Poppy Capsules, bruised, 5, Distilled Water, q.s. to produce 100.—B.P.C.

INFUSUM ANTHEMIDIS—Chamomile Flowers, 1, Boiling Distilled Water, 20 Infuse 15 minutes and strain—*B P* 1885
This has been incorporated in the *B P C*

INFUSUM ANTHEMIDIS CONCENTRATUM—Chamomile Flowers, in powder, 40, Oil of Chamomile, 0.2, Alcohol (20 p c), *q s* to make 100, mix the Oil of Chamomile thoroughly with the powder and submit the latter to re-percolation

Dose—As a stomachic, 1 to 4 fl drim, as an emetic, 5 to 10 fl drim—*Farr* and *Wright*, *P J* '06, 1 165 and '07, 1 621, *C D* '06, 1 252, *Y B P* 1907, 249
This appears in the *B P C*

LIQUOR ANTHEMIDIS ET PAPAVERIS—Concentrated Infusion of Chamomiles and Liquid Extract of Poppies, equal volumes One or two tea spoonfuls in half a pint of boiling Water, for use as a fomentation

TINCTURA ANTHEMIDIS—Single Chamomiles, carefully dried, 1, sufficient Alcohol (90 p c) to percolate, 8, or an equivalent quantity of fresh Flowers (about 3), and macerate with 8 of Alcohol (90 p c) for 7 days, and press.

The moisture in the fresh flowers reduces the strength of the spirit so that less resin is dissolved, and the tincture is consequently less bitter

Foreign Pharmacopœias—Official in Austr, 1 in 5, from Matricaria, Ital and Mex, 1 in 5, both varieties, Belg, Chamomillæ Spiritus, 1 of the Oil in 100

ANTIMONII OXIDUM.

ANTIMONIOUS OXIDE

Sb_4O_6 , eq 571.28

A white, more or less crystalline, powder

When a solution of Antimonious Chloride is poured into Water Antimony Oxichloride is precipitated, and this, when in turn decomposed with Sodium Carbonate, yields Antimonious Oxide

Solubility.—Insoluble in Water, Alcohol, and Nitric Acid, readily dissolved by Hydrochloric Acid and warm solution of Tartaric Acid

Medicinal Properties—Similar to but less active than the Tartrate because less soluble

Dose—1 to 2 grains = 0.06 to 0.13 gramme

Prescribing Notes—The *Pulvis Antimonialis* is generally given in the form of powders, pills or cachets

Official Preparation.—*Pulvis Antimonialis* Used in the preparation of Antimonium Tartaratum

Foreign Pharmacopœias—Official in Mex (*Oxido Antimonioso Precipitado*), Norw (*Oxydum Stibicum*), Port and Span Not in the others

Tests—The distinguishing tests for Antimony Oxide are that its slightly acidified solution yields with Hydrogen Sulphide Solution an orange-coloured precipitate soluble in Potassium Hydroxide Solution and in Ammonium Hydrosulphide Solution, insoluble in Ammonium Carbonate Solution, a cold white porcelain vessel allowed to impinge upon the upper flame produced on igniting the gas yielded by the

interaction of Zinc, Hydrochloric Acid and a solution of the Oxide, acquires a dark metallic-looking stain, which is unaffected by Calcium or Sodium Hypochlorite Solution, the production of a metallic-looking coating on Copper when a piece of Copper foil is boiled with a solution of the Oxide containing free Hydrochloric Acid, the formation of a white amorphous but no crystalline sublimate when this coating is volatilised in a tube, the formation of a black deposit of Antimony on the Platinum, when a Zinc rod is allowed to rest on a piece of Platinum foil in an acidified solution of the Oxide.

It is officially required to indicate 99.98 p.c. of pure Antimonious Oxide, as indicated by titration with Deci-normal Volumetric Iodine Solution. The Oxide is brought into solution by means of Acid Potassium Tartrate or Tartaric Acid and an alkaline reaction throughout the titration ensured by the addition of Sodium Bicarbonate, this being necessary to neutralise the Hydriodic Acid set free during the reaction, Hydriodic Acid otherwise acting as a reducing agent. A weighed quantity of 0.5 gramme dissolved in twice the volume of Acid Potassium Tartrate then mixed with 3 grammes of Sodium Bicarbonate and cooled should decolorise 70 c.c. of the Volumetric Solution of Iodine.

The more generally occurring impurities are Antimonic compounds, Arsenic, Calcium, Copper, Iron, Lead, Chlorides and Sulphates. It is officially required to dissolve completely in an excess of Acid Potassium Tartrate. The extent to which it is true depends upon the age of the specimen, Antimonious Oxide undergoes oxidation on exposure to air, the resulting Antimonic compounds being insoluble. The amount of residue therefore forms a criterion of the proportion of the latter. The remaining impurities are grouped together in the *BP* under the elastic expression, 'it should yield no characteristic reaction with the tests for,' etc. The solution obtained by dissolving the Oxide in Hydrochloric Acid should yield no reaction with the Bettendorf's test, indicating the absence of Arsenic. When dissolved in Sodium Hydroxide Solution (15 p.c. w/w) it should yield on the addition of Hydrogen Sulphide Solution no dark coloration, indicating the absence of Copper, Lead and Iron, a white precipitate would indicate the presence of Zinc. Another portion of the sample dissolved in Sodium Hydroxide Solution (15 p.c. w/w) when supersaturated with Nitric Acid should yield only a faint turbidity on the addition of either Silver Nitrate Solution or Barium Chloride Solution, indicating the absence of more than a trace of Chlorides and Sulphates.

Preparation

PULVIS ANTIMONIALIS. ANTIMONIAL POWDER.

Antimonious Oxide, 1, Calcium Phosphate, 2.

Dose.—3 to 6 grains = 0.2 to 0.4 gramme

Foreign Pharmacopœias — Official in Mex., Antimonious Oxide 1, Calcium Phosphate 2, Port., Antimonious Oxide 85, Calcium Phosphate 65, and in the others.

ANTIMONIUM NIGRUM PURIFICATUM.

ANTIMONIOUS SULPHIDE

FR, TRISULFURE D'ANTIMOINE, GER, GEREINIGTES SCHWEFELANTIMON;
ITAL, TRISOLFURO DI ANTIMONIO, SPAN, SOLFURO DE ANTIMONIO PURIFICADA.

A heavy, odourous, greyish-black crystalline powder, consisting of native Antimonious Sulphide Sb_2S_3 , eq 333 46, separated from siliceous material and from arsenical compounds

Official Preparation —Used to prepare Antimonium Sulphuratum

Foreign Pharmacopœias —Official in Austr, Belg, Dan, Fr, Ger, Hung, Ital (Ciudo and Depurato), Mex, Poit, Span (Sulfuro de Antimonio Purificada), Swed and Swiss Not in the others

Tests —Antimonious Sulphide yields the tests distinctive of Antimony given under Antimonious Oxide, it moreover evolves on boiling with Hydrochloric Acid the characteristic disagreeable odour of Hydrogen Sulphide, and when fused with a mixture of Sodium Carbonate and sufficient Potassium Nitrate to oxidise it, yields a mass which, when dissolved in Water and filtered, affords with Barium Chloride Solution a heavy white precipitate insoluble in Hydrochloric or Nitric Acid, or in a mixture of both

The more generally occurring impurities are Arsenic and siliceous matter The Pharmacopœia stipulates that it should not yield more than slight characteristic reactions with the Arsenic tests The Belgian Pharmacopœia is more precise, and requires that 1 gramme, shaken with 10 c c of Hydrochloric Acid until disengagement of gas ceases, mixed with 5 c c of Water, and cautiously heated on a water-bath with some crystals of Potassium Chlorate, the mixture, when freed from Chlorine, filtered through an asbestos plug and evaporated to 3 c c, shall yield no brown coloration in one hour, when mixed with an equal volume of Stannous Chloride Solution The *P G* and Austri Ph do not allow more than 1 p c of residue insoluble in concentrated Hydrochloric Acid

Hydrochloric Acid —2 grammes of the powdered salt are dissolved on warming gently with 20 c c of Hydrochloric Acid, and then, on boiling for 1 hour, should leave a residue amounting to not more than 0 02 gramme, *P G*

ANTIMONIUM SULPHURATUM. SULPHURATED ANTIMONY *N O Syn* —KREMES MINERAL STIBIUM SULFURATUM AURANTIACUM

FR, PENTASULFURE D'ANTIMOINE, GER, GOLDSCHWEFEL, SPAN, AZUFRE DORADO DE ANTIMONIO

An orange-red, odourless, tasteless powder, which consists of a mixture of Antimony Penta- and Tri-sulphides and -oxides, and containing also some free Sulphur It should be preserved from the light

It is officially stated to be prepared by boiling 10 parts each of Antimonious Sulphide and Sublimed Sulphur for two hours with a solution of 5 parts of commercial Sodium Hydroxide in 100 parts of Distilled Water, stirring frequently, the volume of the liquid is maintained by the occasional addition of Distilled Water Whilst still hot, add 180 parts of boiling Distilled Water, strain through calico,

and add gradually diluted Sulphuric Acid in slight excess to the strained liquid. Collect the precipitate on calico, wash with Distilled Water till the washings are free from Sulphates, and dry at a temperature not higher than 100° C (212° F)

Solubility.—Insoluble in Water, dissolves readily in Sodium Hydroxide solution also in hot Hydrochloric Acid evolving Hydrogen Sulphide

Medicinal Properties.—Alterative, diaphoretic, and emetic, powerfully depressant, uncertain in action from its slight solubility, depending on the acidity of the stomach. Usually prescribed with Calomel and Guaiacum, as in *Pilula Hydrargyri Subchloridi Composita*, as a cholagogue in gout, for secondary syphilis and its cutaneous eruptions, or with Henbane or Hemlock in chronic rheumatism

Objection taken (*L* '05, 1 1610) to the use of red Antimony Sulphide in the composition of red India-rubber. The investigation arose from a case of appendicitis where a large quantity of liquid was in the habit of being drunk from bottles fitted with stoppers having a red rubber ring round them

It is pointed out (*L* '05, 1 1786) that this Sulphide is soluble with difficulty except in hot strong acids or strong alkali, and a series of tests carried out with a number of the more generally occurring beverages, at which they possessed no solvent action as regards Antimony when left in contact with red rubber rings containing 16.83 p.c. of that substance

Dose.—1 to 2 grains = 0.06 to 0.13 gramme

Official Preparation.—Contained in *Pilula Hydrargyri Subchloridi Composita*

Foreign Pharmacopœias.—Official in Austr, Belg, Hung and Swiss (*Stibium Sulfuratum Aurantiacum*), Dan and Dutch (*Sulfidum Stibicum*), Fr (*Pentasulfure d'Antimoine*), Ger, Jap and Russ (*Stibium Sulfuratum Aurantiacum*), Mex (*Sulfuro Antimonico*), Norw (*Sulfuretum Stibicum*), Port (*Enxofre Dourado de Antimonio*), Span (*Azufre Dorado de Antimonio*), Swed (*Kermes Mineralis*). Swiss has also *Stibium Sulfuratum Rubrum*

Tests.—Sulphurated Antimony yields the tests distinctive of Antimony appearing under Antimonious Oxide, when treated with Hydrochloric Acid it evolves a disagreeable characteristic odour of Hydrogen Sulphide, and a separation of Sulphur occurs; and when fused with Potassium or Sodium Carbonate and sufficient Potassium Nitrate to effect oxidation, the product, when dissolved in Water and filtered, yields a solution giving with Barium Chloride Solution a dense white precipitate insoluble in concentrated Hydrochloric Acid or in Nitric Acid, or in a mixture of both

The official gravimetric test requires that when 3 grammes of the Sulphide are fully oxidised with Nitric Acid, 2 grammes of Antimonious Oxide should be produced. It has been pointed out (*Y.B.P.* '07, 473) that it will not yield this amount of residue by this test, and it has been suggested that it should be modified so as to read, 3 grammes moistened with dilute Nitric Acid, with successive portions of fuming Nitric Acid until red fumes cease to be evolved, the excess of Water then evaporated off, and carefully heated to redness, to expel Sulphuric

Acid, should leave a whitish residue weighing not less than 1.6 and not more than 1.8 grammes. It is shown that a sample containing as much as 30 per cent of anhydrous Sodium Sulphate yielded a figure for residue very close to that obtained from a genuine and carefully prepared sample.

The more generally occurring impurities are Arsenic, siliceous matter, Chlorides and Sulphates. The *B P* employs the ordinary tests for Arsenic. The *P G* uses saturated aqueous Ammonium Carbonate Solution for the extraction of the Arsenic, and states that when this solution is supersaturated with Hydrochloric Acid no yellow flocculent precipitate should be thrown down in six hours. The Belgian Pharmacopœia gives an Arsenic test similar to that recorded under Antimonious Sulphide. The tests described in small type below, under the heading of Silver Nitrate and Barium Nitrate, serve to detect Chlorides and Sulphates if present.

Ammonium Carbonate Solution—Allow a mixture of 0.5 gramme of Sulphurated Antimony with 5 cc of an aqueous Solution of Ammonium Carbonate saturated at ordinary temperatures, to stand for 2 minutes with occasional agitation at a temperature of 50° to 60° C (122° to 140° F). In the solution so obtained after filtration, and saturation with Hydrochloric Acid, a yellow flocculent precipitate should not be thrown down within six hours, *P G*.

Silver Nitrate—1 gramme Sulphurated Antimony when agitated with 20 cc of Water and filtered, gives a filtrate which on the addition of Silver Nitrate T.S. should become only faintly opalescent, but should not become brown, *P G*.

Barium Nitrate—The filtrate obtained as above should not immediately become cloudy on the addition of T.S. of Barium Nitrate, *P G*.

Not Official

LIQUOR ANTIMONII CHLORIDI—A yellowish red liquid, sp gr about 1.47. A powerful escharotic.

ANTIMONIUM TARTARATUM.

TARTARATED ANTIMONY

B P Syn—POTASSIO TARTRATE OF ANTIMONY, TARTAR ÉMÉTIQ.

FR, ANTIMONIO-TARTRATE ACIDE DE POTASSIUM, GER, BREI CHWEINSLEIM
ITAL, TARTARO EMETICO, SPAN, TARTRATO ANTIMONICO POTASICO

$[K(SbO)C_4H_4O_6]_3H_2O$, eq 659.14.

N O Syn—TARTARUS STIBIATUS

Colourless, odourless, transparent rhombic crystals, or as a heavy white powder. Taste at first sweet, then nauseous and metallic.

It should be preserved in well-stoppered bottles of a dark amber colour.

Solubility.—1 in 17 of Water (slowly), 1 in 2 of boiling Water, sparingly soluble in Alcohol (60 p.c.), insoluble in Alcohol (90 p.c.)

Medicinal Properties—Diaphoretic, expectorant, alterative, emetic, circulatory and nervous depressant. Useful in the head

symptoms of acute febrile diseases and in delirium tremens, contra-indicated in asthenic cases, alterative in chronic skin affections and in gout

As a diaphoretic and expectorant, it is given with great effect in the treatment of acute pneumonia, bronchitis and croup

Externally, in the form of ointment, it acts as a powerful counter-irritant, producing a pustular eruption

Too purgative and depressant for use in lowering blood pressure B M J '06, 11 1451

A review of post-mortem examinations, after death from the administration of tartar emetic—B M J '03, 1 873

Dose.—As a diaphoretic, $\frac{1}{4}$ to $\frac{1}{2}$ grain = 0.003 to 0.008 gramme; as an emetic, 1 to 2 grains = 0.06 to 0.13 gramme

Ph Ger maximum single dose, 0.2 gramme, maximum daily dose, 0.6 gramme

Prescribing Notes.—*Best prescribed in aqueous solution or as the Vinum. In pill, well triturated with Milk Sugar and Diluted Glucose q s*

Incompatibles.—Tannic Acid, the Alkalis and their Carbonates, and Lead salts, Astringent infusions, as Cinchona, Rhubarb, etc

Official Preparation.—Vinum Antimoniale

Not Official.—Unguentum Antimonii Tartarati.

Antidotes.—Stomach-tube or emetics, Tannic Acid, Catechu, vegetable astringents, Tea or Coffee, stimulants if much collapse

Foreign Pharmacopœias.—Official in Austr (Stibium Kalio-Tartaricum), Belg (Tartarus Stibiatus), Dan, Nor and Swed (Tartarus Stibico-Kalicus), Dutch (Tartras Kalico-Stibicus), Fr (Antimoniotartrate Acide de Potassium), Ger and Swiss (Tartarus Stibiatus), Hung (Kalium Stibio-Tartaricum), Ital (Tartrato di Antimonio e di Potassio), Mex (Tartrato de Potassio y antimonio), Port (Tartrato de Potassa e de Antimonio), Jap. and Russ (Stibio-Kalium Tartaricum), Span (Tartrato Antimonico Potassico), US (Antimonii et Potassii Tartras)

Tests.—Tartarated Antimony should answer the tests distinctive of Antimony given under Antimonious Oxide, after separation of the Antimony it should also give a yellow crystalline precipitate with Platinic Chloride Solution, and a residue of Platinum and Potassium Chloride when this precipitate is ignited, when moistened with Hydrochloric Acid and introduced into a Bunsen flame it should communicate a violet coloration readily distinguished when viewed through a blue glass, it should give a white precipitate soluble in moderately concentrated Potassium Hydroxide Solution, when an aqueous solution is tested with Calcium Chloride Solution; with Silver Nitrate Solution a white precipitate soluble in Ammonia Solution, the ammoniacal solution yielding a precipitate of metallic Silver when the solution is boiled, the precipitate is also soluble in Nitric Acid, a purple or violet colour should be produced when to its solution acidulated with Acetic Acid, a drop or two of Ferrous Sulphate Solution is added, followed by a few drops of Hydrogen Sulphide Solution, and then an excess of Potassium Hydroxide

Solution The *BP* states that an aqueous solution is not precipitated by Gallic Acid, but this is contrary to general experience. A note in reference to this will be found under Gallic Acid. It is officially required to indicate not less than 99.19 p.c. and not more than 100.02 p.c. of the pure salt as ascertained by titration with Decinormal Volumetric Iodine Solution, an excess of Sodium Bicarbonate being maintained throughout the operation in order to neutralise the Hydriodic Acid produced during the reaction. The Sodium Bicarbonate must be added not long before the titration or the Antimony will be precipitated. A weighed quantity of 1 gramme when mixed with about 3 times its weight of Sodium Bicarbonate and dissolved in Water should require not less than 60.2 nor more than 60.7 c.c. of the Volumetric Solution.

The *USP* Volumetric test indicates not less than 99.5 p.c. of the pure salt, the *PG* indicates 99.6 p.c., both processes are compared in small type below under the heading Volumetric Determination.

It is officially required that 1.66 grammes should slowly dissolve without leaving a residue, in 25 c.c. of Water at 15.5° C (60° F).

The more generally occurring impurities are Ammonium salts, Arsenic, Calcium, Copper, Iron, Lead, Sodium, Chlorides, Sulphates and Potassium Acid Tartrate. In the *BP* these are grouped collectively. The more important are Arsenic, Copper and Lead, Iron and Potassium Acid Tartrate. Both *USP* and *PG* adopt the Bettendorf's test for Arsenic. Heavy metals, *e.g.*, Copper, Lead and Iron may be detected by adding to an aqueous solution sufficient Potassium or Sodium Hydroxide Solution to redissolve the precipitate at first formed and then passing Hydrogen Sulphide into the liquid. Chlorides and Sulphates respond to the usual tests, Potassium Acid Tartrate may be detected by the effervescence produced on adding Sodium Bicarbonate Solution. The *PG* includes a test for Arsenic, but for no other impurity. The 1 in 100 aqueous solution acidified with Acetic Acid should be unaffected by Ammonium Oxalate Solution, indicating the absence of Calcium. The *USP* includes a separate test for Iron, which is given in small type under the heading of Potassium Ferrocyanide Solution.

Residue—On heating to 110° C (230° F) it loses its Water of crystallisation (2.71 p.c.) and at a red heat chars, emitting an odour resembling that of burning Sugar, and leaving a black residue with an alkaline reaction, *USP*, it chars on heating, *PG*.

Potassium Ferrocyanide Solution—An aqueous 1 in 100 solution acidulated with Acetic Acid should be unaffected by T.S. of Potassium Ferrocyanide, *USP*.

Stannous Chloride Solution—A mixture of 1 gramme Tartarated Antimony and 3 c.c. Stannous Chloride Solution should not assume a dark colour in the course of an hour, *PG*, 2 grammes dissolved in 5 c.c. Hydrochloric Acid should not respond to Bettendorf's test for Arsenic, *USP*.

Hydrogen Sulphide Solution—If sufficient solution of Sodium Hydroxide be added to an aqueous solution (1-20) of Tartarated Antimony to redissolve the precipitate first formed, and then an equal volume of freshly prepared Hydrogen Sulphide Solution added, no coloration should be noticeable after standing in a warm place for half an hour, when viewed by reflected light, holding it against a white surface, indicating absence of heavy metals, *USP*.

Sodium Bicarbonate or Carbonate—No effervescence should occur with Solution of Sodium Bicarbonate, *B P*, Solution of Sodium Carbonate, *U S P*. Absence of Acid Potassium Tartrate

Volumetric Determination—1 gramme is dissolved in sufficient Water to measure 100 cc, then 33 cc of this solution should, after the addition of 20 cc of a cold saturated aqueous solution of Sodium Bicarbonate and a little Starch T S, require not less than 19.9 cc of Tenth-normal Iodine V S. to produce a permanent blue colour (each cc of the pure salt). Titration should begin immediately after the addition of the Sodium Bicarbonate Solution, *U S P*. A solution of 0.2 gramme of Tartarated Antimony and 0.2 gramme of Tartaric Acid in 100 cc of Water should after the addition of 2 grammes of Sodium Bicarbonate and a few drops of Starch Solution, require 12 cc of Tenth-normal Solution of Iodine to produce a blue colour, *P. G*

Preparation.

VINUM ANTIMONIALE. ANTIMONIAL WINE.

Tartarated Antimony, 40 grains, boiling Distilled Water, 1 fl oz, Sherry, *q s* to yield 20 fl oz

Boiling Water is added to dissolve the Tartarated Antimony, as recommended in former editions of the *Companion*

Dose.—10 to 30 minims = 0.6 to 1.8 cc, as an emetic, 2 to 4 fl drms = 7.1 to 14.2 cc

Contains 1 grain in 240 minims

Foreign Pharmacopœias—Official in Belg, Dutch, Ger and Jap (Vinum Stibiolum), 1 in 250, Mex (Vino estibiado), 1 in 300, Span. (Vino Emetico), 1 in 250, Russ (Vinum Stibio-Kalii Tartarici), 1 in 250, US (Vinum Antimonii), 1 in 250, all with Sherry Austr (Vinum Stibii Kalio-Tartarici), 1 in 250, Hung (Vinum Stibiato-Tartaricum), 1 in 240, Swiss (Vinum Stibiolum), 1 in 250, all with Malaga Wine Port (Vinho Antimonial), 1 in 200 of Port Wine All by weight, except US Not in Dan, Fr, Ital, Norw or Swed

Tests.—Antimonial Wine has a specific gravity of about 1.006; it contains about 4.75 p c w/v of total solids and about 19 p c w/v of Absolute Alcohol

Not Official

UNGUENTUM ANTIMONII TARTARATI—Tartarated Antimony, in fine powder, 1, Simple Ointment, 4—*B P* 1885
This has been incorporated in the *B P C*

ANTIPYRINE.

See PHENAZONUM.

Not Official.

APIOL.

An oily liquid, with a peculiar odour and disagreeable taste, obtained from the Fruits of *Apium Petroselinum*, L (Parsley)

Medicinal Properties—It is useful in amenorrhœa and dysmenorrhœa

Dose.—3 to 5 minims = 0.18 to 0.3 cc

Prescribing Note—Usually given in capsules

Foreign Pharmacopœias—Official in Fr, Mex and Port (Apiol), Dan. and Norw (Ætheroleum Petroselinii), Swed includes Fructus Petroselinii, and an Aqua of it.

Apiol was described by Messrs Joret and Homolle, who introduced the substance into medicine, as a yellow, oily, non volatile liquid, but the Apiol obtained by us from the Homolle capsules, although yellow in colour, was volatile in the vapour of Water to the extent of 95 p c. Witney went into the subject in 1880, and describes Apiol as an impure Essential Oil of Parsley containing minute quantities of soft resin, and the Apiol of Homolle as the Essential Oil of Parsley Seeds with small traces of a soft resin. The Essential Oil of Parsley is a yellow, oily liquid, and as such has been made official in the Danish and Norwegian Pharmacopœias.

Arising out of a discussion as to what should be the colour of liquid Apiol, it was suggested in *C D* '94, 11 17, that it was simply an alcoholic extract of Parsley Seeds, but this product is green, and contains but a small proportion (under 15 p c) of the Essential Oil of Parsley.

The stearoptene from the Oil is known as **Crystallised Apiol**

Not Official.

APOCYNUM

Syn—CANADIAN HEMP

The dried Rhizome of *Apocynum Cannabinum*, L., is official in U S

Medicinal Properties—It has been used in the United States for some years as a cardiac tonic, and diuretic in cardiac dropsy. Also as a **fluid extract** (dose 5 to 15 minims = 0.3 to 0.88 c c) in pleurisy with effusion.

It also possesses emetic and cathartic properties, but as it is a drastic purgative it should be given with some caution.

The diuretic action of Canadian Hemp was favourably considered, although it was admitted that it might produce violent emesis and catharsis. These undesirable results were, however, attributed to the admixture of the bitter fibre of the wood with the bark of the root—*B M J* '97, 11 1714.

In 1 minim doses has been successfully employed (*L* '05, 11 955) in a case of incompetency and ascites, increased by 2 minims up to 10 minim doses 3 times daily, and subsequently reduced to 6 minims.

The most irritant of all cardiac tonics, and not a drug to be employed advantageously in medicine—*B M J* '06, 11 1460.

Descriptive Notes—The root is usually $\frac{1}{8}$ to $\frac{1}{2}$ inch (4 to 6 mm) thick, cylindrical, somewhat angular, and longitudinally wrinkled with a few transverse fissures. It has an orange-brown bark, which becomes grey brown on keeping, whitish or pinkish internally, nearly as thick as the woody portion, and contains large laticiferous vessels. The yellowish wood has several concentric rings, is finely radiate and coarsely porous, taste bitterish and somewhat acrid, it has scarcely any odour. The root of *A. androsaemifolium*, L., is sometimes confused with it, but it has a white porous wood and groups of stone cells in the outer part of the bark.

FLUIDEXTRACTUM APOCYNII—100 of Apocynum in No. 60 powder is moistened with 40 of a mixture of Glycerin 10, Alcohol (95 p c) 60, and Water 30, packed in a percolator, then enough menstruum added to saturate the powder and leave a stratum above it, macerated for 48 hours, and percolation allowed to proceed slowly, gradually adding, first, the remainder of the menstruum, afterwards, a mixture of Alcohol (95 p c) 60 and Water 40, until the Apocynum is exhausted, reserving the first 90 of percolate and evaporating the remainder at a temperature not exceeding 50° C (122° F) to a soft extract which is dissolved in the reserved portion, and enough menstruum added to make 100. Average Dose—1 c c (15 minims)—*U S P*.

This has been incorporated in the *B P C*.

TINCTURA APOCYNII—Root, 1, Alcohol (60 p c), 10, by maceration.

Dose,—5 to 10 minims = 0.3 to 0.8 c c

This has been incorporated in the *B P C*.

APOCYNIN—An amorphous resinous substance, almost insoluble in Water, but soluble in Alcohol (90 p c) and in Ether.

APOMORPHINÆ HYDROCHLORIDUM.

APOMORPHINE HYDROCHLORIDE

FR, CHLORHYDRATE D'APOMORPHINE, G&S, APOMORPHINHYDROCHLORID;
ITAL, CHLORIDRATO DI APOMORFINA, SPAN, CLORURO DL APOMORFINA

$C_{17}H_{17}NO_2, HCl$, eq 301.36

White or greyish-white, odourless, minute, shining, needle-shaped crystals, which should be kept from the light in dark amber-coloured, thoroughly dry, glass bottles, and protected as far as possible from the air.

Apomorphine is obtained from Morphine by the abstraction of a molecule of Water, and Apomorphine Hydrochloride is prepared by its Hydrochloride in sealed tubes with an excess of strong Zinc Chloride. The *B P* mentions Morphine or Codeine, but the product of the abstraction of a molecule of Water from Codeine is generally considered to be Apocodeine.

Solubility—About 1 in 60 of Water, 1 in 50 of Alcohol (90 p c); nearly insoluble in Chloroform and in Ether, 1 in 100 of Glycerin.

The solubility in Water is given in *B P* as 1 in 50, minimum quantity of Water required for complete solution in 3 days at 60° F is between 1 in 56 and 1 in 60, but if dissolved by the aid of a gentle heat it will remain in solution at 1 in 50. The aqueous solution, on being gently warmed, rapidly turns green.

The material used was recrystallised, air-dried, and powdered. It lost 3 p c of hygroscopic moisture on heating in a water-bath, which was exactly regained after 12 hours' exposure to air.

The solubility of Apomorphine Hydrochloride has been stated (*P J* '05, i, 230, *C D* '05, i, 282) to be 1 in 53 of Water, and 1 in 48 of Alcohol (90 p c). The *Companion* figures have been since shown to be quite correct in references to them in *P J* '06, i, 345, *C D* '06, i, 471.

Medicinal Properties.—The most reliable emetic, $\frac{1}{10}$ grain hypodermically, or $\frac{1}{2}$ grain by the mouth, usually acts promptly (2 or 3 minutes) without the production of much preceding nausea or depression, or unpleasant after-effects. As a hypodermic injection in cases of poisoning, especially if unable to swallow, and if emesis be indicated.

Invaluable as an expectorant in acute and chronic bronchitis with viscid secretion, and in croup, in bronchial irritation due to inhalation of factory dust, and in asthma.

As a hypnotic, $\frac{3}{8}$ grain hypodermically. As patients are occasionally susceptible to emetic action it is well to begin with $\frac{2}{10}$ grain, as a hypnotic—*L*, '00, i, 1088.

Absolutely inert as an emetic in alcoholic poisoning—*L*, '00, i, 1685.

In the acute stage of alcoholism, delirium tremens, 5 drops of the Injection are generally sufficient to produce, within 5 minutes, several hours' sleep. This dose can be repeated if necessary, the patient ought to be in horizontal position, occasionally, vomiting precedes the sleep. It is not a remedy for alcoholic craving—*B M J* '07, ii, 951.

As a hypnotic, hypodermically, in acute alcoholism, it has not received the recognition it deserves—*M R* '07, ii, 144.

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain = 0.003 to 0.007 gramme, by hypodermic injection, by the mouth, $\frac{1}{10}$ to $\frac{1}{2}$ grain = 0.007 to 0.016 gramme.

Ph Ger maximum single dose, 0.02 gramme, maximum daily dose, 0.06 gramme.

Prescribing Notes.—*Its aqueous solution on keeping, or on being gently warmed, rapidly turns green. This green coloration is said to be due to the liberation of free Apomorphine by the alkalinity of the glass, and can be prevented by adding a few drops of dilute Hydrochloric Acid to the preparation. The official injection keeps fairly well for a month or so. Some authorities are of opinion that the Ammonia in the an causes the alkalinity.*

Official Preparation—Injectio Apomorphinæ Hypodermica

Not Official.—Hypodermic Discs, Haustus Apomorphinæ Compositus, Mistura Apomorphinæ et Terebenti, Pastillus Apomorphinæ et Codeinæ, and Syrupus Apomorphinæ Hydrochloridi

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Russ, Span, Swed, Swiss and U S

Tests—The distinguishing tests of Apomorphine Hydrochloride are the production of a white precipitate, rapidly changing to green on exposure to air, when its aqueous solution is made alkaline with Potassium or Sodium Bicarbonate. The changed alkaloid is soluble in Alcohol (90 p c) producing an emerald green solution, in Chloroform producing a fine violet tint, and in Ether a purple coloration. An aqueous solution affords a precipitate with Mercuric-potassium Iodide (Mayer's) Solution, with Iodo-potassium Iodide (Wagner's) Solution, and with Mercuric Chloride Solution. The two following tests serve to distinguish Apomorphine Hydrochloride from Morphine on the one hand, and from Codeine, Nacaine, and Narcotine on the other. The first is given in the *B P*, but without any explanation of its object, the second is peculiar to the *U S P*.

(1) Ferric Chloride Test—solution colours Apomorphine Hydrochloride Solution red, whilst Morphine yields a dull greenish-blue coloration.
(2) A solution of 0.05 gramme of Apomorphine Hydrochloride when shaken with a solution of 0.05 gramme of Ferrous Sulphate in 10 c c. of Water, gradually acquires a blue colour, changing after some time to a bluish-black, the original blue should be restored upon the addition of Alcohol (90 p c), but Carbon Bisulphide, Chloroform and Ether should remain colourless when shaken with the aqueous liquid.

An aqueous solution gives with Silver Nitrate Solution a white curdy precipitate insoluble in Nitric Acid, on the addition of Ammonia Solution, the precipitate dissolves, but its solution is immediately reduced.

A number of colour reactions for the identification of the alkaloid are given in small type below, and where possible comparison is made with statements appearing in the respective Pharmacopœias.

Apomorphine Hydrochloride and Pilocarpine Nitrate are two exceptions to the usual *B P* requirements, that the alkaloidal salt shall afford the tests distinctive of the individual acid radical entering into its composition.

The more generally occurring impurities are acidity, the presence of salt which has undergone decomposition, and mineral matter. Acidity is covered by the requirements of the three Pharmacopœias that the salt or its aqueous solution shall be neutral, or only very feebly acid to Litmus paper or solution. A salt which has been kept under unfavourable conditions, or which has been in stock for a long while, almost invariably contains a considerable amount of salt which

has undergone change. The *BP*, *USP* and *PG* state that a salt, one part of which with 100 parts of Water yields an emerald green solution should be rejected, the *PG* further stating that a colourless or at most only a pale reddish liquid should result on shaking the dry salt with Ether. Neither the *BP* nor *USP* mention the likelihood of mineral matter being present, but *PG* states that the salt shall leave no residue on ignition.

Colour Tests—With Nitric Acid it yields a blood red coloration *BP*, and *PG*, fading to orange *USP*, with dilute Solution of Ferric Chloride it gives a deep red coloration *BP* and *USP* (distinction from Morphine which yields a blue colour).

USP also includes the following colour reactions which do not appear in *BP* or *Ger*.

Sulphuric Acid does not colour the salt, but with Sulphuric Acid containing (a) a trace of Selenious Acid it produces a dark blue colour fading to violet and then to pink, (b) a trace of Ferric Chloride, a pale blue colour, (c) a trace of Ammonium Vanadate, a violet blue colour, changing to deep greenish-blue, (d) a little Paraldehyde, a green colour, fading to reddish-brown, (e) Potassium Iodate, a black colour, changing to brown and finally to pale brown, (f) a trace of Nitric Acid, a blood red colour, fading to orange. A crystal of Apomorphine Hydrochloride and a crystal of Potassium Nitrate with Sulphuric Acid added are coloured red, and on stirring with a glass rod the solution becomes green, then blue, then purple, and finally cherry red. Acetic Acid dissolves the salt without colour, but on adding a trace of Potassium Iodate, the solution turns blood red, changes to purple, and on adding a little Ether and shaking, the latter assumes a blue colour. Gold Chloride T.S. produces a reddish purple precipitate in a solution of the salt.

Preparation.

INJECTIO APOMORPHINÆ HYPODERMICA. HYPODERMIC INJECTION OF APOMORPHINE

Apomorphine Hydrochloride, 1 gram, Diluted Hydrochloric Acid, 1 minim, Distilled Water (recently boiled), *q. s.* to make 110 minims.

5 minims = $\frac{1}{2}$ grain Apomorphine Hydrochloride

Dose.—5 to 10 minims = 0.3 to 0.6 c.c.

Not Official.

DISCS OF APOMORPHINE— $\frac{1}{10}$ to $\frac{1}{20}$ grain dissolved in 6 to 10 minims of Distilled Water at the time or using subcutaneously—*St. Bartholomew's*.

PASTILLUS APOMORPHINÆ ET CODEINÆ—Apomorphine Hydrochloride, $\frac{1}{2}$ grain, Codeine, $\frac{1}{10}$ grain—*Martindale and B.P.C.*

HAUSTUS APOMORPHINÆ COMPOSITUS—Apomorphine Hydrochloride, $\frac{1}{10}$ grain, Diluted Hydrochloric Acid, 1 minim, Oil of Turpentine, 10 minims, Mucilage of Gum Acacia, *q. s.*; Spirit of Ether 10 minims, Distilled Water, to 1 fl. oz.—*Muddeler*.

MISTURA APOMORPHINÆ ET TEREBINI—Apomorphine Hydrochloride, $\frac{1}{10}$ grain, Pure Terebene, 15 minims, Peru Balsam, 10 minims; Mucilage Mixture, to 1 oz.—*Guy's*.

SYRUPUS APOMORPHINÆ HYDROCHLORIDI—Apomorphine Hydrochloride, 5 grains, Diluted Hydrochloric Acid, 10 minims, Alcohol (90 p.c.), 7 fl. drm., Distilled Water, 7 fl. drm., Syrup, to produce 20 fl. oz. Dissolve the salt in the Spirit and Water mixed, then add the Acid and the Syrup—*B.P.C. Formulary 1901*.

Dose— $\frac{1}{2}$ to 1 fl. drm. = 1.8 to 3.6 c.c.

Contains $\frac{1}{32}$ grain in 1 fl drm

This has been incorporated in the *B.P.C.* as follows —

Syrupus Apomorphinæ—Apomorphine Hydrochloride, 0·05, Diluted Hydrochloric Acid, 0·25, Alcohol (90 p c), 4·50, Distilled Water, 4·50, Syrup, q s to make 100

This contains about $\frac{1}{32}$ grain in 1 fl drm

AQUÆ.

WATERS

The Waters of the British Pharmacopœia, all of which are distilled, except Aqua Camphoræ and Aqua Chloroformi, are as follows, the formulas are given under the names of the substances from which they are prepared —

AQUA ANETHI From the dried ripe fruit
 AQUA ANISI From dried ripe Anise fruit
 AQUA AURANTII FLORIS From the flowers Imported
 AQUA CAMPHORÆ
 AQUA CARUI From the dried fruit
 AQUA CHLOROFORMI
 AQUA CINNAMOMI From the bark
 AQUA DESTILLATA
 AQUA FENICULI From the dried ripe fruit
 AQUA LAUROCERASI From fresh leaves
 AQUA MENTHÆ PIPERITÆ With oil and distilled
 AQUA MENTHÆ VIRIDIS With oil and distilled
 AQUA PIMENTÆ From the dried unripe fruits
 AQUA ROSÆ From the fresh flowers
 AQUA SAMBUCI From the fresh flowers Imported

In preparing distilled aqueous liquids only good, natural, potable Water must be employed, as directed for 'Distilled Water'

In India and other tropical countries the Waters of Anethum, Anisum, Carum, Cinnamomum, Fœniculum, Mentha Piperita, Mentha Viridis, and Pimenta, may be prepared from the oils without distillation, using 1 of Oil and 2 of Calcium Phosphate to 500 of Distilled Water

AQUA DESTILLATA.

DISTILLED WATER

FR, EAU DESTILLÉE, GER, DESTILLIRTWASSER, ITAL, ACQUA DISTILLATA, SPAN, AGUA DESTILADA

A clear, colourless, odourless, tasteless, neutral, limpid liquid, obtained by distilling good natural Water of a potable quality

Foreign Pharmacopœias.—Official in all

Tests—Distilled Water at the normal temperature and pressure boils at 100° C (212° F), and should evaporate leaving scarcely a weighable residue. It should possess neither taste nor odour, and should be perfectly neutral. It may contain as impurities various metals, dissolved solids, Chlorides, Nitrates, Nitrites, Sulphates, organic matter, and Ammonia, all of which are specially mentioned in the *B.P.* The *USP* and *PG* examine for heavy metals. The *PG* and *USP* include a test for Carbonic Acid gas. The quantities used

by the *B.P.* (25 cc) and by the *P.G.* (10 cc) for the determination of the amount of solid residue are ridiculously small, the *USP* quantity (1000 cc) is much more to the point, and admits of a quantitative determination. The tests for Chlorides, Nitrates, Nitrites, and Sulphates given in the *B.P.* are those mentioned in the Appendix, but with the exception of those for Chlorides and Sulphates are too crude unless specially applied. The *USP* employs the Diphenylamine test for Nitrates, requiring that no blue colour shall be produced, and the Sulphanilic Acid and Naphthylamine Acetate test for Nitrites, stipulating that no pink coloration shall be produced in 5 minutes. The *B.P.* test for Ammonia is carried to the other extreme, and is described with more minuteness than its importance justifies. The *B.P.*, *USP* and *P.G.* employ 100 cc of Distilled Water in carrying out the test for readily oxidisable organic impurities with Potassium Permanganate Solution, but the relative quantities of Sulphuric Acid and Potassium Permanganate vary, as does also the time of boiling. The *B.P.* and *P.G.* tests coincide pretty closely, with the exception of the relative strengths of the diluted Sulphuric Acid official in each Pharmacopœia. Both boil for 3 minutes, and at the end of this time the liquid should retain its pink colour. The *USP* boils for 10 minutes, and requires in addition that the pink colour should not wholly disappear if the vessel is covered to protect it from dust and set aside in a dark place for 10 hours.

A detailed comparison of the tests adopted by the three Pharmacopœias for the detection of the above impurities is for convenience made in small type below.

Residue—The *B.P.* requires that the residue left on the evaporation of 25 cc should be scarcely visible, the *P.G.* states that 10 cc of Distilled Water when evaporated should not leave a weighable residue, and the *USP* that 1000 cc of Distilled Water, after evaporation to dryness on a water bath, should not leave more than 0.050 grammes of residue.

Silver Nitrate—It should not be affected by Silver Nitrate T.S., indicating the absence of Chlorides, *P.G.* and *USP*.

Mercuric Chloride—It should not be affected by solution of Mercuric Chloride, *P.G.*

Barium Chloride—It should not yield the slightest turbidity on the addition of Barium Chloride 1:5, indicating the absence of Sulphates, *USP*.

Ammonium Oxalate—No turbidity should result on the addition of Ammonium Oxalate T.S., indicating the absence of Calcium, *USP*.

Hydrogen Sulphide—It should not be affected by Hydrogen Sulphide T.S., even after the addition of Solution of Ammonia, *P.G.* It should not respond to the time-limit test for heavy metals, *USP*.

Calcium Hydroxide—When mixed with twice its volume of Lime Water it should remain clear, indicating the absence of Carbonic Acid, *P.G.* and *USP*.

Diphenylamine—If 10 cc of Distilled Water mixed with a few drops of Diphenylamine T.S. be carefully poured upon about 3 cc of Sulphuric Acid free from Nitrous compounds, contained in a test-tube, so as to form a separate layer, no blue colour should be formed at the line of contact of the two liquids, *USP*.

Sulphanilic Acid and Naphthylamine Acetate—If to 50 cc of Water contained in a glass cylinder 2 cc each of Sulphanilic Acid T.S. and Naphthylamine Acetate T.S. are added, and the solution well mixed, no distinct pink coloration should appear within 5 minutes, if the cylinder be placed upon a white surface and viewed from above, *USP*.

Mercuric Potassium Iodide—The *BP* requires that it shall not contain more than 0.005 part per million, equivalent to 0.00035 grain per gallon, of Ammonia as determined by the colour produced when 2 c.c. of Potassium mercuric Iodide (Nessler's) Solution is added to 100 c.c. of the Water, the colour is compared with that produced by 0.25 c.c. of Nessler's Ammonium Chloride Solution diluted with 50,000 c.c. of Ammonia free Water. A somewhat similar test is given in the *USP*, which uses 50 c.c. of Distilled Water and 2 c.c. of reagent. This should not yield a yellow or brownish tint when contained in a glass cylinder placed on a white surface and viewed from above. The *USP* does not, however, direct the use of a comparative test.

Potassium Permanganate—If 100 c.c. of Water be heated to boiling with 1 c.c. of Diluted Sulphuric Acid (the *USP* uses 10 c.c. of Diluted Sulphuric Acid) and solution of Potassium Permanganate be added and the mixture boiled for 3 minutes (10 minutes *USP*), the liquid should not be decolorised, *BP*, *USP* and *PG*. The *BP* states that the liquid should retain its colour for 1 hour, and the *USP* that the colour should not be completely destroyed by boiling for 10 minutes, nor should it wholly disappear if the vessel be afterwards set aside in a dark place and covered for 10 hours. The quantity of Potassium Permanganate Solution ordered in the *BP* is 0.1 c.c. of a mixture of 1 part solution of Potassium Permanganate (1 p.c.), and 2 parts of Water, in the *PG* 0.8 c.c. of a 0.1 p.c. w/w solution of the salt is used, and in the *USP* 0.1 c.c. of a Tenth normal Volumetric Solution is used.

ARAROA.

ARAROA

BP Syn—GOA POWDER, CRUDE CHRYSAROBIN

Fine powder, or in more or less agglomerated particles, yellow when first obtained, but rapidly becoming of a dull ochre or brown colour. Obtained from fissures in the trunk of *Andra Araroba*, Aguiar and freed from woody fragments.

Descriptive Notes—The crude drug of commerce is usually of an umber-brown colour but yellowish internally and more or less mixed with, or attached to, pieces of the heart wood of the tree. From these pieces it should be freed and then dried and powdered, and it may then vary in colour from brownish-yellow to umber-brown. Samples which have been imported in a damp condition and exposed to atmospheric Ammonia become deep brown or purple. It varies much in the amount of wood it contains. Good specimens yield as much as 80 p.c. of soluble matter to Benzol or Chloroform.

Official Preparation.—Used to prepare Chrysarobin.

Tests.—Araroba should be soluble in hot Chloroform to the extent of not less than 50 p.c., and when the solution is filtered and evaporated to dryness, the powdered residue is known as Chrysarobin.

Not Official

ARECA.

The Seed of the *Areca Catechu*, L., the betel nut tree. Imported from the East Indies.

Medicinal Properties—Astringent, narcotic, anthelmintic. A remedy for tapeworm. 60 grains = 4 grammes, of powdered Areca Nut made into a ball.

with Honey, answers well as a vermifuge for a large dog. A paste is made of the powder for a dentifrice

Areca Nut Charcoal used also as a dentifrice

Foreign Pharmacopœias—Official in Ger and Swiss, Semen Arecae

Descriptive Notes—The seeds of the Areca palm vary a good deal in size and somewhat in shape. In size they vary from 1 to $1\frac{1}{2}$ inches (25 to 37 mm) in diameter in the broadest part, the transverse section is white marbled with brown, owing to the infolding of the seed coat in the albumen. The taste is astringent and slightly acid. The hemispherical or rounded fruits, derived from the variety *alba*, are much less active as a vermifuge than the conical or typical form. The larger and more mature seeds are to be preferred to the smaller for medicinal use.

ARECOLINÆ HYDROBROMIDUM—Fine white needles, readily soluble in Water and in Alcohol (90 p c), difficultly soluble in Ether and in Chloroform

Sialagogue, diaphoretic and anthelmintic. $\frac{1}{2}$ p c solution applied to the eye produces tingling followed by myosis. Maximum effect in from 10 to 15 minutes, lasts about one hour. Administered internally causes vomiting and diarrhoea—*B M J* '99, 1 82

Dose— $\frac{1}{16}$ to $\frac{1}{8}$ grain = 0.00625 to 0.00125 gramme, to be given with caution.

Foreign Pharmacopœias—Official in Fr, Ger, Swed and Swiss.

Tests—It should have a melting point of 167°C (332.6°F); *Ph Codex* gives 170°C (335°F). A 1 in 10 aqueous solution of the salt yields a brown precipitate with Iodine Solution, a brown precipitate with Bromine Water, and a light yellow precipitate with Silver Nitrate Solution, but none with Platinum Chloride Solution, Mercuric Chloride Solution, or Tannic Acid Solution. It should leave no residue when ignited with free access of air.

ARGENTI NITRAS.

SILVER NITRATE

B P Syn—LUNAR CAUSTIC

AgNO_3 , eq 168.69

Fr, AZOTATE D'ARGENT, GER, SILBERNITRAT, ITAL, NITRATO DI ARGENTIO, SPAN, NITRATO ARGENTICO CRISTALIZADO

Colourless, transparent, tabular, rhombic crystals. It should be kept in well stoppered, dark amber-coloured vials protected from the light and dust.

Solubility.—100 grains in 50 minims of Water, measuring 80 minims, 1 in 18 of Alcohol (90 p c). Insoluble in strong Nitric Acid.

Medicinal Properties.—Astringent, sedative, antispasmodic. It is useful in hæmatemesis, gastric ulcer, diarrhoea and cholera, as well as in chronic nervous irritability of and pain in the stomach; also in some nervous diseases, as epilepsy, chorea and locomotor ataxy. It is employed in chronic constipation as an **enema**, 60 grains dissolved in 60 oz of Water, after clearing away the contents of lower bowel, and as a **bougie** in chronic gonorrhoea. A dark line on the edges of the gums, removable by a course of Acid Tartrate of Potassium, precedes the indelible discoloration of the skin and mucous membranes (argyria), produced by the long-

continued internal administration of this salt Its administration should be interrupted for fourteen days at the end of two or three months, however small the dose More than 100 grains per month should not be given

Externally as a local stimulant to weak and callous ulcers, fistulæ, and aphthous affections of the mouth, as a caustic to warts and poisoned wounds As a local application to prevent pitting in smallpox, and to relieve the itching in pruritus, it is also applied, under Cocaine, to ulcers of the cornea 1 to 3 grains to the oz is employed for lotions and collyria, in all forms of conjunctivitis and both as a prophylactic and curative in ophthalmia neonatorum, and as an injection in urethritis, cystitis, and vaginitis For eczema or pityriasis of the ear, a 1 in 20 solution in Spirit of Nitrous Ether answers well Hæmostatic for leech bites

Chilblains are sometimes painted with a strong solution of Silver Nitrate

A weak solution (1 in 500) for obstinate forms of eczema in children —*L M R* '88, 525

In cholelithiasis —*B M J E* '02, 1 99

Powdered Silver Nitrate in antral empyema —*B M J E* '90, 1 96

A 2 p c solution of Silver Nitrate by far the best prophylactic in ophthalmia neonatorum —*B M J* '03, 11 135, *L* '03, 11 163, a 4 grains to the oz solution for treating the same, *Pr lxxv* 561, as a prophylactic, 1 p c is even more efficacious than the 2 p c advocated by Ciede, whilst the inflammatory reaction is less marked, *L* '07, 11 588

Intravenous injection of a 2 or 5 p c solution in the treatment of septic conditions —*B M J E* '02, 1 12

Strong Solution of Potassium Iodide, or Potassium Cyanide, has been suggested for the removal of the black stains on the skin produced by Silver Nitrate

Dose — $\frac{1}{4}$ to $\frac{1}{2}$ grain = 0.016 to 0.032 gramme

Prescribing Notes — *Prescribed in pills with Massa Kaolin. Solutions should be dispensed in stoppered bottles*

For application to the skin, a solution in Spirit of Nitrous Ether has been recommended This solution throws down a light coloured precipitate, but does not itself become black like a simple spirituous solution It, however, blackens the skin in a shorter time.

Incompatibles — The Alkalis and their Carbonates and Alkaloids, all Bromides, Chlorides, Iodides, and Phosphates, Solutions of Arsenic, and Tannin

Official Preparations — Argenti Nitras Induratus and Argenti Nitras Mitigatus Used in the preparation of Argenti Oxidum

Not Official — Mild Caustic Points, Argenti Iodidum Nascens, Argentum Foliatum, Actol, Albaigin, Argentamin, Argentol, Argonin, Argyrol, Collargol, Ichthaigau, Itrol, Largin, Novaigan, Protargol, and Tachiol

Antidotes — Aqueous solution of Common Salt, Milk or some demulcent drink given freely, Emetic, White of Egg

Foreign Pharmacopœias — Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Span, Swed, Swiss and U S Also fused Nitrate of Silver in all except Belg, Dan, Fr, Ger, Ital, Swed and Swiss Russ now includes only a fused Nitrate.

Tests. — The distinguishing tests for Silver Nitrate are that its aqueous solution yields with Hydrochloric Acid or a soluble Chloride a white curdy precipitate insoluble in Nitric Acid but soluble in Ammonia Solution, Potassium Chromate Solution yields a red precipitate disappearing on the addition of a solution of a soluble Chloride,

Bromide or Iodide, and destroyed by mineral acids, a solution of Ferrous Sulphate gently poured on to a well-cooled mixture of its aqueous solution and Sulphuric Acid, produces a brown or purplish-brown coloration at the junction of the two fluids, an aqueous solution warmed with Sulphuric Acid and a strip of Copper liberates red fumes. It is officially required to yield 84.3 p.c. of Silver Chloride as ascertained gravimetrically by precipitating 1 gramme of the salt with Hydrochloric Acid, the filtrate from the precipitate, when evaporated to dryness should leave no residue. The *P.G.* completely precipitates the Silver from 5 cc of an aqueous 1 to 20 solution by the addition of an excess of Hydrochloric Acid, and requires that the evaporated filtrate should leave no residue; the *USP* uses a 1 to 10 solution and requires that not more than 0.1 p.c. of residue should remain. The *BP* gravimetric test indicates 100.0 p.c. of the pure salt, the *USP* volumetric test indicates 99.98 p.c. of the pure salt, neither a gravimetric nor a volumetric determination is given in *P.G.* The *USP* test is performed with Deci-normal Volumetric Sodium Chloride Solution, the excess being titrated back with Deci-normal Volumetric Silver Nitrate Solution.

The more generally occurring impurities are Copper, Iron and Lead, Potassium, Sodium and Sulphates, all of which are mentioned in the *BP*. Copper and Lead are the more important, the former is readily detected by the blue colour of the ammoniacal solution, the latter by the insoluble Sulphate thrown down on the addition of Sulphuric Acid.

Sulphuric Acid—5 cc of an aqueous solution (1-10) with 20 cc of hot diluted Sulphuric Acid and heated to boiling should give no white precipitate (absence of Lead), *USP*.

Volumetric Determination—0.5 gramme of Silver Nitrate is dissolved in 10 cc of Distilled Water and well mixed with 30 cc Tenth-normal Volumetric Solution of Sodium Chloride and 3 drops of Potassium Chromate T.S. when not more than 0.4 cc Tenth-normal Volumetric Silver Nitrate Solution should be required to impart to the liquid a permanent red colour, *USP*.

Preparations.

ARGENTI NITRAS INDURATUS. TOUGHENED CAUSTIC.

Silver Nitrate, 19, Potassium Nitrate, 1. Mix by fusion.

Foreign Pharmacopœias—Belg (*Argentum Nitricum Stylis*), Fr. (*Crayons d'Azotate d'Argent*), Ital (*Nitrato d'Argento Fuso con Nitrato di Potassio*), Mex (*Lápices de Nitrato de Plata*), Span (*Nitrato Argentico Mitigado*), all Silver Nitrate 9, Potassium Nitrate 1.

Argentum Nitras Fusus.—4 grammes of Hydrochloric Acid are added to 100 grammes of Silver Nitrate in a porcelain dish and melted at as low a temperature as possible, stirred well and poured into suitable moulds, which should be kept in dark amber-coloured vials protected from light—*USP*.

ARGENTI NITRAS MITIGATUS. MITIGATED CAUSTIC.

Silver Nitrate, 1, Potassium Nitrate, 2. Mix by fusion.

Foreign Pharmacopœias—Official in Austr, Ger., Russ and Swiss, 1 in 3, Jap, 1 in 2, all (*Argentum Nitricum c. Kalio Nitrico*). Dan (*Nitras Argenticus bis Mitigatus*), 1 in 3, Norw and Swed (*Nitras Argenticus Mitigatus*), 1 in 3, Fr. (*Crayons d'Azotate d'Argent*

Mitigé), containing $\frac{1}{2}$, $\frac{1}{3}$, and $\frac{1}{4}$ of Nitrate of Silver, US (*Argentum Nitras Mitigatus*), 1 in 8 Not in the others

Mild Caustic Points, made by fusing Potassium Nitrate in various proportions with Silver Nitrate, are used by oculists and others

Not Official

ARGENTUM FOLIATUM (*Austr, Belg, Dan, Dutch, Fr, Ger, Russ and Swiss*)—Thin leaves of pure Silver, which dissolve in Nitric Acid, yielding a clear colourless solution

ARGENTI IODIDUM NASCENS—Freshly precipitated Silver Iodide has been recommended in conjunctival catarrhs

Silver Iodide is a heavy, amorphous, yellowish powder, which should be kept in dark amber-coloured vials, protected from light

ACTOL (Silver Lactate)—A white amorphous powder, or as colourless crystalline needles Soluble 1 in 20 of Water Introduced as an antiseptic Useful as an injection ($\frac{1}{4}$ to $\frac{1}{2}$ grain per oz) in gonorrhoea The injection is attended with some pain

Possesses no advantage for ophthalmic work over Silver Nitrate—*B M J* '01, 11 1383

ALBARGIN (Gelatose Silver, Silver Glutin)—Bright yellow powder, soluble in Water Stated to be an active antiseptic—*P J* '01, 11 345

ARGENTAMIN—Silver Phosphate dissolved in Ethylenediamine solution Antiseptic and astringent A dilution of 1 to 4000 of Water has been recommended for urethral injection in gonorrhoea As a 5 p c solution in ophthalmic work—*B M J E* '95, 11 20, '96, 11 64, *L* '95, 11 47, *B M J* '01, 11 1333

ARGENTOL—A compound of Silver with Oxymolinol A sparingly soluble yellowish powder, recommended as an antiseptic application to wounds and ulcers—*P J* '97, 1 369, '98, 11 342

ARGONIN—Is obtained by precipitating Silver Nitrate and Casein-soda with Alcohol Contains about 4 p c of Silver It is a fine white powder, soluble in Water It is recommended as a disinfectant—*P J* (3) xxv 1193, *J S C I* '95, 1060, *L* '95, 11 47 A 2 p c aqueous solution gradually increased to 10 p c, recommended in the treatment of gonorrhoea—*B M J E* '96, 11 64, *T G* '97, 740, *B M J* '01, 11 1333

ARGONIN L—Contains 10 p c Silver and is readily soluble 1 p c solution used successfully in the treatment of anterior and posterior urethritis—*B M J E* '99, 1 96

ARGYROL—Fine black glistening hygroscopic scales readily reduced to a powder Readily soluble in Water forming a dark brownish black solution, but insoluble in Alcohol (90 p c) It contains 30 p c of Silver combined with a protein extracted from wheat 5 p c injections in acute gonorrhoea—*L* '03, 11 1716 Instillations of 5 to 50 p c solutions are useful in ophthalmic work, and are painless

In the treatment of ophthalmia neonatorum 1 or 2 drops of a 20 to 50 p c solution put into each eye is stated (*P* lxxv 561) to be certainly less irritating than, and quite as effective as, Silver Nitrate Bacteriological experiments have shown that Argyrol is more effective in killing micro organisms than Silver Nitrate in the strengths in which the latter can be tolerated in the eye

In the form of 'drops' of a 25 p c solution it is of the greatest value in checking suppuration from the conjunctiva, and in some most unpromising cases it proved to be the best remedy—*L* '05, 1 1416

An ointment containing 10 grains to the oz of Vasoline is simply invaluable (*M P* '05, 11 138) in eczematous conjunctivitis or keratitis complicated with marked photophobia, blepharospasm and watering of the eyes, and when the photophobia is very intense 2 to 4 grains of alkaloidal Atropine and a similar amount of alkaloidal Cocaine may with advantage be added to the prescription

Of the three Silver compounds, Protargol, Collargol and Argyrol, the latter

(*L* '06, ii 14) gives the best results in acute conjunctivitis. It is the least irritating and possesses quite a wonderful power in lessening discharge and relieving pain. It can be used in as great a strength as 50 p.c., and may be applied as an ointment or solution. It is so non-irritating that it can safely be injected into the anterior chamber to control intraocular suppuration. It is the most valuable remedy we possess in the treatment of purulent ophthalmia, either in the adult or in the new-born child. It is also useful in blenorrhagia of the lachrymal passages.

Uses and limitations in eyework of Argylol.—Great advantage, even in strong solution, over Silver Nitrate, lies in the fact that its action is painless, and that it can be used freely by the patient without risk.—*Am. J. Ophth. and Surg. Jour.* '07, i 396. In ophthalmia neonatorum, solutions of Argylol are much better than strong solutions of Silver Nitrate, because they are practically inert, and therefore do not injure the conjunctival epithelium (*B. M. J.* '07, ii 67a), as an enema, in ulcerative colitis (*L* '04, ii 1209), yields good results applied as 20 p.c. solution in ophthalmia neonatorum (*B. M. J.* '04, ii 1246), 25 p.c. solution applied in acute conjunctival cases, and great improvement followed application in a case of persistent ophthalmia.—*B. M. J.* '04, ii 1633.

See also Summary given below

COLLARGOL (Colloid Silver)—Black or greyish-black shining scales, with a metallic lustre. Soluble 1 in 2 of Water. Antiseptic and disinfectant. Employed in the form of a 15 p.c. ointment. Intravenously as an injection, 5 to 20 c.c. of a $\frac{1}{2}$ to 1 p.c. solution. As a 1 to 5 solution in ophthalmic work.—*L* '02, ii 1800, *B. M. J.* '01, ii 95, '02, ii 16, *M. P.* '02, i 85, *P. J.* '02, i 11.

Of the three Silver compounds, Protargol, *Colloidal Silver*, and Collargol is to be preferred (*L* '06, ii 14) in recent wounds of the eyeball, and is employed for the most part in the form of Gelatin waters containing 10 p.c. of the drug. It is also used in the form of solution and as an ointment, the strength varying from 5 to 20 p.c.

ICHTHARGAN (Silver Thiohydrocarbauo sulphonate, Silver Ichthyolate)—A light brown, odourless, amorphous powder, containing 30 p.c. Silver. Soluble 1 in 6 of Water and in Glycerin, Insoluble in Alcohol (90 p.c.) and in Ether. Powerful antiseptic. Useful as an injection, 0.02 to 0.2 p.c., in gonorrhoea. 1 to 3 p.c. solution in affections of the posterior urethra.—*B. M. J.* '01, ii 104, '02, ii 16, '03, ii 31, *P. J.* '01, ii 299.

ITROL (Silver Citrate)—A white odourless powder, containing about 63 p.c. of Silver. Only slightly soluble in Water (1 in 4000). Antiseptic. Useful in gonorrhoea. As an injection (1 in 8000 to 1 in 4000 solution). As an insufflation. As a dusting powder for wounds. In the form of sticks for fistulae, deep wounds, and endometritis.—*Itrol* 2 to 5, White Wax, 10. Ol. Theobromi, 9, melt and divide into 80.—*P. J.* '96, i 243, '97, ii 254, *Pr. ix* 292, *B. M. J.* '00, i 99, *T. G.* '99, 631, *P. J.* '99, ii 185, *B. M. J.* '01, ii 1333.

Official in Swed

LARGIN (Silver Albuminate)—A light brown, amorphous odourless powder. Soluble 1 in 8 of Water. Contains 11 p.c. Silver. Introduced as an antiseptic. Useful in gonorrhoea as an injection (1 in 4000). It is stated to have given very satisfactory results in superficial eye-diseases, such as acute infectious ophthalmia in 8 to 10 p.c. solution. Inferior to the Nitrate or Protargol in gonorrhoeal ophthalmia. Even saturated solution stated to cause no pain.—*B. M. J.* '00, i 622, *B. M. J.* '00, i 68, *P. J.* '00, i 413.

NOVARGAN—A fine yellow odourless powder, yielding neutral red-brown solutions with Water, which should be kept in non-actinic glass bottles. An antiseptic in gonorrhoea.

PROTARGOL (Silver Protein).—A light brown or yellow, odourless powder, possessing a disagreeable metallic taste. It should be preserved in well stoppered glass bottles of a dark amber tint and protected as far as possible from the light. It is soluble 1 in 2 of Water. A powerful antiseptic and germicide possessing deep penetrating powers, and stated not to precipitate albumen. Has been recommended in $\frac{1}{2}$ to 2 p.c. solution as an unirritating and successful injection in gonorrhoea.—*B. M. J.* '97, ii 98, '98, i 40, '98, ii 2, *Pr. ix* 292.

and 311, *L* '97, ii, 1628, '98, i 872, *B M J E* '99, ii 56, 59, *L* '02, i 1525, *B M J E* '99, i 24, '01, ii 103, *B M J* '07, i 912, *FT* '07, 46 Irritant effect sometimes seen probably due to worthless imitations of Protargol, or to the solutions not being made up freshly and with cold Water—*B M J E* '07, i 72 In conjunctival affections in the form of a 5 to 10 p.c. solution—*B M J E* '99, i 8, *T G* '99, 318, *Pr* lxxiv 476, *L* '99, ii 1046, '01, ii 553 In gonorrhoeal ophthalmia, 10, 20, and 80 p.c. solutions may be used—*L* '01, ii 553, *B M J* '01, ii 1333 1 p.c. solution never fails to cure—*B M J* '07, i 912 Zinc Sulphate stated to be incompatible with Protargol—*P J* '02, ii 293 In phthisis, injection of 40 c.c. of saline solution containing $1\frac{1}{2}$ to 2 $\frac{1}{2}$ grains Protargol, preceded and followed by an injection (through the same needle) of a few c.c. of pure saline solution—*Proc Brit Cong on Tuberc* iii 444, *L* '01, ii 309 $1\frac{1}{2}$ p.c. solution as an injection, and local application of a 10 to 20 p.c. solution to diseased area in urethral hæmorrhage in gonorrhoea—*L* '02, i 1526 Two cases of argyrosis following the use of Protargol in conjunctivitis—*L* '02, ii 1199 Injections of solutions of this salt, followed by astringents—*e g*, Zinc Chloride or Acetate—are considered (*L* '04, ii 1223) best in the treatment of gonorrhoea 2 to 5 p.c. solutions are usually employed—*Pr* lxxiv 225

Of the three Silver salts, Protargol, Collargol and Argylol, in chronic inflammation of the conjunctiva and the edges of the eyelids, Protargol, in from 10 to 25 p.c. solution or ointment brushed vigorously over the affected parts, produces far quicker and better results than are to be obtained by any other known method of treatment—*L* '06, ii 13

See also Summary below

Prescribing Notes—In preparing solutions of Protargol it is preferable to place the greater portion of the Water which is intended to be used into a vessel and then to introduce the Protargol, which dissolves gradually, finally adding the rest of the Water. Shaking should be avoided until solution is complete

Foreign Pharmacopœias—It is official in Austr., Belg., Jap. and Swiss

Tests—A 1 p.c. aqueous solution of Protargol is not precipitated by the addition of alkalis, Sodium Chloride Solution, or by Ammonium Hydrosulphide Solution. Hydrochloric Acid produces a precipitate soluble in excess of the reagent, and Picric Acid Solution yields a yellow precipitate. Solutions of Protargol yield the Biuret reaction when mixed with an equal volume of Potassium or Sodium Hydroxide Solution and a drop or two of a diluted Copper Sulphate Solution. It should leave on ignition about 8 p.c. of metallic Silver which should conform to the characteristic tests and freedom from impurities mentioned under 'Silver Nitrate'

Liquor Protargol—Protargol, 40, 80, 120, or 160 grains, Distilled Water, to 1 fl. oz.—*London Ophthalmic*

TACHIOI (Silver Fluoride)—Colourless, transparent crystals, changing rapidly on contact with air. Readily soluble in Water, and the solutions, if not too strong, are permanent. Introduced as a new antiseptic. It is stated to possess powerful bactericidal powers, superior to Carbolic Acid, and only slightly inferior to Corrosive Sublimate. Employed in from a 1 in 1000 to 1 in 5000 solution to disinfect cavities and suppurating sinuses, in tubercular lesions, and ulcerative processes. It is also stated to have met with some success in ophthalmic practice, its non-irritating character being an advantage. Its solution, however, blackens linen fabrics—*L* '02, i 993, ii 1707, *C D* '02, i 309 A 1 in 8000 to 1 in 5000 solution has been shown (*B M J E* '05, i 24) to be an excellent antiseptic and antifermentative for the stomach, whether used for washing out or given internally

Summary of Experiments with Organic Silver Compounds.—A series of experiments were carried out to determine the bactericidal action of Silver compounds, and the results were embodied in a report to the British Medical Association—*B M J* '06, ii 359 The various Silver compounds investigated fall into three groups (1) Those which are powerfully bactericidal, (2) one (Nargol) much less powerfully bactericidal, (3) two (Argylol and Collargol) which possess practically no bactericidal action whatever. The first group includes most of the substances investigated, namely, Silver Nitrate, Silver Fluoride, Actol,

Itrol, Argentamin, Argonin, Ichthargan, Largin, Novargan and Protargol. These in solutions containing the same percentage of combined Silver is closely similar, and it is practically impossible to place them in any order of activity which would be true under all circumstances.

As Argyrol and Collargol are not bactericidal, it is evident that the amount of Silver which a compound may contain is no criterion of its bactericidal power. Moreover, in view of the results obtained with Argyrol, it seems impossible to attribute the good effects which many clinicians have obtained with it to its bactericidal action.

F. 1475, largely confirmatory of the above—*B M J* '07, ii

Silver Nitrate in eye diseases is a dangerous remedy, except in the hands of the surgeon, and its application even in a 2 p.c. solution is attended with such excruciating pain as to make the strongest shudder—*Scot Med and Surg Jour.* '07, i 396.

ARGENTI OXIDUM.

SILVER OXIDE.

Ag_2O , eq 230.10.

FR, OXYDE D'ARGENT, GÉR, SILBEROXID

A brownish-grey odourless powder when freshly prepared, but becoming of a blackish-brown colour on drying or on exposure to the air.

When mixed with readily oxidisable substances great heat is evolved, and the mixture is liable to explode.

It may be prepared by the interaction of solutions of Silver Nitrate and Calcium Hydroxide.

It should be preserved in dark amber-tinted dry bottles, and protected from dust and ammoniacal fumes.

Medicinal Properties—It has the general therapeutic qualities of the Nitrate, without its escharotic effect. It is more slowly absorbed, and is said to be less liable to discolour the skin.

Dose.— $\frac{1}{2}$ to 2 grains = 0.032 to 0.13 grammes.

Prescribing Notes—Usually given in a pill, made with *Massa Kaolini*.

It prescribed with Creosote or with the Chlorides in pills, the Oxide must be first diffused through some inert matter such as Kaolin, as the heat produced in rapidly reducing the Silver or by its combining with it causes the mass to become red-hot, or to explode.

Incompatibles—Bromides, Chlorides, and Iodides. Organic and readily oxidisable matter.

Foreign Pharmacopœias—Official in U.S. Not in the others.

Tests.—The distinguishing tests for Silver Oxide are the ease with which it undergoes decomposition when mixed with readily oxidisable substances such as Creosote and Potassium Permanganate, such decomposition being accompanied with rapid disengagement of heat, and if in a confined space with explosive violence, the evolution of Oxygen when heated to dull redness leaving a residue of metallic Silver, which should, when dissolved in Nitric Acid, yield the tests distinctive of Silver given under that substance. It is

officially required to indicate 100.0 p.c. of pure Silver Oxide as gravimetrically determined by solution in Nitric Acid and precipitation with Hydrochloric Acid, 1.237 grammes of Silver Chloride should be yielded by 1 gramme of Silver Oxide. The *USP* gravimetric test indicates 99.8 p.c. of pure Silver Oxide, which is equivalent to 92.9 p.c. of pure metallic Silver, determined as the residue left on igniting the Oxide in a porcelain crucible, 0.5 gramme should not leave less than 0.464 gramme. Silver Oxide is not official in the *PG*.

The more generally occurring impurities are metallic Silver, Lead, Copper, and Iron, all of which are mentioned in *BP*. The presence of metallic Silver is evidenced by the evolution of reddish fumes when the Oxide is dissolved in Nitric Acid. Lead and Copper are detected as described under *Argentum Nitratum*. The *USP* includes a test for Carbonate and a limit of Chloride, requiring that the Oxide should dissolve without effervescence in Nitric Acid, and that when a weighed quantity of 0.2 of a gramme of the Oxide is dissolved in 1 c.c. of Nitric Acid mixed with twice its volume of Water, and 10 c.c. of Ammonia Solution are added, the liquid diluted to 60 c.c. the addition of 1 c.c. of Nitric Acid to 10 c.c. of this dilution should not produce a cloudiness.

ARMORACIÆ RADIX.

HORSERADISH ROOT

FR, RAIFORT, GER, METTRICH, ITAL, RAPANO RUSTICANO,
SPAN, RABONO RUSICANO

The fresh Root from cultivated plants of *Cochlearia Armoracia*, L. Most active in the autumn and early spring before the leaves have appeared.

Medicinal Properties—Sialagogue, stomachic, slightly diuretic, and diaphoretic. Used in atonic dyspepsia and as a condiment, also as a sudorific in chronic rheumatism. Externally as a rubefacient. The infusion is used as a gargle.

Official Preparation—*Spiritus Armoracæ Compositus*

Not Official—*Infusum Armoracæ Compositum*, *Sirup de Raifort Composé*

Foreign Pharmacopœias—Official in Dutch, Fr, Port (*Rabao Rustico*), Span and Mex. Not in the others.

Descriptive Notes—The root is imported from Belgium in barrels, that usually sold not being cultivated in this country. It is made up in bundles of about twenty roots. It is whitish or yellowish-white externally, about 8 to 12 inches (20 to 30 cm.) or more long, about an inch (2.5 cm.) in diameter, cylindrical, slightly enlarged and marked with leaf scars at the crown, odourless, until scraped or broken, when it gives off a pungent odour, the taste is very pungent. Aconite root has on rare occasions been mistaken for it, but the latter is conical, tapering much below, blackish-brown externally and not pungent. Horseradish root is usually sold in the fresh state, rarely in a dried condition.

Preparation.**SPIRITUS ARMORACIÆ COMPOSITUS.** COMPOUND SPIRIT OF HORSE RADISH.

Scraped Horseradish Root, 1 oz, Dried Bitter-Orange Peel, 1 oz, Nutmeg, 11 grains, Alcohol (90 p c), 5 fl oz, Distilled Water, 6 fl oz Mix and distil 8 fl oz

Dose.—1 to 2 fl dm = 3 6 to 7 1 c c

Foreign Pharmacopœias—Not in the other Pharmacopœias Port, compound Wine, Mex (Alcoholato de coquealia); Span (Alcohol de coquealia) They all differ widely from the above

Not Official.

INFUSUM ARMORACIÆ COMPOSITUM—Fresh Root, sliced, 1; Black Mustard Seed, 1, Compound Spirit of Horseradish, 1, boiling Distilled Water, 20 Macerate two hours, strain, and add the Spirit

It is found in practice that a temperature of 150° to 180° F makes the strongest infusion

Dose.—1 to 2 fl oz = 28 4 to 56 8 c c, as a warm stimulant.

SIROP DE RAIFORT COMPOSÉ (Antiscorbutic Syrup)—Cochlearia Leaves, 1000, Water-cress Leaves, 1000, Horseradish Root, 1000, Dried Leaves of Menyanthes Trifoliata, 100, Bitter-Orange Peel, 200, Ceylon Cinnamon, 50, White Wine, 4000, White Sugar, 5000, all by weight Bruise the Water-cress and Cochlearia Leaves, cut up the Horseradish Root, the Leaves of Menyanthes Trifoliata and the Bitter-Orange Peel, break up the Cinnamon Bark Macerate the whole in the White Wine for two days and distil on a water-bath Collect 1000 of the aromatic liquor, and with it prepare a syrup in a closed vessel on the water-bath in the proportion of 100 grammes of Sugar for each 100 grammes of the liquor—*Fr*

ARNICÆ RHIZOMA.**ARNICA RHIZOME.***B P Syn*—**ARNICÆ RADIX.**

FR., RACINE D'ARNIQUE, **GER.**, ARNIKAWURZEL, **ITAL.**, RHIZOMA DI ARNICA; **SPAN.**, RIZOMA DE ARNICA.

The dried Rhizome and Roots of *Arnica montana*, Linn.

Collected in the mountainous parts of Central and Southern Europe

The dried flower-heads are official in the *Ind.* and *Col Add*

Medicinal Properties.—Stomachic and slightly stimulant, irritant to the stomach and bowels in large doses The **tincture** is used externally for bruises and sprains, diluted with Water, but inflammation of the skin may be set up, equally good results have been produced by the application of Spirit and Water.

Official Preparation—*Tinctura Arnicæ*

Not Official—*Arnica Opodeldoc*, *Extractum Arnicæ Radicis Fluidum*, *Linimentum Arnicæ*

Antidotes—Opium, Morphine

Symptoms of poisoning by Arnica are violent vomiting, intense headache, diarrhoea, colic, feeble pulse

Foreign Pharmacopœias—Official in Austr, Ital and Port, root and flowers, Hung, root, leaves, and flowers, Belg, Dan, Dutch, Fr, Ger, Jap, Norw, Russ, Swed, Swiss and U S, flowers, Mex, rhizome, leaves, and flowers, Span, rhizome and flowers

Descriptive Notes—The rhizome as imported requires to be picked over before use, and freed from various foreign matters and vegetable fibres, which are almost always mixed with it. It is officially described as about 1 to 2 inches (2½ to 5 cm) in length, ½ to 1 inch (4 to 6 mm) in diameter, cylindrical and curved, horizontal. It is often furnished with one or more terminal proliferations, giving it a jointed appearance, and with rather distant, wavy, unbranched, brittle roots, on the lower surface only, and is sometimes terminated at the crown by the hairy bases of the leaves. The taste is acid and bitter, and the odour characteristic, recalling that of apples. The transverse fracture shows a greyish or dirty white centre, and resin ducts near the inner margin of the cortex. It is sometimes mixed with the rhizome of species of *Hieracium*, or of *Geranium urbanum*, Linn. The former lacks the resin ducts and odour, and the latter has a clove odour, and astringent taste, and has roots all round the erect rhizome or rootstock.

In the *PG* and *USP* the flowers are official instead of the root, but these are liable to attacks by insects, and lose their volatile oil more quickly than the rhizome.

Preparation

TINCTURA ARNICÆ TINCTURE OF ARNICA

1 of Arnica Rhizome in No 40 powder, percolated with Alcohol (70 p c) to yield 20 (1 in 20)

Foreign Pharmacopœias—Official in Fr and U S, 1 in 5, Belg, Dan, Dutch, Ger, Norw, Russ, Swed and Swiss, 1 and 10, Port 1 in 10, all from flowers, Port, 1 in 5, from the root, Ital, root 1, Alcohol (60 p c) 10, Austr, root 4, flowers 1, Alcohol (70 p c) 25, Hung, root 6, leaves 3, and flowers 1, dilute Alcohol (70 p c) 50, Mex, dried leaves 1 in 5, Span, root 1, flowers 1, Alcohol (70 p c) to 10, all are by weight except U S.

Tests—Tincture of Arnica has a specific gravity of 0.890 to 0.895, contains about 0.6 p c w/v of total solids and about 68 p c w/v of Absolute Alcohol.

TINCTURA ARNICÆ FLORUM—Percolate 1 of Arnica flowers with Alcohol (45 p c) to make 10.

Official in the *Ind* and *Col Add* for North American Colonies

Not Official

ARNICA OPODELDOC—White Soap, 4, Alcohol (90 p c), 10, Tincture of Arnica, 5, Camphor, 1. Dissolve by heat, and strain.

This has been incorporated in the *BPC* under the title **Linimentum Arnicæ**.

EXTRACTUM ARNICÆ RADICIS FLUIDUM—1 in 1, made percolation with a mixture of Alcohol 8, Water 1.—*USP* 1890.

This has been incorporated in the *BPC*.

Not Official

ARSENII BROMIDI LIQUOR.LIQUOR POTASSII ARSENIATIS ET BROMIDI (*U S N F*) CLEMENS' SOLUTION

115. Potassium Bicarbonate, 587 grains, Bromine, 235 grains, Water, *q s*. Boil the Arsenic and Potassium Bicarbonate in 8 oz of Water till dissolved, when cold add 16 oz of Water, then the Bromine, and make up with Water to 32 fl oz. Stir occasionally during a few hours, then filter.

This Liquor was originally described by Dr. Clemens as 'a chemical union of Arsenic and Bromine,' but as the action of Bromine on Arsenious Acid results in the formation of Arsenic Acid and Hydrobromic Acid, the above formula has been adjusted to yield these products as Potassium salts.

The solution contains Arsenic equal to 1 p.c. of Arsenious Anhydride Recommended in the treatment of diabetes.—*J. M. R.* '83, 86

Dose —1 to 5 minims = 0.06 to 0.3 c.c.

ARSENII IODIDUM.

ARSENIOS IODIDE

 AsI_3 , eq 452.20*Syn* —ARSENIC IODIDE

Orange or orange red coloured crystals, having a faint odour of Iodine, and which lose Iodine on exposure to air and light.

It should be kept in dark amber-coloured well stoppered glass bottles in a cool place.

Solubility —1 in 11 of Water, 1 in 42 of Alcohol (90 p.c.); 1 in 19 of Carbon Bisulphide.

It is gradually decomposed by boiling Water and by boiling Alcohol.

Medicinal Properties.—Has been used in obstinate cutaneous affections of syphilitic and tubercular origin.

Dose — $\frac{1}{8}$ to $\frac{1}{2}$ grain = 0.0034 to 0.013 gramme.

Prescribing Notes —It is generally given as Donovan's Solution, or in a pill well triturated with Milk Sugar and massed with Glucose.

Official Preparation —Liquor Arsenii et Hydragryri Iodidi.

Foreign Pharmacopœias —Official in Jap, Mex (*Yoduro de Arsenico*) and U.S. Not in the others.

Tests —The distinguishing tests for Arsenious Iodide are that its aqueous solution shall, when acidulated with Hydrochloric Acid, yield on addition of Hydrogen Sulphide Solution a yellow precipitate soluble in Potassium or Sodium Hydroxide Solution, in Potassium Carbonate Solution or in Ammonium Carbonate Solution, being reprecipitated on the addition of Hydrochloric Acid, a cold porcelain vessel impinged upon the flame of the ignited gas produced by the interaction of Zinc, Hydrochloric Acid and a little of an aqueous solution of the salt, acquires a dark metallic looking stain readily.

dissolved by Chlorinated Soda Solution, Hydrogen Arsenide is evolved when a little of the solution is boiled with Zinc and Potassium or Sodium Hydroxide Solution, this gas yields a black stain to filter paper moistened with Silver Nitrate Solution, and a dark metallic stain on porcelain as above when ignited, Stannous Chloride Solution containing a large excess of Hydrochloric Acid yields a brown or brownish black coloration when mixed with a little of an aqueous solution, an aqueous solution acidulated with Hydrochloric Acid yields a dark metallic looking deposit on Copper when boiled with that metal, the Copper when removed, dried between folds of bibulous paper, and heated in a clean, dry test-tube yields a sublimate of white characteristic octahedral crystals. The aqueous solution yields with Silver Nitrate Solution a curdy yellow precipitate insoluble in Nitric Acid, almost insoluble in Ammonia Solution, but soluble in Potassium Cyanide solution, with a small quantity of Chlorine Solution and Starch Mucilage it yields an intense blue coloration, disappearing on heating and reappearing as the liquid cools, when treated with Chlorine Solution and shaken with Carbon Bisulphide, the latter liquid assumes a fine violet coloration. No mention of a volumetric or gravimetric method of determination is made in the *BP*, but the *USP* requires it to contain not less than 16.3 per cent of Arsenic as indicated by titration with Deci-normal Volumetric Iodine Solution by the method described in the small type below.

The more generally occurring impurities are free acid, either Arsenous or Hydriodic, and mineral matter. The neutrality of the aqueous solution to Litmus affords an indication of the former, the latter is revealed by a residue remaining after volatilisation.

Volatilisation—When heated on a water bath no loss in Iodine occurs, *USP*, but at a higher temperature it volatilises, *BP* and *USP*. Violet vapours of Iodine being set free, *BP*.

Volumetric Determination—0.5 gramme of Arsenious Iodide and 2 grammes of Sodium Bicarbonate dissolved in 50 c.c. of Water require not less than 21.9 c.c. Tenth normal V.S. of Iodine to impart a slight yellow tint to the solution, *USP*.

Preparation

LIQUOR ARSENII ET HYDRARGYRI IODIDI. SOLUTION OF ARSENIOS AND MERCURIC IODIDES

Arsenious Iodide, 87½ grains, Mercuric Iodide, 87½ grains, Distilled Water, *qs* to make 20 fl. oz. (1 of each in 100)

A yellowish, odourless liquid, with a disagreeable metallic taste, sp. gr. 1.015 to 1.018. It is also known as **Donovan's Solution**.

Dose.—5 to 20 minims = 0.3 to 1.2 c.c.

11 minims contain $\frac{1}{10}$ grain of each salt.

Incompatibles—Acids, the salts of Morphine, or other Alkaloid, and Corrosive Sublimate.

Foreign Pharmacopœias—Official in U.S., 1 in 100,

ASAFETIDA.

ASAFETIDA

FR, ASAFETIDA, GER, ASANT, ITAL, ASSAFETIDA, SPAN, ASAFETIDA

A gum resin obtained by incision from the Root of *Ferula foetida*, Regel, and probably other species

Medicinal Properties—Nervine stimulant, expectorant, laxative and calmative Useful in cases of flatulence, in hysterical paroxysms, also in some forms of chronic bronchitis, very useful as an enema in the flatulent distension of typhoid or peritonitis, and in infantile convulsions

As a successful preventive against abortion—*M A* '93, 64, *B M J B* '95, 1 35

Dose.—5 to 15 grains = 0.32 to 1 gramme

Prescribing Notes—In pill massed with a little dilute Alcohol They are best varnished, as silver leaf is affected by this drug The Tincture may be prescribed with Aromatic Spirit of Ammonia, or with the Tinctures of Valerian and Hyoscyamus When diluted with water to form a mixture, it requires the addition of Mucilage of Gum Acacia

Official Preparations—Tinctura Asafetide Used in the preparation of Pilula Aloes et Asafetidae, Pilula Galbani Composita, and Spiritus Ammoniae Fetidis

Not Official—Enema Asafetida, Mistura Asafetida Composita, Pilula Asafetida

Foreign Pharmacopoeias—in Austr, Belg, Dan., Dutch, Fr, Ger., Hung., I, J, N, S, S, Russ, Span, Swed, Swiss and U. S.

Descriptive Notes—The Asafetida of commerce varies exceedingly in appearance and in purity It may occur in whitish tears from $\frac{1}{2}$ inch (12.5 mm) in diameter, or in flattened tears up to 3 inches (75 mm) or more in diameter, or in masses of agglomerated tears of various sizes, either whitish or brownish or reddish-brown according to age, and more or less agglutinated with darker gum resin and mixed with stones More rarely balls of sand, about 4 cm. in diameter, made with the liquid gum resin are offered under the name of stony Asafetida As it is very difficult to purify without loss of essential oil, it is very necessary that the purest drug obtainable should be selected for dispensing purposes. It is officially limited to the rounded or flattened tears, more or less agglutinated, which are dull yellow in colour and darken on keeping, and internally yellowish and translucent, or milky-white and opaque, the freshly exposed surfaces gradually assuming a pink colour, changing to red and finally to reddish-brown The *U S P.* requirements are much the same The *P G* gives *Ferula Nardus*, Boiss, also as a source of the drug The gum resin of that species, however, never becomes red on keeping, and Arclison ascertained that in Kashmir it is not collected. For the purpose of being powdered the *P G* directs that it should be dried over quicklime, and triturated at the lowest practicable temperature The Asafetida in tears that enters into commerce does not invariably turn red on exposure Even fine-looking specimens in the form of tears, sometimes contain half their weight of pebbles

covered with a thin layer of Asafetida, and it is only from selected specimens, easily distinguished by their light weight, that a drug affording only 10 p c of ash can be obtained. Usually the tears met with in commerce yield only one-third of their weight of this quality. Indeed, in this as in other cases, where much impurity is present, a purified preparation extracted by Alcohol from the crude drug should be official for dispensing purposes.

Tests—The distinguishing tests for Asafetida are that when triturated with Water it forms a milky-white emulsion, which assumes a yellowish coloration on the addition of a few drops of Ammonia Solution, the addition of Nitric Acid diluted with an equal volume of Water to the freshly fractured surface produces a greenish coloration, when strongly heated in a dry test-tube, cooled and treated with boiling Water it yields a liquid which, when largely diluted and made alkaline with Ammonia Solution, exhibits a blue fluorescence. This test is known as the umbelliferone test, and the remarks on the test appearing under Ammoniacum apply equally here. It is officially required to contain not less than 65 p c of matter soluble in Alcohol (90 p c), but only the best quality will yield this proportion. The *USP* and *PG* fix 50 p c as the limit of matter soluble in Alcohol (90 p c). The method adopted by the *PG* of weighing the insoluble residue is preferable to determining the amount dissolved, on account of the loss of volatile constituents during evaporation. The determination of the Acid, Ester and Saponification values affords useful indications of the purity, but no mention of them appears in the *BP*. Commercial Asafetida has an Acid value of from 60 to 80, an Ester value of from 80 to 130, and a Saponification value of 120 to 185. A sample of fine selected tears examined in the author's laboratory, which yielded 3.1 p c of ash and contained 68.3 p c of matters soluble in Alcohol (90 p c), had an Acid value of 131.9, an Ester value of 119.3, and a Saponification value of 251.3. Another sample which contained 37.8 p c of ash, and 44.5 p c of matters soluble in Alcohol (90 p c), had an Acid value of 43.4, an Ester value of 127.4, and a Saponification value of 170.8.

The more generally occurring impurities are inferior varieties of Gum and mineral matter. The presence of the former is detected by the Alcohol-solubility, the latter by the ash. A lengthy controversy has taken place over the amount of ash permissible. An ash limit of 20 p c has been suggested (*YBP* '00, 405), and it has been stated (*CD* '99, 11 983) that at that date it was practically impossible to obtain any considerable quantity which would satisfy the *BP* tests. On the other hand, it was stated (*CD* '99, 11 1037) that provided a fair price were paid a sufficient supply of *BP* quality could readily be procured. The *USP* and *PG* both state not more than 10 p c. The *Dutch Pharmacopœia*, which in the Third Edition adopted a 20 p c limit, in the new Fourth Edition allows not more than 10 p c.

Preparations

PILULA ALOES ET ASAFETIDÆ, 1 in 4. *See* ALOES.

PILULA GALBANI COMPOSITA. about 1 in 3½ See GALBANUM

SPIRITUS AMMONIÆ FETIDUS, about 33 grains in 1 oz.
See AMMONIA.

TINCTURA ASAFETIDÆ. TINCTURE OF ASAFETIDA.

1 of Asafetida, maceiated with Alcohol (70 p c), to yield 5
(1 in 5)

Dose — ½ to 1 fl drim = 18 to 36 c c

Foreign Pharmacopœias Official in Belg (1 and 4½), Dan, Dutch, Fr, Ital, Jap, Norw, Port, Span, Mex, Swed and Swiss, 1 and 5, U S, 1 in 5, all by weight, except U S, not in Austr, Ger, Hung or Russ

Tests — Tincture of Asafetida has a specific gravity of about 0.912. It contains about 9½ p c w/v of total solids and about 60 p c w/v of Absolute Alcohol

Not Official

ENEMA ASAFÆTIDA.—Asafetida, 30 grains, Distilled Water, 4 fl oz. Rub the Asafetida in a mortar with the Water added gradually so as to form an emulsion — *B P* 1885

Tincture of Asafetida, 1 fl drim, Mucilage of Starch, 1 fl oz — *St. Thomas's*.

This has been incorporated in the *B P C* as follows —

Tincture of Asafetida, 3, Mucilage of Starch, q s to make 100.

MISTURA ASAFETIDA COMPOSITA — Asafetida, picked, 5 grains, Liquid Extract of Cascara Sagrada, 10 minims, Ammonium Carbonate, 1 grain, Infusion of Valerian (1 in 40), to 1 fl oz. The Ammonia in this mixture develops the taste and odour of the other constituents — *St. Thomas's*.

This has been incorporated in the *B P C*, using 5 grains of Ammonium Carbonate in place of 4

PILULÆ ASAFÆTIDA — Asafetida, 20 grammes, Soap, in fine powder, 6 grammes, Water, q s to make 100 pills — *U S P*. Each pill contains 3 grains of Asafetida

This has been incorporated in the *B P C*

ATROPINA.

ATROPINE

FR, ATROPINE, GER, ATRORIN, ITAL, ATROPINA, SPAN., ATROPINA.

Colourless, odourless acicular crystals, or as a white more or less amorphous powder. Taste bitter and acrid. Obtained from the leaves and root of Belladonna. It gradually assumes a yellowish tint on exposure to air, and should be kept in well-stoppered dark amber-tinted bottles

It is officially regarded as an alkaloid, obtained from Belladonna Leaves or Root. The bulk of the alkaloid existing in Belladonna is Hyoscyamine, which is isomeric with Atropine, and the former has a constant tendency to change into the latter

Atropine (uncombined with an Acid) easily decomposes when heated. A solution of 1 in 200 of Water heated in a basin or on a water-bath for two hours was so completely decomposed that it lost

its alkaline reaction and ceased to precipitate with Mercuric Chloride Solution, after eight hours the reaction was faintly acid

Solubility —1 in 500 of Water, 1 in 3 of Alcohol (90 p c), 1 in 25 of Ether, 1 in 1 of Chloroform, 1 in 52 of Glycerin, 1 in 15 of Oleic Acid

Medicinal Properties —The Ointment is used for the relief of pain arising from muscular spasm, and for neuralgia. See also Atropinæ Sulphas and Belladonna

Dose — $\frac{1}{200}$ to $\frac{1}{100}$ grain = 0.0003 to 0.0006 gramme

It is freely soluble in Oleic Acid, and is sometimes applied as a 1 or 2 p c solution

Official Preparation —Unguentum Atropinæ

Not Official —Atropinæ Oleas, Unguentum Atropinæ, Unguentum Atropinæ Dilutum, Unguentum Atropinæ cum Acido Borico, Unguentum Atropinæ cum Cocainæ, and Atropinæ Oleas

Antidotes —In case of poisoning by Atropine, the antidotes are the same as for Belladonna

Foreign Pharmacopœias —Official in Fr, Mex, Port, Span and U S Not in the others

Tests —The distinguishing tests for Atropine are the melting point which, when pure, should be about 115.5°C (248°F), the Aurichloride, which should be dull and pulverulent in physical appearance, should possess a melting point of 137°C (278.6°F), the strongly marked mydriatic action when a drop of a very dilute solution is carefully instilled into the eye, the optical inactivity, the purple-violet coloration produced when a crystal is evaporated to dryness with fuming Nitric Acid, and the residue is moistened with a freshly prepared alcoholic Potassium Hydroxide solution, this test being known as Vitali's test, the yellow precipitate changing to red, which occurs when an alcoholic solution is warmed with Mercuric Chloride Solution, the alkaline reaction to Litmus and Phenolphthalein, which distinguishes Atropine and its isomers from almost all other known alkaloids. The *BP* mentions most of these tests, but not the optical inactivity or melting point of the Aurichloride, although it describes the method of producing the salt and its physical appearance and includes a melting point for Hyoscyne Aurichloride. The *USP* states that pure Atropine Aurichloride melts at 136°C (276.8°F). The colour reaction with Vitali's test is very delicate, and although other alkaloids, Pseudoaconitine, Veratrine, and Strychnine, afford colours somewhat resembling this, there is no difficulty in detecting Atropine in the pure state when unmixed with other alkaloids. The *USP* states that the presence of Strychnine masks this reaction. The latter Pharmacopœia also states that it produces no precipitate with Platonic Chloride Solution and that it yields a pink coloration not dissipated by 0.5 gramme of Chloral Hydrate, when a crystal is treated with Sulphuric Acid containing a drop of Cresol, which distinguishes it from most other alkaloids. It is also stated to give a peculiar odour indicative of a mixture of Rose, Orange flower, and Melilot

when heated with a little Sulphuric Acid, the odour changing to one of Bitter Almonds on the addition of a small crystal or two of Potassium Bichromate

Atropine may be readily titrated with Deci- or Centi-normal Volumetric Hydrochloric or Sulphuric Acid Solution, using Cochineal Solution as an indicator. 1 cc Deci-normal solution = 0.0287 gramme of Atropine, and 1 cc of Centi-normal solution = 0.00287 gramme of Atropine. Atropine is not official in the *P.C.*

The more generally occurring impurities are mydriatic alkaloids other than Atropine, *e.g.*, Hyoscyamine and Scopolamine, Morphine, and mineral matter

Hyoscyamine and Scopolamine are readily detected by their optical activity, Morphine, if present, by the red coloration produced when a small quantity of the alkaloid is treated with a mixture of Sulphuric and Nitric Acids, mineral matter by the amount of residue left on ignition, which should be nil

Gold Chloride—The Chloraurate may be made by adding Gold Chloride T.S. to a solution of Atropine in dilute Hydrochloric Acid, washing, collecting, and drying the precipitate, which should be yellow and lustreless, *U.S.P.*

Vitali's Test—If Atropine be moistened with Nitric Acid (fuming, *B.P.*), and heated in a porcelain dish on a water-bath to dryness, the residue, yellow, (*U.S.P.*) gives with alcoholic Potassium Hydroxide solution, reddish-violet coloration, *B.P.*, an intense violet coloration, *U.S.P.* (which is due to a fragment of the base). The base directs the addition of a fragment of the base to the solution. Hyoscyamine and Hyoscyamine give a reddish-violet coloration, the presence of Strychnine will mask the coloration, *U.S.P.*

Sulphuric Acid—Sulphuric Acid when added to Atropine should show no colour (absence of readily carbonisable organic impurities), nor should subsequent addition of Nitric Acid yield any colour (absence of and discolouration from Morphine), *U.S.P.*

Preparation

UNGUENTUM ATROPINÆ.—ATROPINE OINTMENT.

Atropine, 2; Oleic Acid (by weight), 8; Lard, 90. (1 in 50)

Not Official.

UNGUENTUM ATROPINÆ—Atropine, 4 grains, Soft Paraffin, 1 oz.; heat till dissolved and stir till cold—*London Ophthalmic*; *Middlesex*, same strength with Vaseline

UNGUENTUM ATROPINÆ DILUTUM—Atropine 1 p.c. in fine powder, incorporated in Yellow Soft Paraffin of uniform consistency having a melting point of about 35° C—*St. Thomas's*

This has been incorporated in the *B.P.C.*

UNGUENTUM ATROPINÆ CUM ACIDO BORICO.—Atropine, 4 grains, Powdered Boric Acid, 60 grains, Soft Paraffin, 1 oz—*London Ophthalmic*

UNGUENTUM ATROPINÆ CUM COCAINA—Atropine, 4 grains, Cocaine, 8 grains, Soft Paraffin, 1 oz, heat till the alkaloids are dissolved—*London Ophthalmic*

Atropine, 1 p.c., Cocaine, 2 p.c.—*St. Thomas's*

This has been incorporated in the *B.P.C.*

ATROPINÆ OLEAS—Atropine, 8 grains; Oleic Acid, 1 oz.

OLEATUM ATROPINÆ.—Atropine, 2, Alcohol (95 p c), 2, Oleic Acid, by weight, 50, Olive Oil, *q s* to make 100 by weight. Triturate the Atropine in a tared mortar with the Alcohol, then add an equal volume of the Oleic Acid and, after warming the mortar, stir until the Alcohol has evaporated, add the remainder of the Oleic Acid and continue stirring until the Atropine is dissolved, then add Olive Oil to make 100 by weight —*U S P*

This has been incorporated in the *B P C* with the title **Oleinatum Atropinæ** *Syn.* OLEATUM ATROPINÆ

HOMATROPINE —*See* p 598

ATROPINÆ SULPHAS

ATROPINE SULPHATE

FR, SULFATE D'ATROPINE, GER, ATROPINSULFAT, ITAL, SOLFATO DI APROINA,
SPAN, SULFATO DL ATROPINA

A white, or almost white, odourless, more or less crystalline powder, having a bitter, nauseous taste

It is the Sulphate of an alkaloid obtained from *Belladonna Leaves* or *Root* and may be obtained by neutralising Atropine with Diluted Sulphuric Acid. As obtained commercially it almost invariably contains a small proportion of Hyoscyamine Sulphate

Solubility—10 in 4 of Water, 1 in 4 of Alcohol (90 p c) Insoluble in Ether and Chloroform

Medicinal Properties—Mydriatic, anhidrotic, antigalactagogue. Employed locally to dilate the pupil and paralyse the accommodation, in iritis, and before testing refraction or making ophthalmoscopic examination, used also to cause retraction of protruding iris, as it increases intraocular tension it does harm in glaucoma. It is frequently combined with Morphine in hypodermic administration to prevent the undesirable effects of the latter. Injected as near the nerve as possible in sciatica, hypodermically in ovarian and uterine pain. The hypodermic method is also the best to diminish the sweating of phthisis, for which purpose, in doses of $\frac{1}{100}$ to $\frac{1}{1000}$ grain, Atropine is very useful, it at the same time relieves the cough, or 1 or 2 minims of the *Liquor Atropinæ Sulphatis* may be given by the mouth

Hypodermically also in spasmodic asthma, in narcotic poisoning, in aiding the reduction of hernia, and, with Strychnine, in lessening the craving for Alcohol. *See* also Atropine and Belladonna

In morphinism —*B M J E* '94, 1 20

In hernia, the hypodermic injection of $\frac{1}{10}$ grain of Atropine was followed by immediate spontaneous reduction. In four subsequent cases $\frac{1}{10}$ to $\frac{1}{20}$ grain were used. In another case, a second injection necessary, and in a sixth case three injections —*B M J E* '02, 11 92

In intestinal obstruction, three injections of $\frac{1}{10}$ grain each —*B. M. J. E.* '01, 11 48, *M. A.* '02, 362

In asthma, $\frac{1}{2}$ milligramme internally, increasing dose every second or third day by $\frac{1}{2}$ milligramme until patient is taking 4 milligrammes a day, gradually diminishing doses after a time. Duration of treatment, four to six weeks. Second and third course recommended at interval of six months —*Fr.* lxii 698

In broncho-pneumonia in children — *P*, lxx 698

Warning against the indiscriminate use of Atropine in eye diseases, particularly in the elderly — *B M J* '02, i 267

In 192, and '07, ii 951 are the details of the treatment for inebriety

Diabetes successfully treated — *B M J* '07, ii 28

Morphinomania successfully treated by Atropine and Strychnine — *B M J* '07, i 1173

In the treatment of infantile syphilitic iritis (*P*, lxxv 563), the local use of a solution of 2 grains of Atropine Sulphate to the oz of Distilled Water, together with theunction of mercurial ointment, is recommended

2 or 3 drops of a 4 grains to the oz solution instilled into the eye daily, or where the patient objected one eye was merely bandaged, thus altering the principal focus the motion of objects is not so uniformly transmitted to the brain and tendency to sea-sickness is diminished — *B M J* '05, i 1090

In the treatment of inebriety (*B M J* '05, ii 1691) the hypodermic injection of Atropine combined with Strychnine has proved of great value in relieving the intensity of the appetite, and when thoroughly pushed it confers indifference to Alcohol $\frac{1}{100}$ grain Atropine increased to $\frac{1}{80}$ grain with $\frac{1}{10}$ grain Strychnine; also, the injection of 1 minim of Liquor Atropine Sulphatis, with 4 minims of Liquor Strychnine Hydrochloridi, twice daily for a month, then once daily for a fortnight, then every second day for a month — *B M J* '06, i 515

Drops of Atropine Sulphate, 1 grain, Cocaine Hydrochloride, 1 grain, Adrenalin solution (1 in 1000), 30 minims, Water, 24 dim, applied 1 drop in the eye every 3 hours in acute conjunctivitis — *M P*, '05, ii 308

Two cases of toxic symptoms following the use of Atropine drops to the eyes of children In one case drops ' ' ' and in the other 1 grain of Atropine to the oz were used — *L* '06, ii 904

Dose. — $\frac{1}{200}$ to $\frac{1}{100}$ grain = 0.0003 to 0.0006 gramme.

Dan, Dutch, Fr, Ger, Ital, Norw, Russ and Swiss give the maximum single dose as 0.001 gramme, Ger, Ital and Russ, maximum daily dose 0.003 gramme, Fr, 0.002 gramme

Prescribing Notes — *The Sulphate is best adapted for aqueous Solutions, and the pure Alkaloid for Ointments. Can be given in pill and triturated with Milk Sugar and mixed with Diluted Glucose. Generally given in solution.*

Official Preparations — Lamellæ Atropinae, and Liquor Atropinae Sulphatis

Not Official — Glycerinum Atropinae, Guttæ Atropinae Sulphatis, Guttæ Atropinae cum Cocaina, Injectio Atropinae Hypodermica, Linimentum Atropinae, Linimentum Atropinae et Chloroformi, Pilulæ Atropinae et Morphinae, Pessus Atropinae, Pilulæ Atropinae, Atropinae Methylbromidum, Atropinae Salicylas, Atropinae Valerianas, Euphthalmine Hydrochloridum, Guttæ Euphthalmine Hydrochloridi, Lamellæ Euphthalmine

Atropine is used as an antidote in poisoning by Phosphorus, Morphine, Aconite, Gelsemine, Hydrocyanic Acid, Muscarine, Nerve poisons, and Pilocarpine

Antidotes — In case of poisoning by Atropine, the antidotes are the same as for Belladonna, *q v*

Foreign Pharmacopœias — Official in Aust, Belg, Dan, Dutch, Fr., Ger, Hung, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U.S

Tests — The distinguishing tests for Atropine Sulphate are the melting point, which should be 189° C (347.2° F), the mydriatic action produced even by highly diluted solutions of the salt, the production of a purple-violet coloration when a small quantity is moistened with Nitric Acid evaporated on a water-bath and the residue treated with an Alcoholic Potassium Hydroxide Solution; the production of a white precipitate, on the addition of Sodium Carbonate to a saturated aqueous solution, and when this precipitate is collected

it should answer the tests described under Atropine. The aqueous solution yields on acidification with diluted Hydrochloric Acid and addition of Barium Chloride Solution, a white precipitate insoluble in Hydrochloric Acid.

The melting point given in the *BP* and *PG* is open to criticism (*PJ* '98, ii 195). Will gives 196°C ($384\ 8^{\circ}\text{F}$), *USP* about $189\ 9^{\circ}\text{C}$ ($373\ 5^{\circ}\text{F}$), and when free from Hyoscyamine about 188°C ($370\ 4^{\circ}\text{F}$), Hesse, 180° to 181°C (356° to $357\ 8^{\circ}\text{F}$), Merck, 189° to 191°C ($372\ 2^{\circ}$ to $375\ 8^{\circ}\text{F}$), whilst a salt prepared by Jowett from pure Atropine melted at 190°C (374°F). 3 c c of a 1 in 60 aqueous solution mixed with 1 c c of Sodium Hydroxide Solution (15 p c) yields a precipitate, but a solution of the same strength is unaffected by a corresponding amount of Ammonia Solution. A pleasant aromatic odour is evolved when a small quantity of the salt, which has been heated until white fumes are disengaged, is warmed with Sulphuric Acid until it commences to turn brown, and then a small quantity of Water is carefully added, the addition of a few crystals of Potassium Permanganate produces an odour of Essential Oil of Bitter Almonds.

The more generally occurring impurities are Sulphates of mydriatic alkaloids other than Atropine, *eg*, Hyoscyamine and Scopolamine, readily oxidisable organic impurities, Morphine and mineral matter. Hyoscyamine and Scopolamine Sulphates are indicated by their optical activity, organic impurities by the colour imparted to a solution of the salt in concentrated Sulphuric Acid, Morphine by the red coloration produced on the addition of Sulphuric Acid followed by Nitric Acid to a little of the salt, and mineral matter by the ash left on ignition which should be nil. Atropine Sulphate contains 85.5 p c of Atropine and 14.5 p c of Sulphuric Acid.

Sulphuric Acid—If 1.5 c c Sulphuric Acid be added to 0.01 gramme of Atropine Sulphate which has been heated in a test-tube until the evolution of white vapours occurs, and then warmed until the mixture begins to turn brown, then on immediately and carefully adding Water to this, a pleasant characteristic aromatic odour comes off. After the addition of a crystal of Potassium Permanganate the liquid smells of Essential Oil of Almond, *PG*. See also *USP*, under Atropine.

Vitali's Test—0.01 gramme Atropine Sulphate heated to dryness in a porcelain dish on a water-bath with 5 drops fuming Nitric Acid, leaves a faintly yellow residue, which on pouring over it an Alcoholic Solution of Potassium Hydroxide, and warming, assumes a violet colour, *PG*.

Preparations

LAMELLÆ ATROPINÆ. DISCS OF ATROPINE

Discs of Gelatin, each weighing about $\frac{1}{10}$ gram (1.3 milligrammes) and containing $\frac{1}{1000}$ gram (0.013 milligramme) of Atropine Sulphate.

Gelatin Discs, each containing 0.001 gramme Atropine Sulphate, are official in Sweden. It contains $\frac{1}{10}$ milligramme.

LIQUOR ATROPINÆ SULPHATIS. SOLUTION OF ATROPINÆ SULPHATE.

Atropine Sulphate, 1, Salicylic Acid, $\frac{1}{2}$, Distilled Water, 100
(1 in 100)

Dose.— $\frac{1}{2}$ to 1 minim = $\frac{1}{20}$ to $\frac{1}{10}$ grain of Atropine Sulphate.

Foreign Pharmacopœias—Official in Port, 1 in 100. Not in the others.

Not Official.

GLYCERINUM ATROPINÆ—Atropine Sulphate, 25 $\frac{1}{2}$ grains, dissolved in Water, 5 fl oz., add Compound Tincture of Lavender, 100 minims, and Glycerin, to 20 fl oz. 100 c c contains 0.25 gramme Atropine—*St Thomas's*

Atropine Sulphate, 1 $\frac{1}{2}$ grains, Water, 2 dim., Compound Tincture of Lavender, 5 minims, Glycerin, to 1 oz.—*University*

Atropine Sulphate, 0.25, Distilled Water, 25, Compound Tincture of Lavender, 1, Glycerin, q s to produce 100—*B P C*

GUTTÆ ATROPINÆ SULPHATIS—Atropine Sulphate, 1, 2 or 4 grains, Di-tilled Water, 1 oz.—*London Ophthalmic*

GUTTÆ ATROPINÆ CUM COCAINA—Atropine Sulphate, 2 grains; Cocaine Hydrochloride, 10 grains, Distilled Water, 1 oz.—*London Ophthalmic.*

INJECTIO ATROPINÆ HYPODERMICA.—Atropine Sulphate, 2 grains, Water, 1 oz

Dose—2 to 4 minims = $\frac{1}{20}$ to $\frac{1}{10}$ grain of Atropine Sulphate.

B P C Injection contains 0.12 p c

INJECTIO ATROPINÆ ET MORPHINÆ HYPODERMICA. See *MORPHINÆ ACETAS*

LINIMENTUM ATROPINÆ—Atropine Sulphate, 88 $\frac{1}{2}$ grains; Compound Tincture of Lavender, 100 minims, Alcohol (90 p c), to 20 fl oz.—*St Thomas's.*

This has been incorporated in the *B P C* as follows—

Atropine Sulphate, 0.40, Compound Tincture of Lavender, 1, Alcohol, q. s. to produce 100

LINIMENTUM ATROPINÆ ET CHLOROFORMI—Atropine Liniment 5, Chloroform, 1—*St Thomas's*

This has been modified in the *B P C* as follows—

Chloroform, 12.50, Atropine Liniment, q s to make 100

PILULA ATROPINÆ—Atropine Sulphate, $\frac{1}{16}$, $\frac{1}{8}$, $\frac{1}{4}$, $\frac{1}{2}$ grain; Liquorice Powder, 2 grains, Tragacanth Powder, 1 grain, Mucilage of Acacia, q s—*Brompton*

PILULA ATROPINÆ ET MORPHINÆ—Atropine Sulphate, $\frac{1}{16}$ grain, Morphine Hydrochloride, $\frac{1}{4}$ grain, Milk Sugar, 1 grain—*St Thomas's.*

This has been incorporated in the *B P C*

PESSUS ATROPINÆ—Atropine, $\frac{1}{2}$ grain, Conine, 1 minim; Oil of Theobroma, to 120 grains—*Samaritan*

ATROPINÆ METHYLBROMIDUM (Mydrasine)—A white crystalline powder, readily soluble 1 in 1 of Water, soluble 1 in 10 of Alcohol (90 p c), insoluble in Ether. Employed in the form of a 1 to 2 p c solution either plain, or as a solution containing 1 p c of Cocaine. A valuable succedaneum for Atropine Sulphate. Free from its disadvantages and possessing its advantages. Invaluable in determining static refraction or in any ophthalmoscopic examination, where dilatation of the pupil is indispensable. In large quantities (1 to 2 p c solution) it has the same action on the pupil and accommodation as Atropine Sulphate. In moderate quantities (1 drop of 1 p c solution) the mydrasis produced may last about twenty-four hours, but the paralysis of accommodation disappears in a few hours. In small quantities (1 drop 0.5 p.c. solution containing 1 p c of Cocaine), considerable dilatation of the pupil results with scarcely any appreciable paresis of accommodation. Atropine Methylbromide is thus a valuable diagnostic agent in the beginning of iritis, but should there be no iritis, the inconvenience produced is less than if Atropine had been instilled. One drop of a 1 p c solution produces a maximum dilatation of the pupil in from 30 to 45 minutes. Cocaine intensifies the dilatation; Eserine quickly diminishes the pupillary dilatation produced by Methylbromide.—

B M J E '03, 11 52 Has been used in doses of $\frac{1}{10}$ to $\frac{1}{2}$ of a grain = 0.0065 to 0.013 gramme in pill form in the treatment of the night sweats of phthisis. In addition to its mydriatic effect it has a distinct sedative and analgesic effect (*B M J E* '06, 1 72), for ophthalmic purposes it may be used in strengths from $\frac{1}{4}$ to 5 p c. A useful average strength is 1.0 p c.

Tests.—Atropine Methylbromide has a melting point of 222° to 223° C (431.6° to 433.4° F), its aqueous solution yields a whitish precipitate with Mayer's reagent, the residue remaining after evaporating a small quantity of the salt with a few drops of concentrated Nitric Acid yields a purple violet coloration when treated with Alcoholic Potassium Hydroxide Solution, its aqueous solution yields a white curdy precipitate with Silver Nitrate solution and a yellow coloration with Chlorine Water, the latter when shaken with Chloroform yielding a yellowish brown solution. It should leave no residue when ignited with free access of air.

ATROPINÆ SALICYLAS, $C_{17}H_{13}NO_3 \cdot C_7H_5O_2$, eq. 424.06.—A white crystalline powder, only slightly soluble in Water. Introduced as a substitute for the Sulphate in ophthalmic practice, but its aqueous solution does not keep so well as that of the latter. The author prepared 1 p c solutions of each salt, and the Salicylate developed a growth more quickly than the Sulphate. To make the solution keep well an excess of Salicylic Acid is required, and then it is irritating to the eye.

Tests.—The aqueous solution yields with Mayer's reagent a whitish precipitate, a crystal evaporated on a water bath with concentrated Nitric Acid leaves a residue which when moistened with a few drops of Alcoholic Potassium Hydroxide Solution yields a purplish violet coloration. The diluted aqueous solution yields with Ferric Chloride Test solution a deep violet coloration. It should leave no residue when ignited with free access of air.

It should contain 67.7 p c of Atropine and 32.3 p c of Salicylic Acid.

Liquor Atropinæ Salicylatis—Atropine, 5 grains, Salicylic Acid, 7½ grains, Water, 10 oz.—*Charing Cross*

ATROPINÆ VALERIANAS, $C_{17}H_{13}NO_3 \cdot C_8H_{10}O \cdot H_2O$, eq. 406.24.—Colourless, or white hygroscopic rhomboid crystals, having an odour of Valerianic Acid, and becoming coloured on exposure to light. Readily soluble in Water and in Alcohol (90 p c). Antispasmodic, antineuralgic. Recommended for internal administration.

Dose.— $\frac{1}{8}$ grain = 0.001 gramme. **Official in Mex. and Port.**

Tests.—The salt softens at 20° C (68° F), and melts at 32° C (89.6° F). The aqueous solution when acidified with a mineral acid throws out an oily fluid which collects on the surface of the liquid, Sodium or Potassium Hydroxide Solution produces a white precipitate. A crystal with a few drops of concentrated Nitric Acid evaporated to dryness yields a residue which assumes a purplish-violet coloration when moistened with a few drops of Alcoholic Potassium Hydroxide Solution. When ignited with free access of air it should leave no residue. The crystallised salt should contain 70.6 p c of Atropine and 24.9 p c of Valerianic Acid.

EUPHTHALMINÆ HYDROCHLORIDUM (Phenylglycoyl-*n*-methyl β vinyl diacetone alkamine hydrochloride).—White crystalline powder. Readily soluble in Water. Mydriatic. Introduced as a substitute for Atropine and Homatropine, and used as a 2 to 5 p c solution. Stated to weaken the accommodation only to a very slight extent, but has no appreciable effect on the conjunctival vessels or on the corneal epithelium, and causes no hyperæmia, and effects soon pass off.—*B M J* '99, 11 775, *L* '99, 11 458, *P* lxiv 476. The free base Euphthalmine crystallises in six sided prisms. A readily soluble Euphthalmine Salicylate has also been prepared.

Guttæ Euphthalminæ Hydrochloridi—Euphthalmine Hydrochloride, 10 grains, Distilled Water, 1 oz.—*London Ophthalmic*

Lamellæ Euphthalminæ.—Each disc contains $\frac{1}{2}$ grain Euphthalmine.—*London Ophthalmic*

AURANTII CORTEX.

FR, BIGARADIER, GER, POMERANZENSCHALE, ITAL, ARANCIO AMARO;
SPAN, NARANJA AMARA

Both the fresh and the dried outer part of the Pericarp of *Citrus Aurantium*, var *Bigaradia*, are official

In India and the Eastern Colonies, Auranti Cortex Indicum (*Ind* and *Col Add*) may be used. It is the dried portions of the varieties of *Citrus Aurantium* grown in India and Ceylon

Medicinal Properties—Carminative and bitter stomachic. The Tincture and Syrup are largely used as *fructus* agents.

Prescribing Note—If Orange Peel should not be prescribed with Tincture of Peppermint, the latter would be blackened.

Official Preparations—Of the **Fresh Peel**, Tinctura Aurantii and Vinum Aurantii. Of the **Tincture**, Syrupus Aurantii, contained in Tinctura Quininae, Syrupus Aromaticus and Syrupus Cascariae Aromaticus. Of the **Dried Peel**, Infusum Aurantii and Infusum Aurantii Compositum, used in the preparation of Infusum Gentianae Compositum, Spiritus Amomaci Compositus, Linctura Cichorii Composita, and Tinctura Gentianae Composita.

Not Official—Oleum Aurantii Corticis, Elixir Aurantii, Elixir Aromaticum, Elixir Simplex, Infusum Aurantii Concentratum, Infusum Aurantii Compositum Concentratum, Spiritus Aurantii Compositus, Vinum Aurantii Detannatum.

AURANTII CORTEX RECENS. FRESH BITTER-ORANGE PEEL

The Fresh outer part of the Pericarp of *Citrus Aurantium*, var *Bigaradia*, Hook f

Foreign Pharmacopœias—Official in Belg, Fr, Mex, Port and Span, U S, *Citrus Aurantium*. The following use the unripe fruit: Ger, Jap, Norw, Russ, Swed and U S

Descriptive Notes.—The fresh rind of the Seville or bitter orange *Citrus Aurantium*, L, var *Bigaradia*, Hook f, is official. It is characterised by its reddish or deep orange red colour and its rough glandular surface. It should retain but little of the white spongy portion. The taste is bitter and aromatic. It is most easily purchased in the fresh state in February and March, when it usually arrives in this country.

Preparations

SYRUPUS AROMATICUS. AROMATIC SYRUP

Tincture of Orange, 1, Cinnamon Water, 1; Syrup, 2. The turbid fluid, formed by mixing the Tincture and Cinnamon Water, is cleared by filtration through Tale, before the Syrup is added.

Dose.— $\frac{1}{2}$ to 1 fl drm. = 1.8 to 3.6 cc

SYRUPUS AURANTII. SYRUP OF ORANGE.

Tincture of Orange, 1, Syrup, 7

(1 in 8)

Dose.— $\frac{1}{2}$ to 1 fl drm = 1.8 to 3.6 cc

Foreign Pharmacopœias—Official in Hung, Peel, weak Spirit, Sugar, and Tincture, Belg, Fluid Extract 1, Syrup 19, Dutch, Peel, Water, and Sugar,

Dan, Fr, Ital and Swed, Peel, Spirit, Water, and Sugar, Austr, Ger, Russ and Swiss, Peel, Wine, and Sugar, Jap, Tincture of Bitter-Orange Peel 3, Syrup 17, Norw, Tincture 1, Syrup 9, Mex, Alcoholatura 1, Syrup 9, Port, Peel, Boiling Water and Sugar, Span (Jarabe de Corteza de Naranja), Water of Orange Peel and Sugar, (Jarabe de Corteza de Naranja Amarga), Wine of Bitter Orange Peel and Sugar All by weight, except U S

Syrupus Aurantii (U S)—Tincture of Sweet Orange 5, is triturated with Magnesium Carbonate 1, and Water 40, gradually added, filtered, sufficient Water added to produce 45, Citric Acid 0.5 dissolved in the filtrate, then Sugar 82, and sufficient Water added to produce 100 by volume

TINCTURA AURANTII TINCTURE OF ORANGE

Macerate 1 of Fresh Bitter Orange Peel, cut small, with 4 of Alcohol (90 p c) (1 in 4)

Formerly called Tinctura Aurantii Recentis, and 6 of Fresh Peel made 20 of Tincture

Dose —30 to 60 minims = 1.8 to 3.6 c c

Foreign Pharmacopœias—Official in Belg, Fresh Peel 1, Alcohol (60 p c) 5, Dutch, Peel 1, Alcohol (70 p c) 5, Fr (Alcoolature d'Orange), Fresh Peel 1, Alcohol 2, Ital, Peel 1, Alcohol 2, both by weight U S (Tinctura Aurantii Dulcis), from Fresh Peel, 1 in 5, not in the others The following are made with Dried Peel Austr, Dan, Dutch, Fr, Ger, Hung, Jap, Norw, Russ, Swed, Swiss and U S, 1 and 5, all by weight, except U S Not in Port

Tests—Tincture of Orange has a sp gr of about 0.880, contains about 2 p c w/v of total solids and about 74 p c w/v of Absolute Alcohol

VINUM AURANTII ORANGE WINE

A sherry-coloured weak alcoholic liquid, prepared by the fermentation of a saccharine solution containing Fresh Bitter Orange Peel

Foreign Pharmacopœias—Official in Span, Dried Bitter Orange Peel 1, Carinena or Alicante Wine 20 Belg and Swiss have a compound wine, but they vary considerably in composition

The Orange Wine of commerce

Tests.—Orange Wine has a sp gr of about 1.030, it contains about 11.5 p c of total solids It is officially required to contain 10 to 12 p c w/v of Ethyl Hydroxide Good commercial samples contain from 15 to 18 p c w/v of Absolute Alcohol In testing for Salicylic Acid 1 fl oz of the Wine is rendered alkaline by the addition of Sodium Hydroxide Solution, and shaken with Ether, the ethereal solution separated and rejected, the Wine may then be rendered acid with diluted Sulphuric Acid and again shaken with Ether, the ethereal solution separated, carefully washed with Water till free from mineral acid and shaken with Water to which a drop or two of Ferric Chloride T S has been added, Salicylic Acid, if present, is indicated by the violet coloration produced The B P performs the test for Salicylic Acid on the distillate obtained from a mixture of 50 c c of Wine, 50 c c of Water and 5 c c of Normal Volumetric Sulphuric Acid Solution, rejecting the first 10 c c distilled and shaking the balance with Ether Ferric Chloride T S is used as a reagent, and the test is carried out on the residue left on evaporation

Not Official

INFUSUM AURANTII CONCENTRATUM —Dried Bitter Orange Peel, in No 10 powder, 40, Tincture of Orange, 5, Alcohol (90 p c), 22 5 Dilute Chloroform Water (1 in 1000), *q s* to make 100 Prepare by repercolation Dose — $\frac{1}{2}$ to 1 fl dm —*Farr and Wright, P J '06, 1 165 and '07, 1 621, C D '06, 1 252, Y B P 1907, 250*

This appears in the *B P C*

INFUSUM AURANTII COMPOSITUM CONCENTRATUM —Dried Bitter-Orange Peel, in No 10 powder, 20, Dried Lemon Peel, in No 10 powder, 5, Cloves, freshly powdered, 2 5, Tincture of Lemon, 5, Tincture of Orange, 5, Alcohol (90 p c), *q s* Dilute Chloroform Water (1 in 1000), *q s* to make 100 Macerate the powdered Cloves in 20 of the Alcohol for 12 hours, filter through Cotton-Wool, and pass through the same sufficient Alcohol to make the filtrate measure 20, add the tinctures and set aside, mix the other powders, and submit them to macero-expression with dilute Chloroform Water, adding the mixed tinctures to the reserved portion Dose — $\frac{1}{2}$ to 1 fl dm —*Farr and Wright, P J '06, 1 165 and '07, 1 621, C D '06, 1 252, Y B P 1907, 249*

This appears in the *B P C*

VINUM AURANTII DETANNATUM —Orange Wine, 1 gallon, Gelatin, in No 100 powder, $\frac{1}{2}$ oz., macerate for 24 hours and decant

It is recommended by *F C J* Bud that Gelatin in No 100 powder should be used in place of Gelatin cut small, as recommended in the *B P C Formulary* 1901, it being found possible by this process to completely detannate an average sample of Wine in 24 hours with the aid of occasional shaking, or in 8 hours if frequently agitated Care must be taken to keep the temperature of maceration at or below 15 5° C, or during extremely hot weather the Gelatin will probably pass into solution —*P J '99, 1 183*

This suggestion has been incorporated in the *B P C* as follows —

Orange Wine 100, Gelatin, in No 100 powder, 0 15 Macerate for 24 hours at a temperature not exceeding 15 5° C, with frequent agitation, and afterwards decant.

OLEUM AURANTII CORTICIS —A volatile Oil, extracted by mechanical means from Fresh Orange Peel, both varieties of Orange Peel are used, that from *Citrus Aurantium*, L, var *Bigaradia*, Hook, is known as *Essence de Bigarade*, and that from *Citrus Aurantium*, L, as *Essence de Portugal*, the former yields the finest Oil

A pale yellowish liquid, with neutral reaction, having the odour of Orange Peel At least 90 p c of the Oil consists of dextro-rotatory Limonene

By keeping, the Oil becomes thicker and acquires a disagreeable terpeninathate taste, which may be prevented by mixing it while fresh with 10 p c of Absolute Alcohol It should be kept in well-stoppered dark amber-tinted glass bottles in a cool place

Solubility —Soluble 1 in 7 of Alcohol (90 p c), and in all proportions of Absolute Alcohol

Foreign Pharmacopœias —Official in Austr and Belg., sp gr 0 848 to 0 852, Dutch, sp gr 0 850 to 0 870, Fr, sp gr 0 848 to 0 853, Hung. and Jap, sp gr 0 850 to 0 860, Port, sp gr 0 835 to 0 850, Mex., sp gr 0 837; Spain, 0 835 to 0 844, U S, sp gr 0 842 to 0 846 at 25° C (77° F.), not in Dan, Ger, Ital, Norw, Russ, Swed or Swiss.

Tests —The oil of sweet orange has a sp. gr of 0 848 to 0 852, that from bitter orange 0 854 to 0 857 Both have a characteristic orange odour The oil has a boiling point of 175° to 180° C (347° to 356° F), between which temperatures about nine-tenths of the oil distils over The oil of sweet orange has an optical rotation in a tube of 100 mm diameter of +96° to +98° at 20° C (68° F), that of the bitter orange is between +90° and +98°

The more generally occurring sophistications are Turpentine Oil and the terpenes remaining from the manufacture of terpeness Oil of Lemon and Oil of Orange Turpentine Oil may generally be detected directly by the optical rotation, or by a determination of the optical activity of the first 10 p c fraction,

The optical rotation of this first 10 p c fraction should not materially differ from that of the original oil

The terpenes remaining from the manufacture of terpeneless Lemon Oil are readily detected by the optical rotation, but terpenes from terpeneless Oil of Orange are detected with much greater difficulty. They reduce the colour of the oil and produce a difference in the odour and taste

ELIXIR AURANTII (formerly *U S*, now omitted)—Sprinkle or spray 1 fl oz of Oil of Orange over 2 oz of Cotton-Wool, pack it tightly in a percolator and pass through it a mixture (Alcohol 1, Water 3), sp gr 0.971, till 200 fl oz of a clear percolate are obtained, in which dissolve, without heat, Sugar 100 oz, all by weight

A better method of disseminating the Oil is to sprinkle it upon blotting paper pulp this with the diluted Alcohol, allow it to stand for 24 hours, and filter

ELIXIR AROMATICUM—Compound Spirit of Orange, 1 2, Syrup, 87 5, Purified Talc, 3, Alcohol (95 p c), *q s*, Distilled Water, *q s* to produce 100. To the Compound Spirit of Orange add enough Alcohol to make 25, to this solution add the syrup in several portions, agitating after each addition, then 87.5 of Distilled Water. Mix the Purified Talc with the liquid and then filter through a wetted filter, returning the first portions of the filtrate until a transparent liquid is obtained. Lastly, wash the filter with a mixture of Alcohol 1 volume and Distilled Water 3 volumes, until the product measures 100—*U S P*

This has been incorporated in the *B P C*, which appears to direct twice as much Compound Spirit of Orange, but the *B P C* Compound Spirit is only half the strength of the *U S P*. This, however, has been altered in the *B P C Supplement*, the Spiritus Aurantii Compositus (see below) has now been doubled in strength, and half the quantity of it used, and the amended formula for Elixir Aromaticum will agree with that given above for *U S P*

ELIXIR SIMPLEX—Oil of Bitter Orange, 30 minims, Alcohol (90 p c), 6 fl oz, dissolve and add Distilled Cinnamon Water, 7 fl oz, Syrup, 7 fl oz, mix. Filter through paper moistened with Alcohol (45 p c) and well sprinkled with kaolin, returning the first portions of filtrate until it passes through bright—*B P C Formulary* 1894 omitted in 1901

Dose—20 to 60 minims = 1 2 to 3 6 c c

Tincture of Orange, 7 50, Syrup, 40, Distilled Water, *q s* to make 100.—*B P C*

This is the same formula as given under Pepsin

SPIRITUS AURANTII COMPOSITUS (*U S*)—Oil of Orange, 10, Oil of Lemon, 2½, Oil of Coriander, 1, Oil of Anise, ½, Alcohol (95 p c), to make 50

The *B P C* Spiritus Aurantii Compositus employ Alcohol (90 p c) to make 100 and is therefore half this strength. This has been altered in the *B P C Supplement*, reducing the quantity of Alcohol (90 p c) to make 50, so that the formula will correspond in strength to the *U S* preparation, but using Alcohol (90 p c) in place of *U S P* Alcohol (95 p c)

AURANTII CORTEX SICCATUS. DRIED BITTER-ORANGE PEEL

The dried outer part of the Pericarp of *Citrus Aurantium*, L., var *Bigaradia*, Hook f

Official Preparations—Infusum Aurantii and Infusum Aurantii Compositum

Foreign Pharmacopœias—Official in Austr, Dan, Dutch, Fr, Ger, Hung, Ital (Arancio Amaro), Jap, Norw, Port. (Laranjeira Azeda), Russ, Swed and Swiss, *U S*, Aurantii Amari Cortex, also Aurantii Dulcis Cortex.

Descriptive Notes.—Bitter-Orange Peel occurs in English commerce in three forms, viz, English, exotic and Maltese. The English is more carefully dried, externally and nearly white on the inner surface, in long strips about $\frac{1}{8}$ in (8 mm.) wide and more or less curled in drying. The exotic is less carefully dried and of a duller orange-red or brownish-red colour externally, and a dirty white colour on the inner surface. The Maltese resembles the exotic, except that it occurs in very slender strips about 2 lines wide only, is cut up into shorter pieces, and has less of the mesocarp or white spongy portion attached to the zest or rind. The official description simply directs that it should be in thin strips, but as the colour must be orange-red, it is evident that the English-dried kind is intended. The *U S P* describes the dried peel as of a brownish-green colour, and in strips or quarters, thus apparently admitting the badly dried W Indian peel which is usually dried in quarters. The *P G* describes the dried peel as brownish, and directs that it should be prepared by softening the rind in cold Water for a quarter of an hour, pouring off the Water and keeping the peel in a cool place until the next day when the white spongy tissue should be cut off and the outer portion dried. Dried Orange Peel if long kept loses its bright colour and becomes brownish-red.

Preparations

INFUSUM AURANTII. INFUSION OF ORANGE PEEL.

Dried Bitter-Orange Peel, 1, boiling Distilled Water, 20. Infuse for 15 minutes (1 in 20)

Dose $-\frac{1}{2}$ to 1 fl oz = 14.2 to 28.4 cc

Fr (Tisane d'Oranger), Leaves, 5, boiling Water, 1000

INFUSUM AURANTII COMPOSITUM. COMPOUND INFUSION OF ORANGE PEEL.

Dried Bitter-Orange Peel, $\frac{1}{2}$ oz, Fresh Lemon Peel, $\frac{1}{2}$ oz, Bruised Cloves, 55 grains, boiling Distilled Water, 20 oz. Infuse for 15 minutes (1 in 40)

Dose.— $\frac{1}{2}$ to 1 fl oz = 14.2 to 28.4 cc.

TINCTURA AURANTII. See AURANTII CORTEX RECENS

Formerly two Tinctures were official, one from Fresh Peel and the other from Dried Peel, the latter is now omitted

AURANTII FLORIS AQUA.

ORANGE-FLOWER WATER

NO Syn—AQUA NAPHE

Fr, L'EAU DE FLEUR D'ORANGER; GER, POMERANSENBLÜTENWASSER; ITAL, ACQUADI FIORI DI ARANCIO; SPAN., AGUA DESTILADA DE AZAHAR

Commercial Orange-flower Water prepared by a process of distillation from the Flowers of the Bitter-Orange tree, *Citrus*

Aurantium, L, var *Biganadra*, Hook f, diluted with twice its volume of Distilled Water. It keeps best in the undiluted state, and should therefore be diluted only as required.

U S directs the Triple Extract to be diluted with an equal volume of Distilled Water. Swiss use the undiluted Water.

Medicinal Properties—Both the Water and the Syrup are used as flavouring agents, about 1 of the Concentrated Water to 8 of Distilled Water, it is also used in eye lotions.

Official Preparation—Syrupus Aurantii Floris. Contained in Mistura Olei Ricini, and Syrupus Calcii Lactophosphatis.

Not Official—Oleum Aurantii Florum (Oleum Neroli).

Foreign Pharmacopœias—Official in Austr, Belg, Dutch, Fr (Eau Distillée de Fleur d'Oranger), Hung, Ital (Acqua Distillata di Arancio) Jap, Mex (Agua destilada de corteza de naranja amarga), Port (Água de Flores de Laranjeira), Russ, Span (Agua Destilada de Azahar), Swed, Swiss and U S. Not in Dan, Ger, or Norw.

Preparation

SYRUPUS AURANTII FLORIS SYRUP OF ORANGE FLOWER

Dissolve 6 of Refined Sugar in 2 of boiling Distilled Water, add 1 of undiluted Orange-flower Water of commerce, and make up the total weight to 9 with recently boiled Distilled Water.

Dose— $\frac{1}{2}$ to 1 fl drm = 1.8 to 3.6 cc

Foreign Pharmacopœias—Official in Austr, O F W 1, Sugar $1\frac{1}{2}$, Belg, O F Spirit (1 Oil in 100) 1, Syrup 199, Fr and Mex, O F W 10, Sugar 18, Port, O F W 7, Sugar 13, Span and Swiss, O F W 36, Sugar 64, all by weight. U S, Sugar 85, O F W to measure 100. Not in the others.

Not Official

OLEUM AURANTII FLORUM *Syn* OLEUM NEROLI—A volatile Oil, obtained by distilling fresh Orange flowers with Water. The watery distillate constitutes the Aqua Floris Aurantii Conc of commerce. The finest Oil is obtained from the Bitter-Orange, that from the Portugal or Sweet-Orange is not so good. From the leaves, twigs and immature fruits of both varieties is obtained the commercial Oil of Petit Grain.

A yellowish or brownish limpid liquid, with neutral reaction, having a powerful odour of Orange flowers.

Solubility—Soluble in all proportions of Alcohol (90 p c) or in Absolute Alcohol.

Foreign Pharmacopœias—Official in Austr, Belg and Swiss, sp gr 0.870 to 0.880, Mex, sp gr 0.870 to 0.878, Fr, sp gr 0.875 to 0.880, Span, sp gr 0.850 to 0.900, Ital, sp gr 0.872 to 0.890, Jap, sp gr 0.86 to 0.88, Port, sp gr 0.874 to 0.878. Not in Dan, Dutch, Ger, Hung, Norw, Russ, Swed or U S.

Tests—The Oil has a specific gravity of 0.870 to 0.890 and a powerful characteristic odour of Orange flowers. It should possess an optical rotation in a tube of 100 mm diameter of $+2^{\circ}$ to $+5^{\circ}$ and occasionally as high as $+8^{\circ}$. It should form a clear solution in $1\frac{1}{2}$ to 2 volumes of Alcohol (80 p c). A determination of the Saponification value affords a useful criterion of the purity of an Oil, that of genuine Oils being between 20 and 52 corresponding to 7 to 18 p c of Esters calculated as Linallyl Acetate.

The more generally occurring sophistications are Bergamot and Petit Grain Oils, which being composed largely of the same chemical constituents as Neroli

Oil can only be detected when in relatively large amounts being next to impossible. The value here affords the recognition of the best criterion.

Not Official
AURI BROMIDUM

AuBr₃, eq 433.75

In dark brown masses, soluble in Water. It has been used on the Continent for the relief of hysteria and epilepsy.

The salt should be kept in small bottles of a dark amber tint.

The Tribromide obtained from it is soluble about 1 in 75 of Water.

It appears to be about ten times more active than the more commonly used Bromides, and has been given in $\frac{1}{2}$ (increased to $\frac{1}{3}$) grain doses in severe cases of hysteria and epilepsy — *L* '90, i 869.

Dose — $\frac{1}{10}$ to $\frac{1}{2}$ grain = 0.0067 to 0.016 gramme.

Prescribing Notes — Dispensed in pills with *Massa Kauloni*, or in compressed Tablets.

Official in Mex., Bromuro de Oro.

AURI ET POTASSII BROMIDUM — Brownish-black needle-shaped crystals. Readily soluble in Water. Used for the same purposes as for the Tribromide.

Dose — $\frac{1}{2}$ grain = 0.021 gramme.

LIQUOR AURI ET ARSENI BROMIDI — Arsenious Acid, 0.25 gramme, Gold Tribromide, 0.325 gramme, Bromine Water and Distilled Water, of each a sufficient quantity to make 100 c.c. — *U.S.N.F.* 1896 and 1906.

10 minims of this solution contain $\frac{1}{2}$ grain of Tribromide of Gold and the equivalent of $\frac{1}{8}$ grain of Tribromide of Arsenic.

Arsenious Acid, in powder, 40 grains, Potassium Carbonate, 40 grains, Bromine, 100 grains, Gold, in leaf, 13.5, Distilled Water, q.s. to 20 fl. oz. (Wright) — *Y.P.B.* 1896, 354.

10 minims contains an amount of Arsenium in combination equal to $\frac{1}{8}$ grain of Arsenious Acid and $\frac{1}{2}$ grain of Gold Tribromide.

This has been incorporated in the *B.P.C.* under the title **Liquor Auri et Arsenii Bromatus**.

This liquor has been found useful in rheumatism — *L* '95, ii 921, '00, i 72; it is also combined with Mercury Oxybromide in syphilitic affections.

Not Official.
AURI CHLORIDUM.

Under this heading are arranged the following varieties —

- 1 **Pure Chloride of Gold**, AuCl₃, containing about 65 p.c. of metallic Gold. Official in Port. (Chloreto de Ouro), and Mex. (Cloruro de Oro).
- 2 **Chloride of Gold and Sodium** (Commercial 'Chloride of Gold'), the crystallised double salt AuCl₃.NaCl.2H₂O, containing 50 p.c. of Gold. Official in Fr. (Chlorure d'Or et de Sodium), Port. (Chlorure de Ouro e de Sodio), and Mex. (Cloruro de Oro y Sodio).
- 3 **Commercial Chloride of Gold and Sodium**. Commercial Chloride of Gold and Sodium is the above crystallised salt mixed with an equal weight of Chloride of Sodium, and contains 25 p.c. of metallic Gold.
- 4 **Auri et Sodii Chloridum, U.S.** A mixture composed of equal parts of anhydrous Gold Chloride and anhydrous Sodium Chloride,

and which contains not less than 30 p.c. of metallic Gold
Official in Russ (Auro-natrium Chloratum)

The salts should be kept in well-stoppered bottles of a dark amber tint

Some foreign samples of commercial Chloride of Gold are the double Chloride of Gold and Potassium $\text{AuCl}_3 \cdot \text{KCl} 2\frac{1}{2}\text{H}_2\text{O}$, corresponding to about 47 p.c. of metal—*P J* (3) xxii 902

Medicinal Properties—It has been given on the Continent for amenorrhœa and secondary syphilis Chloride of Gold and Sodium has been used in tertiary syphilis, spinal sclerosis, hystero epilepsy, asthma, chorea, and in uterine affections

Dose— $\frac{1}{16}$ to $\frac{1}{2}$ grain = 0.004 to 0.016 gramme

Prescribing Notes—*It may be given in the form of pills made with Massa Kaolin, or in aqueous solution Its solutions should be protected from white light*

It is also used in photography

Not Official.

AZADIRACHTA INDICA

INDIAN AZADIRACH

Syns—NEEM BARK, MARGOSA BARK

The dried Bark of the stem of *Melia Azadirachta*, L. **Infusum Azadirachtæ Indicæ** (1 in about 109), dose $\frac{1}{2}$ to 1 fl. oz. = 14.2 to 28.4 cc., and **Tinctura Azadirachtæ** (1 in 10), dose 30 to 60 minims = 1.8 to 3.6 cc., are official in the *Ind* and *Col Add* for India and the Eastern Colonies

BALSAMUM CANADENSE.

See TEREBINTHINA CANADENSIS

Not Official

BALSAMUM DIPTEROCARPI

GURJUN BALSAM

A balsamic exudation, obtained from the Trunk of *Dipterocarpus turbinatus*, Gærtn f., and other species by incision and the application of heat Imported from the East Indies It is an oleo resin, constituting a transparent liquid of the consistence of Olive Oil, lighter than Water, and of a dark brown sherry colour, slightly fluorescent

Medicinal Properties—Similar to those of Copaiba Useful for leprosy. Mr J D Hillis, of the Leper Asylum in British Guiana, is greatly in favour of it—*L* '80, 1 659, *MP* '89, 1 664, see also *L* '90, 1 136 Von Reissen gives Wood Oil internally, commencing with daily doses of 5 drops, increasing gradually to 70 or more, suspending the treatment when intolerance is shown Externally the leprous parts are treated with an ointment of Gurjun Balsam, 3 parts, Lanolin, 1 part—*P J* '95, 11 27

It is used in India as a substitute for Balsam of Copaiba in gonorrhœa, also as a natural varnish

Prescribing Notes—*Best prescribed in capsules for internal administration As a local application in the form of an emulsion made with Lime Water, or as an ointment made with a Lanolin basis*

Descriptive Notes—It is also known as Wood Oil, but must not be confounded with the Wood Oil of China, which is a drying fixed Oil, used in China

instead of Linseed Oil, and is derived from *Aleurites Fordii*, Harms', and other species, it is also known as Tung Oil. To prevent confusion on the name, Gurjun Oil or Gurjun Balsam should be used for Balsamum Dipterocarpi.

BALSAMUM PERUVIANUM.

BALSAM OF PERU

FR, BAUME DU PEROU, GER, PERUBALSAM, ITAL, BALSAMO PERUVIANO, SPAN, BALSAMO DEL PERU

A dark brownish viscid liquid, obtained (by special treatment) from the Trunk of *Miconia Peruvica*, Klotzsch, growing in San Salvador, Central America.

It consists mainly of Cinnamoin, the Benzyl Ester of Benzoic Acid, with a smaller proportion of the Benzyl Ester of Cinnamic Acid, free Cinnamic Acid, traces of Vanillin and Pteroesinotannol Esters of Cinnamic and Benzoic Acid.

Solubility—1 in 1 of Alcohol (90 p.c.), when more than 3 of Alcohol are added to 1 of Balsam it becomes turbid, in all proportions of Chloroform, insoluble in Olive Oil.

Medicinal Properties—Stimulant and disinfectant expectorant. Useful in chronic bronchitis, contra-indicated in acute bronchial catarrh because of its stimulant action, also used as a urinary antiseptic.

Externally as an ointment for chronic indolent ulcers and for sore nipples, for scabies and pediculi and parasitic skin diseases, to relieve itching in urticaria, and prevent or heal bed-sores.

The Balsam contains an Essential Oil, the vapour of which is extremely toxic to the acarus of itch. The patient is rubbed in the evening for fifteen or twenty minutes with the Balsam, it is not necessary to rub hard, as the vapour is sufficient to kill the parasite—*L* '96, i 1101.

As a dressing in warfare, it may be left on for 20 days without removal and disinfection, and sterilisation is unnecessary—*L* '04, ii, 1807.

Not to be applied to large areas of skin for scabies in children, small bodied adults, and patients with renal trouble, as it may produce albuminuria or nephritis—*B M J* '07, i 972.

Superior to sulphur in scabies—*B M J* '07, ii 1710.

Dose.—5 to 15 minims = 0.3 to 0.9 c.c.

Prescribing Notes—Given as an emulsion with Mucilage of Gum Acacia, or Sugar and yolk of Egg with Water.

Not Official.—Unguentum Peruvianum, and Unguentum Peruvianum Resinosum.

Foreign Pharmacopœias—Official in Austr., sp gr 1.14 to 1.16, Belg., 1.187 to 1.150, Dutch, sp gr 1.14 to 1.145, Dan., Ital., Norw. and Swed., sp gr 1.135 to 1.150, Fr., sp gr 1.135 to 1.150, Ger., sp gr 1.140 to 1.150, Hung., sp gr 1.137 to 1.150, Jap., sp gr 1.140 to 1.162, Russ., sp gr 1.135 to 1.145, Port., sp gr 1.15, Span., sp gr 1.13 to 1.16, Swiss, sp gr 1.145 to 1.155, U.S., sp gr 1.140 to 1.150, at 25° C (77° F), Mex., 1.14 to 1.145.

Descriptive Notes—Balsam of Peru is not a natural exudation, but is a pathological product formed after the bark has been beaten and scorched. It is a nearly black, oily liquid, heavier than Water,

and with a balsamic rather smoky odour, which is fragrant and agreeable when the balsam is smeared on paper and warmed. It has not a very pronounced taste, but leaves an unpleasant burning sensation in the fauces. It is liable to be adulterated with several substances, *see* Tests. An artificial Balsam of Peru, called Perugen, is now sold in commerce, but its use in medicine is not justified, since it cannot be said to be derived from *Myroxylon Perense*. With the Nitric Acid test of Cæsar and Loretz, *PJ* (4) xxi, p. 579, Perugen gives an intense olive-green colour, instead of the golden yellow yielded by pure Balsam.

Tests—The distinguishing tests for Peruvian Balsam are (1) the specific gravity, which should be 1.137 to 1.150 [the *USP* gives 1.140 to 1.150 at 25° C (77° F), the *PG* 1.140 to 1.150], (2) the presence of from 57 to 60 p.c. of Cinnamoin as determined by first shaking a weighed quantity of 5 grammes of the Balsam with 5 c.c. of Sodium Hydroxide Solution (15 p.c.) and shaking the latter solution with three successive portions each of 15 c.c. of Ether (sp. gr. 0.720), the residue from the ethereal solution on evaporation being dried until the loss between two weighings at intervals of five minutes does not exceed 0.01 gramme, (3) the percentage of Potassium Hydroxide required to saponify the residue, which should be from 23.23 to 23.76 p.c. as determined by saponifying the weighed residue from the Ether treatment with Normal Volumetric Alcoholic Potassium Hydroxide Solution titrating the uncombined alkali with Normal Volumetric Sulphuric Acid Solution.

The *USP* requires the Balsam to contain at least 56 p.c. of Cinnamoin as determined by a single extraction with Ether from a mixture of the Balsam and Sodium Hydroxide Test Solution, the residue from the Ether treatment should require not less than 23.49 p.c. of Potassium Hydroxide for saponification. The *PG* test indicates 56 p.c. of Cinnamoin as determined by extraction with three successive portions of Ether from a mixture of the Balsam, Water, and Sodium Hydroxide Solution (15 p.c.), the Ether residue should require not less than 23.66 p.c. of Potassium Hydroxide for its saponification. Both *USP* and *PG* employ Semi-normal Volumetric Hydrochloric Acid Solution for titrating the uncombined alkali after saponification. Attention has been called (*PJ* '01, i. 29) to the ambiguous wording of the Pharmacopœia test. The original test directs the exhaustion of the Balsam with Ether and treatment of the filtered ethereal solution with Sodium Hydroxide Solution. The original directions are that the Balsam shall be shaken with Sodium Hydroxide Solution (15 p.c.) and then washed with Ether, the Ether removed and the residue weighed after suitable drying. The residue would be taken to mean the residual Balsam after treatment with Sodium Hydroxide Solution (15 p.c.) and Ether, whereas the residue of Cinnamoin and other Ether soluble bodies is intended.

A determination of the Acid, Ester and Saponification value of the original Balsam is useful in judging of the quality of a sample. The *BP* does not make any reference to such determinations. The *USP*

gives a quantitative test for limit of Acid Resins and according to the test these should not amount to more than 14.09 p.c. reckoned as Cinnamic Acid. No saponification test on the original Balsam is given. The *PG* omits the 'limit of Acid Resins,' but includes a Saponification test, the Balsam being required to neutralise not less than 22.46 p.c. of Potassium Hydroxide, indicating a Saponification value of 224.6.

The more generally occurring impurities are Copaliba Balsam, Colophony, fixed oils, *et c.*, Olive and Castor Oils, Ethylic Alcohol, Turpentine, Storax and Gurjun Balsam. As a general rule adulterants raise the Acid and lower the Saponification values. The *BP* employs trituration with Lime as a test for ensuring the absence of Copaliba and Resins and when warmed until the volatile matter is dissipated and effervescence commences, the absence of fatty odour is assumed to indicate the absence of Castor and other Fatty Oils. No diminution in volume when equal volumes of the Balsam and Water are shaken together indicates the absence of Ethylic Alcohol. The separation of about 40 p.c. of Resin and a clear pale brown supernatant fluid with only a slight fluorescence, when one part of the Balsam is treated with three parts of Carbon Bisulphide, is officially stated to indicate the absence of Gurjun Balsam. The trituration with Lime is included in the *USP*, though the latter part of the test is omitted; the test was official in *PG* III, but is omitted altogether in *PG* IV. Neither *USP* nor *PG* includes a test for Ethyl Alcohol, nor the Carbon Bisulphide test. Both *USP* and *PG* include a Sulphuric Acid test for Fixed Oils and Gurjun Balsam. The *USP* alone includes a test with Benzoin and concentrated Nitric Acid for the detection of Resin, the balance of the Benzoin solution being shaken with Copper Acetate Solution, the non-production of a green or bluish-green coloration indicating the absence of Resin, Turpentine, Storax, Fatty Oils, etc. Dieterich is of opinion that qualitative reactions are devoid of any value in judging the quality of a Balsam, and suggests including a determination of the Resin-ester. The following test has been suggested by Dieterich (*Beichte der deutschen pharmaceutischen Gesellschaft* 18, 135) for inclusion in the *BP* tests.—The alkaline solution of the Resin obtained in the assay of the balsam is acidified and shaken with 10 c.c. of Ether, 5 c.c. of this solution is poured into a test-tube, and after inclining the tube 1 c.c. of concentrated Sulphuric Acid is allowed to flow in, the test-tube is brought into a vertical position, and after a short time is again inclined and 2 c.c. of concentrated Hydrochloric Acid allowed to flow in. A reddish-brown, but not a green or greenish-brown zone should develop between the Hydrochloric Acid and the Ether, a red zone between the Sulphuric Acid and the Hydrochloric Acid. This test is intended to detect the presence of synthetic Balsam of Peru (Perugen).

Calcium Oxide—When the Balsam is mixed with half its volume of Calcium Hydroxide and heating on a water-bath for half an hour a solid mass should not be formed, indicating the absence of Resin, Storax, or Copaliba, *USP*.

Sulphuric Acid—If 10 drops of the Balsam be triturated with 20 drops of Sulphuric Acid a tough homogeneous mass results, which when washed with cold

Water develops a violet colour on its surface, and, after draining out the Water a brittle mass is obtained which may be crumbled up, indicating the absence of fixed oils, *P G* and *U S P*

Benzin and Nitric Acid—If 1 gramme of the Balsam be shaken with 5 c c of Petroleum Benzin, the mixture warmed on a water bath for 10 minutes, and sufficient solvent added to replace loss by evaporation, then if 2 c c of this Benzin Solution be evaporated and treated with a drop of Nitric Acid, *sp gr* 1.42, a permanent green or bluish green colour should not be produced (absence of Resin), *U S P*. The remaining 3 c c of Benzin Solution when shaken with an equal volume of aqueous Solution of Copper Acetate (1-1000) should not be coloured green or bluish green (absence of Resin, Turpentine, Storax, Fatty Oils, etc), *U S P*

Saponification—Let 1 gramme of Balsam be dissolved in 20 c c of Alcohol (90 p c) and 50 c c of Semi-normal Alcoholic Solution of Potassium Hydroxide be added, then let the mixture be heated on a water-bath for half an hour. Dilute with 300 c c of Water and titrate with Semi-normal Solution of Hydrochloric Acid, not more than 42 c c of the Acid solution should be necessary to neutralise the excess of Potassium Hydroxide Solution, *P G*

Volumetric Determination of Free Acid—The *U S P* directs 1 gramme of Balsam to be dissolved in 100 c c of Alcohol (94.9 p c), and titrated with Semi-normal Alcoholic Solution of Potassium Hydroxide, using 1 c c of Phenolphthalein T S as indicator, when not more than 2 c c of the Volumetric Alkali Solution should be required to produce a pink colour

Gravimetric and Volumetric Determination of Cinnamain—The *B P* quantities are outlined in the large type notes above, the *P G* quantities are 2.5 grammes of Balsam, 5 c c Sodium Hydroxide Solution (15 p c w/w) and 5 c c of Water, washing with three quantities of Ether 10 c c each. The final residue should amount to at least 1.4 grammes. The *U S P* directs the mixture of 3 grammes of Balsam with 80 c c Sodium Hydroxide T S, then washing with 60 grammes of Ether, and the careful evaporation of 51.5 grammes of the ethereal liquid, when not less than 1.4 grammes of residue of constant weight should be obtained (presence of at least 56 p c of Cinnamain). The residue obtained from the *B P* gravimetric determination of Cinnamain is dissolved in 40 c c of Alcohol (90 p c), and saponified under a reflux condenser for one hour with 20 c c of Normal Volumetric Alcoholic Potassium Hydroxide Solution, the excess of Volumetric alkali solution being titrated with Normal Volumetric Sulphuric Acid Solution, to neutralise this excess from 7.2 to 8.1 c c should be necessary. The *P G* and *U S P* direct the solution of the weighed residue in 25 c c of Alcohol, mixing with 25 c c Semi-normal Volumetric Alcoholic Solution of Potassium Hydroxide and carefully heating on a water bath for half an hour, then after the addition of 10 drops (1 c c, *U S P*) of Phenolphthalein T S as indicator, the mixture should require not more than 13.2 c c Semi-normal Volumetric Solution of Hydrochloric Acid for exact neutralisation

Not Official

UNGUENTUM PERUVIANUM—Balsam, 1, Lard, 7

This has been incorporated in the *B P C*

UNGUENTUM PERUVIANUM RESINOSUM—Balsam, 1, Resin Ointment, 1

BALSAMUM TOLUTANUM.

BALSAM OF TOLU

FR, BAUME DE TOLU, GFR, TOLUBALSAM, ITAL, BALSAMO TOLUTANO, SPAN., BALSAMO DE TOLU

A yellowish-brown, soft, tenacious mass, which exudes from the Trunk of *Myroxylon Toluifera*, H B and K, on incision. Imported from the northern ports of Colombia, South America

might be inserted in the place of the Potassium Hydroxide in the requirement as to the quantity necessary for saponification. One-third of the weight of the residue is considered to be too high, and it is suggested that the sentence should read not less than 290 parts of Potassium Hydroxide per 1000 parts of dry residue. A saving of time would, moreover, be accomplished by expressing the percentage of Potassium Hydroxide required, on the original Balsam instead of on the residue, the evaporation of the Carbon Bisulphide would then not require to be carried beyond the stage necessary for the removal of the solvent. The Carbon Bisulphide test is not included in the *USP* and *PG*, but both these Pharmacopœias give an Acid and Ester value. According to the *USP* the amount of Potassium Hydroxide required to neutralise the acidity should be not less than 11.14 p.c. nor more than 16.72 p.c. corresponding to an Acid value of 111.4 to 167.2. The *PG* requires not less than 11.23 p.c. nor more than 16.84 p.c. corresponding to an Acid value of 112.3 to 168.4. The amount of Potassium Hydroxide required by the *USP* to saponify the Esters should be not less than 15.32 p.c. nor more than 18.95 p.c. corresponding to a Saponification value of 153.2 to 189.5. That required by the *PG* is not less than 15.44 p.c. nor more than 19.09 p.c., corresponding to a Saponification value of 154.4 to 190.9.

The more generally occurring impurities are Resin and Copaiba. The *BP* relies solely on the sufficient proportion of Benzoates and Cinnamates as indicated by the Carbon Bisulphide residue and its Saponification figure, the *PG* on the Acid and Saponification value, whilst the *USP* gives in addition confirmatory qualitative tests with Sulphuric Acid on a solution in Glacial Acetic Acid of residue obtained on evaporating a Carbon Bisulphide solution of the Balsam, and the non-production of a green coloration when a 1 in 8 solution of the Balsam in Benzine is shaken with an equal volume of a 1 in 1000 aqueous Copper Acetate solution.

The following test has been suggested by Dieterich for the detection of Colophony.—A weighed quantity of 0.5 gramme of the balsam is mixed with 5 c.c. of Water, and 5 c.c. of Sodium Hydroxide Solution (15 p.c. w/w), the mixture is shaken with 10 c.c. of Ether, separated, acidified, and again shaken with Ether. A measured portion of the ethereal solution is introduced into a test-tube, the tube inclined and 1 c.c. of concentrated Sulphuric Acid allowed to flow in, again brought into a vertical position, and after a short time again inclined, and 2 c.c. of Hydrochloric Acid allowed to flow in. It should produce a red zone between the Hydrochloric Acid and the Ether, and a deep red zone between the Sulphuric Acid and the Hydrochloric Acid. A weighed quantity of 1 gramme of the balsam dissolved in 5 c.c. of Glacial Acetic Acid and 2 drops of Sulphuric Acid dropped into the solution, previously heated to boiling, should produce a bluish-violet or bluish-green colour.

Carbon Bisulphide, Glacial Acetic, and Sulphuric Acids.—If 0.5 gramme of the Balsam be shaken with 25 c.c. of Carbon Bisulphide, allowed to stand for 30 minutes, filtered, and the filtrate evaporated to dryness, a residue is

obtained which when dissolved in Glacial Acetic Acid should not yield a green colour on the addition of a few drops of Sulphuric Acid, *U S P*

Benzin and Copper Acetate—If 1 gramme of the Balsam be agitated with 8 c.c. Petroleum Benzin for 5 minutes, the supernatant liquid should not be coloured green when shaken with an equal volume of a 1 in 1000 solution of Copper Acetate, indicating the absence of Resin and Copaiba, *U S P*

Acid Value—If 1 gramme of the Balsam be dissolved in 50 c.c. of Alcohol and 10 drops (1 c.c. *U S P*) of Potassium Permanganate Solution be added, then the addition of not less than 4 c.c. and not more than 6 c.c. of Semi-normal Volumetric Alcoholic Solution of Potassium Hydroxide should be required to produce a red colour, indicating the limit of acidity, *P G* and *U S P*

Saponification Value—If this liquid be mixed with more Semi-normal Alcoholic Solution of Potassium Hydroxide until the total amount used is 20 c.c., and the mixture heated on a water-bath for half an hour and allowed to cool, then on titrating with Semi-normal Volumetric Solution of Hydrochloric Acid (Semi-normal Volumetric Solution of Sulphuric Acid, *U S P*) the liquid should require not less than 13.2 and not more than 14.5 c.c. of the Acid Solution to neutralise the excess of Potassium Hydroxide Solution, *P G* and *U S P*.

Preparations.

SYRUPUS TOLUTANUS. SYRUP OF BALSAM OF TOLU

FR., SIROP DE BAUME DE TOLU, GER., TOLUBALSAMSIROP, ITAL., SCIROPO DI BALSAMO DEL TOLU, SPAN., JARABE DE BALSAMO DE TOLU

Balsam of Tolu, 1½, is boiled with 20 of Distilled Water to produce 16 of liquid, in which (after filtration) are dissolved 32 of Sugar. When finished it should weigh 48

A better flavoured Syrup may be made as follows—Balsam of Tolu, 1½, Sugar, 8 Powder the Tolu with the Sugar, macerate in Water 16, for 24 hours, with frequent agitation, filter bright, and dissolve in it (cold) Sugar 24

In a paper read before the British Pharmaceutical Conference (*P J*, '99, ii 103, 116, *C D* '99, ii 212, 228) the superiority of a Syrup made on the above lines has been clearly demonstrated. Six Syrups were prepared, the two samples of genuine Balsam used being previously submitted to careful examination. The Syrup prepared by the *Companion* process ranked first, having the best flavour and containing 1.12 parts of Cinnamic Acid out of 3.33 contained in the Balsam used. The *B P* Syrup ranked last, containing in summer 1.00, and in winter 0.60 parts of Cinnamic Acid

Syrupus Tolutanus (*U S*)—Tincture of Tolu, 5, is triturated with Magnesium Carbonate, 1, and Sugar, 6, gradually adding Water 45, filtering, dissolving Sugar 76 in the liquor with aid of gentle heat, straining while hot and adding sufficient Water to make 100

Dose—½ to 1 fl. drm. = 1.8 to 3.6 c.c.

Liquor Tolutanus pro Syrup.—Balsam of Tolu 4, dissolved in 12 of Alcohol (90 p.c.) and added to 26 of Water previously heated to 70° C. and placed in a bottle, shaken vigorously, then set aside for 24 hours, filter bright. To make Syrup of Tolu mix 1 of the solution with 7 times its volume of simple syrup—(*Farr and Wright*) *Y B P* 1899, 366

This has been incorporated in the *B P C*.

Foreign Pharmacopœias—Official in Belg., Fr., Ital., Norw., Port., Span.; Swed., Swiss and U.S., Mex. made with Tincture. Not in the others

Belg. and Fr. have Tablets of Balsam of Tolu.

TINCTURA TOLUTANA. TINCTURE OF BALSAM OF TOLU.

1 of Balsam of Tolu, macerated with Alcohol (90 p.c.) 95 to yield 10.
(1 in 10)

Dose — $\frac{1}{2}$ to 1 fl drm = 1·8 to 3·6 c c

Foreign Pharmacopœias —Official in Belg, Dan, Fr, Swed and U S,
1 in 5, Port, 8 in 20 All by weight, except U S Not in the others

Tests —Tincture of Tolu has a sp gr of 0·860 to 0·865, it contains from 8 to 10 p c w/v of total solids and about 80 p c of Absolute Alcohol by volume

Not Official

BAPTISIN

A powdered extract obtained from *Baptisia tinctoria*, R. Di In small doses, laxative, in large doses, purgative and emetic

Dose —1 to 5 grains = 0·06 to 0·32 gramme Usually given in pill

Not Official

BARI SULPHIDUM

It is somewhat difficult to obtain in a pure condition, and commercial samples as a rule do not contain more than 50 p c BaS

Medicinal Properties —The chief use of this is as a depilatory, for which purpose it is unequalled, removing hair with less injury to the skin than any other application

Test —For the estimation of BaS 1 Make a standard Zinc Solution by dissolving 7·7 grammes of Zinc in about 75 c c of Diluted Hydrochloric Acid, adding excess of Ammonia Solution and diluting to 1000 c c, 2 Make an alkaline Lead Solution by dissolving 1 gramme Lead Acetate in about 20 c c of hot Solution of Potassium Hydroxide and diluting to 100 c c, 3 Heat to boiling 1 gramme of Barium Sulphide in about 50 c c of Water and titrate with the standard Zinc Solution till no black or brown colour is obtained by adding a drop of the filtered Barium Solution to a drop of the Lead indicator, spotted on a porcelain slab Each c c of the Zinc Solution used is equivalent to 2 per cent of Barium Sulphide in the sample operated upon

Preparation

DEPILATORY —Barium Sulphide (containing 70 p c BaS, or an equivalent quantity of any other strength), in fine powder, 2, Starch, 5, Orris Root, in powder, 1 Mix

For use make it into a thin paste with Water, apply to the part from which the hair is to be removed, after five minutes scrape off with a blunt knife

Not Official

BARI CHLORIDUM

BaCl₂, eq, 206·78

Colourless crystalline plates

Solubility —1 in 2½ of Water

Medicinal Properties —Occasionally given in syphilis, scrofula, and as a cardiac tonic, but requires care on account of its toxic properties

Dose — $\frac{1}{2}$ to 2 grains = 0·016 to 0·13 gramme

Toxic effects occur only with large doses —J. '03, i 1194

Stated (B M J E. '05, i 24) to have no cumulative effect in ordinary doses, does not disturb the digestion or irritate the kidneys Usual adult dose, 3 grains = 0·2 gramme, 3 or 4 times daily in Water.

Foreign Pharmacopœias—Official in Ger, Mex. and Swiss. Not in the others

Tests—An aqueous solution yields with diluted Sulphuric Acid Solution or an aqueous solution of a soluble Sulphate, a heavy white precipitate insoluble in concentrated Hydrochloric Acid and in strong Nitric Acid, with Potassium Bichromate Solution it yields a yellow precipitate soluble in diluted mineral acid. With Silver Nitrate Solution it yields a white curdy precipitate insoluble in Nitric Acid, soluble in Ammonia Solution, and in Potassium Cyanide Solution. It should yield no coloration or precipitate when acidified with Hydrochloric Acid and tested with Hydrogen Sulphide Solution. The P.G. includes a test for Iron, 20 c.c. of a 1 in 20 aqueous solution shall not be coloured blue by 0.5 c.c. of Potassium Ferrocyanide Solution (5 p.c.) No residue shall remain after complete evaporation of the Barium by Sulphuric Acid, evaporation of the filtrate and ignition at a low red heat

Not Official

BEBEERINÆ SULPHAS

Dark-brown thin translucent scales, yellow when in powder, with a strong bitter taste. A preparation made from *Nectandra* or *Bebeeru* Bark (*Nectandra Roduei*, Schomb.), containing about 60 p.c. of alkaloids, one half being **Bebeerine** (Beberine), $C_{17}H_{21}NO_3$, eq. 308.87. It was official from 1861 till 1898.

Solubility—Sparingly in Alcohol (90 p.c.), dissolves about 1 in 1 of Water, and the solution can be diluted up to 1 and 8 of Water, but on further dilution it precipitates until about 80 or 100 parts of Water have been added, but samples vary in this respect, readily soluble in Water containing a mineral Acid.

Medicinal Properties—Aromatic bitter, stomachic tonic, an imperfect substitute for Quinine.

Dose.—1 to 5 grains = 0.06 to 0.32 gramme.

Prescribing Notes—*Given in solution, or in pills made with 'Dispensing Syrup.'*

The following pure products are commercial. **Bebeerine** pure, slightly soluble in Water, readily in Alcohol, Chloroform and Ether, **Bebeerine Hydrochloride** and **Bebeerine Sulphate**, are both readily soluble in Water and Alcohol. Dose of the two latter 1 to 2 grains = 0.06 to 0.13 gramme.

Not Official

BELÆ FRUCTUS.

Bael Fruit is obtained from *Ægle Marmelos*, Correa.

The dried half-ripe Fruit was formerly official, but is now omitted.

The fresh half-ripe Fruit is now official in the *Ind* and *Col. Add.* for use in India and the Eastern Colonies, as is also the Liquid Extract.

Medicinal Properties—The Fresh Fruit has been much extolled in India for diarrhoea and dysentery, and the Confection prepared in Britain appears to have similar properties. The Dried Fruit is not considered a trustworthy remedy.

If the fresh fruit is not obtainable, the official preparation **Extract Belæ** Liquid answers well in the treatment of dysentery. Generally speaking, Milk is the best vehicle for Bael Fruit and pulp.—*I.M.G.* '05, ii 264.

CONFECTIO BELÆ RECENTIS (*Synure*)—Prepared from Fresh Fruit, imported from India in the Spring months. It retains the odour and flavour of the Fresh Fruit.

Dose—A teaspoonful.

EXTRACTUM BELÆ LIQUIDUM (*Ind* and *Col. Add.*)—Made by macerating 4 of bruised Bael Fruit in Water by successive treatments, evaporating the mixed fluids to 3, and when cold adding Alcohol (90 p.c.), *q.s.* to make 4.

Dose—1 to 2 fl. drms = 3.6 to 7.2 c.c.

BELLADONNA.

BELLADONNA

FR, BELLADONE, GER, BELLADONNA, ITAL, BELLADONNA, SPAN, BELLADONA

The fresh Leaves and Branches of *Atropa Belladonna*, L, as well as the dried Root, are official

Medicinal Properties—Anodyne, antispasmodic, mydriatic, antilactagogue, anhydrotic, and urinary sedative. There is no drug which can compare with it in checking the secretions of milk, sweat, and saliva. It is given for epilepsy, and is one of the best remedies for whooping-cough and for painful spasm of the bladder, in renal colic, dysmenorrhœa and typhlitis, in full and frequent doses for asthma, both as a prophylactic and curative. It is of the utmost value in relieving cardiac pain and distress, palpitation and aortic regurgitation. Useful in typhoid with contracted pupil, and in acute bronchitis it stops profuse secretion. In large or continued doses it causes dilatation of the pupil and dryness of the mouth and throat. For habitual constipation $\frac{1}{4}$ to $\frac{1}{2}$ grain of Extract on rising in the morning. For nocturnal incontinence of urine, 5 to 10 minims of the Tincture, with the same dose of Tinct of Perchloride of Iron three times a day. Ringer recommends larger doses of Belladonna for this troublesome complaint in children, 10 to 30 minims of the Tincture three times a day, small doses often fail when large doses at once succeed. Useful in loss of tone and irritable state of the generative organs which gives rise to nocturnal emissions, although it has slightly aphrodisiacal properties.

For external uses, see Prescribing Notes.

In the treatment of epilepsy (L '05, i 710) it is a remedy which should be tried in all cases in which the Bromides have failed. Every now and again cases will be met with in which this drug produces remarkable and persistent arrest of seizures.

Cases of poisoning (L '05, i 714) by application of Belladonna plaster 8 x 5 applied to the loins for the relief of lumbago—Recovery. Ointment of 4 grains Atropine Sulphate in the oz applied for chronic eczema of the nates causes toxic symptoms—Recovery.

Poisoning by liniment, recovery after use of Strychnine—B M J '07, ii 1515.

Prescribing Notes—The Extract in pills, also the Tincture and Succus are for internal use. The Suppository is used in prostatitis, cystitis and chordee. Bougies made with Gelatin base or Oil of Thiodon contain $\frac{1}{4}$ to 2 grains of Alcoholic Extract of Belladonna. Externally the Liniment and Compound Liniment sprinkled on impermeable Plumb are very useful in pleurodynia, lumbago and muscular rheumatism, as is also the Chloroform preparation alone or mixed with oil. The Glycerinum as a paint, and the Emplastrum, are used for sprains, acute synovitis, and to check mammary secretion and prevent inflammation of the breast, both are also an excellent remedy in cardiac pain and palpitation. Extract of Belladonna is a component of many Hospital formulas for pills, and is prescribed with Aloes, Camphor, Quinine, Rhubarb, Valerian and Zinc Oxide, in doses of $\frac{1}{2}$ to $\frac{1}{4}$ grain in each pill. In Eye Lotions 2 grains of the green extract to the fl oz.

Dose.—Will be found under the respective preparations.

Incompatibles.—Caustic Alkalis, Opium, Strychnine.

Official Preparations—*Extractum Belladonnæ Vinide*, and *Succus Belladonnæ*, from the fresh leaves and branches *Extractum Belladonnæ Liquidum*, from the dried root. *Emplastrum Belladonnæ*, *Extractum Belladonnæ Alcoholicum*, *Linimentum Belladonnæ*, *Tinctura Belladonnæ*, and *Unguentum Belladonnæ*, from the **Liquid Extract**, *Suppositoria Belladonnæ*, from the **Alcoholic Extract**. *Atropine*, from leaves or root

Not Official—*Chloroformum Belladonnæ*, *Collodium Belladonnæ*, *Emplastrum Belladonnæ Vinide*, *Extractum Belladonnæ Foliorum*, *Extractum Belladonnæ Exsiccatum*, *Glycerinum Belladonnæ*, *Linimentum Belladonnæ Compositum*, and *Ethereal Tincture of Belladonnæ*

Antidotes.—In cases of poisoning by Belladonna, use stomach-tube or give one of the following emetics: 10 grains of Copper Sulphate, 20 grains of Zinc Sulphate, 1 oz of Ipecacuanha Wine, or hypodermic injection of $\frac{1}{10}$ grain Apomorphine. Give stimulants, inject Pilocarpine, an enema of Coffee. If necessary apply artificial respiration.

BELLADONNÆ FOLIA. BELLADONNA LEAVES.

FR, FEUILLES DE BELLADONNE, GER, BELLADONNABLAUFLER, ITAL, FOGLIE DI BELLADONNA, SPAN, HOJA DE BELLADONA

The fresh Leaves and Branches of *Atropa Belladonna*, L., collected when the plant is in flower

The Leaves are official in the *USP* and *PG*. The *USP* has introduced a process of assay and requires that they shall yield not less than 0.33 p.c. of mydriatic alkaloids when assayed by this process. Neither *BP* nor *PG* fixes a standard for the Leaves

Descriptive Notes—The Pharmacopœia directs that the fresh Leaves and Branches of *Atropa Belladonna* should be collected when the plant is in flower. But the plant often continues to flower long after the fruits are ripe, and consequently the leaves are likely to vary in strength, it would, perhaps, have been better to use the words 'commencing to flower.' The flowering branches are easily recognised by the dull purple bell-shaped flowers, and the ovate entire leaves apparently arranged in pairs, of which one leaf is smaller than the other. The smaller leaf is, however, a bract belonging to the flower, which is placed outside, not in, the axil of the larger leaf. The lower stem leaves are alternate and not in pairs. The leaves vary in size from 3 to 8 inches (7.5 to 20 cm.) in length, and 2 to 3½ inches (5 to 9 cm.) broad and are glabrous or nearly so.

It will be noted that the dried leaves are not official in the *BP* although they are in the *USP* and the *PG*. The dried leaves are usually brownish-green above and paler beneath, and present, especially on the under surface, when seen under a good lens, minute pale dots or prominences caused by cells filled with sandy crystals of Calcium Oxalate, which do not contract in drying. These crystal cells are easily seen under the microscope in a fragment of the leaf cleared by Chloral Hydrate Solution, as well as the striations of the epidermal cells, which are also characteristic. The dried leaves of *Scopolia carniolica*, Jacq., have been offered in commerce when Belladonna leaves were scarce and dear, but they are thinner, darker green, and the small veins are more prominent. The leaves of *Phytolacca decandra*, L., from Bosnia, have also been offered as Belladonna in European commerce. Their upper surface has no hairs, and is of a

lighter green, and contains no crystal sand, but acicular raphides, and the epidermal cells are polygonal, not sinuate as in *Belladonna*.

The *P G* leaves are collected in the flowering season.

The percentage of alkaloid varies considerably, a good well dried sample should contain about 0.5 p.c.

Ph. Ger. maximum single dose, 0.2 gramme, maximum daily dose, 0.6 gramme.

Foreign Pharmacopœias—Official in Austri, Belg, Dan, Dutch, Et, Ger, Ital, Jap, Mex, Norw, Russ, Span, Swed, Swiss and U.S., Leaves, Port, Herb. Not in Hung.

The *Brussels Conference* (1906) uses only the leaf, dried, powdered drug to be used entire.

Tests—No standard for *Belladonna Leaves* is given in either *B.P.* or *P.G.*, the *U.S.P.* states that they should yield not less than 0.33 p.c. of mydriatic alkaloids when assayed by the *U.S.P.* process. The *U.S.P.* method of standardisation is as follows—A weighed quantity of 10 grammes of the leaves in No. 60 powder is allowed to stand for ten minutes in an Erlenmeyer flask with 50 c.c. of a mixture containing 4 parts by volume of Ether and 1 part by volume of Chloroform. A mixture of 2 c.c. of Ammonia Water with 3 c.c. of Water is added and the whole shaken at frequent intervals for one hour. The contents of the flask are then transferred, as far as possible, to a small percolator inserted in a separator containing 6 c.c. of Normal Volumetric Sulphuric Acid Solution diluted with 20 c.c. of Water. After the liquid has passed through, the leaves are packed in the separator, the flask washed first with 10 c.c. and then with several portions of 5 c.c. of the Chloroform-Ether mixture, and these with the remaining contents of the flask transferred to the percolator, the percolation being continued with the Chloroform Ether mixture until 50 c.c. has been used. The separator is now securely stoppered, agitated for one minute, the fluids allowed to separate clear, and the acid aqueous solution removed to a second separator. A further quantity of 10 c.c. of a mixture of Normal Volumetric Sulphuric Acid Solution of the same strength as that previously used is added, the contents well shaken, allowed to separate and the acid aqueous portion again drawn off into the second separator, and this operation is repeated. To the mixed acid liquids in the second separator is added a small piece of red Litmus paper and sufficient Ammonia Water to render the fluid distinctly alkaline, the mixture being then shaken with two successive quantities of 15 c.c. and one of 5 c.c. of Chloroform. The Chloroform solutions are separated, collected, and evaporated in a beaker, the residue dissolved in 3 c.c. of Ether and the Ether allowed to evaporate. The residue is dissolved in 3 c.c. of Tenth-normal Volumetric Sulphuric Acid Solution, 5 drops of Cochineal Test Solution added and the excess of Acid titrated with Fiftieth-normal Volumetric Potassium Hydroxide Solution. The number of c.c. of Fiftieth-normal Volumetric Potassium Hydroxide Solution required is divided by 5, the quotient subtracted from 3 and the product multiplied by 0.0287 and again multiplied by 10, giving the percentage of total mydriatic alkaloids in the leaves.

EXTRACTUM BELLADONNÆ VIRIDE. GREEN EXTRACT OF BELLADONNA.

Heat the expressed Juice of the Fresh Leaves and Young Branches to 54·4° C (130° F), and collect on a filter the green colouring matter which separates, heat the filtrate to 93·3° C (200° F) and filter. Evaporate the clear liquid to an Extract, returning the green colouring matter towards the end of the process and completing the operation at 60° C (140° F)

100 lb of Herb yielded 56 lb of Juice, or nearly 4 lb Extract

100 lb Leaves, when dried, weighed 16 lb

An estimation of the alkaloids contained in four samples of Extract of Belladonna, prepared in 1885 by different makers, gave 0·94 p.c., 1·17 p.c., 1·11 p.c., and 0·73 p.c. The following samples in good condition were examined at the same time 1880—1·26 p.c., 1·22 p.c., 1881—1·16 p.c., 1·21 p.c., 1884—1·21 p.c.

A sample of 1892 Extract yielded 1·7 p.c. of alkaloids

An average sample of Extract contains rather over 1 p.c. of alkaloids

Dose.— $\frac{1}{4}$ to 1 grain = 0·016 to 0·06 gramme.

Ph. Ger. maximum single dose, 0·05 gramme, maximum daily dose, 0·15 gramme

Foreign Pharmacopœias—Official in Austr., Belg. and Mex., Alcoholic from the leaves, Mex. has also Alcoholic extract from the root, and a Fluid Extract 1 in 1. Dan., made from leaves with weak Spirit, Dutch, Alcoholic from leaves, Fr., Alcoholic from leaves and seeds, Ger., made with Water and Spirit from leaves, Hung. and Ital., Alcoholic from root, Norw. and Swed. Alcoholic from leaves, Port., aqueous from dried leaves, Alcoholic from fresh herb and Alcoholic extract purified by Alcohol, Russ., made from leaves with Water and Spirit, Span., aqueous from fresh leaves, also Alcoholic from dried leaves, U.S.—an Alcoholic extract from the powder of the leaf, also Fluid Extract of the root

Extractum Belladonnæ Foliorum (U.S.)—To be prepared with a mixture of Alcohol (95 p.c.) 2, and Water 1, and adjusted with powdered Sugar of Milk to contain 1·4

Extractum Belladonnæ Exsiccatum—Syn. **Extractum Belladonnæ Folii Exsiccatum**. Belladonna Leaves (as per test with Alcohol (70 p.c.) and adjusted with Powdered Belladonna Leaves so as to finally form a powder containing 1 p.c. of alkaloids—*B.P.C.*

The *Brussels Conference* (1906) prepares a solid extract (containing about 10 p.c. of Water) by means of Alcohol (70 p.c.)

The Belg., Dan., Fr. and Swiss Ph. adopt this standard

Tests.—Green Extract of Belladonna, *B.P.*, is not a standardised preparation. The official alcoholic Extract is made from the standardised Fluid Extract, and is required to contain 1 p.c. of the alkaloids of Belladonna Root. The method of procedure adopted by the *U.S.P.* for the standardisation of the Extract from the leaves is as follows—A weighed quantity of 5 grammes of the Extract is dissolved in a mixture of 5 c.c. of Alcohol (94·9 p.c.), 10 c.c. of Water, 2 c.c. of Ammonia Water, and 20 c.c. of Chloroform, and transferred to a separator, using a little Alcohol (94·9 p.c.) to wash out the vessel in which the Extract was dissolved. After the contents of the separator have been well shaken for half a minute they are allowed to separate, the chloroformic solution is removed to another separator, and the contents of the first separator are shaken with another 10 c.c. of Chloroform. After a similar period of shaking and allowing the

liquids to separate, the chloroformic solution is transferred to the second separator. This process is repeated with a further quantity of 10 c c of Chloroform. The alkaloids are then extracted from the mixed chloroformic solutions by shaking for half a minute with 5 c c of Normal Volumetric Sulphuric Acid Solution and 10 c c of Water. The chloroformic layer is removed and again shaken for half a minute with 1 c c of Normal Volumetric Sulphuric Acid Solution and 10 c c of Water, the liquids allowed to separate, and the chloroformic layer removed and rejected. The mixed acid aqueous solutions are filtered through a plug of Cotton wool, the vessels in which they were contained being washed with about 10 c c of Water. After the addition of 15 c c of Chloroform and sufficient Ammonia Water to produce a distinctly alkaline reaction, the contents of the separator are shaken for half a minute, allowed to separate, and the chloroformic layer is drawn off into a beaker. The shakings are repeated, using two separate portions each of 10 c c of Chloroform, the mixed chloroformic liquids are evaporated to dryness, the residue is dissolved in 3 c c of Ether and again evaporated. It is now dissolved in 5 c c of Deci-normal Volumetric Sulphuric Acid Solution, 5 drops of Cocineal or Iodeosin Test-solution added, and the excess of Sulphuric Acid is titrated back with Fiftieth-normal Volumetric Potassium Hydroxide Solution. The number of c c of Fiftieth-normal Volumetric Potassium Hydroxide Solution used is divided by 5, and the quotient is subtracted from 5, the remainder is multiplied first by 0.0287 and then by 20, which gives the percentage of mydriatic alkaloids.

The process of the *P G* is as follows —A weighed quantity of 2 grammes of the Extract is dissolved in 5 grammes of Water and 5 grammes of Absolute Alcohol. 50 grammes of Ether and 20 grammes of Chloroform are added to the solution, and after brisk agitation 10 c c of a 1 in 3 Sodium Carbonate Solution. After the mixture has been allowed to stand for one hour, with frequent intervals of brisk shaking, 50 c c of the clear Chloroform-Ether solution is filtered through a dry, well-covered filter into a flask, and one-half distilled. The remaining Chloroform-Ether solution is transferred to a separator, the flask being washed out with three separate quantities each of 5 c c Ether, and the mixed fluids thoroughly shaken with 20 c c of Hundredth-normal Volumetric Hydrochloric Acid Solution. When the liquids have completely cleared, and after the addition of sufficient Ether to cause the Chloroform-Ether solution to float on the surface of the acid fluid, the latter is filtered through a small filter paper moistened with Water into a flask of white glass holding about 200 c c. The Chloroform-Ether solution is shaken with three successive quantities each of 10 c c of Water, these being passed through the same filter, the filter washed with Water, and the filtrate and washings diluted to about 100 c c. Sufficient Ether to form a layer of 1 cm is added, 5 drops of a 1 in 500 alcoholic Iodeosin solution, and Hundredth-normal Volumetric Potassium Hydroxide Solution until the lower aqueous layer acquires a pale reddish coloration, the liquids being vigorously shaken after each addition. Not more than 13.0 c c of Hundredth normal Volumetric Potassium

Hydroxide Solution should be required. The number of c.c. of Hundredth-normal Volumetric Potassium Hydroxide Solution required, subtracted from 20, multiplied first by 0.0028927, then by 100, and divided by 1.333, will give the percentage by weight of mydriatic alkaloids present in the Extract, which should amount to not less than 1.5 p.c.

The quantity chosen for the assay is a somewhat inconvenient one, the instructions given in the process necessitating the employment of 1.333 as a factor in calculating the percentage yield of alkaloid, the point has already been referred to in Meick's Annual Report for the year 1900. A stock of Chloroform-Ether mixture should be employed instead of a freshly-prepared mixture of Chloroform and Ether, an appreciable rise of temperature ensuing when the liquids are mixed in the indicated proportions. Great attention to the cleanliness of all the vessels employed is also necessary in dealing with Hundredth-normal Volumetric Solutions.

SUCCUS BELLADONNÆ. JUICE OF BELLADONNA

Add 1 of Alcohol (90 p.c.) to 3 of the expressed Juice from the Fresh Leaves and Young Branches.

Dose.—5 to 15 minims = 0.3 to 0.9 c.c.

Belladonna Juice, which would yield an Extract containing 1 p.c. of alkaloid, would form a Succus of about 0.05 p.c., which is also the strength of the Tincture.

BELLADONNÆ RADIX. BELLADONNA ROOT

FR., RACINE DE BELLADONNE, GER., BELLADONNAWURZEL, ITAL., RADICE DI BELLADONNA, SPAN., RAIZ DE BELLADONA

The Root of *Atropa Belladonna*, collected in the autumn and dried.

A good parcel of Roots should average 0.5 p.c. of alkaloid, but occasional bales are found averaging 0.7 to 0.8 p.c.

Foreign Pharmacopœias. Official in Austr., Hung., Ital., Mex., Port., Span., Swiss, Belg., Dan., Dutch, Fr., Ger., Jap., Norw., Russ. or Swed.

Descriptive Notes.—The Belladonna root of commerce is either of English or European origin. That prepared in this country is usually derived from the cultivated plant, the roots of which are dug up every third and fourth year after having furnished Belladonna leaves during that period. It varies in quality, some samples consisting largely of the woody rootstock or underground stem crowning the roots, distinguished by its radiate woody zone, and by being more or less hollow, others consist almost entirely of the true root with occasionally pieces of the horizontal underground stems or suckers which show traces of leaf scars and buds at intervals. The true root, which is the official part, is cylindrical, it may vary considerably in size, but those of medium thickness are to be preferred. It is stated officially to be $\frac{1}{2}$ to $\frac{3}{4}$ in (9 to 19 mm.) in diameter and 6 to 12 in (15 to 30 cm.) or more in length. Vogl gives it as about 10 cm. long, and 1 to 2 cm. thick. Hanbury and Flückiger recommend roots which

are not thicker than the finger. It is of a pale brownish colour with occasional short transverse scars and is finely wrinkled longitudinally, and the surface is easily abraded with the finger nail showing the white starchy tissues beneath. The central portion, clearly defined by the darker cambium ring, is not radiate in structure, but the vascular bundles and vessels are small and scattered irregularly, although more numerous near the cambium. Under the microscope the scattered parenchymatous cells, filled with sandy crystals of Calcium Oxalate, and the starch grains usually in groups of 2 to 3, but rounded when free, form distinctive characters. The root is sometimes met with of darker colour internally and harder, due to slight charring during drying. From Germany it is sometimes imported in carefully dried thin longitudinal slices, so that the official characteristics are not easily seen, and dependence must then be placed on the presence of the sandy raphides, and the form and size of the starch granules. The *U S P* test of a 0.5 percentage of mydriatic alkaloids is not given in the *B P* but would be useful, especially for the sliced root.

The 'root' of *Scopolia Japonica*, Max, sometimes offered as Japanese Belladonna and that of *S. Carniolica*, Jacq, are both characterised by being prostrate rhizomes with numerous closely placed circular stem scars on the upper surface. The true roots, of which there are usually few present, are smaller than Belladonna root and only 2 to 4 inches (5 to 10 cm) long and tapering, and the epidermis is not easily abraded by the nail. Recently Belladonna root imported from Austria has been found to be largely adulterated with the root of *Phytolacca decandra*, L, which though similar in colour is easily recognised by the concentric rings of woody tissue. It is a dangerous adulterant, as it is irritant, acrid and emetic.

Tests—The *B P* does not include a process for the assay of Belladonna Root. The *U S P* gives a process for the determination and requires that it shall yield not less than 0.45 p.c. of mydriatic alkaloids, with the exception that 10 grammes of the root in No. 60 powder are used in the place of 10 grammes of the Leaves, the process is essentially that described under Belladonna Leaves.

The root is not official in the *P G*, but the greater part of the root used in this country comes from Germany.

EMPLASTRUM BELLADONNÆ BELLADONNA PLASTER

4 of Liquid Extract of Belladonna evaporated to 1 and mixed with 5 of Resin Plaster

Contains 0.5 p.c. of alkaloids

This Plaster can be obtained spread on calico, linen, or leather, it is also supplied in rubber combination, spread on felt or kid, plain or porous.

Foreign Pharmacopœias—Official in *F 1*, Extract 1 in 4, *Max*, Belladonna Leaves 20, Alcohol (90 p.c.) 10, *Ammonia* 1, Yellow Wax 80, Turpentine 25, Colophony 25, *Port*, Alcoholic Extract 1, Lead Plaster 9, *Span*, Extract about 1 in 5, *Swiss*, Belladonna extract 1, *Elemi* 1, Colophony 2, Adhesive Plaster 6, *U S*, Extract of Leaves 1, Adhesive Plaster 2½, *Mex*, from the leaves with Alcohol. Not in the others.

EMPLASTRUM BELLADONNÆ (U S)—Standardised Alcoholic Extract of Belladonna Leaves 3, Adhesive Plaster 7. Contains not less than 0.38 p.c. nor more than 0.42 p.c. of mydriatic alkaloids.

EMPLASTRUM BELLADONNÆ VIRIDE (B P C)—Green Extract of Belladonna 1, treated with 4 of Alcohol (90 p.c.), evaporation of the Alcohol, and admixture of the residue with Resin Plaster *q s* to make 4.

It is not standardised and even when made from herb of good quality will only be about half the strength of the official plaster.

Tests.—The Emplastrum Belladonnæ of the *B P* is prepared with the official standardised Fluid Extract of Belladonna, and is officially stated to contain 0.5 p.c. of the alkaloids of the root. The figure is arrived at by calculation, but no process is given by which the presence of the requisite amount of alkaloids may be ensured. One or two processes have been recommended (*P J* '99, ii 110, 114, 180, *C D* '99, ii 214, 227, 331). One of the best and most generally employed is that suggested by Bnd (*P J* '99, ii 146, *Analyst* '99, 175), which is based upon the disintegration of the plaster by Chloroform and Acetic Acid, the removal of the Lead as an insoluble Sulphate, the extraction of the impure alkaloids from the filtered aqueous acid liquid by treatment with Ammonia Solution and Chloroform and then final purification as in the *B P* process for Extractum Belladonnæ Liquidum.

The details of the process are as follows.—A weighed quantity of 15 grammes of the Plaster is gently warmed with 35 c.c. of Chloroform and 5 c.c. of Glacial Acetic Acid until dissolved, and after the addition of a mixture of 35 c.c. of a 1 in 12 dilute Sulphuric Acid Solution and 40 c.c. of Water is again gently warmed and filtered under pressure through a Buchner's filter. The cake of insoluble Lead Sulphate is disintegrated, warmed with a mixture of 10 c.c. of Chloroform, 5 c.c. of dilute Sulphuric Acid, and 10 c.c. of Water, and again filtered. The mixed filtrates are transferred to a separator, the chloroformic layer is removed and washed with two successive quantities of a mixture of 1 c.c. of dilute Sulphuric Acid and 4 c.c. of hot Water, the washings being returned to the aqueous portion. A measured quantity of 20 c.c. of Chloroform and a decided excess of Ammonia Solution are added to the mixed acid aqueous solutions, the mixture gently warmed and agitated. The chloroformic solution is drawn off, and to ensure the complete extraction of the alkaloids the agitation is twice repeated with 10 c.c. of Chloroform. The chloroformic solutions are in each instance separated, mixed and shaken with 5 c.c. of a mixture of 1 in 12 dilute Sulphuric Acid Solution and twice its volume of warm Water. When separation is complete the chloroformic layer is removed and again treated with 5 c.c. of the same mixture as above, the chloroformic layer being again removed, the acid aqueous liquids mixed together and washed with Chloroform, using about 3 c.c. Sufficient Ammonia Solution is then added to form a distinct excess, and the liberated alkaloids are then removed from the mixture by shaking three times in succession with 10 c.c. of Chloroform, the mixed chloroformic solutions, after washing with 5 c.c. of Water containing one drop of Ammonia Solution, are evaporated to dryness on a water-bath in a tared basin, and the

residue dried at a temperature below 100°C (212°F) The amount of alkaloid in this residue may then be determined volumetrically by dissolving in 10 c c of Deci-normal Volumetric Hydrochloric Acid Solution and titrating the excess of acid with Centi-normal Volumetric Sodium Hydroxide Solution, using Tincture of Cochineal, Methyl Orange, Hæmatoxylin, or Iodeosin Solution as an indicator of neutrality The number of c c of Centi-normal Volumetric Sodium Hydroxide Solution used, deducted from 100, the remainder multiplied first by 0.00287, then by 20, and divided by 3, will give the percentage by weight of the alkaloids of Belladonna Root present in the Plaster

The process of assay adopted by the *U.S.P.* is essentially as follows.—A weighed quantity of 10 grammes of the Plaster in strips is macerated with a mixture of 50 c c of Chloroform and 3 c c of Ammonia Water, the mixture being stirred until the Plaster is completely removed from the cloth, when the Chloroform is transferred to another vessel, the cloth being washed with a mixture of 25 c c of Chloroform and 1 c c of Ammonia Water, if necessary with a further quantity of 25 c c of Chloroform, the chloroformic solutions in each case being removed and added to the main quantity The cloth is dried at a low temperature, cooled and weighed, its weight being deducted from the original weight of Plaster A measured quantity of Alcohol (94.9 p c) equivalent to four fifths of its volume is added to the mixed chloroformic solution, the liquid is gently stirred and allowed to rest until the rubber separates The supernatant liquid is transferred to a separator and agitated for two minutes with 20 c c of a solution prepared by diluting 40 c c of Normal Volumetric Sulphuric Acid Solution with 60 c c of Water After separation, the chloroformic liquid is drawn off and again shaken for two minutes with 10 c c of an acid solution of the same strength, the separated acid liquid mixed with the main quantity, the treatment with this acid solution continued until the shakings fail to give a reaction with Mayer's reagent (Mercuric Potassium Iodide Test Solution) Sufficient Ammonia Water is added to the mixed aqueous acid liquids to ensure an alkaline reaction, and the liberated alkaloids are removed by shaking with Chloroform, using first 25 c c, then 15 c c, and finally 10 c c The chloroformic solutions are separated, mixed, and the Chloroform evaporated off on a water-bath A slight excess of Deci-normal Volumetric Sulphuric Acid Solution is added to the alkaloidal residue, the actual amount added being carefully noted, 10 drops of Chloroform are added, the liquids rotated, and the Chloroform evaporated by means of a water-bath The excess of acid is titrated with Fiftieth-normal Volumetric Potassium Hydroxide Solution, using Cochineal Test-solution as an indicator of neutrality The number of c c of Fiftieth normal Volumetric Potassium Hydroxide Solution used divided by 5, the quotient subtracted from the number of c c of Deci-normal Volumetric Sulphuric Acid Solution first used, divided by the number of grammes of Plaster separated from the cloth, multiplied first by 0.0287 and then by 100, gives the percentage of mydriatic alkaloids present in the Plaster. The *U.S.P.* requires

that it should contain not less than 0.38 p.c. nor more than 0.42 p.c. by weight of such alkaloids

EXTRACTUM BELLADONNÆ ALCOHOLICUM ALCOHOLIC
EXTRACT OF BELLADONNA

Prepared from the Liquid Extract of Belladonna, and readjusted by means of Milk Sugar, so as to contain 1 p.c. of alkaloids

Dose — $\frac{1}{4}$ to 1 grain = 0.016 to 0.06 gramme

Foreign Pharmacopœias compared under Extractum Vinde

EXTRACTUM BELLADONNÆ LIQUIDUM LIQUID EXTRACT
OF BELLADONNA

A fluid prepared from Belladonna Root in No. 20 powder, with a mixture of 7 volumes of Alcohol (90 p.c.) and 1 volume of Distilled Water, by repercolation, and standardised to contain 0.75 p.c. of alkaloids = $\frac{3}{4}$ grain in 110 minims

A standardised Liquid Extract of Belladonna is official in the *B.P.*, the *U.S.P.* Fluid Extract is prepared with the official standard Belladonna Root in No. 60 powder and contains 0.1 p.c. w/v of mydriatic alkaloids, the *B.P.* from a root which is not standardised, in No. 20 powder. The *P.G.* does not include a fluid extract

Commercial samples of this liquid extract vary enormously in colour and consistence, consequently all preparations made from the liquid extract will also have a tendency to vary in colour, and may necessitate explanations to physicians and patients

Tests.—Liquid Extract of Belladonna has a sp. gr. of from 0.896 to 1.022, and may contain from 6.2 to 26.2 p.c. w/v of total solids and about 70 p.c. w/v of Absolute Alcohol. The *B.P.* process of assay consists in extracting the alkaloids from 10 c.c. of the liquid extract diluted with 5 times its volume of Water, by adding a decided excess of Ammonia Solution, and shaking out with three successive quantities each of 10 c.c. of Chloroform. The chloroformic layers are separated in each instance and the alkaloids are removed from the mixed chloroformic solutions by shaking with a mixture of 5 c.c. of Diluted Sulphuric Acid mixed with twice its volume of warm Water, the operation being repeated to ensure their complete extraction from the Chloroform. The mixed acid liquids are shaken with a small quantity (3 c.c.) of Chloroform, the latter separated and rejected, an excess of Ammonia Solution is added, and the liberated alkaloids are shaken out with two successive quantities each of 10 c.c. of Chloroform. The mixed chloroformic solutions, after being shaken with a little Water (5 c.c.) made faintly alkaline by the addition of one drop of Ammonia Solution, are separated and evaporated, the residue being subsequently weighed after drying at a temperature under 100° C. (212° F.). The actual amount of alkaloid present is then determined volumetrically by dissolving this residue in 10 c.c. of Deci-normal Volumetric Hydrochloric Acid Solution, the excess of acid being determined by titration with Centi-normal Volumetric Sodium Hydroxide Solution, Tincture of Cochineal being used as an indicator of neutrality. 10 c.c. of Deci-normal Volumetric

Hydrochloric Acid Solution being equivalent to 100 c.c. of Centi-normal Volumetric Hydrochloric Acid Solution, if the number of c.c. of Centi-normal Volumetric Sodium Hydroxide Solution required to restore neutrality be deducted from 100 and the product multiplied first by 0.00287 and then by 10, the result will be the weight in grammes of alkaloids present in 100 c.c. of the Fluid Extract. The *B.P.* requires 0.75 p.c. w/v of alkaloids. This process has been subjected to prolonged and severe criticism, and numerous processes have been suggested to fill its place. The obstinate emulsions formed in the very first stages of the process are the worst features. Of the many modifications suggested for the removal of the defects attending the *B.P.* method that of Bird's is probably the most generally used. It is rapid in execution, is free from emulsification, it extracts practically the whole of the alkaloids in a pure condition from any sample of fluid extract, and the results are about from 5 to 6 p.c. higher than by the *B.P.* process. A measured quantity of 10 c.c. is mixed with 2 c.c. strong Ammonia Solution and shaken vigorously with 16 c.c. of a mixture of 3 volumes of Amylic Alcohol, 1 volume of Chloroform and 4 volumes of Ether. The ethereal layer is separated, washed in a second separator with 4 c.c. of Water, added in two portions. The washings are returned to the first separator and the mixed fluids again shaken with 8 c.c. of the Amylic-chloroform ether mixture. The ethereal layer is transferred to the second separator and again washed with 1 c.c. of Water, separated and returned to the first separator. It is extracted a third and a fourth time with 7 c.c. of the above-mentioned mixture and washed in the second separator with 1 c.c. of Water. The mixed ethereal liquids are now extracted four times, first with a mixture of 4 c.c. of Normal Volumetric Sulphuric Acid Solution and 6 c.c. of Water, and then three times in succession with 3 c.c. of Water. Sufficient Ammonia Solution is added to the mixed acid liquids to render them distinctly alkaline in reaction, and they are shaken out four times with Chloroform, using first 10 c.c. and then three successive quantities of 5 c.c. The mixed chloroformic solutions are evaporated on a water-bath at a temperature below 100° C (212° F) to a constant weight, and titrated in the usual manner. Bird has pointed out (*P.J.* [4] 8, 432) that Methyl Orange Solution gives good results as an indicator of neutrality for Belladonna alkaloids. He states that the difference between the results by weight and titration should not exceed 3 or 4 p.c.

The method adopted by the *U.S.P.* is essentially as follows — A measured quantity of 10 c.c. of the fluid extract is diluted with an equal volume of Water and shaken with 20 c.c. of Chloroform and 2 c.c. of Ammonia Solution. The chloroformic layer is removed to a second separator, the treatment being continued with two portions each of 10 c.c. of Chloroform. The mixed chloroformic solutions are now shaken for one minute with 8 c.c. of Normal Volumetric Sulphuric Acid Solution and 20 c.c. of Water. The chloroformic layer is removed and rejected, the aqueous acid liquid is filtered into a clean separator, the first separator and filter being washed with 10 c.c. of Water and

the washings added to the main quantity. After the addition of 4 c c of Armonia solution the latter is well shaken with 20 c c of Chloroform, the chloroformic layer is separated and the extraction repeated with two separate portions of 10 c c of Chloroform. The mixed chloroformic solutions are evaporated on a water-bath and the residue heated till perfectly dry. The residue is then dissolved in 5 c c of Tenth-normal Volumetric Sulphuric Acid Solution, and the excess of acid titrated with Fiftieth-normal Volumetric Potassium Hydroxide Solution, 5 drops of Cochineal or of Iodeosin Test-solution being employed as an indicator of neutrality. If the number of c.c. of Fiftieth-normal Volumetric Potassium Hydroxide Solution required to neutralise the excess of acid be divided by 5, the quotient subtracted from 5, and then multiplied by 0.0287 and by 10, the product will be the weight in grams of mydriatic alkaloids contained in 100 c c of the Fluid Extract. The opening stages of the *USP* process are very similar to those of the *BP*, and it has been remarked (*P.J.* '07, 1, 393) that it is rather surprising that, after the somewhat harsh criticism to which the process of the *BP* has been subjected, the revisers of the *USP* should adopt a similar one, but on the whole comparatively little difficulty was experienced with the *USP* process, and subsequent experience has shown that if carried out to the letter sharp separations will be obtained. It must not, however, be too hastily assumed that the process is faultless and it is finally concluded that Bud's modification of the *BP* process is more suited to the requirements of pharmacists.

In the author's laboratory the *USP* process has given satisfactory results and is certainly considered preferable to the *BP* process. No emulsification occurred in the earlier stages of the process, the extracted alkaloid was of good appearance and free from dark colour. A note specifically instructed to do so in the *USP* monograph, and these were in nearly all cases weighed when constant, and the difference between the gravimetric and the volumetric estimations never amounted to more than from 3 to 4 p c.

LINIMENTUM BELLADONNÆ. LINIMENT OF BELLADONNA.

Liquid Extract of Belladonna, 10, Camphor, 1, Distilled Water, 2, Alcohol (90 p c), *q.s.* to yield 20

Prescribing Notes—*Prescribed with equal parts of Soap Liniment or Compound Camphor Liniment. Does not mix readily with fixed Oils. When an oily liniment is required is better to order the Chloroform of Belladonna mixed with Olive or Almond Oil.*

Foreign Pharmacopœias—Official in U.S., Camphor 1, Fluid Extract of Belladonna to make 20, Mex. (Acete de Belladonna), Dried Leaves 1, Sesame Oil 10. Not in the others.

SUPPOSITORIA BELLADONNÆ. BELLADONNA SUPPOSITORIES

Made with alcoholic Extract of Belladonna and Oil of Theobroma. Each Suppository contains $1\frac{1}{2}$ grain of Extract, = about $\frac{1}{2}$ grain of alkaloid.

TINCTURA BELLADONNÆ. TINCTURE OF BELLADONNA

1 of Liquid Extract of Belladonna diluted with Alcohol (60 p c) to yield 15

Dose—5 to 15 minims = 0.3 to 0.9 c c

Foreign Pharmacopœias—Official in Austr, Belg, Dutch, Fr, Span, Swiss and U S, 1 in 10, Ital, Mex and Port, 1 in 5, Russ, 1 in 12 Port, also 1 in 1, from leaves. All by weight except U S. Not in the others.

The Brussels Conference (1906) adopts a strength of 10 p c, and prepares it by percolation with Alcohol (70 p c). The Belg, Fr and Swiss Ph adopt this standard.

Tests—Tincture of Belladonna, *BP*, is prepared from the standardised Fluid Extract and is officially required to yield not less than 0.048 p c nor more than 0.052 p c w/v of alkaloid. The word 'alkaloid' is presumably intended to read 'alkaloids'. The Fluid Extract from which it is prepared is officially required to yield a fixed percentage of alkaloids. A measured quantity of 100 c c is employed in the process of assay. The Alcohol is removed by evaporating to a low bulk and the resultant product is assayed by the process described under *Extractum Belladonnæ Liquidum*. In calculating the result of the titration the number of c c of Centi-normal Volumetric Sodium Hydroxide Solution used should be deducted from 100 and the product multiplied by 0.00287, which will give the weight in grammes of alkaloids present in 100 c c of the Tincture.

The *USP* evaporates 100 c c of the Tincture until it is reduced to about one-tenth of its volume, adds sufficient Alcohol (94.9 p c) to redissolve any substance which has separated out and employs the process mentioned under *Extractum Belladonnæ Fluidum*. The number of c c of Fiftieth-normal Volumetric Potassium Hydroxide Solution required to restore neutrality divided by 5, subtracted from 5, and multiplied by 0.0287, gives the weight in grammes of mydriatic alkaloids present in 100 c c of the Tincture, it should be 0.3 p c w/v.

The specific gravity of the Tincture varies according to the specific gravity of the liquid extract with which it is prepared, it is usually about 0.910, it contains about 1 p c w/v of total solids, and about 60 p c w/v of Absolute Alcohol.

UNGVENTUM BELLADONNÆ. BELLADONNA OINTMENT

8 of Liquid Extract of Belladonna evaporated to 1, and mixed with 9 of Benzoated Lard.

Contains 0.6 p c of Alkaloid.

Foreign Pharmacopœias—Official in Belg and U S, Extract 1 in 10, Fr (*Pommade Belladonnée*), Extract 3, Glycerin 2, Benzoated Lard 25, Ital (*Pomata di Belladonna*), Extract 10, Glycerin 5, Benzoated Lard 85, Mex (*Pomada de extracto de Belladonna*), Extract 1, Lard 7½, Port (*Pomada de Belladonna*), aqueous Extract 1, Lard 9, (*Pomada de Belladonna Forte*), Alcoholic Extract 1, Lard 9, Span (*Pomada de Belladonna*), Extract 1½ in 10. Not in the others.

Not Official.

CHLOROFORMUM BELLADONNÆ—Belladonna Root, in powder, 20, percolate with Chloroform *q s* to yield 20.—*Squire's Companion* 1864.

Applied with equal parts of Camphor Liniment or Olive Oil, for painful rheumatism

It is well known that this preparation only extracts about half of the total alkaloids. By mixing the Root (in No 40 powder) with Slaked Lime and powdered Carbonate of Ammonium, four-fifths of the alkaloid will appear in the first 1 in 1 percolate. —Squire's *Chemistry*, 1894

Belladonna Root, 1 No 60 powder, 100, Solution of Ammonia, 25 Absolute Alcohol *q s*, Chloroform *q s*. Moisten the Belladonna root with the solution of Ammonia and set aside for 24 hours. Transfer to a 1-litre percolator with a menstruum consisting of 1 of Absolute Alcohol to 7 of Chloroform until 100 of percolate is obtained —*B P C*

The above formula is the outcome of a series of experiments undertaken by R. Wright, full particulars will be found in *Y B P* '03, 589; *P J* '03, 153; *C D* '03, 246; *Y B P* '07, 367, 371; *P J* '07, 106; *C D* '07, 171

Samples of Chloroform of Belladonna were prepared by the *B P C* process, and by that recommended by the *B P C*. That prepared by the *Com pamon* 1894 process had a specific gravity of 1.476, it contained 3.11 p.c. w/v of total solids, and when assayed according to an adaptation of the *U S P* process for the assay of Belladonna Root yielded gravimetrically 0.25 p.c. w/v of alkaloids and volumetrically 0.236 p.c. w/v of alkaloids, calculated as Atropine. When assayed by the process recommended by Farr and Wright it yielded gravimetrically 0.24 p.c. w/v of alkaloids and volumetrically 0.235 p.c. w/v of alkaloids, calculated as Atropine. This latter process gave no trouble in its manipulation, and emulsions were produced which could be separated even on standing, and clear separations had to be produced mechanically. The product of the *U S P* process of assay worked admirably, it yielded the alkaloids practically free from colour and in a pure condition, no trouble was experienced through emulsification. The *B P C* product had a specific gravity of 1.419, it contained 3.79 p.c. w/v of total solids, and showed when assayed by a method founded on a modification of the *U S P* process for the assay of Belladonna Root, gravimetrically 0.38 p.c. w/v of alkaloids, volumetrically 0.365 p.c. w/v of alkaloids, calculated as Atropine. By the process recommended by Farr and Wright it indicated gravimetrically 0.22 p.c. w/v of alkaloids, and volumetrically 0.209 p.c. w/v of alkaloids, calculated as Atropine.

COLLODIUM BELLADONNÆ *Syn.* ENIPLASTRUM BELLADONNÆ FLUIDUM —Liquor Extract of Belladonna, 50, Canada Turpentine, 1 Castor Oil, 2 and Ether, 40. Mix and digest for 12 hours, filter and add Camphor, 15, Pyroxilin 25, and Ether (sp. gr. 0.720), *q s* to make 100 —*B P C*

This is a modification of the formula given in *B P C* *Formulary* 1901

GLYCERINUM BELLADONNÆ —Green Extract of Belladonna, 8, boiling Distilled Water 1, Glycerin, to 16 —*B P C* *Formulary* 1901

This has been incorporated in the *B P C*

This is practically the same as the *U S P* formula, it also appears in other Hospital Pharmacopœias, with varying quantities.

Official in Part, 1 Extract in 10

LINIMENTUM BELLADONNÆ COMP —Liniment of Belladonna, 7, Chloroform of Belladonna, 1, mix. For application to the loins in lumbago it should be sprinkled on impermeable piline (not *gummi piline*), and firmly pressed with the hands on the part for five minutes to ensure perfect contact, it should then be kept on for at least 16 or 12 hours.

Peter Squire, who suffered much from lumbago, found this more effectual and much more convenient than Belladonna Plasters.

LINIMENTUM BELLADONNÆ CUM CHLOROFORMO —Chloroform, 12 50, Liniment of Belladonna, *q s* to make 100 —*B P C*

ETHEREAL TINCTURE OF BELLADONNA (*Squibb's*) —Substituted by the Ether for Rectified Spirit in the Liniment of *B P* '55 —*J.* '90, 11 67

Not Official BENZIN

PETROLEUM BENZIN PETROLLEUM ETHER

A purified distillate from American Petroleum. It is a transparent, colourless, highly inflammable liquid, possessing a characteristic odour.

It should be preserved in well-stoppered bottles and in a cool atmosphere. It forms a highly explosive mixture with air.

Solubility—Insoluble in Water, about 1 in 6 of Alcohol (90 p c), readily soluble in Ether, Chloroform, fixed and volatile Oils.

Medicinal Properties—Used in seborrhoea, in acne, and generally for the purpose of dissolving off grease from the skin. It is highly inflammable, and must not be used near a fire or naked flame.

Foreign Pharmacopœias—Official in Ger, Jap, Russ, Swiss and U S. U S has also Benzinum Purificatum.

Tests—The distinguishing tests for Benzin are its peculiar odour, the specific gravity which should be 0.670 to 0.675, the boiling point which should be from 45° to 60° C (113° to 140° F), and that it does not produce the odour of Nitro benzene when treated with ten times its volume of a mixture of 1 volume of Sulphuric Acid and 1 volume of Nitric Acid.

Petroleum Ether sp gr 0.716, generally known under the name of **Petrol**, is used extensively for the internal combustion engines of motor vehicles.

BENZINUM PURIFICATUM—Potassium Permanganate, 1, Sodium Hydroxide, 0.2, Sulphuric Acid, 6, Petroleum Benzin, 100, Water *q s*. Add the Acid to 55 of Distilled Water and when cold pour into a bottle having the capacity of about 200. Add 0.8 of Potassium Permanganate, agitate till dissolved, then add the Petroleum Benzin in four portions, shaking the liquid after each addition, allow the liquids to remain in contact for 24 hours, shaking the bottle at frequent intervals, then decant the Petroleum Benzin, and having dissolved 0.2 gramme of Potassium Permanganate in 24 of Water, in which the Sodium Hydroxide has previously been dissolved, mix and agitate frequently, then decant, repeat the washing with Water, and again decant the Petroleum Benzin.—U S P.

This has been incorporated in the *B P C*.

BENZONINUM.

BENZONIN

FR, BENJOIN, GER, BENZONHARZ, ITAL, BENZOINO, SPAN, BENJUI

A balsamic Resin, obtained from *Styrax Benzoin*, Dry, and probably from other species of *Styrax*, both Siam and Sumatra Benzoin are specifically mentioned in *B P*, but the latter very seldom complies with the official characters.

Siam Benzoin consists of about 38.0 p c of Benzoic Acid, 56 to 57 p c of the Benzoic Ester of Siareosinotannol, and about 5 p c of the Benzoic Ester of Benzoresinol, a small amount of Vanillin, and an oily neutral liquid consisting of the Benzoic Ester of Cinnamyl or Benzyl Alcohol. Sumatra Benzoin consists chiefly of the Cinnamic Ester of Benzoresinotannol, some Cinnamic Ester of Benzoresinol, Styracin, Cinnamic Acid Ester of Phenylpropyl Alcohol, a little Vanillin, free Benzoic and Cinnamic Acids, and traces of Benzaldehyde and Benzol.

Solubility.—The tears are as a rule wholly soluble 1 in 5 of Alcohol (90 p c), 1 in 1 of Ether, and in Solution of Potassium

Hydriodic. The mass contains impurities, which are left after treating it with Alcohol. The Solution in Alcohol or Ether is acid.

B.P. requires Benzoin to be almost entirely soluble in Alcohol (90 p.c.), but Sumatra Benzoin is rarely so.

Medicinal Properties.—Expectorant, styptic, antiseptic, used in making aromatic fumigating pastilles. The **compound tincture** is given internally for chronic bronchitis, the **vapour** or **spray** is used in chronic laryngeal and bronchial catarrh to check abundant secretion and cough, lint soaked in the compound tincture forms a styptic and antiseptic dressing for wounds.

Prescribing Notes.—*If given in the form of mixture the Tincture should be emulsified with Mucilage of Gum Acacia, or yolk of Egg. A nice lotion to protect the face from the heat of the sun is made with Tincture of Benzoin 1, Rose Water 40.*

Official Preparation.—*Tinctura Benzoini Composita.* Used in the preparation of Acidum Benzoicum, Adeps Benzoatus, and Unguentum Cetacei.

Not Official.—*Tinctura Benzoini, Insufflatio Benzoini, Lint Virginal, Lotic Benzoini, Sevum Benzoatum, Sobum Benzoinatum, Unguentum Benzoini, Vapor Benzoini.*

Foreign Pharmacopœias.—Official in Austri, Belg, Dan, Dutch, Fr, Ger (Benzoe), Hung, Ital, Jap, Norw, Port, Russ, Mex, and Span., Swed, Swiss and U.S.

Descriptive Notes.—Several varieties of Benzoin are met with in commerce known respectively as Siam, Saigon, Sumatra, Penang and Palembang. The last three kinds are produced in different districts of Sumatra, probably by different trees. Of each kind several grades occur, varying in freedom from foreign matter and in their appearance. Siam Benzoin almost always occurs in more or less distinct tears, or when broken into masses they leave interstices and the masses have a translucent or varnished surface. The odour of Siam Benzoin recalls that of Vanilla. The tears may vary in size from that of small shot to an inch or two (25 to 50 mm) in length and breadth and $\frac{1}{2}$ inch (12.5 mm) in thickness, the tears being usually flattened and of a pale brown externally but milky-white internally. It is remarkably free from impurity and rich in Benzoic Acid, and contains Vanillin. Sumatra Benzoin occurs in solid masses, presenting irregular white tears immersed in a dull greyish-brown resin, and does not exhibit the translucent varnished appearance of the Siam lump Benzoin. It has a characteristic odour resembling Storax rather than Vanilla. It contains Cinnamic as well as Benzoic Acid. It is chiefly produced in Sumatra. Penang Benzoin resembles that of Sumatra, but has a much more pronounced Storax or Hyacinth odour. It is probably produced in W. Sumatra from *Styrax subdenticulatum*, Miq., and comes *via* Penang. It is rarely met with in the form of tears. Saigon Benzoin, imported from Cochinchina, resembles that of Sumatra in appearance and odour. Palembang Benzoin is distinguished by almost entire absence of white tears and a varnished, not dull appearance as in Sumatra Benzoin, it has but little odour. It is produced in the East of Sumatra.

Unfortunately the commercial Benzoin which has a Storax odour is sometimes sold under the name of Penang, and sometimes sold under that of Sumatra Benzoin, so that one is often mistaken for the other. Cinnamic Acid is present in Sumatra Benzoin and the Storax smelling Benzoin, but absent in Siam, Saigon, and Palembang Benzoin, according to E. Wightman Bell, who states that Siam is the richest in Benzoic Acid, yielding 30 to 37 p c.

Tests—The distinguishing tests for Benzoin are its physical appearance and agreeable aromatic odour, that it readily softens when warmed, and on being subjected to a still higher degree of heat yields vapours of Benzoic Acid, it should be almost entirely soluble in Alcohol (90 p c) and in Potassium Hydroxide Solution. The Acid and Saponification values afford useful data for judging the quality of the Gum, but no mention of these values is made in either the *BP*, *USP*, or *PG*. The Acid value of a good specimen of Siam Benzoin should be between 140–170, and the Saponification value 220–240. Three good commercial samples of Siam Benzoin examined in the author's laboratory, leaving only about 1 p c insoluble in Alcohol (90 p c), gave Acid values ranging from 154.6 to 184.8, and Saponification values ranging from 197 to 218. A sample of Siam Benzoin which left 14.7 p c insoluble in Alcohol (90 p c) yielded an Acid value of 123.2, and a Saponification value of 184.8. A fine commercial sample of Sumatra Benzoin, leaving 1.4 p c insoluble in Alcohol (90 p c), had an Acid value of 132.2, and a Saponification value of 181.5. The five samples of Siam Benzoin left ashes ranging from 0.01 p c to 0.88 p c, the Sumatra Benzoin left 0.68 p c of ash. The solubility in Alcohol (90 p c) varies with the origin of the Gum. The best Siam Benzoin is as a rule wholly soluble 1 in 5. Sumatra Benzoin, although distinctly specified, would appear from the description not to be intended for use, since it is almost impossible to obtain it in commerce with less than 7 to 10 p c of residue, which is not presumably covered by the words 'almost entirely soluble in Alcohol (90 p c)'. In view of the use of Benzoin in the preparation of the Compound Tincture, the question of the solubility of the sample assumes some importance.

Attfield has pointed out in his *Digest of Researches and Criticisms* (Report for 1898) that Benzoin containing the usual varying proportions of bark (1 to 30 p c) may be employed in preparing the Compound Tincture, due allowance being made for the insoluble matter, until it can be shown that the attached bark has parted with harmful soluble matter to the Alcohol (90 p c). The *USP* requires Benzoin to be almost wholly soluble 1 in 5 parts of warm Alcohol (94.9 p c), the *PG*, which only recognises the Siam variety, requires that it shall leave not more than 5 p c by weight of insoluble residue when exhausted with boiling Alcohol (90 p c).

The more generally occurring adulterants are inferior varieties of Gum, Colophony, Storax, Turpentine, and mineral matter. The *BP* does not include tests for any of these substances. The *USP* and *PG* require that it should not, on incineration, leave more than 2 p c by weight of Ash. The *PG* also requires that crystals of Benzoic

Acid shall separate from the colourless fluid obtained on warming 1 part of the Gum with 10 parts of Carbon Bisulphide Styra^x lowers the Acid value, and Turpentine the Ester and Saponification value

Preparation

TINCTURA BENZOINI COMPOSITA. COMPOUND TINCTURE OF BENZOIN.

B P Syn —FRIAR'S BALSAM *N O Syn* —TRAUMATIC BALSAM

Benzoin, 8, prepared Storax, 6, Balsam of Tolu, 2, Socotrine Aloes, $1\frac{1}{2}$ (less $\frac{1}{4}$)^{*}, macerated with Alcohol (90 p c) to yield 80. (1 in 10)

Although Sumatra Benzoin is permitted by the Pharmacopœia only Siam should be used, on account of its superior solubility

Dose.— $\frac{1}{2}$ to 1 fl drim = 18 to 36 cc

Foreign Pharmacopœias.—Official in Mex (Tinctura de benjuí compuesta), Port, Swed, and U.S., Fr (Teinture Balsamique), the tinctures vary considerably in composition and strength Not in the others

Benzoin, in No 40 powder, 10, Purified Aloes, in No 40 powder, 2, Storax, 8, Balsam of Tolu, 4, Alcohol (95 p c), *qs* to make 100 —*U.S.P.*

Tests.—It possesses a specific gravity of about 0.900, and contains from 17 to 18 p c of total solids and about 75 p c w/v of Absolute Alcohol It has been suggested (C.D. '02, 1432) that independently of the determination of extractive matter, a determination of free and combined Cinnamic Acids should be made, and that a good Tincture should yield not less than about 5 p c of balsamic acids calculated as Benzoic Acid, of which neither more nor less than two-fifths should be present in an uncombined condition

Not Official

LOTIO BENZOINI—A nice lotion to protect the face from the sun is made with Tincture of Benzoin, 1, Rose Water, 40 —*Squire*

This has been incorporated in the *B.P.C.*

LAIT VIRGINAL—Tincture of Benzoin, 2 fl drim, Rose Water, to 8 fl oz

A proof-spirit tincture gives the best result, but the Milk is greatly improved by the addition of 3 fl drim of Glycerin to the Water Orange-flower Water or other aromatic Water may also be used —*Pharm. Form.*

TINCTURA BENZOINI.—1 of Benzoin in powder, macerated with Alcohol (90 p c) *qs* to yield 10

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr., Ger., Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U.S., 1 in 5, all by weight, except U.S. Swiss includes also Tinct Benzoës Æthereæ 1 in 5 The Austr and Belg Ph require the tincture to yield at least 18 p.c. of dry residue, the Dutch not less than 15 p c

INSUFFLATIO BENZOINI (*Vigier*)—Tincture of Benzoin, 1, Boic Acid, 1, Starch Powder, 1 Mix, and let the Alcohol evaporate. Used as a snuff in coryza —*T.G.* '88, 141

SEVUM BENZOATUM.—Benzoated Suet is prepared in the same manner as Benzoated Lard, Prepared Suet being used in place of Lard —*Ind* and *Col. Add*

^{*} To be exact, 18 grains are to be taken from every $1\frac{1}{4}$ oz of Aloes

Sebum Benzoinatum —Suet, 100, Benzoin, 4, Dried Sulphate of Soda, 6
Swiss

UNGUENTUM BENZOINI —Benzoin, in fine powder, 1, Adeps, 4

VAPOR BENZOINI —Compound Tincture of Benzoin, 60 minims in a pint of Water at 140° for each inhalation

For bronchitis and laryngitis

This has been incorporated in the *B P C* as follows —

Compound Tincture of Benzoin, 0 50, Water at 60 °C, 100

BENZOL.

A colourless, inflammable, volatile liquid, containing about 70 p c of Benzene and 20 to 30 p c of Toluene. It is obtained from Coal-tar Naphtha and must not be confused with Benzoin from Petroleum. See p 237

Introduced into *B P* as a solvent for india rubber

Solubility.—Insoluble in Water. Soluble in all proportions of Absolute Alcohol, Chloroform, and Ether

Medicinal Properties —Stated to be useful in influenza

Only the purest crystallisable Benzol should be used for internal administration

Dose —For children 3 minims, adults 5 minims, prescribed in capsules every two or three hours, or in mixture

Benzol 80 minims, Alcohol (90 p c) $\frac{1}{2}$ oz, Sp Chloroform 3 fl drms, Mucilag Trag to 8 oz, dose, $\frac{1}{2}$ oz every three hours, in lemonade —*B M J* '92, i 171, '93, ii 1425, *L* '92, i 234

Foreign Pharmacopœias —Official in Dutch, Fr (Benzine), Mex (Bencina), Port (Benzina), and Swed

Tests —The distinguishing tests for Benzol are its peculiar somewhat aromatic odour, its specific gravity, about 0 885. It should commence to boil at 80° C (176° F), nine-tenths should distil below 100° C (212° F), and the remainder below 120° C (248° F)

The *U S P* gives the specific gravity as 0 871 at 25° C (77° F), and the boiling point as 80 4° C (176 7° F)

The more generally occurring impurities are readily oxidisable organic compounds or Thiophene. The *B P* does not include tests for these compounds. The *U S P* requires that Sulphuric Acid mixed with an equal volume of Benzol shall not become coloured, indicating the absence of readily charred organic impurities, and that no green or blue tint shall be developed on shaking it with quarter its volume of Sulphuric Acid and one drop of Fuming Nitric Acid, indicating the absence of Thiophene

Not Official

BERBERIS

The Bark of the root of *Berberis vulgaris*, L

It contains the alkaloids, Berberine $C_{22}H_{17}NO_4$, and Oxyacanthine $C_{11}H_9NO_2$

The dried stem of *Berberis Aristata* is official in the *Ind* and *Col Add* for India and the Eastern Colonies, also **Tinctura Berberidis**, 1 in 10 of Alcohol (60 p c), dose, 30 to 60 minims = 1.8 to 3.6 c c

Medicinal Properties—A bitter tonic. Has been used with success in intermittent fevers.

It has also been used in India as a local application in affections of the eye.

EXTRACTUM BERBERIDIS FLUIDUM.—Made with Alcohol (60 p c) One fl. oz. of Extract is equal to 1 oz. of Bark.

Dose—20 to 60 minims = 1.2 to 3.6 c c

Liquor Berberidis Concentratus (1 in 2), dose 30 to 60 minims, is official in the *Ind* and *Col Add* for India and the Eastern Colonies.

BERBERINÆ PHOSPHAS—This is the most soluble salt of Berberin. Soluble 1 in 15 of Water, 1 in 9 of hot Water, but part separates out on standing, it is also thrown down as a yellow precipitate by excess of Alcohol.

Dose.—1 to 5 grains = 0.06 to 0.32 gramme

Not Official

BETEL.

The Leaves of *Piper Betle*, L., are official in the *Ind* and *Col Add* for India and the Eastern Colonies. It is largely employed in India as a masticatory in conjunction with Lime and the nut of *Azeca Catechu*, L.

Not Official.

BETULÆ ALBÆ OLEUM.

BIRCH TAR OIL.

Syn—**OLFUM RUSCI**

A bituminous liquid obtained by destructive distillation of the Wood of *Betula alba*, L., produced in Russia.

Principally employed as an application in skin diseases, also in rheumatism and gout. Was at one time given also internally, in doses of 3 to 8 grains = 0.2 to 0.52 gramme, in pill.

Official in Austr., Jap. and Swiss.

Oleum Betulinum Rectificatum—A light-brown Oil, obtained by the steam distillation of Birch Tar Oil.

The active constituents of the Rectified Oil are probably Guaiacol and Cresol—*P J* (3) 661.

Solubility—Almost insoluble in Water, soluble in all proportions of Alcohol, Chloroform or Ether.

Official in Dutch.

Tests—The specific gravity should be from 0.900 to 0.920. A saturated aqueous solution of the Oil gives a green coloration on the addition of a few drops of a 1 in 1000 aqueous Ferric Chloride Solution.

Not Official

TINCTURA RUSCI (*Hebra*)—Birch Tar Oil, 25; Oils of Lavender, Rue and Rosemary, of each 1, Ether, 86, Alcohol (50 p c) 36.

Official in Austr., Lavender Oil, 1, Rosemary Oil, 1, Birch Tar Oil, 26, Ether, 86, Alcohol, 86.

UNGUENTUM OLEI BETULÆ.—Birch Tar Oil, 5 fl. drms., Yellow Beeswax, 120 grains, melt the Beeswax, add the Oil, and stir till cold.

* Used in psoriasis and dry eczema.

Caution.—The use of this Ointment in eczema demands care.

UNGUENTUM BETULÆ COMPOSITUM — Oil of Cade, 10, Resorcin, 1, Ichthyol, 1, Birch Tar Oil, 1, Lard, 30 — *St George's*

Not Official

FR, BISMUTH PURIFIC, GER, WISMUT, ITAL, BISMUTO, SIAM, BISMUTO

Bismuth in its crude state is generally impure the official salts, however, are required to give no reaction with a special test for Selenium and Tellurium

Official in Mex (Bismuto), Port, Span and Swiss

Official Bismuth Salts — Bismuthi Carbonas, Bismuthi Oxidum, Bismuthi Salicylas, and Bismuthi Subnitras

Not Official — Bismone (Colloidal Bismuth Oxide), Bismuthum Purificatum, Bismuthi Benzoas, Bismuthi Betanaphtholas (Oiphol), Bismuthi et Cerii Salicylas, Bismuthi Citras, Bismuthi et Ammonii Citras, Bismuthi et Cinchonidine Iodidum (Erythrol), Bismuthi Di-thio Salicylas (Thioform), Bismuthi Iodoresorcin Sulphonas (Anusol), Bismuthi Methylenedigallas (Bismal), Bismuthi Nitras, Bismuthi Oleas, Bismuthi Oxichloridum (Pearl white), Bismuthi Oxydodogallas (Ainol), Bismuthi Phenolas, Bismuthi Phosphas, Bismuthi Quinolini Sulphocyanidum (Crurin), Bismuthi Sulphis, Bismuthi Subgallas (Dermatol), Bismuthi Subiodidum, and Bismuthi Tribromophenolas (Xeroform)

BISMUTHI CARBONAS.

BISMUTH OXYCARBONATE

($\text{Bi}_2\text{O}_3\text{CO}_3$), H_2O , eq 1029 70

FR, SOUSCARBONATE DE BISMUTH, GER, WISMUTSUBCARBONAT, ITAL., BISMUTO CARBONATO, SPAN, CARBONATO DE BISMUTO

A white or almost white, odourless and tasteless amorphous powder, which varies much in density, the lighter variety is most suited for dispensing, being more easily suspended

It may be prepared from the Subnitrate by precipitation with Ammonium Carbonate

Solubility — Soluble with effervescence in Nitric Acid, insoluble in Water

Medicinal Properties — Similar to the Subnitrate, and often preferred to it

The Carbonate is most generally useful as a gastric sedative, the Subnitrate is the most effective as an intestinal antiseptic, the Salicylate being weaker and the Carbonate inert for this purpose — *L* '05, 1 432

Dose — 5 to 20 grains = 0.32 to 1.3 gramme

Prescribing Notes — *Suspended in mixture by Compound Tragacanth Powder*

Mucilage of Gum Acacia is not a good vehicle for Bismuth salts. On standing, a compact mass forms at the bottom of the bottle, which is difficult to diffuse

When Sodium Bicarbonate is to be given with a Bismuth salt, the Carbonate should be selected

a good one for pyrosis *Bismuthi Carbonatis*, 2
 drms, *Pulv. Tragac.* Comp 1 drms, *Aq. Flor.*
Aurant. (glycerine of each 2 fl drms, *Aquæ Chloroformi*, 1½ fl oz, *Aquam ad* 6
 fl oz 3 to 4 teaspoonfuls three times a day after meals

Official Preparation—*Trochiscus Bismuthi Compositus*

Not Official—*Glycerinum Bismuthi Carbonatis*, *Mistura Bismuthi*,
Mistura Bismuthi cum Soda, *Pastillus Bismuthi*, *Pastillus Bismuthi et Mor-*
phinæ.

Foreign Pharmacopœias—Official in Dutch, Jap., Mex. (*Carbonato*
de Bismuto), Port., Span. and U.S. Not in the others.

Tests.—The distinguishing tests for Bismuth Carbonate are that it dissolves with effervescence in Hydrochloric Acid yielding a solution from which (1) Hydrogen Sulphide throws down a brownish-black precipitate insoluble in Ammonium Hydrosulphide Solution, in Potassium or Sodium Hydroxide Solution, but soluble in hot Nitric Acid, (2) except in the presence of Citric Acid or Citrate, Ammonium, Potassium or Sodium Hydroxide Solution throws down a white precipitate insoluble in excess, (3) the copious dilution with Water of a strong solution of the salt in a sufficiency of mineral acid results in the formation of a white precipitate, in the case of the solution in Nitric Acid if no precipitation results on dilution, the addition of Ammonium or Sodium Chloride Solution brings about immediate precipitation, the presence of Tartaric Acid not affecting the precipitation, (4) the addition of Potassium Chromate Solution causes a yellow precipitate insoluble in Potassium or Sodium Hydroxide Solution, soluble in dilute Nitric Acid. When treated with Hydrochloric Acid it effervesces briskly evolving a gas, which, passed through Calcium Hydroxide Solution, affords a white precipitate. The salt is officially required to indicate 99.93 p.c. of Bismuth Carbonate, as ascertained from the weight of Bismuth Sulphide (99.0 p.c.) resulting from precipitation with Hydrogen Sulphide, the *B.P.* employing the latter reagent for the determination of the Bismuth. A weighed quantity of 1 gramme of the Carbonate is dissolved in a little Hydrochloric Acid, the solution diluted with Water acidified with Hydrochloric Acid, and Hydrogen Sulphide is passed through the solution until the Bismuth is completely precipitated. The precipitate is filtered off, rapidly washed with Water and dried at 100° C. (212° F.) till constant in weight, and when cool, weighed. The weight of Bismuth Sulphide should amount to 0.99 grammic. The *U.S.P.* method of determination is to ignite at a red heat and to weigh the residue of Bismuth Oxide which should amount to not less than 90 p.c., equivalent to 100 p.c. of Bismuth Subcarbonate. The results obtained by the Sulphide method of determination are likely to be much higher than those obtained by the *U.S.P.* method owing to the tendency towards co-precipitation of Sulphur which would not be washed out and which would be weighed as Bismuth Sulphide. It is considered (*C.D.* '98, i. 674, '98, ii. 348) that the differences by the ignition method are much smaller than those occurring in the Sulphide method.

The Carbonate is not official in the *P.U.*

The more generally occurring impurities are Arsenic, Calcium, Copper, Iron, Lead, Magnesium, Silver and Zinc, Chlorides, Nitrates

and Sulphates, Selenium and Tellurium. These are characteristically lumped together by the *BP* without any regard to their relative importance, and so long as the salts are 'suitably treated,' the usual tests for these substances are employed. A standard of 2 parts per 1,000,000 is suggested (*CD* '08, i 795) for Arsenic. It should yield no reactions for Arsenic when examined by the Bettendorf's test. When 3 grammes of the salt is dissolved in just sufficient warm Nitric Acid to affect solution, and this solution be then poured into 100 c c of Water, filtered, the filtrate evaporated on a water-bath to 30 c c, and again filtered, portions each of 5 c c of this filtrate should not yield a blue supernatant fluid on the addition of an excess of Ammonia Solution when the precipitate is allowed to settle, indicating the absence of Copper, should not become cloudy when mixed with an equal volume of Diluted Sulphuric Acid, indicating the absence of Lead, should not yield a precipitate on the addition of Hydrochloric Acid, indicating the absence of Silver, nor yield a turbidity on the addition of Barium Chloride Solution, indicating the absence of Sulphates. If 1 gramme of the salt be dissolved in equal parts of Acetic Acid and Water, and the Bismuth be completely removed by Hydrogen Sulphide, the filtrate from the Sulphide precipitate should yield no residue on evaporation, indicating the absence of metals of the alkalis and alkali earths. The *USP* disregards the presence of Iron and Zinc, Selenium and Tellurium, except in so far as the two latter are covered by Bettendorf's Arsenic test. A special test for Ammonium salts with Potassium Hydroxide Solution is given, a limit for Chlorides is adopted and in contradistinction to the *BP* the presence of Nitrates is prohibited, the *BP* allows not more than the slightest reactions. The commercial Carbonate invariably contains more than a trace of Nitrate (*PJ* (3) xvi 936, (3) xviii 721, 780), but it can be obtained in commerce free from Nitrate (*CD* '98, i 837). Nitrates may be detected, if present, by the Ferrous Sulphate and Sulphuric Acid test given under that heading in the small type below, Chlorides by the test given under the heading of Silver Nitrate. When testing for Selenium and Tellurium the *BP* removes the major portion of the Bismuth as an oxy-salt by the addition of Sodium or Ammonium Chloride to the Nitric Acid solution, and adds an excess of Sodium Sulphite to the filtrate, no precipitate or coloration should be given after 12 hours, indicating the absence of Selenium and Tellurium. A delicate test for Tellurium given (*CD* '97, i 631) is to dissolve without heat 10 grains of Bismuth salt in 60 minims of strong Hydrochloric Acid mixed with 60 minims of Water, add 10 grains of Sodium Hypophosphite, an evolution of Nitrous fumes will take place in the case of Subnitrate and of Carbonic Anhydride only if it be Carbonate, but no development of colour or precipitation if the Bismuth salt be pure. If Tellurium be present in very small proportion a black precipitate will form, and if Arsenic be the impurity the precipitate will be brown.

Ferrous Sulphate and Sulphuric Acid.—If a mixture of 0.05 gramme of Bismuth Subcarbonate and 5 c c of equal parts of Water and Ferrous Sulphate be agitated and poured as a layer over 5 c c of Sulphuric Acid (free from

Not a brownish red zone should form at the junction of the liquid, indicating a limit of Subnitrate, *U S P*

Silver Nitrate—If the precipitate (if any) formed by the addition of 0.1 c.c. Tenth-normal Volumetric Silver Nitrate Solution to a solution of 0.3 gramme of Bismuth Subcarbonate in 10 c.c. of Nitric Acid be filtered off the clear filtrate should be unaffected by the further addition of the reagent, indicating a limit of Chlorides, *U S P*

Gravimetric Determination—1 gramme of Bismuth Subcarbonate ignited in a porcelain crucible should yield a residue of not less than 0.9 gramme of Bismuth Oxide, *U S P*

Preparations

TROCHISCUS BISMUTHI COMPOSITUS. COMPOUND BISMUTH LOZENGE

2 grains of Bismuth Oxycarbonate, 2 grains Heavy Magnesium Carbonate, and 4 grains Precipitated Calcium Carbonate in each, with Rose basis

Dose.—1 to 6 lozenges

A modification, known as the **Gastric Antacid Lozenge**, has been recommended by Sir W. Roberts, the Bismuth is omitted and Sodium Chloride added—*B M J '89* ii 874.

Foreign Preparation—Official in Port, $1\frac{1}{2}$ grain of subnitrate in each. Not in

Not Official

GLYCERINUM BISMUTHI CARBONATIS—Bismuth Oxynitrate, 2820 grains, Water, 3 fl oz, Nitric Acid, $1\frac{1}{2}$ fl oz. Dissolve the Bismuth Oxynitrate in the mixture of Water and Nitric Acid and pour into a solution of Ammonium Carbonate $5\frac{1}{2}$ oz in Water 30 fl oz, wash the precipitate by decantation, drain, and mix the residue with Glycerin, *q s* to make 10 fl oz. This preparation contains 1 grain of Bismuth Oxycarbonate in 2 minims.—*St Thomas's*

Bismuth Nitrate, in crystals, 100, Nitric Acid, 15, Ammonium Carbonate, 50, Distilled Water, 360, Glycerin, *q s* to produce 100. The product contains about 50 p.c. of Bismuth Carbonate—*B P C*

The *B P C Supplement* gives the first formula as an alternative method, with the *syn* Bismuth Cream

MISTURA BISMUTHI—Glycerin of Bismuth Carbonate, 30 minims; Water, to 1 fl oz.—*St Thomas's*

This has been incorporated in the *B P C*

MISTURA BISMUTHI CUM SODA—Bismuth Oxycarbonate, 15 grains, Sodium Bicarbonate, 10 grains, Tragacanth, 11 grains, Water, to 1 fl oz. This mixture may be made without Tragacanth but the Bismuth Oxycarbonate subsides more quickly.—*St Thomas's*

Sodium Bicarbonate, 10 grains, Bismuth Mixture, *q s* to produce 1 fl oz.—*B P C*

PASTILLUS BISMUTHI.—Carbonate of Bismuth, 3 grains, 3 minims. Rub together and add the mixture to the melted Tragacanth, 14 grains.—*Throat*.

This has been incorporated in the *B P C*.

PASTILLUS BISMUTHI ET MORPHINÆ—Carbonate of Bismuth, 3 grains, Acetate of Morphine, $\frac{1}{10}$ grain, Glycerin, 3 minims, Glycogelatin, 18 grains.—*Throat*

This has been incorporated in the *B P C*.

BISMUTHI OXIDUM.

BISMUTH OXIDE

 Bi_2O_3 , eq 462 24

A pale yellowish-white, amorphous powder

It may be prepared by the interaction of Bismuth Oxynitrate and Sodium Hydroxide Solution at a boiling heat

Solubility—Insoluble in Water, soluble in Nitric Acid mixed with half its volume of Water**Medicinal Properties**—Similar to the subnitrate**Dose**—5 to 20 grains = 0.32 to 1.3 gramme**Not Official**—Bismuthi Oxidum Hydratum and Cremor Bismuthi**Tests**—Bismuth Oxide should answer the tests distinctive of Bismuth given under the Carbonate. It is officially required to contain 99.68 p.c. of Bismuth Oxide, as gravimetrically determined by conversion into Bismuth Sulphide. 1 gramme of the Oxide should yield 1.1 gramme of the Sulphide. The objections to this method of determination are given under Bismuth Carbonate.

The more generally occurring impurities are such as are also found in the Carbonate and are there discussed. In addition it may contain Bismuth Oxy carbonate or the Oxynitrate, or moisture, in which case there will be an appreciable loss of weight when a weighed quantity is heated to incipient redness. Such diminution in weight is officially prohibited.

Not Official.**BISMUTHI OXIDUM HYDRATUM**—A white amorphous powder, soluble in an excess of Hydrochloric Acid and precipitated again on the addition of Water as Oxychloride. It mixes readily with Water to form a cream.**Official in Fr. and Span.****CREMOR BISMUTHI**—Hydrated Bismuth Oxide, 1, Water, 4. Rub together till smooth.

Under the name 'Intestin' a mixture containing Bismuth Oxide, Benzoic Acid and Naphthalene has been introduced.

BISMUTHI SALICYLAS.

BISMUTH SALICYLATE

 $\text{C}_6\text{H}_4(\text{OH})(\text{COO BiO})$, eq 359 19

A white or nearly white, odourless powder, but also supplied in crystals. It should contain 62 to 64 p.c. of Bismuth Oxide.

It may be prepared by precipitating Bismuth Nitrate with a solution of Sodium Salicylate.

Solubility—Insoluble in Water and Alcohol (90 p.c.)**Medicinal Properties**—An excellent intestinal antiseptic and sedative, has been given with success in gastro intestinal affections, particularly the summer diarrhoea of children.

Dose—5 to 20 grains = 0.32 to 1.3 gramme

Prescribing Notes—Given in cachets, or in a mixture suspended with Water. The salt is dissociated by contact with Water, and if an alkaline Carbonate be present, the mixture effervesces, in such cases it is better to prescribe *Bismuth Carbonate* and *Sodium Salicylate*.

Foreign Pharmacopœias—Official in Aust, Belg, Ger, Ital, Jap and Swiss, 63 p.c. of Bismuth Oxide, Dutch, 60 to 65 p.c., Fr and Mex, 61 p.c., Russ, 60 p.c., Dan and Swed 60 p.c., Norw and Span, no p.c. given, U.S., 62 to 64 p.c. Not in the others.

Tests—Bismuth Salicylate, when dissolved in diluted Hydrochloric Acid, and the Salicylic Acid separated, yields the distinctive tests for Bismuth which are mentioned under Bismuth Carbonate. It gives a violet coloration when treated with diluted Ferric Chloride Test-solution. The salt undergoes dissociation rapidly and even Alcohol (90 p.c.) causes the liberation of a certain amount of free Salicylic Acid notwithstanding the official requirement that such alcoholic liquid should not give a violet coloration with Ferric Chloride Test-solution. It is officially required to contain 98.59 p.c. of Bismuth Salicylate as gravimetrically determined by conversion into Bismuth Sulphide, 1 gramme of the Salicylate is required to yield 0.7 gramme of the Sulphide. When gravimetrically determined as Oxide it is officially required to yield 96.35 to 99.46 p.c. of Bismuth Salicylate. It will thus be seen that the amount of Bismuth Salicylate calculated from the Sulphide determination does not agree with that calculated from the Oxide determination. The U.S.P. requires it to yield not less than 62 p.c. nor more than 66 p.c. of Bismuth Oxide, when ignited as described in the small type below under the heading of Gravimetric Determination. This amount of Bismuth Oxide calculates out to not less than 96.4 p.c. nor more than 102 p.c. of Bismuth Salicylate. The P.G. requires it to leave not less than 63 p.c. of Bismuth Oxide when the salt is calcined as described in the same, corresponding to a calculated figure of not less than 97 p.c. of Bismuth Salicylate.

The more generally occurring impurities are Arsenic, Calcium, Copper, Iron, Lead, Magnesium, Silver and Zinc, Selenium and Tellurium, Chlorides, Nitrates and Sulphates, free Salicylic Acid.

The detection of the majority of these impurities is referred to under Bismuth Carbonate, in carrying out the tests for them the Bismuth Oxide left on the ignition of the Salicylate should be dissolved in Nitric Acid, and the major portion of the Bismuth removed as an oxy-salt. With regard to the detection of free Salicylic Acid the methods adopted vary. The employment of Alcohol (90 p.c.) as recommended in the B.P. results in the liberation of a sufficient amount of free Salicylic Acid to give a pronounced coloration with Ferric Chloride Test-solution. Chloroform is a more appropriate solvent and the U.S.P. test is carried out with this menstruum, a weighed quantity of 1 gramme of the salt being shaken with 5 c.c. of Chloroform and the chloroformic solution filtered into an equal volume of Water containing 3 drops of the Ferric Chloride Test-solution, when no violet zone should form at the junction of the two liquids within one minute. The P.G. requires

that a weighed quantity of 0.5 gramme of the salt when shaken with 5 c.c. of water shall yield a filtrate which produces no reddening of blue Litmus paper, but does not also test the solution with Ferric Chloride Test-solution.

The Salicylic Acid liberated when the salt is treated with an acid, when filtered off, washed free from mineral acid and carefully dried, should possess the melting point and answer the tests given under Acidum Salicylicum and should otherwise conform to the tests of purity given for this acid. The *BP* and *PG* formulate no such requirement, the *USP* has carefully noted this.

The three Pharmacopœias differ widely in the test adopted for the detection of Nitrates. The *USP* uses a mixture of Bismuth Salicylate, Sodium Salicylate and Sulphuric Acid, the *PG* test depends upon the reduction of the Nitrates to Ammonia by the use of Zinc foil and powdered Iron and its liberation by Sodium Hydroxide Solution (15 p.c.), the *BP* depends upon the formation of Nitrous Oxide and liberation of red fumes when the salt is warmed with Sulphuric Acid and Copper, the *USP* and *PG* tests are compared in detail in small type below under the heading of Sodium Salicylate and Sulphuric Acid and Zinc foil, powdered Iron, and Sodium Hydroxide. The most delicate is that of the *USP*. Both the *USP* and *PG* employ Bettendorfs test as a means of detecting Arsenic. The Uranium Nitrate test for distinguishing it from Carbolates and Sulpho carbolates is peculiar to the *BP*, and is commented upon in the large type under Acidum Salicylicum.

Sodium Salicylate and Sulphuric Acid—0.05 gramme triturated with 0.1 gramme of Sodium Salicylate and 5 c.c. of Water, carefully poured as a layer over 5 c.c. of Sulphuric Acid (free from Nitrous Compounds) should not immediately form a pink to brownish red zone, *USP*.

Zinc Foil, Powdered Iron, and Sodium Hydroxide—On warming 0.5 gramme Bismuth Subsalicylate with 5 c.c. Sodium Hydroxide Solution and the addition of 0.5 gramme of Zinc foil and reduced Iron, Ammonia gas should not be evolved, *PG*.

Gravimetric Determination—If 1 gramme of Bismuth Subsalicylate be calcined and the residue dissolved in Nitric Acid, this solution carefully evaporated, and the residue again calcined, a final residue of at least 0.63 gramme of Bismuth Oxide should be obtained, *PG*. The *USP* directs the use of 5 c.c. of Nitric Acid in above test, adding it to the residue drop by drop until solution is complete. The final residue obtained as above should weigh not less than 0.62 gramme and not more than 0.66 gramme.

Stannous Chloride—The residue of Bismuth Oxide obtained when 2 grammes of Bismuth Subsalicylate is ignited as described above, should not respond to Bettendorfs test for Arsenic, *USP*. A mixture of 1 gramme of Bismuth Subsalicylate and 3 c.c. of Stannous Chloride T.S. should not assume a dark colour in the course of an hour, *PG*.

Not Official

BISMUTHI CERII SALICYLAS—A reddish white powder, insoluble in Water and Alcohol (90 p.c.). Recommended in diarrhoea and dysentery.

Dose—5 grains = 0.32 gramme.

The following mixture was proposed by the Royal College of Physicians for use during the prevalence of cholera in 1892—*L*, '92, p. 682—

Cholera Mixture—Bismuthi et Cerni Salicylas, 5 grains, Mist Cretæ Aromat, 1 fl oz, Tinct Camph Co, $\frac{1}{2}$ fl drim, Tinct Chloroformi Co, 20 drops, Spirit Ammon Aromat, 20 drops, Ess Menth Pip, 10 drops

Should this mixture disagree, or in 24 hours fail to give relief, the following mixture should be substituted and taken in 1 oz doses every 3 or 4 hours—

Acid Sulph Aromat, 15 drops, Tinct Camph Co, $\frac{1}{2}$ drim, Tinct Chloroformi Co, 20 drops, Tinct Coto, 20 drops, Syrupi Aulanti Flor, 1 drim, Aq. Menth Pip ad 1 oz

BISMUTHI SUBNITRAS.

BISMUTH OXYNITRATE

$\text{BiONO}_3 \cdot \text{H}_2\text{O}$, eq 302.64

FR, SOUSNITRAT DE BISMUTH, GFR, BASISCHES WISMUTHNITRAT, ITAL, SOTTO-NITRATO DI BISMUTO, SPAN, NITRATO (SUB) BISMUTICO

A heavy, white, odourless, crystalline powder, which may be prepared from Bismuth Nitrate by the action of Water

The formula calculates into 77 p.c of Oxide, but it always contains 79 to 82 p.c. If the $\text{BiONO}_3 \cdot \text{H}_2\text{O}$ exists, it is so unstable that it could certainly not be decomposed—C P '85, 561

Although Mr David Howard called attention to the inaccuracy of the formula given in B P '85, the error is repeated in B P '98. It is also at variance with the official test, which requires that it should yield 84 p.c of Bismuth Sulphide

Solubility—Insoluble in Water Insoluble in Alcohol (90 p.c). Soluble in Hydrochloric and in Nitric Acid

Medicinal Properties.—Sedative and astringent both internally and externally. It is highly useful in pyrosis, all forms of vomiting and irritative dyspepsia, in gastric ulcer, also in diarrhoea from any cause, usually combined with Soda, Magnesia, Opium, etc., it renders the fæces leaden-grey in colour. It is recommended to be injected in gonorrhœa and leucorrhœa, 60 grains to the oz of Water, the Bismuth is mixed with an equal quantity of Glycerin or suspended with Compound Tragacanth powder. The addition of Bismuth to mixtures for diarrhoea of phthisis controls it better than other ingredients alone. As an intestinal antiseptic, *see* under Bismuthi Carbonas

Externally it is sometimes used as a cosmetic, but is more or less blackened by an impure lotion, powder, or ointment in burns, eczema, and other cases when exudation and itching are present, also as an ingredient of Ferri's Snuff in acute coryza and chronic rhinitis

Has been recommended as a dressing for wounds—L '85, 11 684, T G '85, 266, B M J '01, 11 811

Dose.—5 to 20 grains = 0.32 to 1.3 gramme.

Prescribing Notes—When prescribed in a mixture, it should be suspended with Compound Powder of Tragacanth, 1 drim. in a 6-oz mixture. *See* Bismuthi Carbonas

As Bismuth Oxynitrate in Water slowly parts with its Nitric Acid, the mixture is always acid, and this somewhat interferes with its suspension, and when prepared with Sodium Bicarbonate it causes a slight but steady evolution of Carbonic

Acid, which may cause the bottle to burst, these objections do not apply to the Bismuth Carbonate, which is therefore preferable in mixtures

Incompatibles—Effervescence ensues if prescribed in Water with Alkaline Bicarbonates With Potassium Iodide double decomposition slowly ensues

Official Preparations—Used in the preparation of Liquor Bismuthi et Ammonii Citratis, and Bismuthi Oxidum

Not Official—Fenier's Snuff, Elixir Bismuthi, Glyceritum Bismuthi, Liquor Bismuthi Conc, Lotio Bismuthi, Mistura Bismuthi Comp, Mistura Bismuthi Composita cum Pepsino, Mistura Bismuthi Composita cum Morphina, Unguentum Bismuthi Oleatis, and Unguentum Bismuthi

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U S

Tests—The distinguishing tests for Bismuth are given in large type under Bismuth Carbonate, and the Subnitrate when dissolved in dilute Nitric Acid should conform to these When heated in a porcelain crucible nitrous vapours are evolved and a white residue of Bismuth Oxide remains, red fumes are evolved when a little of the salt is warmed with Sulphuric Acid and metallic Copper, after separation of the Bismuth the filtrate affords when mixed with an equal volume of Sulphuric Acid, cooled and poured gently on to the surface of Ferrous Sulphate Solution a brown ring at the junction of the two fluids It is officially required to contain 99.68 p.c. of Bismuth Subnitrate, as gravimetrically determined by conversion into Bismuth Sulphide 1 gramme of the Subnitrate is required to yield 0.84 gramme, corresponding to 84 p.c. of the Sulphide The criticism of this method of determination appearing under Bismuth Carbonate applies with still greater force here, as owing to the oxidising influence of Nitric Acid, Sulphur is almost certain to be precipitated along with the Bismuth Sulphide The *USP* and *PG* employ the Oxide method of determination, the former requiring that the salt shall yield not less than 80 p.c. of pure Bismuth Oxide, the latter that it shall yield from 79 to 82 p.c. of Bismuth Oxide Bismuth Subnitrate is distinguished from the Carbonate by being soluble without effervescence in diluted Nitric Acid, from the Oxychloride by dissolving in Acetic Acid

The more generally occurring impurities are Arsenic, Calcium, Copper, Iron, Lead, Magnesium, Silver, and Zinc, Chlorides and Sulphates, Carbonates, Selenium or Tellurium, Calcium Phosphate A standard of 2 parts per 1,000,000 is suggested (*CD '08*, i 795) for Arsenic With the exception of Carbonates and Calcium Phosphate the remarks upon the detection of these impurities appearing under Bismuth Carbonate are also applicable here The presence of Carbonates is shown by effervescence produced when the salt is dissolved in Nitric Acid, Calcium Phosphate by a precipitate or opalescence produced when a solution of 1 gramme of the salt in Nitric Acid is mixed with a solution containing twice this weight of Citric Acid and sufficient Ammonia Solution to produce a decided alkalinity Neither the *USP* nor the *PG* include a similar test The *USP* requires that no residue should be left when the salt is dissolved in warm Nitric Acid, indicating the absence of foreign salts

Diluted Sulphuric Acid—The *PG* directs that 0.5 grammes should form a clear solution at ordinary temperature with 25 c.c. of Diluted Sulphuric Acid without evolution of Carbon Dioxide, indicating the absence of Lead and Carbonates.

Stannous Chloride Solution—If 1 gramme of Bismuth Subnitrate be heated until vapours cease to be given off, the residue cooled and dissolved in a little Hydrochloric Acid, this solution, with double its volume of Stannous Chloride Solution, should not assume a dark colour in the course of an hour. *PG*. The *USP* requires that the residue, obtained by heating 2 grammes of Bismuth Subnitrate in a porcelain crucible until nitrous vapours cease to be given off, should weigh not less than 1.6 grammes and should not respond to Bettendorfs test for Arsenic.

Silver Nitrate Solution—0.5 grammes of Bismuth Subnitrate dissolved in 5 c.c. of Nitric Acid should give a clear solution which is not rendered more than opalescent by 5 c.c. of Silver Nitrate Solution, *PG*.

Barium Nitrate Solution—0.5 grammes should dissolve to a clear solution in 5 c.c. of Nitric Acid, and be unaffected by 0.5 c.c. of Barium Nitrate Solution diluted with an equal quantity of Water, *PG*.

Potassium or Sodium Hydroxide Solution—Warmed with Sodium Hydroxide Solution in excess, Bismuth Subnitrate should not evolve Ammonia, *PG*. The *USP* directs that 1 gramme of the salt be boiled with 5 c.c. Potassium Hydroxide TS.

Gravimetric Determination—The *PG* requires that 100 parts of Bismuth Subnitrate heated until the evolution of yellowish red fumes ceases, should yield from 79 to 82 parts of residue, and the *USP* that 2 grammes, heated in a porcelain crucible until nitrous vapours cease to be evolved, should yield a residue weighing when cold not less than 1.6 grammes.

Preparation

LIQUOR BISMUTHI ET AMMONII CITRATIS. SOLUTION OF BISMUTH AND AMMONIUM CITRATE *BP Syn*—LIQUOR BISMUTHI.

A clear, colourless liquid possessing generally a faint odour of Ammonia and a slight metallic taste, 1 fl. drm is equal to rather less than 3 grains of Bismuth Oxide.

Dose— $\frac{1}{2}$ to 1 fl. drm = 1.8 to 3.6 c.c.

A formula is given in *USNF*, using Glycerite of Bismuth (see below), Alcohol and Distilled Water. 1 fl. drm equals 1 gram Bismuth and Ammonium Citrate.

Tests.—Bismuth and Ammonium Citrate Solution should possess a specific gravity of 1.070. It should be faintly alkaline in reaction towards red Litmus paper, and when warmed with an excess of Potassium or Sodium Hydroxide Solution should yield a strong ammoniacal odour and a white precipitate. It is required to contain 9 p.c. by weight equivalent to 9.61 p.c. w/v of Bismuth Ammonium Citrate $\text{BiC}_2\text{H}_3\text{O}_7(\text{NH}_3)_2$, eq. 445.64, as gravimetrically determined by precipitation of the Bismuth as Sulphide. The amount of Bismuth Sulphide yielded by the *BP* test is 5.14 p.c. by weight equivalent to 5.5 p.c. w/v, the corresponding amount of Bismuth Oxide being 4.65 p.c. by weight equivalent to 5 p.c. w/v.

The more general occurring impurities are Arsenic, Copper, Iron, Lead, Silver, Selenium or Tellurium. Of these the more important are Arsenic and Lead, Selenium and Tellurium. To detect these

impurities the liquor is evaporated to dryness, ignited and the residue redissolved in diluted Nitric Acid. The presence of Arsenic may be detected by Bettendorf's test, Lead by diluted Sulphuric Acid after separation of the Bismuth as an oxy-salt, and Selenium or Tellurium by the Sodium Hypophosphite or Sodium Sulphite tests

A good deal of controversy has ranged round the official method of preparation. The earlier criticisms (*C D* '98, 1 620) were apparently favourable to the new formula. Later (*C D* '98, 1 955) it has been pointed out that when the process is carried out strictly according to the *B P* directions that considerable difficulty arises in taking into solution the whole of the Bismuth Citrate precipitate, it being shown that the quantity of Ammonium Citrate ordered is the main factor in determining this insolubility. An increase in the amount of Ammonium Citrate is also suggested (*C D* '99, 11 211, 233, *P J* '99, 11 101, 116), the addition of *Liquor Ammonii Citratis* (after the solution of the precipitate), in the proportion of 8 fl. oz (or 400 c c) and then dilution to 20 fl. oz (or 1000 c c) is recommended. Amongst other modifications suggested in the same reference are the omission of the addition of Distilled Water until the liquid is very faintly opalescent, the use of 236 grains instead of 175 grains of Potassium Carbonate per pint of liquor, the latter quantity being inadequate to neutralise the free Nitric Acid and a corresponding amount of Bismuth being lost in the acid liquid, the non-dilution of the Bismuth Oxynitrate and Nitric Acid mixture, the reversion of the order of mixing, the Bismuth mixture being added to the Potassium Citrate and Carbonate instead of *vice versa*, and the use of a definite quantity of Water for dissolving the Potassium salts. The precipitate thus produced is easily washed, and is perfectly soluble. Samples containing the exact amount of Ammonium Citrate recommended by the *B P* formula deposit when dispensed with alkali Bicarbonates, solutions containing an additional quantity remain clear.

The conclusion drawn (*C D* '02, 1 852, '02, 11 312, *P J*, '02, 11 135) is that Bismuth Citrate is an acid and not a salt, being Citric Acid with one of the Hydrogen atoms replaced by Bismuthyl. Its acid properties are shown by it forming salts with Ammonia and yielding an effervescence with alkali Carbonates and Bicarbonates. Determinations of the combining weight of the acid are also recorded in support of this theory. The following process is suggested:—629 grains of Bismuth Subnitrate mixed in a mortar with $1\frac{1}{2}$ fl. oz of Water, is set aside for 2 hours, occasionally stirring, or until the mixture yields a clear solution with Ammonia Solution, sufficient of the latter is then added to form a clear solution and the mixture diluted to 20 fl. oz with water and filtered. An alteration in the official title to *Liquor Ammonii Bismuthyl-Citratis* is recommended. The chief drawback to the official method of preparation appears (*P J* '99, 11 604) to be the use of a smaller quantity of Potassium Citrate than is necessary for converting the whole of the Bismuth into Citrate. The method recommended in this reference is to dissolve 70 grammes Bismuth Oxynitrate in diluted Nitric Acid by gently warming, to add 50 grammes of Citric Acid dissolved in a little water (and if a

Carbonate is used two-thirds of it may be mixed with the Citric Acid), and a solution of 103 grammes of Potassium Bicarbonate or 86 grammes of Sodium Bicarbonate and dilute with hot Water to 1000 c c, cool, filter and wash free from Nitrate. The precipitate is dissolved in 60 c c of Liquor Ammonia *B P* diluted to 200 c c with Water and made up to 1000 c c or to a specific gravity of 1.070.

Not Official.

ELIXIR BISMUTHI—Bismuth and Ammonium Citrate, 3.50, Distilled Water, hot, 6, Water of Ammonia (*U S P*), *q s*, Aromatic Elixir, *q s* to produce 100—*U S N F* 1896.

This has been incorporated in the *B P C*

Glycerite of Bismuth (*N F*), 12.5, Glycerin, 12.5, Water, 25, Aromatic Elixir (*U S P*), 50—*U S N F* 1906.

BISMUTH ET AMMONII CITRAS EFFERVESCENS 2 grains are contained in 1 dm.

FERRI'S SNUFF—Bismuth Subnitrate, 6 dm, Morphine Hydrochloride, 2 grains, Gum Acacia, in powder, 2 dm—*L*, '76, 1525.

It is described as a speedy and efficacious remedy for a recent cold in the head, each time the nostrils are cleared another pinch should be taken, using it frequently at first. One quarter to one half of this formula may be used in the twenty-four hours.

Glass insufflators are made to blow it up the nostrils.

This has been incorporated in the *B P C* as follows—

Insufflatio Bismuthi et Morphinae—Bismuth Subnitrate, 75, Morphine Hydrochloride 0.40, Gum Acacia, in powder, to make 100.

GLYCERITUM BISMUTHI—A solution of Bismuth and Ammonium Citrate in Ammonia and Water containing Glycerin. 1 fl dm contains 16 grains of the salt—*U S N F* 1896.

4 c c (1 fl dm) contains about 1 gm (16 grains) of Bismuth and Sodium Tartrate—*U S N F* 1906.

LIQUOR BISMUTHI CONC—Dissolve 7 of Bismuth Subnitrate in 10 of equal volumes of Nitric Acid and Distilled Water with a gentle heat, when cold add first a solution of Citric Acid 5 in Distilled Water 7, and subsequently stirring in a solution of Sodium Bicarbonate 8½ in Distilled Water 7. Wash the precipitate free from Nitrates, and after draining dissolve it in solution of Ammonia 6, or a sufficient, and add solution of Ammonium Citrate 12, and Distilled Water, *q s* to yield 50—*B P C Formulary* 1901.

Incorporated in the *B P C*

LOTIO BISMUTHI—Bismuth Subnitrate, 10 grains, Water, 1 fl oz. A sedative lotion in cases of eczema.

MISTURA BISMUTHI COMPOSITA—Compound—Caradomoms, 9 fl oz, Chloroform, 70 minims, Liquid Extract of Nux Vomica, 85 minims, Diluted Hydrocyanic Acid, 320 minims. Mix and add Concentrated Solution of Bismuth, 15 fl oz, Morphine Hydrochloride, 8 grains dissolved in 4 fl dm of Distilled Water, add finally Distilled Water, *q s* to yield 20 fl oz.

Each fl dm contains 2 minims of Diluted Hydrocyanic Acid, ½ grain of Morphine Hydrochloride, and the equivalent of 5 minims of Tincture of Nux Vomica—*B P C Formulary* 1901.

Dose—20 to 30 minims=1.2 to 1.8 c c

Mistura Bismuthi Composita—Bismuth Citrate, 320 grains; Solution of Ammonia, *q s*, Chloroform, 32 minims, Tincture of Nux Vomica 1 fl oz, Diluted Hydrocyanic Acid 128 minims, Solution of Carmine (Martindale), 32 minims, Distilled Water, *q s* to produce 8 fl oz. Rub the Bismuth Citrate with a little Water, add Solution of Ammonia until salt is just dissolved

and make up to 6 oz with Distilled Water. Dissolve the Chloroform in the Tincture of Nux Vomica and add to the Bismuth Solution, then add the Solution of Carmine and filter, wash the filter paper with sufficient Distilled Water to produce with the Hydrocyanic Acid 8 fl oz of finished product. Each fl drim is equivalent to 1 drim of the *B P* Bismuth Solution, 10 minims of Spirit of Chloroform, $7\frac{1}{2}$ minims of Tincture of Nux Vomica, and 2 minims of Diluted Hydrocyanic Acid. Dose — $\frac{1}{2}$ to 1 drim — *Bournemouth Formulary*

This has been incorporated in the *B P C*

MISTURA BISMUTHI COMPOSITA CUM PEPSINO — Bismuth Citrate, 320 grains, Solution of Ammonia, *q s*, Soluble Scale Pepsin, 64 grains; Chloroform, 32 minims, Tincture of Nux Vomica, 1 fl oz, Diluted Hydrocyanic Acid, 128 minims, Solution of Carmine (Martindale), 32 minims, Distilled Water, *q s* to produce 8 fl oz. Rub the Bismuth Citrate with a little Water, add Solution of Ammonia until salt is just dissolved, and make up to 4 oz with Distilled Water. Dissolve the Pepsin in 2 oz of Water and add to the Bismuth Solution, then add the Chloroform dissolved in the Tincture of Nux Vomica, and the Carmine Solution, filter, and wash the filter paper with sufficient Water to produce with the Hydrocyanic Acid 8 fl oz of finished product. Each fl drim is equivalent to Solution of Bismuth, 1 drim, Spirit of Chloroform, 16 minims, Tincture of Nux Vomica, $7\frac{1}{2}$ minims, Pepsin, 1 grain, Hydrocyanic Acid, 2 minims — *Bournemouth Formulary*

This has been incorporated in the *B P C*

MISTURA BISMUTHI COMPOSITA CUM MORPHINA — Morphine Hydrochloride, 1 grain, Compound Bismuth Mixture, 3 fl oz. Each fl drim contains $\frac{1}{24}$ grain of Morphine Hydrochloride. Dose — $\frac{1}{2}$ to 1 drim — *Bournemouth Formulary*

This has been incorporated in the *B P C*

UNGUENTUM BISMUTHI — Bismuth Subnitrate, 60 grains, Lard, 1 oz. Bismuth Subnitrate, 12 5, Lard, 87 5 — *B P C*

BISMUTHI BENZOAS — A white powder, without taste, almost insoluble in Water. Given internally as an antiseptic and sedative. Used externally as an antiseptic dusting powder.

Dose — 5 to 20 grains = 0 32 to 1 3 gramme

Foreign Pharmacopœias — Official in Mex, not in the others

Tests — When dissolved in diluted Hydrochloric Acid and separated from the precipitated Benzoic Acid, the filtrate should answer the tests distinctive of Bismuth given under Bismuth Carbonate. When shaken with a few drops of Ferric Chloride Test-solution a buff coloration is produced. The Benzoic Acid separated from the salt should possess the melting point and conform to the tests for identity and purity given under Benzoic Acid. The salt should leave from 60 to 70 p c of Bismuth Oxide after ignition at a low red heat.

It should be free from the impurities mentioned under Bismuth Carbonate

BISMUTH CITRAS — A white amorphous, odourless and tasteless powder

Solubility — Insoluble in Water, readily in Solution of Ammonia, and in solutions of alkali citrates

Medicinal Properties — Similar to the Subnitrate

Dose — 2 to 5 grains = 0 13 to 0 32 gramme

Foreign Pharmacopœias — Official in U S. Not in the others

Tests — The residue obtained on ignition, when dissolved in warm Nitric Acid yields the tests distinctive of Bismuth given under Bismuth Carbonate. The salt chars when first heated and the residue left on ignition is more or less black in colour with a yellow surface. If to the solution of Bismuth Citrate in Ammonia Solution sufficient Hydrogen Sulphide be added to precipitate the whole of the Bismuth, the filtrate, when freed from Hydrogen Sulphide and boiled with an excess of Calcium Hydroxide Solution yields a white precipitate. The salt is official in the *U S P* and is required to contain not less than $\frac{1}{4}$ 75 p c

nor more than 99.17 p.c. of pure Bismuth Citrate, as gravimetrically determined by weighing.

As regards arsenic, it should be free from the impurities mentioned under Bismuth Carbonate and when the Bismuth is separated by Hydrogen Sulphide, the latter removed, the filtrate when mixed with an equal volume of concentrated Sulphuric Acid, and cooled should produce no brown or brownish-black colour round a crystal of Ferrous Sulphate.

BISMUTHI ET AMMONII CITRAS—Small shining translucent scales, which yield Ammonia when warmed with a solution of a fixed alkali, and gradually lose Ammonia on exposure to the air.

Solubility—1 in 1 of Water, sparingly in Alcohol (90 p.c.)

Dose.—2 to 5 grains = 0.13 to 0.32 gramme

Foreign Pharmacopœias.—Official in U.S. Not in the others.

Tests—A blackish residue with a yellow surface remains when the salt is ignited, and a solution of this residue in warm Nitric Acid yields the tests distinctive of Bismuth given under Bismuth Carbonate. When heated with an excess of Potassium or Sodium Hydroxide Solution, the salt evolves a strong odour of Ammonia and yields a white precipitate when the Bismuth is separated from its solution by means of.

and the excess of the latter is removed by heat, the filtrate when boiled with an excess of Calcium Hydroxide Solution yields a white precipitate. The U.S.P. requires the salt to yield not less than 46 p.c. nor more than 50 p.c. of pure Bismuth Oxide as gravimetrically determined by ignition and oxidation with Nitric acid.

It should be free from the impurities mentioned under Bismuth Carbonate, should give a negative test for Arsenic, and when separated from the Bismuth and from the excess of the latter by boiling should, when mixed with an equal volume of concentrated Sulphuric Acid and cooled, yield no brown or brownish-black coloration to a crystal of Ferrous Sulphate dropped into the mixture.

BISMUTHI NITRAS ($\text{Bi}(\text{NO}_3)_3 \cdot 5 \text{H}_2\text{O}$, eq. 481.44)—In colourless transparent crystals. Decomposed by Water, giving a white precipitate of Subnitrate. Soluble in Glycerin, but is slowly deposited from the solution when Water is added.

A glycerole can be made containing 60 grains to the oz.; but as an application in skin diseases the strength should in most cases not exceed 10 grains to the oz.—*M.T.* 76 ii 646.

The salt should be dissolved without the application of heat.

Official in Fr. (Azotate Neutre de Bismuth)

BISMUTHI OLEAS—Crystallised Bismuth Nitrate, 280 grains, dissolve cold in Glycerin 4 oz. by weight, add slowly Solution of Sodium Oleate, 20 fl. oz.; warm gently, wash by decantation, collect and dry. It forms a pearly-grey soft bland substance.

Medicinal Properties. It is a reliable application in pustular eruptions and hyperæmia of the skin.—*B.M.J.* '84, ii 751.

Unguentum Bismuthi Oleatis (Sir T. McCall Anderson)—Oxide of Bismuth, 1 drim, Oleic Acid, 1 drim, White Wax, 1½ drim, Vaseline, 9 drim—*Pharm. Form.*

Bismuth Oleate, 10, Soft Paraffin, 90.—*B.P.C.*

BISMUTH-PHENOL (Bismuth Phenate)—Prepared by adding a solution of Phenol in an alkali, to a solution of Bismuth Oxynitrate. A greyish-brown amorphous powder, insoluble in Water and Alcohol (90 p.c.). Recommended as an intestinal antiseptic.—*J.J.* (3) xxiv 182, *C.D.* 93, ii 576.

Dose.—5 to 20 grains = 0.32 to 1.3 gramme.

BISMUTHI SUBGALLAS (Dermatol)—A light yellow amorphous insoluble powder, introduced as an odourless substitute for Iodoform.

Sometimes causes symptoms of Bismuth poisoning.

Given for gastric ulcer and diarrhoea in doses of 8 to 30 grains twice a day —
L '97, 11 404

Solubility—Insoluble in Water, Alcohol (90 p c) and in Ether Soluble with decomposition in mineral acids, and readily soluble in alkali Hydroxide Solutions

Foreign Pharmacopœias—Official in Austr, 58 to 55 p c of Bi_2O_3 , Belg, 52 p c, Dutch, 52 to 56 p c, Dan, Ger, Swed and Swiss, 52 p c, Fr, 56 45 p c, Ital, not less than 55 p c, Jap, 51 p c, Mex and Russ, no p c given, Russ also includes a Tannate, Span, 56 66 p c, U S, 52 to 57 p c Not in the others

Tests—When strongly heated it chars, and on ignition leaves a yellow residue, which dissolves in Hydrochloric and in Nitric Acids, yielding a solution which answers the tests distinctive of Bismuth given under Bismuth Carbonate After complete separation of the Bismuth by means of Hydrogen Sulphide and the removal of the latter by boiling, the cold filtrate yields with a drop of Ferric Chloride Test solution a bluish-black coloration The salt is official in the *U S P* and in the *P G*, the former requires it to yield not less than 52 p c nor more than 57 p c of pure Bismuth Oxide, the latter not less than 52 p c of Bismuth Oxide

The more generally occurring impurities are Arsenic and those usually associated with Bismuth, Ammonium salts, Carbonate and Nitrate, free Gallic Acid Bettendorf's test is employed in both Pharmacopœias as a test for Arsenic The methods of detecting the impurities usually associated with Bismuth are given under Bismuth Carbonate The *U S P* and *P G* both use Alcohol as a solvent for free Gallic Acid, the former being content with the neutrality of the alcoholic solution towards blue Litmus paper as ensuring its absence, the latter evaporating the alcoholic solution to dryness, when no weighable residue should remain The *U S P* employs the Sulphuric Acid and Ferrous Sulphate test for Nitrate, the *P G* the reduction with Zinc and powdered Iron, when on boiling with Sodium Hydroxide Solution (15 p c), no evolution of Ammonia should take place

Bismal (Bismuth Methylendigallate)—Introduced as an astringent for internal administration in cases of diarrhoea Insoluble in Water

Dose—1 to 4 grains = 0 06 to 0 26 gramme

BISMUTHI OXYIODOGALLAS (Aiol, Airoform and Airogen)—A bulky greyish powder, odourless and tasteless, insoluble in Water and Alcohol, soluble in dilute mineral acids and in Sodium or Potassium Hydroxide Solution It is gradually converted into a more basic salt by the action of light and moist air, and should therefore be kept in well-stoppered dark amber-tinted glass bottles A combination of Dermatol with Iodine, introduced as a substitute for Iodoform, has attracted a good deal of attention as an antiseptic dressing Used as a dusting powder for ulcers, also mixed with Vaseline or anhydrous Lanolin —*B M J* '98, 1 144, *L* '99, 1 240

Sometimes badly tolerated —*B M J E* '97, 11 43

Comparative experiments with Aiol, Dermatol and Iodoform —*B M J E* '97, 1 67

Foreign Pharmacopœias—Official in Belg and Swiss Not in the others

Tests—A solution in dilute Hydrochloric Acid gives with Hydrogen Sulphide a black precipitate, and if this precipitate be separated, washed and dissolved in Nitric Acid the solutions should yield the tests distinctive of Bismuth given under Bismuth Carbonate A small quantity of the salt warmed with a few drops of concentrated Sulphuric Acid evolves violet vapours of Iodine, its Hydrochloric Acid Solution when treated with Chlorine Water and shaken with Carbon Bisulphide, colours the latter violet A solution in very dilute Hydrochloric Acid gives with Ferric Chloride Test-solution a dark green coloration It should contain about 46 p c by weight of Bismuth Oxide, and about 24 0 p c by weight of Iodine

It should be free from the impurities mentioned under Bismuth Carbonate

BISMUTHI BETA-NAPHTHOLAS (Oiphol) — A reddish-brown powder, insoluble in Water. Recommended as an intestinal antiseptic and astringent, both for adults and children.

Dose — 5 to 90 grains = 0.32 to 1.3 gramme

Experiments with Bismuth Subnitrate and Beta-naphthol as intestinal antiseptics — *B M J* '95, ii 1483

BISMUTHI SUBIODIDUM — A brick-red amorphous powder, insoluble in Water.

Has been recommended as a substitute for Iodoform in the treatment of chancres and foul ulcers — *T G* '87, 612, *Y B P* '87, 286, *B M J* '89, i 783

Dose — 5 to 10 grains = 0.32 to 0.65 gramme

BISMUTHI TRIBROMOPHENOLAS (Xeroform) — A yellow powder, insoluble in Water and in Alcohol (90 p c). It has been recommended as a non-irritating antiseptic.

Used in wound dressing in the Cuban war — *L* '99, i 1509, and '99, ii 1459, *B M J E* '99, ii 88

Foreign Pharmacopœias — Official in Jap, Span and Swiss. Not in the others.

Tests — A white curdy precipitate is thrown down when a solution of the powder in Potassium Hydroxide Solution is acidified with diluted Sulphuric Acid, and if this precipitate be separated, washed and dried it should possess a melting point of 95° C (203° F). The filtrate from this precipitate should yield the tests distinctive of Bismuth given under Bismuth Carbonate. The powder should yield on ignition from 57 to 61 p. c. of Bismuth Oxide. It should be free from the more generally occurring impurities mentioned under Bismuth Carbonate and the residue remaining after ignition at a dull red heat when moistened with Nitric Acid, again ignited and when cool dissolved in Hydrochloric Acid should yield no reaction for Arsenic when tested by Bettendorf's test.

Bismone (Colloidal Bismuth Oxide), **Bismuthi Iodo-Resorcin-Sulphonas** (Anusol), supplied in Suppository form, **Bismuthi Quinolini Sulphocyanidum** (Crurin), **Bismuthi Cinchonidinæ Iodidum** (Lancet), **Bismuthi Di-thio-Salicylas** (Lithorin), **Bismuthi Oxylchloridum**, **Bismuthi Phosphas**, and **Bismuthi Sulphas**, are combinations of Bismuth, mostly insoluble in Water, which have received notice in Medical Literature.

Not Official.

BOLDO.

The Leaves and young Twigs of the *Peumus Boldus*, Mol., a native of Chili. The activity is due to a Glucoside, Boldine, and a volatile Oil (sp gr 0.918).

Foreign Pharmacopœias — Official in Mex and Span. Not in the others.

Medicinal Properties — Has been used as a liver stimulant and as a diuretic, as a stimulant to digestion, also as a hypnotic — *B M J* '85, ii 1134, '88, i 918, gastric stimulant and sedative, antispasmodic, cholagogue — *B M J E* '07, ii 72

Boldine has been given as a hypnotic in capsules containing 3 grains.

TINCTURA BOLDO. — Boldo Leaves, 1, Alcohol (60 p c), 10

Macerate seven days and filter

Dose. — 10 to 40 minims = 0.6 to 2.4 c.c.

This has been incorporated in the *B P C*.

Foreign Pharmacopœias. — Mex, 1 and 5; by weight. Not in the others.

BONE MARROW See **MEDULLA RUBRA**

BORAX.**BORAX***B P Syn*—BIBORATE OF SODIUMFR, BORATE DE SOUDE, GER, NATRIUMBORAT, ITAL, BORATO DI SODIO,
SPAN, BORATO SODICO $\text{Na}_2\text{B}_4\text{O}_{10}$, $10\text{H}_2\text{O}$, eq 379 12

Transparent colourless monoclinic prisms, usually efflorescent

Though this salt is acid in constitution, it gives alkaline reactions with Litmus and Methyl Orange Solutions

Solubility—1 in 25 of Water, 2 in 1 of boiling Water, 2 oz of Borax are dissolved by 2 fl oz of Glycerin, and the solution measures only $3\frac{1}{4}$ fl oz By the aid of 1 of Glycerin, 1 part of Borax will dissolve in 12 of Water Insoluble in Alcohol (90 p c)

Borax is decomposed by Glycerin, forming a solution which reddens Litmus paper, and effervesces with Sodium Bicarbonate

Medicinal Properties—Antiseptic and parasiticide, mildly astringent A local sedative to inflamed mucous membrane As a lotion 10 grains to the oz, as a gargle (saturated solution) about 20 grains to the oz, and as an injection in leucorrhœa and gonorrhœa The Glycerin of Borax is used as a paint for the throat, for cracked nipples, and for erythematous skin eruptions The Glycerin or Mel is used in aphthous ulceration of the tongue or buccal mucous membrane, and for mercurial salivationInternally in epilepsy (*L* '93, 11 1586, '95, 11 755), but is inferior to Bromide and has many inconveniences—*B M J E* '95, 1 4Has been recommended by some authorities in epilepsy, but (*L* '05, 1 710) unless in combination with Bromides it has not been found of much use, although a combination of Borax and Digitalis has been found serviceable in some cases of minor epilepsyThe effects of Borax on infants—*L* '07, 11 369**Dose.**—5 to 20 grains = 0 32 to 1 3 gramme**Prescribing Notes**—*For internal use it is generally given in solution Should not be prescribed with salts of Cocaine or other alkaloids***Incompatibles.**—Mineral Acids and most of their metallic salts, also alkaloidal salts Mucilage of Gum Acacia**Official Preparations**—Glycerinum Boracis and Mel Boracis**Not Official**—Gargarisma Boracis, Liquor Boracis, Liquor Sodii Boratis Compositus, Lotic Boracis, Nebula Antiseptica Alkalina, Seiler's Antiseptic, Tinctura Myrrhæ et Boracis, Trochisci Boracis, and Unguentum Boracis**Foreign Pharmacopœias**—Official in Austr, Belg, Dan, Dutch, Fr, Ger., Hung, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U S**Tests.**—The distinguishing tests for Sodium Borate are the brown coloration (changing to bluish-black on treatment with alkalis) which its acidified aqueous solution produces with Turmeric paper, the intense yellow coloration which the salt imparts to a non-luminous flame; the white scaly crystalline precipitate thrown down when a hot saturated solution of the salt is acidulated with a mineral acid, and the green coloration imparted to a non-luminous flame when the solution of this precipitate in Alcohol (90 p c) is ignited *U S P*

BISMUTHI BETA-NAPHTHOLAS (Orphol) —A reddish-brown powder, insoluble in Water. Recommended as an intestinal antiseptic and astringent, both for adults and children

Dose —5 to 20 grains = 0.32 to 1.3 gramme

Experiments with Bismuth Subnitrate and Beta-naphthol as intestinal antiseptics —*B M J* '95, n 1483

BISMUTHI SUBIODIDUM —A brick-red amorphous powder, insoluble in Water

Has been recommended as a substitute for Iodoform in the treatment of chancre and foul ulcers —*T G* '87, 612, *Y B P* '87, 286, *B M J* '89, 1 783

Dose —5 to 10 grains = 0.32 to 0.65 gramme

BISMUTHI TRIBROMOPHENOLAS (Xeroform) —A white, crystalline, insoluble in Water and in Alcohol (90 p c). It has been recommended as an irritating antiseptic.

Used in wound dressing in the Cuban war —*L* '99, 1 1509, and '99, n 1459, *B M J E* '99, 1 88

Foreign Pharmacopœias —Official in Jap, Span and Swiss. Not in the others

Tests.—A white precipitate is thrown down when a solution of the powder in Potassium Iodide solution is acidified with diluted Sulphuric Acid, and if this precipitate be separated, washed and dried it should possess a melting point of 95° C (203° F). The filtrate from this precipitate should yield the tests distinctive of Bismuth given under Bismuth Carbonate. The powder should yield on ignition from 57 to 61 p c of Bismuth Oxide. It should be free from the more generally occurring impurities mentioned under Bismuth Carbonate and the residue remaining after ignition should not become moistened with Nitric Acid, again ignited and dissolved in Hydrochloric Acid should yield no reaction for Arsenic.

Bismone (Colloidal Bismuth Oxide), **Bismuthi Iodo-Resorcin-Sulphonas** (Anasol), supplied in Suppository for **Bismuthi Quinolini Sulphocyanidum** (Cruin), **Bismuthi Cinchonidinæ Iodidum** (Cruin), **Bismuthi Di-thio-Salicylas** (Thioform), **Bismuthi Oxochloridum**, **Bismuthi Phosphas**, and **Bismuthi Sulphas**, are Water, which have received notice in Medical Literature

Not Official.

BOLDO.

The Leaves and young Twigs of the *Peumus Boldus*, Mol., a native of Chili. The activity is due to a Glucoside, Boldine, and a volatile Oil (sp. gr. 0.918)

Foreign Pharmacopœias —Official in Mex and Span. Not in the others

Medicinal Properties —Has been used as a liver stimulant and as a diuretic, as a stimulant to digestion, also as a hypnotic —*B M J* '85, n 1134, 88, 1 918, gastric stimulant and sedative, antispasmodic, cholagogue —*B M J E* '07, 1 72

Boldine has been given as a hypnotic in capsules containing 3 grains.

TINCTURA BOLDO —Boldo Leaves, 1, Alcohol (60 p c), 10

Macerate seven days and filter

Dose.—10 to 40 minims = 0.6 to 2.4 c c

This has been incorporated in the *B P C*

Foreign Pharmacopœias.—Mex, 1 and 5, by weight. Not in the others.

BORAX.**BORAX***B P Syn*—BIBORATE OF SODIUM

FR, BORATE DE SOUDE, GER, NATRIUMBORAT; ITAL, BORATO DI SODIO, SPAN, BORATO SODICO

 $\text{Na}_2\text{B}_4\text{O}_7, 10\text{H}_2\text{O}$, eq 379 12

Transparent colourless monoclinic prisms, usually efflorescent

Though this salt is acid in constitution, it gives alkaline reactions with Litmus and Methyl Orange Solutions

Solubility—1 in 25 of Water, 2 in 1 of boiling Water, 2 oz of Borax are dissolved by 2 fl oz of Glycerin, and the solution measures only $3\frac{1}{4}$ fl oz By the aid of 1 of Glycerin, 1 part of Borax will dissolve in 12 of Water Insoluble in Alcohol (90 p c)

Borax is decomposed by Glycerin, forming a solution which reddens Litmus paper, and effervesces with Sodium Bicarbonate

Medicinal Properties—Antiseptic and parasiticide, mildly astringent A local sedative to inflamed mucous membrane As a lotion 10 grains to the oz, as a gargle (saturated solution) about 20 grains to the oz, and as an injection in leucorrhœa and gonorrhœa The Glycerin of Borax is used as a paint for the throat, for cracked nipples, and for erythematous skin eruptions The Glycerin or Mel is used in aphthous ulceration of the tongue or buccal mucous membrane, and for mercurial salivationInternally in epilepsy (*L* '93, 11 1586, '95, 11 755), but is inferior to Bromide and has many inconveniences—*B M J E* '95, 1 4Has been recommended by some authorities in epilepsy, but (*L* '05, 1 710) unless in combination with Bromides it has not been found of much use, although a combination of Borax and Digitalis has been found serviceable in some cases of minor epilepsyThe effects of Borax on infants—*L* '07, 11 369**Dose.**—5 to 20 grains = 0.32 to 1.3 gramme**Prescribing Notes**—*For internal use it is generally given in solution Should not be prescribed with salts of Cocaine or other alkaloids***Incompatibles**—Mineral Acids and most of their metallic salts, also alkaloidal salts Mucilage of Gum Acacia**Official Preparations**—Glycerinum Boracis and Mel Boracis**Not Official**—Gargarisma Boracis, Liquor Boracis, Liquor Sodii Boratis Compositus, Lotio Boracis, Nebula Antiseptica Alkalina, Seiler's Antiseptic, Tinctura Myrrhæ et Boracis, Trochisci Boracis, and Unguentum Boracis**Foreign Pharmacopœias**—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U.S.**Tests**—The distinguishing tests for Sodium Borate are the brown coloration (changing to bluish-black on treatment with alkalis) which its acidified aqueous solution produces with Turmeric paper, the intense yellow coloration which the salt imparts to a non-luminous flame, the white scaly crystalline precipitate thrown down when a hot saturated solution of the salt is acidulated with a mineral acid, and the green coloration imparted to a non-luminous flame when the solution of this precipitate in Alcohol (90 p c) is ignited. **U S P**

states that an aqueous solution (1 in 20) after being acidulated with Hydrochloric Acid colours blue Litmus red, yellow Turmeric paper remains unchanged until after drying

It is officially required to contain 98.57 p.c. of Sodium Pyroborate, as volumetrically determined by titration with Normal Volumetric Sulphuric Acid Solution, using Methyl Orange Solution as the indicator of neutrality, 1 gramme neutralises 5.2 c.c. of the Volumetric Solution. Phenolphthalein Solution is of no use for this titration, and even Litmus Solution gives a rather indefinite end reaction. Although Borax is constitutionally an acid salt, Boric Acid has so little action upon the usual indicators that the Sodium Oxide can be estimated by standard acid just as if no Boric Acid were present. It has been pointed out (*PJ* '02, 1 345) that inasmuch as the salt is likely to contain Sodium Carbonate, the official process is apt to give erroneous figures. The direct determination of the Boric Acid by a double titration has been suggested. The same number of c.c. of Normal Volumetric Sodium Hydroxide Solution should be required to neutralise the Boric Acid as are required of Semi-normal Volumetric Sulphuric Acid to liberate it, the titration of the free Boric Acid being conducted in 50 p.c. Glycerin Solution. The proportions indicated in the test recommended are —1 gramme of Borax dissolved in 40 c.c. of Water should require for exact neutralisation 10.55 c.c. of Semi-normal Volumetric Sulphuric Acid and 10.55 c.c. of Methyl Orange Solution as an indicator of neutrality, after boiling and adding 50 grammes of Glycerin, 10.55 c.c. of Normal Sodium Hydroxide Solution should be required to exactly neutralise, Phenolphthalein Solution being employed as the indicator of neutrality. Neither *PG* nor *USP* gives any quantitative test for Borax.

The more generally occurring impurities are Arsenic, Calcium, Copper, Iron, Lead, Magnesium, Bicarbonates, Carbonates and Nitrates, Phosphates, Chlorides and Sulphates. The *BP* groups these collectively under the usual elastic expression 'A standard of 5 parts per 1,000,000 is suggested' (*CD* '08, 1 726) for Arsenic. Tests for heavy metals, Carbonate and Bicarbonate, Nitrate and Phosphate appear in the *USP*, but no tests for Calcium, Magnesium, or Sulphate. The *PG* includes, in addition to tests for heavy metals, specific tests for Calcium, Iron, Chlorides and Sulphates. A 2 p.c. aqueous solution of the salt when acidified with Hydrochloric Acid should be unaffected by Hydrogen Sulphide Solution, indicating the absence of Arsenic, Copper and Lead. 50 c.c. of a 1 in 50 aqueous solution, after the addition of a few drops of Hydrochloric Acid should not yield an immediate coloration on the addition of 0.5 c.c. of Potassium Ferrocyanide Solution, indicating the absence of more than a faint trace of Iron. The 1 in 50 aqueous solution acidified with Acetic Acid should yield no turbidity on the addition of Ammonium Oxalate Solution, indicating the absence of Calcium, and when allowed to stand some time, this solution is filtered, should not yield on the addition of Ammonium Phosphate Solution any turbidity or precipitate, indicating the absence of Magnesium. The aqueous solution should not effervesce on the addition of

mineral acid, indicating the absence of Bicarbonates and Carbonates A 1 in 50 aqueous solution should not be rendered turbid on the addition of either Silver Nitrate or Barium Nitrate Solution, indicating the absence of Chlorides and Sulphates, nor should it be rendered turbid by Magnesium Ammonio-sulphate Solution, indicating the absence of Phosphates The *U S P* employs the Indigo test for Nitrates, requiring that if 1 gramme be dissolved in 20 c c of diluted Sulphuric Acid, by the aid of heat, and 3 drops of Indigo Test-solution be added, the blue coloration should not be discharged after heating for 10 minutes on a water-bath

Preparations

GLYCERINUM BORACIS GLYCERIN OF BORAX

Borax, 1, Glycerin, 6 (by weight 1 in $8\frac{1}{2}$, measure 1 in $6\frac{1}{2}$)

This is not merely a solution of Borax in Glycerin, the Glycerin splits up the Biorate into free Boric Acid and a more basic Borate with secondary reactions. It reddens blue Litmus paper, and effervesces on the addition of Sodium Bicarbonate

Dose — $\frac{1}{2}$ to $1\frac{1}{2}$ fl drm = 1 8 to 5 4 c c

20 minims given in diarrhoea of infants — *L* '89, 11 739

Foreign Pharmacopœias — Official in Mex (Glycerina Boratada), 1 and 19, Dan and Norw (*Linctus boracinus*), 1 and 9, all by weight Not in the others

MEL BORACIS BORAX HONEY

Borax, 2, Glycerin (by weight), 1, Clarified Honey (by weight), 16
(about 1 in 7 by volume)

Foreign Pharmacopœias — Official in Austr, 1 in 20, Mex (*Colutorio boratado*), Borax 1, Honey 1, Swiss, 1 in 10, the ingredients vary slightly Not in the others

Not Official.

GARGARISMA BORACIS — Borax, 1, Water, to 20 — *St Thomas's*

Borax, 4, Distilled Water, to produce 100 — *B P C*

Borax, 10 grains, "Glycerin, 30 minims, Distilled Water, to 1 fl oz — *St George's*

LIQUOR BORACIS (Thompson's Fluid) — Borax, 1, Glycerin, 2, Water, 2 $\frac{1}{2}$ oz to be mixed with 4 fl oz of warm Water before use — *Guy's*

LIQUOR SODII BORATIS COMPOSITUS (Dobell's Solution) (*U S N F*) — Sodium Borate, 15, Sodium Bicarbonate, 15, Carbolic Acid, 3, Glycerin, 35, Water, q s to yield 1000

This has been incorporated in the *B P C*

LOTIO BORACIS — Borax, 1, Rose Water, 24

Borax, 1, Glycerin, 1, Rose Water, 16

SEILER'S ANTISEPTIC — Sodium Bicarbonate, 8 drm, Borax, 8 drm, Sodium Benzoate, 20 grains, Sodium Salicylate, 20 grains, Eucalyptol, 10 grains, Thymol, 10 grains, Menthol, 5 grains, Oil of Wintergreen, 6 minims, Glycerin, $8\frac{1}{2}$ oz, Alcohol, 2 oz, Water, to make 256 oz — *Pharm Form*

Nebula Antiseptica Alkalina — Sodium Bicarbonate, 1, Borax, 1, Sodium Benzoate, 0.04, Sodium Salicylate, 0.04, Eucalyptol, 0.02, Thymol, 0.02, Menthol, 0.01, Oil of Gaultheria, 0.01, Distilled Water, q s, to produce 100. — *B P C*

TINCTURA MYRRHÆ ET BORACIS—Myrrh, 1, Eau de Cologne, 16, Borax, 1, Water, 8, Syrup, 8

Borax, 2, Glycerin, 2, Rose Water (undiluted), 24, dissolve and add Eau de Cologne, 48 Tincture of Myrrh (*B P* 1885), 96

Tincture of Myrrh, 37 50, Oil of Bergamot, 0 20, Oil of Lemon, 0 20, Oil of Orange, 0 20, Oil of Neroli, 0 10, Oil of Rosemary, 0 20, Borax, in powder, 2 50, Glycerin, 5, Alcohol, *q s* to produce 100—*B P C*

The *B P C Supplement* alters the quantity of Tincture of Myrrh to 35, and adds 3 5 of Tincture of Krameria

TROCHISCI BORACIS—Each Lozenge contains 3 grains of Borax Sedative—*Throat*

This has been incorporated in the *B P C*

UNGUENTUM BORACIS—Borax, 1, Spermaceti Ointment, 8

For chilblains or cracked nipples

This has been incorporated in the *B P C* as follows—

Borax, in fine powder, 12 50, Spermaceti Ointment, 87 50—*B P C*

Not Official

BROMUM.

BROMINE

FR, BROME, GER., BROM, ITAL, BROMO, SPAN, BROMO.

Br, eq 79 35

A heavy, dark red liquid, which evolves dense red, intensely irritating vapours It is obtained from sea water and from some saline springs

It should be preserved in dark, amber tinted glass bottles, provided with closely fitting glass stoppers and should be kept in a cool place

Solubility—In Water, 1 in 30 by weight Readily soluble in Glycerin, Alcohol (90 p c), Ether, Chloroform, and Carbon Bisulphide, with gradual decomposition of the solvents

Medicinal Properties—Deodoriser and disinfectant Used medicinally as a sedative in the form of Bromides and Diluted Hydrobromic Acid

Official Preparations—Used to prepare Potassium Bromidum and Sodium Bromidum

Foreign Pharmacopœias—Official in Belg, Fr, Ger., Mex (Bromo), Ital, Jap, Port, Span, Swiss and U S Not in Austr, Dan, Dutch, Hung, Norw, Russ or Swed

Tests.—Bromine has a *density* of 2 97 to 3 14, and a boiling point of about 63° C (145 4° F) It is completely volatilised by heat, without leaving any residue When treated with Potassium Hydroxide Solution in excess it should form a perfectly clear liquid It this liquid be rendered faintly acid with diluted Nitric Acid it yields with Silver Nitrate Solution a yellowish precipitate soluble with difficulty in Liquor Ammonia, insoluble in Nitric Acid It gives a yellow coloration to Starch Solution, and decolorises Litmus and Indigo Solutions

The more generally occurring impurities are mineral matter, organic Bromine compounds, and Iodine Mineral matter is readily detected by a residue remaining after volatilisation Organic Bromine compounds are manifested by the failure to produce a clear solution on treatment with an excess of Potassium Hydroxide Solution Iodine by the blue colour imparted to Starch Solution by an aqueous solution of Bromine, which has been nearly decolorised by the addition of a slight excess of reduced Iron, and to which a small amount of Ferric Chloride has been added

Bromine is official in the U S P and in the F G, the former stipulates that it shall contain not less than 97 p c of pure Bromine, but gives no process for its quantitative determination.

HYPOBROMITE SOLUTION FOR UREA-ESTIMATION—Prepare a stock Solution of Soda (sp gr 1.310) by dissolving $\frac{3}{4}$ oz of pure Sodium Hydroxide in 9 fl oz of Water. To 7 fl drms of this add 42 minims (about 114 grains) of Bromine when the Solution is wanted for use.

Note—The vapour of Bromine is very irritating to the air passages. Bromine can be weighed by taking the difference between the weight of the bottle before and after pouring some out, and calculating the quantity of Soda Solution required.

Glass tubes (hermetically sealed) containing the above quantity of Bromine are made.

In place of 42 minims of Bromine, 2 fl drms of the following concentrated solution of Bromine can be used to 6 fl drms of the Soda Solution—

Liquor Bromi Conc—Bromine, 168 minims = 450 grains, Potassium Bromide, 240 grains, Water, to 1 fl oz. Mix the Bromine and Potassium Bromide and add the Water gradually with constant stirring until 1 fl oz of solution is obtained.

This has been incorporated in the *B P C* as follows—

Liquor Bromi Fortis—Bromine, by volume, $\frac{3}{4}$, Potassium Bromide, $\frac{54}{100}$; Distilled Water, *q s* to produce 100—*B P C*.

BROMIPIN—A pale yellow oily liquid. It is a Bromine addition-compound of the fatty acid of Sesame Oil, containing about 83 p c of Bromine.

Introduced for the treatment of epilepsy, in doses of 1 fl drms.

Being difficult to dispense and costly has not met with much success in epilepsy.—*L '05*, 1.710.

Prescribing Notes—It may be given in capsules, or in emulsion with Mucilage of Gum Acacia.

BROMOFORM (CHBr_3 , eq 250.96)—A heavy, translucent, colourless, mobile liquid, about twice as heavy as Chloroform. It has a pleasant ethereal odour, and a sweetish taste somewhat resembling Chloroform. The *U S P* defines Bromoform as a liquid consisting of 99 p c by weight of absolute Bromoform and 1 p c of Absolute Alcohol.

It undergoes change in colour on exposure to the light, and should therefore be kept in well stoppered dark amber-tinted glass bottles, and should be kept in a cool atmosphere.

Solubility—1 in 800 of Water, soluble in all proportions of Alcohol (90 p c), of Ether, and of Almond Oil, about 1 in 80 of Glycerin.

Dose.— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 c c.

Ph Ger maximum single dose, 0.5 gramme, maximum daily dose, 1.5 grammes.

Prescribing Notes—It is but slightly soluble in Water, and owing to its high sp gr, it is difficult of suspension, and from this cause accidents have occurred from patients taking an excessive quantity in the last dose of a mixture. For oral administration it is best dissolved in Almond Oil, which can then be put into capsules or made into an emulsion, see below.

It decomposes and becomes yellow on exposure to sunlight, and should not then be dispensed.

Given for the relief of whooping cough in doses of 2 to 5 drops three or four times a day, in some cases it caused languor and drowsiness, and an over-dose produced toxic symptoms.—*L '90*, 1.139, '93, 1.1062, *Pr* xlv 47, *T.G '90*, 694, '91, 214, *B M J '01*, 1.1202, 1543.

Importance emphasised of shaking the mixture containing it, before pouring out dose, and of accurately measuring it.—*B M J '07*, 1.299.

Foreign Pharmacopœias—Official in Belg, Dutch, Fr, Ger, Span, Swiss and U S.

Tests—Bromoform has a specific gravity of 2.829 to 2.883, a boiling point of 148°C to 150°C (298.4°F to 302°F), and a solidifying point of 8°C (42.8°F). A few drops of Bromoform boiled with Potassium Hydroxide Solution, and the mixture evaporated to dryness on a water-bath, yield a

residue a portion of which dissolved in Water and faintly acidified with diluted Nitric Acid yields, with Silver Nitrate, a white precipitate, insoluble in Nitric Acid, practically insoluble in Water, and a portion of the residue when dissolved in Water, and acidified with Hydrochloric Acid and Chlorine Water added yields a reddish-brown coloration, and when shaken with Chloroform the reddish-brown colour passes into the chloroformic liquid.

The more generally occurring impurities are mineral matter, free Hydrobromic Acid, Bromides, and Bromine derivatives, free Bromine, and Acetone. Mineral impurity is at once manifested by a residue remaining after evaporation. Free Acid may be detected by the reaction towards Litmus paper, of Water which has been shaken with an equal volume of the sample and allowed to separate. Bromides and Bromine derivatives by the production of a turbidity or precipitate on the addition of Silver Nitrate Solution to the same aqueous menstruum. Free Bromine is detected by the liberation of Iodine from solution of either Cadmium, Potassium, or Zinc Iodide Solution and the subsequent addition of a blue colour with Starch Solution. The U.S.P. employs the following: Starch Solution, the P.G. Zinc Iodide Solution, and the Belg. Cadmium Iodide Starch Solution. Acetone may be detected by the formation of Iodoform, when the aqueous layer separated after shaking together equal volumes of the sample and Water, is treated first with Ammonia Solution in excess and then with Iodine and Ammonium Iodide Solution. A test for this impurity is included in the U.S.P., but not in the P.G. The P.G. states that when equal parts of Bromoform and Water are shaken together, in a vessel which has been rinsed with Water, the coloration of the Acid shall take place within 10 minutes. No such test appears in the U.S.P.

Emulsio Bromoform—Bromoform 40 minims, Almond Oil, 70 minims, Gum Acacia, 40 grains, Syrup, 100 minims, Distilled Water, to 1 fl oz. Dissolve the Bromoform in the Oil or Vaseline and calculate in the usual way.

One minim is contained in 6 minims of the Emulsion.

Dose.—5 to 20 minims = 0.6 to 1.2 cc.

Mistura Bromoformi—Bromoform 12 minims, Almond Oil, 60 minims, Powdered Gum Acacia, 120 grains, Simple Syrup, 240 minims, Water, to make 3 fl oz. Dissolve the Bromoform in the Almond Oil, rub this with the Powdered Gum Acacia, add $\frac{3}{4}$ fl dr of Water and rub into a paste, gradually add the remainder of the Water, and finally the Syrup.

One minim is contained in 2 fl dr of the Mixture.

Dose.—1 to 4 fl dr = 3.6 to 14.2 cc.

BROMETHYLFORMINE (Bromaline)—A white crystalline, almost odourless powder. Has been recommended as a sedative in epilepsy.

Solubility—2 in 1 of Water, 1 in 23 of Alcohol (90 p.c.), insoluble in Ether and in Chloroform.

Dose.—5 to 30 grains = 0.32 to 2 grammes.

Tests—Bromethylformine dissolves readily in Water, forming a clear neutral solution. The aqueous solution when gently warmed with Sodium Hydroxide Solution yields on the addition of a slight excess of Iodine a strong characteristic odour of Iodoform. When Bromine Water is added in excess an orange-red precipitate is thrown down, the precipitation being more pronounced in strong solutions. When boiled with Sodium Hydroxide Solution it evolves Ammonia gas readily recognised by its odour and by its action on red Litmus paper. If the liquid be now cooled, acidified with Sulphuric Acid, and again boiled, it evolves the characteristic irritating odour of Formaldehyde. Boiled with Sodium Hydroxide Solution, cooled, and acidified with dilute Nitric Acid, it yields with Silver Nitrate Solution, a yellowish precipitate practically insoluble in Ammonia Solution, insoluble in Nitric Acid, when dissolved in Sulphuric Acid a yellowish-brown coloration, which passes into solution when shaken with Chloroform. It leaves no residue when ignited with free access of air.

Not Official BRYONIA

The Root of *Bryonia alba*, L., and of *Bryonia dioica*, Jacq

Medicinal Properties—In large doses it is an active hydragogue cathartic, in small doses it is given in pleurisy. It has also been used as a hæmostatic in menorrhagia.—L '88, if 438

It has been used for many years by the homœopaths in the form of tincture. The active principle is a glucoside

Foreign Pharmacopœias—Official in Mex and Port. Not in the others

Descriptive Notes—The root of *Bryonia dioica*, Jacq., is usually the kind met with in commerce. It occurs in circular transverse slices of a yellowish-white colour, about $1\frac{1}{2}$ to 3 inches (37 to 75 mm) or more in diameter and $\frac{1}{2}$ to $\frac{3}{4}$ inch (6 to 8 mm) thick. The narrow bark, which is a very pale brown externally, is separated from the fleshy centre by a fine line, and the cut surface is marked with concentric rings, and with radiating lines of vascular tissue. The dried root has no definite odour, but has a bitter and acrid taste. The fresh root, which is often as much as 2 feet (60 cm) long and 3 inches (75 mm) in diameter at the upper end, is occasionally offered by gardeners under the name of Mandrake root. In homœopathic medicine, the root of *Bryonia alba* is preferred, and is imported from Germany. The plant is distinguished from *Bryonia dioica* by having monocotyledonous flowers and black berries. The plant contains Brein, a glucoside not found in *B. dioica*, and the root is considered to have a different medicinal action, it is stated by Petresco to be not purgative.

TINCTURA BRYONIAE—Made from fresh Bryony Root of such a strength that 10 fl oz shall represent 1 oz of the dried root and shall contain 60 p c by volume of Alcohol.—*B P C Formulary* 1901

Fresh Bryony Root yields on an average 32 to 40 p c of dried root

Dose—1 to 10 minims = 0.06 to 0.6 c c

This has been incorporated in the *B P C*

Foreign Pharmacopœias—Mex, 1 and 5, dried Root

Antidotes—An emetic, stimulants, Brandy or Spirit of Sal Volatile

BUCHU FOLIA.

BUCHU LEAVES

NO Syn.—BUCCO, DIOSMA

FR, FEUILLES DE BUCCO, GER, BUCCOBLÄTTER

The dried leaves of *Barosma betulina*, contain a volatile oil, a bitter principle, and a mucilage

Medicinal Properties.—Tonic, stomachic, diuretic, and diaphoretic. Given chiefly in complaints of the urinary organs, as an antiseptic in chronic cystitis, and in irritation of the bladder and urethra. Also in dyspepsia, chronic rheumatism, and dropsy

Dose—Usually given in the form of Infusion or Tincture, *q v*

Official Preparations—Infusum Buchu and Tinctura Buchu

Not Official—Fluëxtractum Buchu, Infusum Buchu Concentratum, Mistura Buchu Composita

Foreign Pharmacopœias—Official in Jap, Mex, Port. and U S. Not in Austr., Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Norw, Russ, Span, Swed or Swiss

Descriptive Notes.—The dried leaves of *Barosma betulina*, Bart and Wendl, are alone official. These are easily distinguished from the leaves of *B serratifolia*, Willd and *B crenulata*, Hook, which were formerly official, and are still to be met with in commerce, by their obovate shape and recurved obtuse apex. The oil glands on the toothed margin of the leaf and its size (which is given in *B P* as $\frac{1}{2}$ to $\frac{3}{4}$ inch, or 12 to 20 mm, in length), and the layer of mucilaginous cells below the epidermis and the yellow crystals of hesperidin contained in the epidermal cells, are useful characters for distinguishing Buchu from other leaves. The oil of the leaves *B betulina* deposits crystals of Diosphenol, to which the antiseptic properties of the leaves are probably due, this is not the case with the Oil from the other species. Diosphenol has an odour like Menthol. The official leaves have also the advantage that they cannot be mistaken, like those of *B serratifolia* and *B crenulata*, for the leaves of any other species, on account of their very characteristic shape.

Tests—Buchu Leaves yield about 5 p c of ash on ignition, and 6 p c is seldom exceeded. 12 samples examined in the author's laboratory yielded from 3.6 to 5.68 p c, with an average of 4.52 p c.

Preparations

INFUSUM BUCHU. INFUSUM OF BUCHU

Buchu, 1, boiling Distilled Water, 20, infuse 15 minutes (1 in 20)

Dose.—1 to 2 fl oz = 28.4 to 56.8 c c

Not in the other Pharmacopœias

TINCTURA BUCHU TINCTURE OF BUCHU

1 of Buchu Leaves, in No 20 powder percolated with Alcohol (60 p c) to yield 5 (1 in 5)

Dose.— $\frac{1}{2}$ to 1 fl drim = 1.8 to 3.6 c c

Foreign Pharmacopœias—Official in Mex, 1 and 5, both by weight. Not in the others

Tests.—Tincture of Buchu has a sp gr of 0.925 to 0.935, it contains about 4 p c w/v of total solids and about 58 p c of Absolute Alcohol

Not Official

FLUIDEXTRACTUM BUCHU—Macerate 100 of Buchu in No 60 powder with 40 of a mixture of Alcohol (95 p c) 3 and Water 1, and percolate with more of the mixture until the drug is exhausted. Reserve the first 85 of the percolate and evaporate the remainder at a temperature not exceeding 50° C. (122° F) to a soft extract, dissolve this in the reserved portion and add enough menstruum to make 100—*U S P*

INFUSUM BUCHU CONCENTRATUM—Buchu Leaves, bruised, 40, Tincture of Buchu, 22.5, Alcohol (90 p c), 10, Dilute Chloroform Water (1 in 1000), q s to make 100. Prepare by macero-expression. **Dose**—1 to 2 fl drim—*Pharm* and *Wright*, *P J* '06, 165, '07, 1621, *C D* '06, 1252, *Y B P* '07, 249. The authors state that it keeps well, but the product of dilution is not equal to the fresh infusion.

It appears in the *B P C*

MISTURA BUCHU COMPOSITA — Potassium Citrate, 30 grains, Tincture of Hyoscyamus, 30 minims, Infusion of Buchu, to 1 fl oz — *Charing Cross*

Potassium Bicarbonate, 15 grains, Tincture of Hyoscyamus, 20 minims, Spirit of Chloroform, 10 minims, Infusion of Buchu, to 1 fl oz — *King's*

Potassium Citrate, 20 grains, Tincture of Hyoscyamus, 15 minims, Infusion of Buchu, to 1 fl oz — *St Thomas's*

The last has been incorporated in the *B P C*

BUTYL-CHLORAL HYDRAS.

BUTYL CHLORAL HYDRATE

$C_4H_9Cl_2O \cdot OH_2O$, eq 191 97

White crystalline scales of a silky lustre, with a somewhat fruit-like but disagreeable odour and bitter nauseous taste

Butyl-Chloral Hydrate, formerly known as Croton-Chloral Hydrate, is, chemically, Trichlorobutylidene Glycol, and is prepared by acting upon Aldehyde or, preferably, Paraldehyde with Chlorine gas

It should be preserved in well-stoppered amber-tinted glass bottles

Solubility — 1 in 44 of Water, 1 in 1 of Glycerin (very slowly), 5 in 3 of Alcohol (90 p c), 1 in 20 of Olive Oil, 1 in 2 of Ether, 1 in 20 of Chloroform

Some books give the solubility as 4 in 1 of Glycerin, but this is incorrect

Medicinal Properties — Analgesic, is frequently but not always an efficient remedy in neuralgia of the face and head, and in tic-douloureux. As a hypnotic it is seldom used, being weaker and less certain than Chloral Hydrate

Dose. — 5 to 20 grains = 0.32 to 1.3 gramme

Prescribing Notes — *Generally given in the form of pills made with a little Compound Powder of Tragacanth and Syrup. The addition of Alcohol or Glycerin to aqueous mixtures increases its solubility*

Not Official — Mistura Butyl Chloral, Pilula Butyl-Chloral, Pilula Butyl Chloral cum Gelsemio, Syrupus Butyl-Chloral

Antidotes — The same as for Chloral Hydrate

Tests — The distinguishing tests for Butyl-Chloral Hydrate are its melting point, about $78^{\circ} C$ ($172.4^{\circ} F$), and which is officially required to be about $77.8^{\circ} C$ ($172^{\circ} F$), and its solidifying point, which should be, according to the *B P*, about $71.1^{\circ} C$ ($160^{\circ} F$). Some samples are acid, very pungent and acrid. Of these the author found that 1 gramme heated in a porcelain capsule over a water-bath for 10 minutes wholly volatilised, but the sample lost its pungency and acidity after having been washed with about twice its weight of Water, pressed, and dried by exposure to air, and when heated as above lost less than half its weight. The slow volatility of a sample may therefore be taken as a test of purity. An acrid sample by washing and drying had its melting point raised from $73.9^{\circ} C$ ($165^{\circ} F$) to $78.9^{\circ} C$ ($174^{\circ} F$). When warmed with concentrated Sulphuric

Acid, Trichlorobutyl-aldehyde separates out in oily drops. The aqueous solution of Butyl-Chloral Hydrate reduces Silver Ammonio-nitrate Solution.

The more generally occurring impurities are free acid, Chloral Hydrate, and Chlorine derivatives. The behaviour of the aqueous solution towards blue Litmus paper affords a measure of the free acid; the non-production of a turbidity with Silver Nitrate Solution indicates the absence of free Hydrochloric Acid or Chlorine derivatives, and should the sample evolve no odour of Chloroform when heated with Calcium Potassium, or Sodium Hydroxide Solution, the absence of Chloral Hydrate may be inferred.

Its behaviour when warmed with concentrated Sulphuric Acid affords a test for Chlorine derivatives. Thus heated the liquid should not turn brown. The *BP* says nothing respecting these Chlorine derivatives, only testing for freedom from acidity and Chloral Hydrate, the aqueous solution is required to be neutral or but slightly acid to Litmus, the salt should leave no weighable residue when ignited with free access of air.

Not Official.

MISTURA BUTYL-CHLORAL — Butyl-Chloral Hydrate, 5 grains, Glycerin, 15 minims, Chloroform Water, $\frac{1}{2}$ fl oz, Water, to 1 fl oz.

This has been incorporated in *BP C* as follows —

Butyl Chloral Hydrate, $4\frac{1}{2}$ grains, Glycerin 15 minims, Chloroform Water, 240 minims, Distilled Water, *q s* to make 1 fl oz — *BP C*

PILULA BUTYL-CHLORAL — Butyl-Chloral Hydrate, 5 grains, Compound Powder of Tragacanth, 1 grain, Syrup *q s*, in 1 pill.

PILULA BUTYL-CHLORAL CUM GELSEMIO — Butyl-Chloral Hydrate, 3 grains, Alcoholic Extract of Gelsemium, 1 grain — *Guy's and Sheffield Union*

PILULA BUTYL-CHLORAL ET GELSEMINÆ — Butyl-Chloral Hydrate, 3 grains, Gelseminæ Hydrochloridum, $\frac{1}{100}$ grain, Pulvis Tragacanthæ Compositus, 1 grain, Syrupi Glucosi *q s* — *Westminster*

SYRUPUS BUTYL-CHLORAL — Butyl-Chloral Hydrate, 16 grains, Syrup, *q s* to make 1 fl oz. Dissolve by aid of heat — *BP C*

This has been incorporated in *BP C*

Dose — 1 to 4 fl drms = 3.6 to 14.2 cc

Not Official

BYNE. MALT.

Good Malted Barley is tolerably uniform in diastase, and the widely differing results published from time to time by different analysts as to the strength of commercial Extracts must be due partly to a deviation or diastase in the manufacture of the Extracts, and partly to an ambiguity attaching to the phrase 'conversion of Starch'.

EXTRACTUM BYNES *Syn* EXTRACTUM MALTUM MALT EXTRACT.

Is made by infusing or mashing ground Malt in Water at a temperature under 160° F, preferably 140° F, filtering and evaporating the solution *in vacuo* to the consistence of a thick syrup. It is more convenient to use when it is evaporated only to a thin syrup, but in that condition the Extract is more liable to undergo fermentation.

Medicinal Properties—Malt Extract is prescribed as a nutrient in wasting diseases, and where the digestion is weak it is given for its diastase value of converting Starch into Maltose and Dextrin. It is also given with Cod Liver Oil. It is useful for covering the taste of nauseous drugs.

Dose—A teaspoonful to a tablespoonful, immediately after food.

Hale White states, 'like the ferments of pancreatic juice and saliva, diastase can only act in an alkaline medium, and therefore extract of malt should not be given till at least two hours after a meal'—*Hale White Mat Med*. But the usual custom of most prescribers is probably that expressed in the following reasoned statement of the *B M J* '08, 1 363—

Malt Extract is prescribed with one of two objects (1) To increase the supply of carbohydrates in the diet. When given for this purpose it is a matter of indifference at what hour it is taken, and the choice may well be left to the individual taste of the patient. (2) To help in the conversion of starch into sugar by means of the diastase it contains. The contents of the pyloric half of the stomach become acid at a very early stage in digestion. Those of the cardiac half are alkaline for a considerable period, so that amylolytic digestion may continue in the latter after a full meal for an hour or more. The first part of a meal finds its way into the pyloric half, the second part remains in the cardiac half until the former passes into the duodenum. Hence if the latter part of a meal is largely starchy, malt extract taken with it or immediately after it helps in the conversion of starch into sugar. If taken an hour or more after the meal the Malt will be useless, as the contents of all parts of the stomach are then acid.

It is very useful when mixed with baked wheaten flour to form foods for infants and invalids when a certain amount of pre digestion is required.

For a substance with similar properties see TAKA DIASTASE.

Foreign Pharmacopœias—The *U S P* 1882 ordered the Malt to be macerated in cold Water for six hours, then digested for an hour at 181° F, strained and evaporated at a temperature not exceeding 181° F to the consistence of Honey. This contained active diastase. It was omitted in *U S* 1893. It was re introduced in *U S P* 1905 as follows—

Extractum Malti.—Upon 1000 grammes of Malt in coarse powder (not finer than No 12), contained in a suitable vessel, pour 1000 c c of Water, and macerate for six hours. Then add 4000 c c of Water, heated to about 80° C (86° F), and digest for an hour at a temperature not exceeding 55° C (131° F). Strain the mixture with strong expression. Finally, by means of a water-bath, or vacuum apparatus, at a temperature not exceeding 55° C (131° F), evaporate the strained liquid rapidly to the consistence of thick Honey.

This has been incorporated in the *B P C*.

***Test**—For Malt or Malt Extract, three solutions, *A*, *B*, and *C*, are required. (*A*) Infuse 5 grammes of ground Malt in 100 c c of Water at 140° F (60° C) for one hour, cool to 60° F (15 5° C), and make up to 100 c c with Water, filter. For testing Malt Extract, dissolve 5 grammes of the Extract in sufficient Water to make 100 c c of solution. (*B*) Mix 1 gramme of Potato Starch with 10 c c of Water, add to it 90 c c of boiling Water, boil the mixture for ten minutes, cool to 60° F (15 5° C) and make up to 100 c c, strain through fine muslin. (*C*) Dilute 1 c c of *B P* Volumetric Solution of Iodine to 75 c c with Water.

Method—Run 2 c c of the Iodine Solution into each of one dozen test-tubes. Bring solution *A* and solution *B* to 100° F (37 8° C), place 50 c c of *B* in a beaker immersed in Water at 100° F (37 8° C), and add to it 10 c c of *A*, at the end of a minute draw off 2 c c of the mixture and add it to the Iodine Solution in one of the test-tubes, and at the end of each subsequent minute repeat the operation. If the test-tubes are arranged in the order in which the solution is added, the colour in each test-tube will represent the amount of action in a given time represented by minutes. As it occupies from ten to fifteen seconds to run the Malt Solution from a pipette into the Starch, we usually start the stop-watch or chronograph when half of the solution has run out of the pipette. When a first-class sample of Malt Extract is used, the contents of the first test-tube will be of a blue colour, the second will be red, and the third or fourth yellow, but the changes will be somewhat slower in a sample which is not so good.

Six of the best known brands of Malt Extract examined by this test ceased to produce a red colour at the end of three, five, ten, fifteen, and fifteen minutes respectively, showing a variation of about ten to fifteen minutes, in the digestion of *their own weight* of Starch. A fluid Malt Extract, containing Alcohol, ceased to give a red colour at the end of thirty-five minutes.

The best sample, when treated with *five times* its weight of Starch, ceased to produce a red colour at the end of fourteen minutes.

It is important that the conditions should be the same in each experiment, for any variation in the quantity of Starch Solution or the volume of liquid employed will affect the results, but under the conditions given, when the colours are viewed in series, two independent workers should not vary more than 1 minute in the reading.

This process has been found (*Suggested Standards of Purity for Food and Drugs*, p. 184) useful and convenient, but it is mentioned that it may have been better to adopt a standard time and vary the proportion of Starch. This suggestion would render the process much less convenient, and the amount of Starch digested in a Standard time can easily be calculated by a simple formula, the activity of Malt Diastase towards Starch Solution, unlike Pancreatic Diastase (Ankylopilin), being inversely proportional to the amount of enzyme present. A more striking contrast is, moreover, obtained by taking the relative time required by different samples to digest a definite weight of Starch.

LIQUID MALT—Malt Extract, sp gr 1.375, to which diluted Alcohol is added, sufficient to produce a liquid, sp gr 1.250, containing 73 p.c. of Alcohol (90 p.c.) by weight, equal to about 15 p.c. Proof Spirit.

Preparations somewhat similar to this are sold as **Fluid Extract of Malt**, **Bynn**, etc.

Liquid Malt Extract—Extract of Malt (sp gr. 1.375), by volume, 68, Alcohol (90 p.c.), 7.50. Distilled Water, q.s. to produce 100.—Mix to form a liquid sp gr 1.2—**B.P.C.**

FLUIDEXTRACTUM MALTI (U.S.N.F.)—Malt in coarse powder, 100, percolated with a mixture of Alcohol (94 p.c.) 1 and Water 3, until it percolate weighs 75.

MALT EXTRACT WITH COD LIVER OIL—This is supplied under several well-known brands, but can be prepared extremely easily by turning ordinary Malt Extract with 10 to 15 p.c. of V.C. oil, and heating to 120° F., adding the oil and shaking thoroughly until mixed. The commercial product contains from 20 to 30 p.c. of Cod Liver Oil.

Examination of commercial samples gave from 20 to 30 p.c. of Oil by volume.—*P.J.* (3) xxv 162.

Prescribing Note—*Usually given in milk*

EXTRACTUM MALTI CUM OLEO MORRHUÆ (B.P.C.)—Extract of Malt, 17 fl oz, Cod Liver Oil, 3 fl oz. Heat the Extract to 110° F., and pour it into a warm mortar, add the Oil gradually and with constant trituration.—*B.P.C. Formulary* 1901.

B.P.C. incorporates this formula without heating the extract.

EXTRACTUM MALTI FERRATUM—Iron Pyrophosphate, 2, Water 3. Dissolve and add Extract of Malt, q.s.

Dose.—1 to 4 drms = 3.6 to 14.2 cc.

Each fl drms contains about 1 grain Iron Pyrophosphate.

TAKA-DIASE—A powder of a light brown colour, possessing a nutty taste. Derived from a fungus of the species *Eurotium Oryzae*. It possesses high diastasic properties, readily converting over a hundred times its weight of Starch at body temperature.

Specially indicated as an artificial digestant of starchy food in dyspepsia cases in which there is a deficiency of saliva. Also found useful in hyperacidity of the stomach and in gouty dyspepsia.—*L* '96, 1856, '03, n. 1052, *A.J.P.* 188.

Most useful in gouty dyspepsia, it encourages the digestion of carbohydrates, prevents the development of fatty acids which, by their irritating effects,

are so common a factor in the development of gouty dyspepsia, a $2\frac{1}{2}$ grain tablet before each meal —Pr '07, 1 168

Dose—5 to 10 grains = 0.32 to 0.65 gramme, in capsules in the middle of or immediately after a meal

Diastase from Malt is official in Fr, Jap, Mex and Span

CADINUM OLEUM.

OIL OF CADE

B P Syn. JUNIPER TAR OIL

Fr, HUILE DE CADE, Ger, KADEOL, Ital, OLIO CADINO, Span, BREA DE OXICEDRO

A brownish or dark brown, viscid fluid, of an oily nature, with a tarry odour and an empyreumatic and somewhat bitter taste; a product of the dry distillation of the Branches and Wood of *Juniperus Oxycedrus*, L, and other species. It contains a high percentage of the sesquiterpene, Cadinene

Solubility—Mixes in all proportions with Chloroform and Ether, partially soluble in Alcohol (90 p c), slightly soluble in Water

Medicinal Properties—An agreeable form of Tar. Used as a stimulant in cases of psoriasis and of chronic eczema

Prescribing Notes—It is used in the form of Ointment, the Oil mixed with equal parts of Yellow Wax, and further diluted with Lard or Vaseline if required

Foreign Pharmacopœias—Official in Austr, Dan, Dutch, Hung., Ital, Norw, Port, Span (Brea de Oxicedro), Russ, Swed (Pyrooleum Oxycedri), Swiss and U S. Not in the others

In **Balzer's Cade Baths** the oil is emulsified before being added to the bath

An emulsion of Oil of Cade and a fluid extract from the decoction of the tops of the Tannus Pines. The baths are given daily, and can be used in all varieties of psoriasis

Cade Bath Fluid is put up in bottles, one of which, being mixed with a little warm Water, is added to an ordinary bath, which should last from half an hour to an hour, and should be accompanied by slight friction on the affected patches

These baths may be used as an adjuvant to the ordinary treatment, and are suitable both for hospital and private cases

Tests—Oil of Cade has a specific gravity of about 0.990. When shaken with Water and filtered it should yield an almost colourless filtrate possessing an acid reaction. In a sample (sp gr 0.996), examined by the author, the acidity amounted to 0.7 p c of pure Acetic Acid

The filtered aqueous solution should yield a red coloration with diluted Ferric Chloride Test-solution

The B P states that the filtered aqueous solution is almost colourless and possesses an acid reaction, and the U S P that it imparts to Water an acid reaction

VASOLIMENTUM EMPYREUMATICUM, — Juniper Tar Oil, 25, Vasoliment, 75 —Hager.

Parogenum Empyreumaticum.—Oil of Cade, 25; Parogen, 75 —B P C

CAFFEINA.

CAFFEINE

B P Syn — THEINE

N O Syn — COFFEINA

FR, CAFFEINE, GER, KOFFEIN, ITAL, CAFFEINA, SPAN, CAFEINA

Fine white silky acicular crystals, odourless, and possessing a bitter taste

A feebly basic alkaloid, contained in the prepared and dried Leaves of *Camellia Thea*, Link, the dried seed of *Coffea Arabica*, L, and also in other plants. It is chemically allied to Theobromine, being Methyl-theobromine (Trimethyl-xanthine)

The quantities yielded are about as follows. Tea Leaves, 3 to 4 p c, Coffee Seeds, 1 p c, Guarana, 5 p c, Maté or Paraguay Tea, 1 p c, Kola Nut, 2 to 3 p c.

Solubility—1 in 68 of Water, 1 in 40 of Alcohol (90 p c); 1 in 7 of Chloroform, 1 in 400 of Ether, 1 in 1 of boiling Water.

Medicinal Properties.—A valuable heart tonic and diuretic, especially in cases of loss of compensation with cardiac dropsy. To be given with caution in the presence of renal disease.

Given in 1 grain doses every hour for migraine and hemiplegia, also in the form of Effervescent Caffeine Citrate (1 grain in each dram)

It is eliminated but slowly by the kidneys, and its action on the heart is cumulative.—B M J E '00, 1 35

Used by malingering soldiers to produce symptoms of cardiac disease—L '00, 1 1406

Diuretic action of Caffeine—'01, 11 7

Specially valuable in nervous affections. In 5-grain doses every four hours.—Pr '11, 318

Dose.—1 to 5 grains = 0.06 to 0.32 gramme

Ph. Ger maximum single dose, 0.5 gramme, maximum daily dose, 1.5 grammes

Prescribing Notes.—Given in cachets, in mixtures, or in pills made with 'Diluted Glucose', also in the form of effervescent preparations. For hypodermic use 20 grains can be dissolved in 60 minims of Water on the addition of 25 grains of Sodium Salicylate, or 25 grains of Sodium Benzoate. See also Caffeine Sodio-Salicylas, and Caffeine Sodio-Benzoylas.

Official Preparations.—Caffeine Citras, Caffeine Citras Effervescent

Not Official.—Caffeine Hydrobromidum, Caffeine Diiodo-Hydrobromidum, Caffeine Sodio-Benzoylas, Caffeine Sodio-Salicylas, Caffeine Valerianas, Ethoxycaffeinum

Foreign Pharmacopœias.—Official in Austr, Belg, Dan, Dutch, Fr, Ger (Koffein), Hung, Ital (Caffeina), Jap, Mex, Port, Russ, Span (Cafeina), Swed, Swiss and U S. Not in Norw

Tests.—The distinguishing test for Caffeine is the Murexide test which consists in dissolving the alkaloid in a small quantity (about 1 to 1 c c) of concentrated Hydrochloric Acid, adding a crystal of Potassium Chlorate and evaporating the mixture to dryness on a water-bath. When the residue is subjected to the action of Ammonia

gas or is moistened with a little Ammonia Solution, a fine purple coloration is produced. The colour is not affected by an excess of Ammonia, but is immediately discharged by a fixed alkali. A similar coloration is produced when the test is performed with Chlorine or Bromine Water in place of Potassium Chlorate and Hydrochloric Acid, Chlorine Water is used in the *PG* test. The usual alkaloidal reagents precipitate Caffeine only imperfectly. Neither Mercuric-potassium Iodide (Mayer's) Solution nor Iodo-potassium Iodide (Wagner's) Solution precipitate Caffeine from neutral solutions, this non-precipitation serving to distinguish Caffeine from other official alkaloids. If the Iodo-potassium Iodide Solution is preceded or followed by the addition of some dilute mineral acid, a dark-reddish precipitate is at once thrown down. Upon this reaction is based (*CN* '97, 99) a method for the determination of Caffeine. Tannic Acid produces a white precipitate in moderately dilute solutions, but the extent of the reaction is largely dependent on the temperature.

Caffeine is completely extracted by Chloroform from a slightly acid or slightly ammoniacal aqueous solution, and is the solvent generally employed in its gravimetric determination. It dissolves without colour in Sulphuric and in Nitric Acids. It melts, when anhydrous at 231.5°C (448.7°F). No melting point is given in the *BP*. The *PG* gives 230.5°C (446.9°F), and the *USP* 236.8°C (458.3°F) after drying till constant in weight at 100°C (212°F). Theoretically, it should contain 8.49 p.c. of Water, and the *BP* states that the crystals lose this amount at 100°C (212°F), but commercial Caffeine generally loses about 7 p.c. on drying. It has been pointed out (*PJ* '00, u 148) that the Pharmacopœia errs in its method of expression, as commercial Caffeine probably never contains 8.49 p.c. of Water, owing to the facility with which the crystals effloresce. The *PG* states that in the air Caffeine loses 1 part of its Water of crystallisation and at 100°C (212°F) it becomes anhydrous. The sublimation point is given in the *PG* as 180°C (356°F), in the *USP* as 178°C (352.4°F). The *BP* says that 'at a higher temperature than 100°C (212°F) it melts and volatilises without decomposition'. It has been shown (*PJ* (3) xxiii 213) that Caffeine which has been dried at the ordinary temperature over Sulphuric Acid till constant in weight undergoes no further material loss on prolonged exposure in an open dish in the water oven at 100°C (212°F), and that it does not volatilise with steam during the evaporation of its solutions.

The more generally occurring impurities are alkaloids other than Caffeine, organic impurities and mineral matter. The presence of alkaloids other than Caffeine is shown by the formation of a precipitate with Mercuric-potassium Iodide (Mayer's) Solution or Iodo-potassium Iodide Solution, organic impurities by the production of coloured solutions in Sulphuric Acid, and mineral matter by a residue remaining after sublimation.

Potassium Chlorate and Hydrochloric Acid—A small quantity of Caffeine is dissolved in 1 c.c. of Hydrochloric Acid in a porcelain dish, a little Potassium Chlorate is added and the whole evaporated to dryness on a water-

bath, the dish is then inverted over a vessel containing a few drops of Ammonia Water, the residue acquires a milky colour which is destroyed by fixed alkalis *U S P*. A similar test is given in the *P G*, but Chlorine Water is used instead of Potassium Chlorate and Hydrochloric Acid. One part of Caffeine with 10 parts of Chlorine Water are evaporated on a water-bath and yield a yellowish-red residue, which with a little Ammonia Solution becomes coloured a rich purple. It also evaporates an indefinite quantity of Caffeine with Potassium Chlorate and a few drops of Hydrochloric Acid.

Potassium Dichromate and Sulphuric Acid—If a fragment of Caffeine be dissolved in Sulphuric Acid, and a minute fragment of Potassium Dichromate be added to the liquid, a yellowish-green colour which gradually becomes green will be produced, *U S P*.

Chlorine Water—A cold saturated aqueous solution of Caffeine should not become turbid with Chlorine Water, *P G*.

Iodine Solution—A cold saturated aqueous solution should not become turbid with Iodine Solution *P G*.

Ammonia Solution—A cold saturated aqueous solution should not become coloured on the addition of Ammonia Solution, *P G*.

Sulphuric Acid or Nitric Acid—*P G* and *U S P* require that Caffeine should dissolve without coloration in Sulphuric Acid or in Nitric Acid. The *P G* uses 0.1 gramme of Caffeine and 1 c.c. of either Acid.

Preparations

CAFFEINÆ CITRAS. CAFFEINE CITRATE

An unstable combination of Caffeine and Citric Acid, which readily undergoes dissociation in the presence of Water.

A fine white, odourless powder possessing an acid and somewhat bitter taste prepared by stirring one part of Caffeine into a heated solution of 1 part of Citric Acid and 2 parts of Distilled Water, the mixture being subsequently evaporated to dryness on a water-bath and kept constantly stirred towards the end of the evaporation. It is then reduced to powder.

Solubility—1 in 32 of Water, 1 in 22 of Alcohol (90 p.c.), 1 in 10 of a mixture of 2 parts Chloroform with 1 part Alcohol (90 p.c.).

When combined with Sodium Benzoate, it acted rapidly and efficaciously in a case of transudic incompetency—*M P* '04, ii 515.

Dose.—2 to 10 grains = 0.13 to 0.65 gramme.

Foreign Pharmacopœias—Official in Hung, Mex, Span (*Citrato Caffeico*), Swiss and U.S. Not in the others.

Tests.—Caffeine Citrate should afford the reactions distinctive of Caffeine appearing in the large type under that substance. The aqueous solution, after neutralisation and separation of the Caffeine by shaking with Chloroform, yields with Calcium Chloride Solution a white precipitate insoluble in Potassium Hydroxide Solution, with Silver Nitrate Solution a white precipitate soluble in Ammonia Solution, which is distinguished from Tartrate by yielding no mirror on boiling. The salt is official in *BP* and *U S P*, but not in *P G*. Neither *BP* nor *U S P* gives any process for ensuring the presence of the requisite proportion of Caffeine. It should contain not less than 50 p.c. by weight of Caffeine as gravimetrically determined, by rendering an aqueous solution of the salt faintly alkaline.

with Potassium or Sodium Hydroxide Solution and shaking out the Caffeine with successive quantities of Chloroform. The mixed chloroformic solutions are evaporated to dryness and the residue dried till constant in weight at 100° C (212° F) and weighed. The Swiss Pharmacopœia states that it shall contain not less than 50 p c nor more than 75 p c of Caffeine.

The Citric Acid may be determined by direct titration with Normal Volumetric Potassium or Sodium Hydroxide Solution, using Phenolphthalein Solution as an indicator of neutrality. Caffeine is so feebly basic that it exercises no influence on the indicator. Theoretically it should contain about 50 p c of Citric Acid.

The *USP* states that 1 part of Caffeine forms a clear syrupy solution with about 4 parts of hot Water, which is correct, and agrees with the Swiss Pharmacopœia statement, 'soluble' in 4 parts of hot Water. On dilution with 5 parts of Water a white crystalline precipitate separates which redissolves when about 25 parts of Water have been added. The *BP* states that 'with 3 parts of Water it forms a clear syrupy solution,' which is incorrect, but more Water dissociates the salt and affords a white precipitate of Caffeine, which redissolves when excess of Water is added. It has been pointed out (*PJ* '00, ii 148) that in reality with 3 parts of Water it forms a stiff paste and only forms a solution when the mixture is gently warmed, but, on cooling, it again forms an almost solid mass of acicular crystals. On adding a little Water to the warm solution the Caffeine separates out as a mass of acicular crystals and not in the form which might be described as a 'white precipitate'.

The more generally occurring impurities are Calcium, Lead, Chlorides, Sulphates, Tartrates, and mineral matter. The presence of Calcium may be detected by Ammonium Oxalate Solution, Lead by Hydrogen Sulphide Solution in a solution made faintly acid with Hydrochloric Acid, Chlorides by Silver Nitrate Solution, Sulphates by Barium Chloride or Nitrate Solution. The *USP* tests for Tartaric Acid by heating 0.25 gramme of the salt for fifteen minutes on a water-bath with 5 c c of concentrated Sulphuric Acid, care being taken to protect the mixture from dust, no brown or black coloration should be developed, but only a lemon-yellow colour. The *BP* allows 'a mere trace of ash when heated in air'.

The Belgian Pharmacopœia states that when Caffeine Citrate is prescribed for internal use, the indicated dose should be dispensed as a mixture of equal parts of Caffeine and of Citric Acid.

CAFFEINÆ CITRAS EFFERVESCENS EFFERVESCENT CAFFEINE CITRATE

Contains about 2 p c of Caffeine (4 p c of Caffeine Citrate), or nearly 9 grains of Caffeine in the oz.

Dose.—60 to 120 grains = 4 to 8 grammes

Foreign Pharmacopœias—Official in *US*, containing 2 p c of Caffeine, and in *Spain*. Not in the others.

For other Caffeine Citrate Effervescent Compounds, see *PHENACETIN* and *ASAACETONE*.

more than Caffeine scented with Valerianic Acid, but for all purposes of practical dispensing, a product, obtained by absorbing 1 of anhydrous Valerianic Acid by 4 of anhydrous Caffeine, is superior to anything commercially obtainable, and when assayed by the above method shows when freshly prepared about 17 p c, and even after keeping a considerable time, about 9.7 p c of anhydrous Valerianic Acid. The residue obtained on washing and evaporating the chloroformic solution (after titration) to dryness should answer the tests distinctive of Caffeine given under that substance.

ÆTHOXYCAFFEINUM—A compound of Caffeine, containing an additional Æthoxyl group. Colourless, crystalline needles, less soluble in Water than Caffeine, readily soluble in Alcohol. Heart tonic and diuretic, also narcotic. Given with Sodium Salicylate in migraine and trigeminal neuralgia. Simultaneously it acts as an anæsthetic. It readily forms soluble double salts with Sodium Benzoate and Salicylate.

Dose—1 to 3 grains = 0.06 to 0.2 gramme

The following have also received notice in Medical Literature—Caffeine-chloral, Caffeine Tri-bromide, Caffeine Sodium Iodide, Caffeine Sulphate, Caffeine Vanadate, Symphoral L (Lithium Caffeine Sulphonate), Symphoral N (Sodium Caffeine Sulphonate), and Symphoral Sr (Strontium Caffeine Sulphonate).

CAJUPUTI OLEUM.

OIL OF CAJUPUT

FR, HUILE VOLATILE DE CAJEPUT, GER, CAJEPUTOL, ITAL, ESSENZA DE CAJEPUT, SPAN, ESENCIA DE CAJEPUT

A transparent green or bluish-green, thin, oily liquid, possessing an agreeable odour resembling Eucalyptus and a pungent, camphoraceous taste.

A volatile Oil distilled from the leaves of *Melaleuca Leucadendron*.

Solubility—In all proportions of Alcohol (90 p c)

Medicinal Properties.—Antispasmodic, carminative and stomachic. Counter-irritant. Given in flatulent colic, hysteria, and other spasmodic and nervous affections. Externally, diluted with Olive Oil (1 to 2), or with Linimentum Terebinthinæ, it is used for chilblains and to allay rheumatic and gouty pains. Applied on lint for toothache.

Dose— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 c c

Prescribing Notes—Given on Sugar, or in Pill or in the form of Spirit of Cajuput. Occasionally as much as 10 minims are given in a mixture. See below.

Official Preparations—Spiritus Cajuputi, contained in Linimentum Crotonis.

Not Official—Mistura Cajuputi.

Foreign Pharmacopœias—Official in Austr, Dutch, Ital, Jap, Norw, Port, Russ, Span, Swed, Swiss and U S. Not in Belg, Dan, Fl, Ger., Hung, or Mex.

Tests.—Cajuput Oil has a specific gravity of 0.919 to 0.930. The *USP* gives 0.915 to 0.925 at 25° C. (77° F.). The optical rotation is not given in the *BP*, according to the *USP* it should not exceed -2° in a 100 mm tube at a temperature of 25° C (77° F.). Oils are occasionally met with having as high a rotation as $-3^{\circ} 40'$.

It should contain about 55 to 65 p c of Cineol (Eucalyptol) as determined by the Phosphoric Acid process described under Eucalyptus Oil. The *B P* makes no attempt to determine the actual amount of Cineol, only requiring that the Oil shall become semi solid when stirred with one-third or one half its volume of Phosphoric Acid, specific gravity 1.750, the mixture being kept cool. The *USP* measures the actual amount of Cineol produced on decomposing the Cineol Phosphate. A measured quantity of 10 c c of the oil is dissolved in 5 times its volume of purified Petroleum Benzin, cooled by a freezing mixture, Phosphoric Acid, specific gravity 1.707, cautiously added until the white crystalline magma commences to assume a yellowish or pinkish tint. The crystals are filtered under pressure, washed with cold purified Petroleum Benzin and dried by pressure between porous plates. The crystals are decomposed by warm Water and the volume of Cineol read off in a narrow graduated cylinder, the oil should yield not less than 55 p c.

The green colour of the oil is generally supposed to be due to Copper, which may be detected by shaking the oil with an equal volume of Water containing a drop or two of diluted Hydrochloric Acid. The oil loses its green colour and the aqueous portion when tested with a drop or two of Potassium Ferrocyanide Solution, yields a reddish-brown colour if Copper be present. The *USP* includes a test for absence of Copper, which is given below in small type under the heading of Potassium Ferrocyanide.

Potassium Ferrocyanide—On shaking 5 c c of the Oil with 5 c c of Water containing 1 drop of diluted Hydrochloric Acid, a reddish-brown colour should not be produced in the acid liquid when separated from the Oil, if a drop of Potassium Ferrocyanide Test Solution be added (absence of Copper).

Preparation

SPIRITUS CAJUPUTI SPIRIT OF CAJUPUT

Oil of Cajuput, 1, Alcohol (90 p c), *q s* to yield 10

Dose —5 to 20 minims = 0.3 to 1.2 c c

Not Official

MISTURA CAJUPUTI—Oil of Cajuput, 80 minims, Compound Spirit of Orange (*USP*), 80 minims, Powdered Tragacanth, 8 grains, powdered Gum Acacia, 120 grains, Glycerin, 1 fl oz, Chloroform Water, to 8 oz

Dose —1 to 4 fl drms = 3.6 to 14.2 c c

Not Official

CALAMINA PRÆPARATA

PREPARED CALAMINE

Native Zinc Carbonate, calcined in a covered earthenware crucible at a moderate temperature, powdered and freed from gritty particles by elutriation. Genuine Calamine has a yellowish grey colour, the reddish varieties are generally made on a basis of Barium Sulphate.

Medicinal Properties—Mildly astringent, used in face lotions and dusting powders.

Calamina Artificialis.—Dissolve 861 parts of Crystallised Sulphate of Zinc in Water, and add 15 fluid parts of Strong Solution of Perchloride of

Iron (*B P*) Next dissolve 890 parts of Crystallised Sodium Carbonate in a separate quantity of Water, mix the solutions. Shake well, collect the precipitate on a filter, wash until free from Sulphate, well drain, heat in a light tin over a fire until a portion of it ceases to effervesce on the addition of an acid. Grind to an impalpable powder—*Y B P* 1893, 210, *P J* '98, 1 622, *C D* '98, 1 73

Calamina Facititia (*B P C*) uses the above process, with quantities as follows—Zinc Sulphate, 56, Sodium Carbonate, 58, Strong Solution of Ferric Chloride, 1, Distilled Water, *q s*

LINIMENTUM CALAMINÆ—Prepared Calamine, 20 grains, Zinc Oxide, 15 grains, Solution of Lime, 2 dim, Water, 2 dim, Olive Oil, to 1 fl oz—*Guy's*

Variations of this are given in Great Northern, Middlesex and University Hospital Pharmacopœias. The following is sometimes prescribed, but unless treated in the manner here described it is difficult to dispense—Calamine, 3 dim, Zinc Oxide, 2 dim, Lime Water, 4 fl oz, Olive Oil, 4 fl oz

Rub the powders with the Lime Water in a mortar to a smooth cream, and then add the whole of the Oil at once and stir together

This has been incorporated in the *B P C*
Prepared Calamine, 4 50, Zinc Oxide, 3 50, Solution of Lime, 50, Olive Oil, *q s* to produce 100—*B P C*

LOTIO ZINCI OXIDI—Zinc Oxide, 60 grains, Prepared Calamine, 60 grains, Glycerin, 60 minims, Water, 1 fl oz

A mild astringent in chronic eczema and acne rosacea

Most of the Hospital Formulary give a formula under the heading **Lotion Calaminæ** or **Lotio Zinc Oxidi**

LOTIO CALAMINÆ—Levigated Calamine, 40 grains, Zinc Oxide, 20 grains, Glycerin, 20 minims, Water (or Rose Water), *q s* to make 1 fl oz. Elutriate the Calamine and Zinc Oxide by titrating with the Water and decanting from the siliceous matter, then add the Glycerin—*Canadian Formulary* (first issue)

This has been incorporated by the *B P C* as follows—

Prepared Calamine, 10, Zinc Oxide, 5, Glycerin, 5, Rose Water, *q s* to produce 100

Lotio Calaminæ—Levigated Calamine, 40 grains, Zinc Oxide, 20 grains, Glycerin, 20 minims, Lime Water, *q s* to make 1 fl oz—*Canadian Formulary* 1908

UNGUENTUM CALAMINÆ—Prepared Calamine, 1, Benzoated Lard, 5—*B P* 1885

This has been incorporated in the *B P C*

CERATUM CALAMINÆ (*Ph Lond*)—Calamine, 7½, Beeswax, 7½, Olive Oil, 20

This has been incorporated in the *B P C* as follows—

Ceratum Calaminæ—Prepared Calamine, 2, Yellow Beeswax, 2, Olive Oil, 6

Ph Edin—Calamine, 1, Simple Cerate, 5, commonly known as *Turner's Cerate*

CALCII CARBONAS PRÆCIPITATUS.

PRECIPITATED CALCIUM CARBONATE

B P Sym—PRECIPITATED CHALK

FR, CARBONATO DI CALCIO PRÉCIPITÉ, GR, CALCIUMCARBONAT,
ITAL, CARBONATO DI CALCIO, SPAN, CALCIÓCARBONATO

CaCO_3 , eq 99 26

A white, tasteless powder

It may be obtained by precipitating a soluble Calcium salt, usually the Chloride with Sodium Carbonate

Solubility—Insoluble in Water and Alcohol Soluble with effervescence in dilute mineral Acids and some of the organic Acids

Medicinal Properties—Antacid, astringent and desiccant Used in dyspepsia with acidity, valuable in diarrhoea, as a dusting powder in eczema, and for burns

Dose—10 to 60 grains = 0.65 to 4 grammes

Official Preparation—Used in the preparation of Trochiscus Bismuthi Compositus

Foreign Pharmacopœias—Official in Austri, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U S

Tests—Precipitated Chalk effervesces upon the addition of acids, yielding a colourless and odourless gas, which affords, when passed into Lime Water or into Barium Hydroxide Solution, a white precipitate

When dissolved in just sufficient Hydrochloric Acid to effect solution, boiled and cooled, it answers the tests distinctive of Calcium, which are that, when mixed with sufficient Ammonia Solution to render the solution faintly alkaline, Ammonium Oxalate Solution produces a white precipitate, soluble in Hydrochloric Acid, insoluble in Acetic Acid, Ammonium Carbonate Solution produces a white precipitate which, after well boiling, is insoluble in Ammonium Chloride Solution

The *U S P* states that the salt should contain not less than 99 p c of pure Calcium Carbonate, but no process is given for the determination The *B P* and *P G* neither state the requisite percentage nor method of determination It is usually determined gravimetrically as Oxalate, the Calcium Oxalate being ignited and weighed as Calcium Oxide

The more generally occurring impurities are Aluminium, Iron, Magnesium, Chlorides, Phosphates and Sulphates Aluminium, Iron and Phosphates, if present, may be detected by Ammonia Solution in presence of Ammonium Chloride The *P G* gives a specific test for Iron with Potassium Ferrocyanide Solution, which is described in small type below The *U S P* includes a test for heavy metals The standard suggested (*C D* '08, 1796) for Lead is 10 parts per 1,000,000, and for Arsenic 5 parts per 1,000,000 Both *P G* and *U S P* fix a limit of soluble impurities, ascertained by evaporating an aqueous extract Chlorides and Sulphates are indicated by Silver Nitrate and Barium Chloride or Nitrate Solutions respectively

Ammonia—If to 20 c c of the Hydrochloric Acid solution, Ammonia Water be added until of alkaline reaction, no turbidity or precipitation should take place, either before or after boiling, indicating the limit of Iron, Aluminium, Phosphates, etc, *U S P* A solution of the salt in Acetic Acid should not give a precipitate on saturation with Solution of Ammonia, *P G*

Barium Nitrate—The 1-50 solution obtained on boiling, by means of diluted Acetic Acid should not be at once affected by Barium Nitrate Solution, *P G*.

Silver Nitrate—The 1-50 aqueous solution obtained by dissolving in diluted Nitric Acid and boiling shall at the most be rendered only faintly opalescent after five minutes on the addition of Silver Nitrate Solution, *P G*

Potassium Ferrocyanide—The solution obtained by dissolving 1 gramme of the salt by the aid of Hydrochloric Acid in 50 c c of Water shall not become blue on the addition of 0.5 c c of Potassium Ferrocyanide Solution, *P G*

CRETA PRÆPARATA. *See p 456*

CALCII CHLORIDUM.

CALCIUM CHLORIDE

$\text{CaCl}_2, 2\text{H}_2\text{O}$, eq 145.85

FR, CHLORURE DE CALCIUM, GER, CALCIUMCHLORID

White, or nearly white, slightly translucent, hard fragments, having a sharp saline taste. Very deliquescent.

The official salt is obtained by the interaction of Hydrochloric Acid and Calcium Carbonate, the latter being added until the Acid is neutralised. The salt is dried at a temperature not exceeding 200°C (392°F). A slight dissociation and loss of Hydrochloric Acid occurs during the drying, and most commercial samples are alkaline.

The *USP* gives no specific temperature at which the salt should be dried, but states that when it has been overheated the solution has an alkaline reaction and a residue of Oxide remains undissolved, which, however, goes into solution in Hydrochloric Acid.

It should be kept in glass bottles with closely-fitting glass stoppers.

Solubility—1 in 1 of Water, 1 in 3 of Alcohol (90 p 63)

Medicinal Properties.—It increases the coagulability of the blood, and is therefore used in gastric, intestinal and pulmonary hæmorrhage, also in hæmophilia and aneurisms. Has been given internally also for chilblains, 20 grains night and morning, and in glandular enlargements, especially those of tubercular origin.

Given in pneumonia—*Pr* 1 263, *lin* 343

10 to 20 grains every 4 hours given in hæmophilia—*L*. '97, *n* 1061, *L*. '98, *n* 144, *B M J* '02, *i* 1141, *P J* '03, *i* 525

A small pledget of Wool soaked in a solution containing 30 grains to the oz of Water, used successfully in hæmophilia—*L*. '03, *i* 517

If pulmonary hæmorrhage persists, 2 or 3 drms. Chloride or Lactate of Calcium should be given in the course of a few hours—*T G* '07, 323

In pneumonia, 5 to 10 grains dissolved in Water every 4 hours, 1 minim of Elixir of Saccharin covers the taste of 10 grains, does not interfere with use of other remedies (Lauder Brunton)—*B M J* '07, *i* 616

Valuable in hæmorrhagic type of pneumonia, but its use deprecated in dry—*B M J* '07, *i* 1176

Can have no place in treatment of early stage of pneumonia (William Ewart).—*B M J* '07, *i* 779

In hæmorrhagic gastric oozing, 10 grains thrice daily (Hale White)—*L*. '06, *n* 1193.

Rapidly effective, in 3 or 4 grain doses thrice daily, in purpura in children (*B M J* '07, 1 199), and in 15 grain doses in boy of 16, p 1865

Given as a preventive in full doses for 3 days before any intranasal operation, and as a curative in 20 to 60 grain doses in hæmorrhage after extraction of teeth—*B M J* '07, 1 1054, 1 83

When used for hæmoptysis it must not be given for more than 3 or 4 days at a time, otherwise the blood will become less coagulable—*Pr* '07, 1 335

It markedly diminished the amount of albumen excreted by patients with Bright's disease of the non-polyuric form, but who passed 3 to 15 grammes albumen per litre—*L* '07, 1 841

The value of this salt in intestinal hæmorrhage given in 10 or 20 grain doses every 3 hours has been shown (*B M J* '04, 1453) 30 to 40 grains dissolved in a little Water and injected into the rectum, has also been recommended (*B M J* '04, 1 1635), objection has been taken to this method on account of disturbing patient (*B M J* '04, 1 1783), but it has been pointed out (*B M J* '05, 1 108) that good results in hæmoptysis have been accompanied by very little discomfort to patient

It is stated (*B M J* '06, 1 26) that this substance acts as a harmless and simple preventive against free bleeding when administered prior to an operation, and at the same time is not less efficient than other hæmostatic agents Administered in 1 drgm doses night and morning for 3 days previous to operation to prevent hæmorrhage in excision of the testicle in a case of tubercular disease of the seminal tract—*M P* '06, 1 38

Dose—5 to 15 grains = 0.32 to 1 gramme

Prescribing Notes—*This Salt has a very unpleasant taste which is difficult to cover. Elixir Calcium Chloridi accomplishes this better than Liquorice*

Incompatibles—Lime salts and Potassium salts are mutually antagonistic physiologically—*B M J* '87, 1 1038

Official Preparations—Used in the preparation of *Æther Purus*

Not Official—*Elixir Calcium Chloridi, Liquor Calcium Chloridi, Syrupus Calcium Chloridi*

Foreign Pharmacopœias—Official in U.S., Hung (*Calcium Chloratum Fusum*) Port (*Chloreto de Calcio*), Fr (*Chlorure de Calcium Cristallisé* and *Chlorure de Calcium Fondu*), Mex (*Cloruro de Calcio*), Span (*Cloruro Calcio*) Not in the others

Tests—Calcium Chloride should answer the tests distinctive of Calcium given in the large type under *Calcium Carbonas Præcipitatus*. The aqueous solution yields with Silver Nitrate Solution a white curdy precipitate, insoluble in Nitric Acid, soluble in Ammonia Solution and in Potassium Cyanide Solution. A small quantity of the salt heated with Manganese Dioxide and Sulphuric Acid evolves a yellowish-green gas recognised as Chlorine by its odour and liberating Iodine from Potassium Iodide Solution, which on the addition of Starch Mucilage yields a blue coloration

The *B P* does not fix a limit for the amount of pure Calcium Chloride which the salt shall contain, the *U S P* requires that it shall contain not less than 99 p.c. of the pure salt. Neither Pharmacopœia describes a process of determination. The neutral aqueous solution may be titrated with Deci-normal Volumetric Silver Nitrate Solution, or the Calcium may be determined as Oxalate, the Oxalate washed, dried, ignited, and weighed as Calcium Oxide

The more generally occurring impurities are Aluminium, Iron, Magnesium, Carbonates and Hypochlorite. Aluminium, Iron and Magnesium, if present, may be detected by the Ammonia Solution test given below in small type under the heading of Ammonia,

Carbonates by an effervescence following the addition of Hydrochloric Acid HCl , by Ammonium Phosphate Solution after separation of the Calcium as Oxalate in presence of Ammonium Chloride and a trace of Ammonia Solution. Hypochlorite might have been a likely impurity in a salt made according to the process described in *BP* '85, but its presence in a sample prepared according to the *BP* '98 directions is unlikely, especially when dried at the temperature officially directed. The *USP* includes Phosphates as capable of detection by Ammonia Solution test, it also includes a time-limit test for Arsenic and Lead, with Hydrogen Sulphide and a test indicating a limit of Magnesium and alkalis, it is performed by completely precipitating the Calcium from 10 cc of a 1 in 20 aqueous solution by means of Ammonium Oxalate Test-solution, evaporating the filtrate to dryness and igniting, not more than 0.1 of a gramme of fixed residue should remain. The salt is not official in *P G*.

Ammonia—If to the aqueous solution of the salt Ammonia Water be added until of alkaline reaction, no turbidity or precipitation should take place, either before or after boiling, *USP*.

Hydrogen Sulphide—The aqueous solution of the salt (1-20) slightly acidulated with Hydrochloric Acid should not respond to the time-limit test for Arsenic or Lead, *USP*.

Not Official

LIQUOR CALCI CHLORIDI—Chloride of Calcium 1, Distilled Water 5—*BP* 1885

This has been incorporated in the *BP C* as follows—

Calcium Chloride 16, Distilled Water, *qs* to produce 100

ELIXIR CALCI CHLORIDI—Chloride of Calcium, 60 grains, Citric Acid, 20 grains, Aromatic Elixir (*USP*), to 1 fl oz

Syrupus Calcii Chloridi. *Syn* Elixir of Calcium Chloride—Calcium Chloride 12.50 Citric Acid 5, Distilled Water 15, Aromatic Syrup, *qs* to produce 100—*BP C*

CALX CHLORINATA. See p 298

Not Official

CALCI GLYCEROPHOSPHAS.

CALCIUM GLYCEROPHOSPHATE

FR, GLYCEROPHOSPHATE DE CALCIUM, GER, GLYCERINPHOSPHORSAURES CALCIUM, ITAL, GLICEROFOSFATO DI CALCIO, SPAN, GLICEROFOSFATO DE CAL

A white odorless crystalline powder

It is prepared by the action of Milk of Lime on Glycerophosphoric Acid, the product being purified by treatment with Alcohol

Solubility—1 in 22 of Water, less soluble in warm Water, and almost insoluble in boiling Water, insoluble in Alcohol (90 p c)

Medicinal Properties—It improves the general nutrition in neurasthenia

Dose—5 to 15 grains = 0.32 to 1 gramme dissolved in Water

Prescribing Notes—*Liquid Glycerophosphate preparations keep best when undiluted, and any dilution should be done when the medicine is taken, but it*

prescribed in a diluted form the diluent should be Chloroform Water, not Distilled Water

Foreign Pharmacopœias—Official in Belg., Fr., Mex (Glicerofosfato de Calcio), Span (Glicerofosfato de Cal), and Swiss (Calcium Glycerinophosphoricum)

Tests—Calcium Glycerophosphate dissolves in Water, yielding a solution which is neutral in reaction towards Litmus paper. The aqueous solution yields with Ammonium Oxalate a white precipitate soluble in diluted Hydrochloric Acid, when the cold aqueous solution is warmed a white precipitate is thrown out, the salt being less soluble in warm than in cold Water. A little of the salt heated in a tube blackens and evolves the characteristic irritating odour of Acrolein, when ignited on platinum foil it burns with a luminous flame, leaving a white residue, which dissolved in Nitric Acid yields a solution giving on the addition of Ammonium Molybdate Solution a yellow precipitate insoluble in Nitric Acid, soluble in Ammonia Solution.

The Glycerophosphates do not answer the usual reactions of the Phosphates, that is to say they do not give an immediate precipitate with Ammonium Molybdate Solution, nor do they immediately precipitate with Magnesium Ammonio-sulphate Solution. On boiling with a mineral acid the Glycerophosphoric Acid is decomposed, and the solution then responds to the tests for Phosphoric Acid. The aqueous solution of the salt yields a white precipitate with Lead Subacetate Solution. The percentage of Phosphoric Acid may be determined volumetrically by titration of the aqueous solution with Deci-normal Volumetric Sulphuric or Hydrochloric Acid Solution, using Methyl Orange Solution as an indicator, and then titrating the solution with Deci-normal Volumetric Potassium or Sodium Hydroxide Solution, using Phenolphthalein Solution as an indicator. In the first instance one molecule of mineral acid corresponds to two molecules of Phosphoric Acid, and in the second two molecules of alkali correspond to one molecule of Phosphoric Anhydride.

The more generally occurring impurities are Arsenic, heavy metals, *eg*, Lead, Copper, and Iron, Chlorides, Phosphates, and Sulphates, readily carbonisable organic impurities, and free Glycerin.

Arsenic, if present, may be detected by Bettendorf's test, heavy metals by Hydrogen Sulphide in a solution rendered faintly acid with Hydrochloric Acid, Iron by Ammonium Hydrosulphide Solution, Chlorides by Silver Nitrate Solution in a solution rendered acid with Nitric Acid, Phosphates and Sulphates generally exist as insoluble salts and are readily detected by the solubility, and also by Barium Chloride or Nitrate Solution, organic impurities by charring when the salt is treated with concentrated Sulphuric Acid, and free Glycerin by treating the dry salt with Absolute Alcohol, filtering and evaporating off the solvent.

GLYCEROL GLYCEROPHOSPHATIS—Oudbear, 15 grains, Distilled Water, 10 fl oz. Boil for 10 minutes, filter and dissolve in the warm filtrate, Calcium Glycerophosphate, 160 grains, Potassium Glycerophosphate, 80 grains, Sodium Glycerophosphate, 80 grains, Magnesium Glycerophosphate, 80 grains, Iron Glycerophosphate (in scales), 40 grains, Citric Acid, 80 grains, then add Glycerin, 10 fl oz, Chloroform, 5 minims, Alcohol, 40 minims, Orange Flower Water (triple), 2 fl drms, Cherry Laurel Water, 3 fl drms, Distilled Water, *q s* to produce 20 fl oz.—*Bournemouth Formulary*

This has been incorporated in the *B P C* under the title **Glycerinum Glycerophosphatum Compositum** *Syn* Glycerol Glycerophosphatis

SYRUPUS GLYCEROPHOSPHATUM—The following is the formula given by Dr Robin, who introduced the preparation—Calcium Glycerophosphate, 6 grammes, Sodium, Potassium, and Magnesium Glycerophosphates, of each 2 grammes, Iron Glycerophosphate, 1 gramme, Tinctura Ignatæ Amara, 80 minims, Pepsin, 3 grammes, Maltine, 1 gramme, Tincture of Kola, 10 grammes, Syrup of Cherries, to 200 grammes.—*P J '95*, 1 1191

Nearly all commercial Syrups of the Glycerophosphates become turbid and throw down a bulky deposit on standing, and the same objection applies to **Syrupus Glycerophosphatum Compositus (B P C)**. The composition of

this latter preparation has been altered twice in about twelve months. It first of all contained Citric Acid, which was replaced by Acetic Acid, which is now replaced in the *B.P.C. Supplement* by Glycerophosphoric Acid.

FERRI GLYCEROPHOSPHAS (Iron Glycerophosphate) — Yellow or yellowish-green scales, or as a white powder, soluble in cold Water, more readily in hot. Introduced as a nervine tonic. Has been recommended in anæmia and especially chlorosis.

Dose — 5 to 10 grains = 0.32 to 0.65 gramme

Acidum Glycerophosphoricum — A clear, colourless, or pale yellowish-syrupy liquid. Sp. gr. 1.127. Chiefly used for the preparation of the salts, but rarely used medicinally.

CALCII HYDRAS.

CALCIUM HYDROXIDE

B.P. Syn. — SLAKED LIME

$\text{Ca}(\text{HO})_2$, eq. 73.47

A white odourless powder, having a caustic taste.

The Pharmacopœia directs that 'it should be recently prepared,' but this is unnecessary if air be excluded.

It should be kept in well-stoppered glass bottles, and protected as far as possible from contact with the air.

Solubility — Sparingly soluble in Water (1 in 900); the solution, on exposure to the air, soon acquires a film of Calcium Carbonate.

Medicinal Properties. — Antacid, astringent, sedative. The **Solution** (Lime Water) is useful in acid and gouty dyspepsia; in vomiting and diarrhœa of children, especially if given with the Milk, as it renders the curd less dense, in enteric fever it lessens the chances of hæmorrhage, also in the form of diluted **saccharated solution** to relieve chronic vomiting, and vomiting of pregnancy. The **Liniment** of Lime is applied to burns and scalds. When made with Linseed Oil it is known as Carron Oil.

Incompatibles — Vegetable and Mineral Acids, alkaline and metallic salts, Tartar Emetic.

Official Preparations — **Liquor Calcis** and **Liquor Calcis Saccharatus**. Used in the preparation of **Calcii Hypophosphis**, **Chloroformum**, **Extractum Ipecacuanhæ Liquidum**. **Lime Water** is used in the preparation of **Calcii Oxidum**, **Linimentum Calcis**, **Lotio Hydrargyri Flava** and **Lotio Hydrargyri Nigra**.

Not Official — Liniment for freckles, Carron Oil.

Foreign Pharmacopœias — Official in Fr. (**Hydroxide de Calcium**) and Span. (**Cal Apagada**). Not in the others.

Tests — Slaked Lime when dissolved in Water or in diluted Hydrochloric Acid and neutralised should afford the tests distinctive of Calcium given in the large type under **Precipitated Calcium Carbonate**. The aqueous solution should be alkaline in reaction to red Litmus paper and to Phenolphthalein Solution, and may be titrated with Normal Volumetric Hydrochloric or Sulphuric Acid Solution by the use of the latter indicator. 1 cc. of Normal Volumetric Acid Solution is equal to 0.036735 gramme.

of pure Calcium Hydroxide. When strongly heated the salt loses nearly one fourth of its weight of Water.

The more generally occurring impurities are Aluminium, Iron, Magnesium, Potassium, Sodium, Carbonates, Chlorides, Phosphates and Sulphates, and Silica if present is detected by the residue remaining insoluble in diluted Hydrochloric Acid, especially if, after first dissolving in Hydrochloric Acid the solution is evaporated to dryness and redissolved in Hydrochloric Acid, Aluminium, Iron and Phosphates are shown by the appearance of a precipitate when the Hydrochloric Acid Solution is rendered distinctly alkaline with Ammonia Solution, Magnesium by the precipitate produced with Ammonium Phosphate after separation of the Calcium as Oxalate in a solution containing Ammonium Chloride and a slight excess of Ammonia Solution. Potassium and Sodium may be detected, if present, in the residue after complete separation of the Calcium by Ammonium Oxalate. The absence of effervescence on the addition of Hydrochloric Acid is indicative of the absence of Carbonate, whilst Chloride may be detected in the Nitric Acid Solution of the salt by Silver Nitrate Solution and Sulphates in another portion of the same solution by means of Barium Chloride or Nitrate Solution. Phosphate may be detected by adding Ammonium Molybdate Solution to a solution of the salt containing some free Nitric Acid.

Preparations

LINIMENTUM CALCIS LINIMENT OF LIME

Solution of Lime, 1, Olive Oil, 1 (1 in 2)

Foreign Pharmacopœias—Official in Belg., Solution of Lime and Medicinal Oil, equal parts, Fr. (*Linim Calcaire*), Solution of Lime and Olive Oil, equal parts, Ital., Lime Water and Olive Oil, equal parts, Jap. and Mex., Lime Water 1, Sesame Oil 1, Port., Lime Water 9, Oil of Almonds 1, Span., (*Linimento Oleo-Calcareo*) Lime Water 65, Oil of Almonds 35, Austr., Dan. (*Linimentum Calcicum*), Dutch, Russ., Swed., Swiss and U.S., Solution of Lime and Linseed Oil, equal parts. All by weight, except U.S. Not in the others.

LIQUOR CALCIS SOLUTION OF LIME *B.P. Syn*—LIME WATER

A saturated Solution of Calcium Hydroxide (washed free of Chlorides) in Distilled Water. It should contain about $\frac{1}{2}$ grain in the fl. oz.

It should be kept in well-stoppered glass bottles of a dark amber colour, and preserved as far as possible from contact with the air. It is best kept in full bottles.

When freshly prepared it forms a colourless and odourless liquid possessing a peculiar alkaline taste. It gradually absorbs Carbonic Anhydride from the air, and a crust of Calcium Carbonate forms on the surface of the liquid.

The Hydrate is less soluble in hot than in cold Water, and, if saturated, Lime Water should precipitate on boiling.

Dose.—1 to 4 fl. oz. = 28 4 to 113·6 c.c.

It is more palatable when given in Milk

So-called aerated 'Lime Water' is sold in syphons, but we understand that it is aerated with Carbonic Acid gas, and in that case the name is misleading

Foreign Pharmacopœias—Official in Austr and Hung (Aqua Calcis), Dan, Dutch, Norw and Swed (Solutio Hydratis Calcis), Fr (Eau de Chaux), Ger and Jap (Aqua Calcariae), Ital (Acqua di Calce), Mex, Port and Span (Agua de Cal), Russ (Calcium Caustica Soluta), Belg, Swiss (Calcium Hydricum Solutum), U S, Liquor Calcis

Water becomes saturated with much less Lime than ordered in any of the Pharmacopœias, therefore Liquor Calcis is of the same strength in all

Tests.—Lime Water is strongly alkaline in reaction towards Litmus. It should yield the tests distinctive of Calcium described in the large type under Calcium Carbonate. It is officially required to contain 0.153 p.c. w/v of pure Calcium Hydroxide, as volumetrically determined by titration with Deci-normal Volumetric Sulphuric Acid Solution. Neither the *BP* nor the *PG* specify a particular indicator, the *USP* mentions Phenolphthalein Solution. The *PG* requires not less than 0.148 p.c. w/v, nor more than 0.166 p.c. w/v, the *USP* not less than 0.14 p.c. w/v, of pure Calcium Hydroxide.

The liquor should be free from the more generally occurring impurities mentioned under Calcium Hydrate, and in addition should be free from objectionable traces of Lead.

LIQUOR CALCIS SACCHARATUS. SACCHARATED SOLUTION OF LIME

Calcium Hydroxide, 1, Refined Sugar, in powder, 2, Distilled Water, 20 (about 1 in 62)

Contains about 8 grains of CaO in 1 fl oz. 1 oz. = about 14 fl oz. Lime Water

As suggested in our former editions the Sugar should be first dissolved in the Water, and the Calcium Hydroxide added to the Solution, after a few hours' occasional agitation, decant.

It should be kept in well-stoppered glass bottles of a dark amber colour, which should be kept full, and preserved as far as possible from contact with the air.

The Hydrate in this case also is less soluble in the hot than in the cold, and the liquor precipitates on boiling, but clears again on cooling.

A clear, colourless, and odourless liquid possessing a peculiar sweetish and alkaline taste.

Dose.—20 to 60 minims = 1.2 to 3.6 c.c.

Foreign Pharmacopœias—Official in Hung (Aqua Calcis Saccharata). Not in the others.

Tests. *Saccharatus* of Lime has a specific gravity of about 1.055, and is officially required to indicate 2.31 p.c. w/v of pure Calcium Hydroxide, as volumetrically determined by titration with Normal Volumetric Sulphuric Acid Solution. In this case also the *BP* specifies no indicator of neutrality. Phenolphthalein Solution is best for the purpose.

The liquor should be free from the impurities usually associated with the Hydroxide from which it is prepared, and in addition should not contain objectionable traces of Lead

Not Official

LINIMENT FOR FRECKLES—Liniment of Lime, 8, Solution of Ammonia, 1, mix

CARRON OIL—Equal parts of Linsced Oil and Lime Water, shaken to form a cream

One of the best applications to burns or scalds, more particularly when 1 or 2 p c of Phenol has been added

This has been incorporated in the *B P C* under the title *Linimentum Calcis cum Oleo Lini*

CALCII HYPOPHOSPHIS.

CALCIUM HYPOPHOSPHITE

FR, HYPOPHOSPHITE DE CALCIUM, GER, CALCIUM HYPOPHOSPHORUM, ITAL, IPOFOSFITO DI CALCIO, SPAN, HIPOFOSFITO CALCICO

$\text{Ca}(\text{PH}_2\text{O}_2)_2$, eq 168.83

A white, odourless, lustrous crystalline salt, or as a white crystalline powder, having a nauseous bitter taste

It should be kept in well-stoppered bottles and in a cool place. The salt readily undergoes oxidation, and on this account great care should be exercised in mixing it with substances which readily part with Oxygen, *e g*, Chlorates, Nitrates, and Peroxides

It may be obtained by the combined action of Calcium Hydroxide, Phosphorus, and Water, the salt being purified by recrystallisation

Solubility—1 in 8 of Water, and scarcely more soluble in boiling Water. Insoluble in Alcohol (90 p c)

Medicinal Properties.—Similar to those of Phosphorus, but without its unpleasant effects. Given in cases of nervous and general debility, it is by some supposed to be useful in phthisis

No satisfactory evidence that Hypophosphites can influence nutrition in any way differently from other indifferent salts, and the whole of the Hypophosphite administered can be recovered unchanged from the urine—*B M J* '06, ii 1460

Dose—3 to 10 grains = 0.2 to 0.65 gramme

Prescribing Notes—Usually given in mixtures or in one of the various forms of Syrup

Not Official—Glycerola Hypophosphitum, Syrupus Hypophosphitum, Syrupus Calci Hypophosphitis (*Squire*) and Syrupus Calci et Sodii Hypophosphitum

Foreign Pharmacopœias—Official in Belg, Jap and Swiss (Calcium Hypophosphorosum), Dutch and Norw (Hypophosphis Calcicus), Fr (Hypophosphite de Chaux), Ital (Ipofofrito di Calcio), Mex (Ipofofrito de Calcio), Port (Hypophosphito de Cal), Span (Ipofofrito Calcico), U S Not in the others

Tests—The distinguishing tests for Calcium Hypophosphite are

(1) that when heated to redness the crystals evolve spontaneously inflammable Hydrogen Phosphide and Hydrogen, and leave a reddish-coloured residue, (2) an aqueous solution rapidly reduces Potassium Permanganate Solution, yielding if the proportionate quantity of Permanganate be employed a practically colourless filtrate, (3) the aqueous solution reduces Mercuric Chloride Solution first to Mercurous Chloride and ultimately more completely to metallic Mercury. Upon its property of reducing Potassium Permanganate Solution is founded the official quantitative test of its purity, which requires that when 0.25 gramme of the salt is boiled for 10 minutes with 0.6 gramme of Potassium Permanganate in solution, and the liquid filtered, the filtrate shall be practically colourless. Several methods have been proposed with a view to affording a more accurate quantitative determination. Tyrer has suggested (*P. J.* '97, ii 150) reduction of Copper Solution, previously eliminating any impurity likely to affect the result, by treatment with Barium Chloride Solution. Jowett points out (*Y. B. P.* '98, 412, *C. D.* '98, ii 300) that Barium Phosphite is slightly soluble in Water, which would affect the results obtained, and proposes the following method—About 0.3 gramme of the dried salt is dissolved in 10 c.c. of Water, 3 c.c. of a 10 p.c. Lead Acetate solution added, and the mixture allowed to stand 12 hours. It is then filtered, the precipitate thoroughly washed, and the washings added to the filtrate, which is acidified with Hydrochloric Acid, and then saturated with Hydrogen Sulphide, boiled, filtered, and the Lead Sulphide thoroughly washed. The mixed washings and filtrate are then evaporated to a low bulk and 5 c.c. Hydrochloric Acid and 1 gramme Potassium Chlorate added, and gently heated for half an hour, then concentrated to about 20 c.c., and the Phosphate finally determined either gravimetrically or volumetrically by the usual methods. The *U. S. P.*, although requiring that it shall contain not less than 98 p.c. of pure Calcium H₂P₂O₇, gives no process for its determination. The salt is not official in the *P. G.*

The more generally occurring impurities are Aluminium, Arsenic, Copper, Iron, Lead, Magnesium, Potassium, Sodium, Chlorides or Sulphates, Phosphates or Phosphites. The *B. P.* groups these collectively. A 1 in 20 aqueous solution of the salt acidified with Hydrochloric Acid should yield no turbidity or darkening in colour on the addition of Hydrogen Sulphide indicating the absence of Arsenic, Copper and Lead, nor on the subsequent addition of Ammonia Solution should any appreciable darkening in colour ensue, indicating the absence of more than a trace of Iron. The 1 in 20 aqueous solution, after the complete precipitation of the Calcium as Oxalate, should afford no turbidity on the addition of Sodium Phosphate Solution, indicating the absence of Magnesium. The *U. S. P.* does not include tests for Aluminium, Magnesium, Potassium, Sodium or Phosphites; the modified Gutzeit's test is employed in testing for Arsenic, and the time-limit test for heavy metals. The *B. P.* employs Lead Acetate Solution to detect Phosphates and Phosphites, but no commercial sample has been found which does not give more or less precipitate or turbidity with Lead Acetate, which also precipitates Sulphates and Sulphites.

The *USP* takes the solubility of the salt in Water as a criterion of the absence of Phosphate and Sulphate

Modified Gutzzeit's Test—If 5 c c of an aqueous solution of the salt (1-10) be measured into a beaker containing 3 c c of Nitric Acid diluted with about 10 c c of Water and evaporated to dryness on a water bath the residue should not respond to the modified Gutzzeit's test for Arsenic, *USP*

Time-limit Test—A (1-20) aqueous solution of the salt acidulated with Hydrochloric Acid should not respond to the time limit test for heavy metals, *USP*

Not Official

GLYCEROLA HYPOPHOSPHITUM (*Squire*)—Calcium, Potassium, and Sodium Hypophosphites, of each 1, dissolve these in Water, 40, filter and add Sugar, 40, Orange flower Water, 2, Cherry laurel Water, 2, dissolve and add Glycerin, 12, and filter

Dose—1 to 2 fl drm = 3 6 to 7 1 c c

Glycerol Hypophosphitis—Hypophosphite of Potassium, 160 grains, Hypophosphite of Calcium, 160 grains, Hypophosphite of Manganese, 80 grains, Hypophosphite of Quinine, 80 grains, Hypophosphite of Strychnine, 2½ grains, Strong Solution of Hypophosphite of Iron (*BPC*), 4 fl oz, Hypophosphorous Acid, 2 fl drm, Distilled Water, 3 fl oz, Glycerin, to produce 20 fl oz — *Bournemouth Formulary*

This has been incorporated in the *BPC* as follows —

Glycerinum Hypophosphitum *Syn* GLYCEROL HYPOPHOSPHITIS — Calcium Hypophosphite, 1 50, Manganese Hypophosphite, 0 75, Potassium Hypophosphite, 1 50, Quinine Hypophosphite, 0 75, Strychnine Hypophosphite, 0 025, Strong Solution of Ferric Hypophosphite, 20, Hypophosphorous Acid, 10, Distilled Water, 15, Glycerin, q s to produce 100 — *BPC*

SYRUPUS HYPOPHOSPHITUM — Calcium Hypophosphite, 45 grammes, Potassium Hypophosphite, 15 grammes, Sodium Hypophosphite, 15 grammes, Diluted Hypophosphorous Acid, 2 grammes, Sugar, 650 grammes, Tincture of Fresh Lemon Peel, 5 c c, Water, q s. to make 1000 c c — *US*

SYRUPUS CALCII HYPOPHOSPHITIS (*Squire*)—Dissolve Calcium Hypophosphite, 4 in Distilled Water, 38 add Sugar, 59, dissolve without heat and filter the Syrup

Dose—1 fl drm = 3 6 c c containing 3 grains = 0 2 gramme

The *BPC* Syrup is only one third the strength, necessitating an excessive quantity of Syrup for a full dose of the salt

SYRUPUS CALCII ET SODII HYPOPHOSPHITUM (*USNF*) — Calcium Hypophosphite, 35, Sodium Hypophosphite, 35, Hypophosphorous Acid (*USP*), 1 5, Sugar, 775, Water, sufficient to make 1000

1 fl drm contains 2 grains each of Calcium Hypophosphite and Sodium Hypophosphite

The *BPC* has incorporated the old formula (*USNF* 1896) which employs Citric Acid

Not Official CALCII IODAS

CALCIUM IODATE

A white, or more usually yellowish, very deliquescent, crystalline powder antiseptic and disinfectant Under the name Calcinol it has been used as an antiseptic dressing in place of Iodoform — *L* '00, 11 1887, *PJ* '01, 1 27

Dose—1 to 3 grains = 0 06 to 0 2 gramme, two or three times daily in Water, as an intestinal antiseptic

Tests.—The aqueous solution affords the tests characteristic of Calcium given in large part under Calcium Carbonate

If a few drops of Silver Nitrate Solution a white precipitate, sparingly soluble in Water and in dilute Nitric Acid, but readily soluble in Ammonia Solution. When mixed with Potassium Iodide Solution it yields on the addition of Tartaric Acid Solution or a solution of an acid Sulphate and Starch Mucilage a fine blue coloration. Barium Chloride Solution produces a white precipitate practically insoluble in Water and difficultly soluble in Nitric Acid. On the addition of Sulphurous Acid to an aqueous solution Iodine is liberated, and may be recognised by the violet colour of its solution in Carbon Bisulphide or by the blue colour produced on the addition of Starch Mucilage

Not Official.

CALCII IODIDUM.

This salt may be obtained from concentrated solutions in crystalline needles. By evaporating its solution to dryness it may be obtained as a white deliquescent fusible mass which crystallises on cooling. It is readily soluble in Water and in dilute Alcohol. It has recently (*B M J* '06, i, 138) been shown that great benefit is derived from its use in the treatment of ulcers, it had a remarkable effect in reducing thick callous edges into thin healing ones. It is given in doses of 2 to 4 grains (0.13 to 0.26 gramme)

Of great value in leg ulcers.—*B M J* '07, i, 991

Suggested that the gastritis which has sometimes followed its administration was due to free Iodine given off by the salt on exposure to a bright light or air. It should, therefore, be kept unexposed to light, and dispensed in suitably coloured bottles.—*B M J*, '07, i, 1464

CALCII PHOSPHAS.

CALCIUM PHOSPHATE.

FR, PHOSPHATE DE CALCIUM, GER, CALCIUMPHOSPHAT, ITAL, FOSFATO DI CALCIO, SPAN, FOSFATO CALCICO

A light, white, odourless and tasteless amorphous powder

It is generally obtained commercially from Bone Ash. The Bone Ash is treated with Hydrochloric Acid and the resulting solution is precipitated with dilute Ammonia Solution, the precipitate being washed with cold Water to free it from Ammonium salts and dried at a temperature not exceeding 100° C (212° F). It is officially mentioned that it may be prepared by the interaction of Calcium Chloride and Sodium Phosphate, but it has been stated (*C D* '02, i, 190) that the salt produced by precipitation with the official Di-Sodium Hydrogen Phosphate is Di-Calcium Hydrogen Phosphate, and only in the event of Tri-Sodium Phosphate being used as a precipitant is a salt corresponding to the official *Calcii Phosphas* produced. A specimen produced by precipitation of Calcium Hydrogen Phosphate when dissolved in Hydrochloric Acid and reprecipitated with Ammonia Solution showed a loss of over 29 p c, whereas the official requirement is not less than 5 p c.

Solubility—Insoluble in Water, soluble in Dilute Hydrochloric Acid or Diluted Nitric Acid.

Medicinal Properties—For rickets and mollities ossium, and other conditions of malnutrition, said to be useful in scrofulous affections, to promote union of bone fractures, in tardy teething, and in anæmia, given to counteract the draining of Phosphates during pregnancy and lactation, and to prevent decay of the teeth and toothache during pregnancy

Dose—5 to 15 grains = 0.32 to 1 gramme

Prescribing Notes—*More commonly ordered in smaller doses. Given as a powder, or in the form of Syrup*

Official Preparations—Contained in *Extractum Euonymi Siccum* and *Pulvis Antimonialis*

Foreign Pharmacopœias—Official in Austr, Belg, Ger, Hung, Russ and Swiss (*Calcium Phosphoricum*), Dutch and Swed (*Phosphas Calcicus*), Dan (*Phosphas Calcicus Præcipitatus*), Fr (*Phosphate Diacide de Calcium*, *Phosphate Monoacide de Calcium* and *Phosphate Neutre de Calcium*), Ital (*Fosfato Bicalcico*), Jap (*Calcium Phosphoricum Præcipitatum*), Mex (*Fosfato de Calcio*), Port (*Phosphato de Cal*), Span (*Fosfato DiCalcico* and *Fosfato TriCalcico*), US (*Calcii Phosphas Præcipitatus*) Not in Norw

Tests—Calcium Phosphate when dissolved in Hydrochloric Acid answers the tests distinctive of Calcium given in the large type under Calcium Carbonate. Its solution in diluted Nitric Acid gives with Ammonium Molybdate Solution a yellow precipitate, which, when filtered off and washed, dissolves in Ammonia Solution, and affords on the addition of Magnesium Ammonio-sulphate Solution a white crystalline precipitate. The *BP* includes a method of gravimetrically determining the purity of the salt requiring that its Hydrochloric Acid Solution shall yield a white precipitate amounting to 95 p.c. by weight when reprecipitated with diluted Ammonia Solution, washed with cold Water and dried at 100° C (212° F). The *USP* states that it shall contain not less than 99 p.c. of pure Calcium Phosphate, but gives no method for its determination. The *PG* neither gives the requisite percentage nor a method of determination. The salt official in the *PG* is the Di-Calcium Phosphate and not the Tri-Calcium Phosphate.

The more generally occurring impurities are Aluminium, Arsenic, Copper, Iron, Lead, Magnesium, Carbonates, Chlorides, Silica and Calcium Oxalate. With the exception of the last named the *BP* group these collectively without any regard for their relative importance. Arsenic, the most important, is examined for in the *USP* by the modified Gutzeit's test, in the *PG* by Bettendorf's test. The *USP* employs the time limit test, and *PG* Hydrogen Sulphide for the detection of Copper and Lead. Neither the *USP* nor *PG* includes a test for Magnesium or Silica. Calcium Oxalate is an unlikely impurity, and it has been questioned (*CD '02*, 1190) whether the *BP* test for 'absence of Calcium Oxalate' is not a slip for 'absence of Alumina'. Both *USP* and *PG* state that when moistened with Silver Nitrate Solution the salt is coloured yellow, the *USP* mentions 'either before or after ignition,' which

distinguishes it from Acid Calcium Phosphate, which, after ignition, remains white, when so moistened

Potassium Sulphate—5 c c of the solution prepared by means of Nitric Acid strongly acidified with Nitric Acid should yield with 1 c c of Potassium Sulphate T S no turbidity upon standing, indicating the absence of Barium, *U S P*

Silver Nitrate—5 c c of a 1-20 solution prepared by the aid of Nitric Acid and acidulated with Nitric Acid yields with 0.5 c c of Silver Nitrate T S not more than a slight turbidity, *U S P*. The *P G* requires that a (1-20) aqueous solution of the salt obtained with Nitric Acid should be rendered at most opalescent with Silver Nitrate T S after 2 minutes

Barium Nitrate—If 1 part of Calcium Phosphate be shaken with 2 parts of Water, and the mixture filtered, the filtrate, after addition of Acetic Acid, should not be affected by Barium Nitrate Solution, *P G*

Stannous Chloride—A mixture of 1 gramme Calcium Phosphate and 8 c c of Stannous Chloride Solution should not assume a dark colour in the course of an hour, *P G*

Hydrogen Sulphide—The aqueous solution (1-20) obtained with Nitric Acid should give with excess of Solution of Ammonia on the addition of Hydrogen Sulphide T S a pure white precipitate, *P G*

Gutzzeit's Test—5 c c of a 1 in 10 solution of Calcium Phosphate in diluted Hydrochloric Acid should not respond to the modified Gutzzeit's test for Arsenic, *U S P*

Time-limit Test—An aqueous solution (1-20) obtained by shaking the salt with Water, adding Hydrochloric Acid drop by drop and heating until solution is effected, should not respond to the time-limit test for heavy metals, omitting the addition of Ammonia Solution, *U S P*.

Not Official.

CALCII SULPHAS.

CALCIUM SULPHATE.

SULPHATE OF LIME CALCINED GYPSUM PLASTER OF PARIS

Fr, SULFATE DE CALCIUM, GER, GYPSBRANNTER GIPS, ITAL, GESSO CALCINATO, SPAN, Yesso

Native Calcium Sulphate (CaSO_4 , $2\text{H}_2\text{O}$, eq 170.81) rendered nearly anhydrous by heat

A white odourless and tasteless powder

It should be kept in well-closed jars, and should be protected as far as possible from moisture

Foreign Pharmacopœias.—*U S P*, *B P*, *Pharmacopœia Germanica*, Ger, Hung, Jap, Mex, Norw, Russ, Swed, Sw, *Pharmacopœia Scandinavica*, *Pharmacopœia Sibirica*

The native salt is used for the preparation of Calc Sulphurata

Tests—The *U S P* test for Calcium Sulphate is that when mixed with half its weight of Water it should form a smooth paste, rapidly becoming hard. The *P G* states that when so mixed it shall harden within 5 minutes. The saturated aqueous solution answers the tests characteristic of Calcium given in the large type under Calcium Carbonate, it should be neutral to Litmus paper, and should on the addition of Barium Chloride Solution yield a white precipitate, insoluble in Hydrochloric Acid

The more generally occurring impurity is Calcium Carbonate and the salt should not yield any effervescence when added to dilute Hydrochloric or Nitric Acid.

ALX. SULPHURATA (Calcii Sulphuratum) See p. 302,

Not Official CALENDULA

COMMON MARIGOLD

The Florets of *Calendula officinalis*, L

Foreign Pharmacopœias —Official in U S Not in the others

TINCTURA CALENDULÆ FLORUM —1 of Marigold Flowers, dried, in No 20 powder, percolated with Alcohol (60 p c), to yield 5

This is included in the *B P C Formulary* 1901

Calendula, in No 20 powder, 20, Alcohol (95 p c), 100 Prepared by percolation —*U S P*

This has been incorporated in the *B P C*

Medicinal Properties —Used as an application for sprains and bruises, internally for amenorrhœa

Dose —5 to 20 minims = 0 3 to 1 2 c c

Foreign Pharmacopœias —Official in U S, 1 in 5 (Alcohol 94 9 p c) Not in the others

Not Official CALOTROPIS

Syn —MUDAR

The dried root bark of *Calotropis procera*, R Br, and of *Calotropis gigantea*, R Br, freed from the outer corky layer, dose 3 to 10 grains = 0 2 to 0 65 gramme, as a tonic, as an emetic 30 to 60 grains = 2 to 4 grammes, and **Tinctura Calotropis** (1 in 10), dose 30 to 60 minims = 1 8 to 3 6 c c, are official in the *Ind* and *Col Add* for India and the Eastern Colonies

CALUMBÆ RADIX.

CALUMBA ROOT

FR, RACINE DE COLOMBO, GER, KOLOMBOWURZEL, ITAL, COLOMBO,
SPAN, RAIZ DE COLOMBO

The Root of *Jateorhiza Calumba*, Miels, cut in nearly circular transverse discs and dried

The dried stem of *Coscinum fenestratum*, Colebr, (false Calumba Root) is official in the *Ind* and *Col Add* for India and the Eastern Colonies

Medicinal Properties —A bitter stomachic useful in chronic atonic dyspepsia, in promoting appetite, stimulating the gastric functions and removing flatulence Given in convalescence from acute diseases, combined with alkalis or Bismuth Like other bitters, Calumba ought not to be given in gastric ulcer, in acute gastritis, or when there is pain, nor ought it to be given for too long

Prescribing Notes —Given in the form of *Infusum*, *Liquor Concentratus*, or *Tincture* with other medicines It is one of the few bitters that can be given with salts of Iron

Official Preparations —*Infusum Calumbæ*, *Liquor Calumbæ Concentratus*, and *Tinctura Calumbæ*.

Not Official—*Extractum Calumbæ, Fluidextractum Calumbæ, Infusum Calumbæ Concentratum*

Foreign Pharmacopœias—Official in all

Descriptive Notes—*Calumba* root as met with in commerce varies much in character and quality, some specimens being of fresh appearance and yellowish tint, and others dull or greyish-yellow in colour and badly dried, and sometimes worm-eaten. The transverse or oblique slices average about $1\frac{1}{2}$ inch (37 mm) in diameter and about $\frac{1}{2}$ inch (8 mm) in thickness. The *BP* defines the size as about $\frac{1}{2}$ to $\frac{3}{4}$ inch (3 to 12 mm) or more in thickness, and about 1 to 2 inches ($2\frac{1}{2}$ to 5 cm) or more in diameter. The bark is $\frac{1}{4}$ inch or more in thickness, and harder and less shrunken than the starchy parenchymatous central portion, which is more or less depressed. The whole surface has a number of slender lines radiating from the centre and the bark is marked off by a darker cambium ring. The taste is bitter and mucilaginous and the odour characteristic. Under the microscope the distinctive features are the large irregular starch grains (0.09 mm *P G*), a stellate hilum, and the irregularly thickened yellow sclerenchymatous cells in the bark, containing rhomboidal crystals of Calcium Oxalate. The active principle is not Berberine, as formerly supposed, but consists of two alkaloids resembling it (*P J* (4) xvi p 341). The infusion made with cold Water to avoid dissolving starch should be strained and then boiled to destroy a ferment or oxydase which causes the infusion, at first neutral, to become acid and turbid. To prevent the gum present from readily dissolving, the root is usually cut into small pieces instead of being pounded.

The root should be selected of good quality and of moderate size, as the larger pieces have less bark in proportion, and it is in this part that the activity of the drug chiefly resides. If old it is usually darker and duller in colour and more or less worm-eaten. A very bright colour usually indicates that the root has been washed and dried and may have lost some of its active principle. *Calumba* root is not often adulterated, sometimes small pieces with prominent woody wedges are occasionally found mixed with *Calumba*, but do not differ in the character of the starch or in taste, and are apparently pieces of the short underground stem from which the fusiform roots proceed. Another root has recently been found mixed with *Calumba*, resembling it in shape and size, but with a reddish tint, distinctly radiate structure, and containing bundles of acicular raphides in some parenchymatous cells and sphaeraphides in others.

Preparations

INFUSUM CALUMBÆ. INFUSION OF CALUMBA

Calumba Root, 1; Distilled Water, cold, 20, infuse for half an hour, strain (1 in 20)

Cold Water is used to avoid solution of the Starch which exists in the root,

Dose.— $\frac{1}{2}$ to 1 fl. oz. = 14.2 to 28.4 c.c.

A corresponding preparation, **Infusum Coccinii**, is official in the *Ind* and *Col Add* for India and the Eastern Colonies

Foreign Pharmacopœias—Official in Belg, 1 of Fluid Extract in 20, Ital, 1 in 20, Span, 1 in 100 Not in the others

LIQUOR CALUMBÆ CONCENTRATUS. CONCENTRATED SOLUTION OF CALUMBA

An aqueous preparation of Calumba (preserved by the addition of Alcohol) 1 of Calumba in 2 of Liquor

It contains 22.5 p c by volume of Alcohol (90 p c)

Dose — $\frac{1}{2}$ to 1 fl drm = 1.8 to 3.6 c c

Tests—Concentrated solution of Calumba has a specific gravity of 0.990 to 0.996, it contains about 4 p c w/v of total solids and about 20 p c w/v of Absolute Alcohol

A corresponding preparation, **Liquor Coccinii Concentratus**, is official in the *Ind* and *Col Add* for India and the Eastern Colonies

TINCTURA CALUMBÆ TINCTURE OF CALUMBA

1 of Calumba Root in No 20 powder, macerated with 10 of Alcohol (60 p c) (1 in 10)

Dose — $\frac{1}{2}$ to 1 fl drim = 1.8 to 3.6 c c

Tests—Tincture of Calumba has a specific gravity of 0.915 to 0.920, it contains about 1 p c w/v of total solids and about 60 p c w/v of Absolute Alcohol

A corresponding preparation, **Tinctura Coccinii**, is official in the *Ind* and *Col Add* for India and the Eastern Colonies

Foreign Pharmacopœias—Official in Belg, Fr, Mex, Port, Span, Swed, Swiss and U S, 1 in 5, Ital and Jap, 1 in 10, all except U S by weight Not in the others

Not Official

EXTRACTUM CALUMBÆ—Calumba Root exhausted with Alcohol (60 p c) and the product evaporated to a pill consistence 16 parts of Root yield 1 to 1 $\frac{1}{2}$ parts of Extract

This has been incorporated in the *B P C*

Dose — $\frac{1}{2}$ to 2 grains = 0.03 to 0.13 gramme

Foreign Pharmacopœias—Official in Austr, Dutch, Hung and Span, made with Alcohol (70 p c), Belg, Ital and Mex, made with Alcohol (60 p c), Port, made with Alcohol (65 p c), Jap, made with Alcohol (45 p c), U S, **Fluid Extract** only, made with Alcohol (about 66 p c) Not in Dan, Fr, Ger, Norw, Russ or Swed

FLUIDEXTRACTUM CALUMBÆ (U S P)—A 1 in 1 Fluid extract prepared by macerating and percolating 1 of the Root with a mixture of 7 of Alcohol (94.9 p c) and 3 of Water. The Fluid Extract of the *Belg Pharm* is prepared from the Root with Alcohol (30°), the resultant fluid extract being required to contain at least 13 p c of dry residue

INFUSUM CALUMBÆ CONCENTRATUM—Calumba Root, in No 10 powder, 40, Alcohol (90 p c), 25, Dilute Chloroform Water (1 in 100), *q s* to make 100. Prepare by macero expression, the reserved liquid should be heated to 85° C, for 5 minutes before adding the Alcohol. **Dose** — $\frac{1}{2}$ to 1 fl drim—*Farr and Wright, P J '06, 1 165, '07, 1 621, C D '06, 1 252, Y B P '07, 247*
This appears in the *B P C*

CALX.

LIME

FR, OXYDE DE CALCIUM, GER, GEBRANNTER KALK, ITAL, OSSIDO DI CALCIO;
SPAN, CAL VIVA

Calcium Oxide, CaO , eq 55 59, obtained by calcining Chalk, Limestone, or Marble

White or whitish, hard, odourless masses, possessing a characteristic caustic taste When exposed to the atmosphere Lime rapidly absorbs Water and Carbonic Anhydride, and should therefore be kept in well-closed vessels, and protected as far as possible from contact with the air

Solubility.—Decomposed by Water, forming Calcium Hydrate, under which heading the solubility is given

Foreign Pharmacopœias—Official in all

Tests—The distinctive test for Lime is the heat evolved when mixed with about half its weight of Water, the masses swelling up and crumbling to powder The *BP* mentions rather less than its own weight of Water, the *PG* with half its weight of Water, and the *USP* with about half its weight of Water, the *USP* and the *PG* stating, in addition, that with from 3 to 4 parts of Water, it forms a smooth magma When mixed with Water and dissolved by the aid of Hydrochloric Acid, it yields a solution conforming to the distinctive tests for Calcium given in the large type under *Calci Carbonas Præcipitatus* The aqueous solution is alkaline in reaction towards red Litmus and to Phenolphthalein Solution The *USP* requires that in the anhydrous state it shall contain not less than 90 p c of pure Calcium Oxide, the *BP* and *PG* specify no definite percentage Neither Pharmacopœia refers to any method of quantitative determination

The more generally occurring impurities are Aluminium, Iron, Magnesium, Potassium, Sodium, Carbonates, Chlorides, Phosphates, Sulphates, and Silica. These are grouped collectively in the *BP* The methods adopted for their detection in the case of Calcium Hydrate are applicable here also The *PG* includes only a test for Carbonates and residue insoluble in Nitric Acid, the *USP* a limit of Carbonate, and a limit (0.5 p c) of matter insoluble in Hydrochloric Acid

CALCI HYDRAS.—See p 286

CALX CHLORINATA.

CHLORINATED LIME

FR., CHLORURE DE CHAUX, GER., CHLORKALK, ITAL, CLORURO DI CALCE.

A white, or greenish-white, dry, amorphous powder, evolving a strong chlorinnaceous odour Is a mixture of variable composition, consisting chiefly of Calcium Hypochlorite

As it becomes moist and gradually decomposes on exposure to the air, it should be preserved in well closed vessels in a cool and dry place

Solubility—Partially soluble in Water and in Alcohol (90 p c) Decomposed by acids with formation of Hypochlorous Acid, which in the case of Hydrochloric Acid reacts with it to form Chlorine

Medicinal Properties—Chiefly used as a disinfectant A solution of 1 of Calx Chlorinata to 120 of Water is very powerfully antiseptic and is neither toxic nor caustic Acts best at a temperature of 110° to 120° F

A remarkably efficacious and absolutely harmless antiseptic Useful as an external application in surgical, ophthalmic and gynaecological practice and also as an injection in affections of the rectum and bladder See also below, Liquor Calcis Chlorinatae

Bleaching Powder frequently consists of little else than inert Calcium Chloride and Carbonate, the active Chlorine being spent Generally speaking, it only destroyed the least resistant microbes, though in the case of anthrax spores on linen this substance proved more effective than Carbolic Acid—*London County Council's Report on Disinfectants, L '02, i 759*

Official Preparations—Liquor Calcis Chlorinatae Used in the preparation of Chloroform and Liquor Sodæ Chlorinatae

Not Official—Liquor Potassæ Chlorinatae

Foreign Pharmacopœias—Official in Dan, Norw, Swed (Calx Chlorata), Austri and Russ (Calcium Hypochlorosum), Fr (Chlorure de Chaux), Belg, Ger, Hung, Jap and Swiss (Calcaria Chlorata), Ital (Cloruro di Calce), Mex (Hipoclorito de Calcio Impuro), Port (Cal Chlorada), Span (Hipoclorito Calcico Clorinado), US (Calx Chlorinata), Hung and Norw, contain 20 p c of available Chlorine, Austr, Belg, Dan, Ger, Jap, Russ, Swed and Swiss, 25 p c, Ital, 28.6 p c, Fr 35 p c, Span, 32 p c, US not less than 30 p c, Port, not indicated Not in Dutch

Tests—The distinguishing tests for Calx Chlorinata are that when treated with Hydrochloric Acid it evolves a yellowish gas which at first reddens and then bleaches moistened blue Litmus paper, its aqueous solution decolorises Indigo Sulphate Solution, its Acetic Acid solution yields with Ammonium Oxalate Solution a white precipitate, insoluble in Acetic Acid, soluble in Hydrochloric Acid It is officially required to contain 33 p c (more correctly 32.93 p c) of available Chlorine as indicated by titration of the Iodine liberated on mixing 0.5 gramme of the salt with 1.5 grammes of Potassium Iodide dissolved in 200 c c of Water and 6 c c of Hydrochloric Acid, at least 46.8 c c of Volumetric Sodium Thiosulphate Solution should be required A detailed comparison of the *U.S.P.* and *P.G.* processes will be found below in the small type under the heading of Volumetric Determination It should be noted that only a good and well-kept sample will yield the percentage of Chlorine required by the *B.P.* The *P.G.* requires 24.95 p c and the *U.S.P.* not less than 30 p c of available Chlorine, the latter Pharmacopœia triturating a definite weight of the substance with Water, making up to a standard volume and performing the assay on an aliquot portion

Volumetric Determination—The *P.G.* uses 0.5 gramme Calcaria Chlorata mixed with a solution of 1 gramme Potassium Iodide in 20 c c of Water, and

acidulated with 20 drops Hydrochloric Acid, and directs that it should require at least 85 c c Tenth-normal Volumetric Sodium Thiosulphate Solution to combine with the liberated Iodine, *P G*

Introduce into a stoppered weighing bottle between 3 and 4 grammes of Chlorinated Lime and weigh accurately, titrate this thoroughly with 50 c c of mixture to a graduated vessel, together with the rinsings, and to make 1000 c c. After thoroughly shaking add to 100 c c of the mixture 1 gramme of Potassium Iodide, 5 c c Diluted Hydrochloric Acid and sufficient Tenth-Normal Volumetric Sodium Thiosulphate Solution for complete decolouration. Multiply the number of c c of Tenth normal Volumetric Solution consumed by 0.8518, and divide the product by one tenth of the weight of the Chlorinated Lime taken, the quotient represents the percentage of available Chlorine present, *U S P*

Preparations

LIQUOR CALCIS CHLORINATÆ. SOLUTION OF CHLORINATED LIME

Chlorinated Lime, 1, Distilled Water, 10 (1 in 10)

The Chlorinated Lime should be thoroughly mixed with the Water, and set aside in a stoppered bottle or three hours, shaking it at intervals, and finally strained.

yield, when fresh, about p c of available Chlorine, but on keeping. It should be preserved in well-stoppered amber-coloured bottles and kept in a cool and dark place.

Medicinal Properties.—A powerful antiseptic and bleaching agent. Diluted 1 to 12 or 16 of Distilled Water, it is used as an antiseptic lotion for unhealthy ulcers, purulent ophthalmia, iteal cutaneous diseases, as an injection in foul nasal, aural and as a gargle in septic tonsillitis and diphtheria.

Antidotes.—Emetics, White of Egg, Milk, Flour, not Acids.

Foreign Pharmacopœias.—Official in Belg, 3 in 100, Russ (Calcium Hypochlorosum Solutum), 2.5 p c of Chlorine, Span, about 1 in 48. Not in the others.

Tests.—The tests for Chlorinated Lime Solution are that it has a specific gravity of about 1.055 and shall yield not less than 2 p c of available Chlorine as determined by titration of the Iodine liberated, when 1 gramme of the liquor is mixed with 0.5 gramme of Potassium Iodide dissolved in Water and 1 c c of Diluted Hydrochloric Acid added, not less than 5.6 c c of Deci-normal Volumetric Sodium Thiosulphate should be required, corresponding to 1.97 p c of available Chlorine.

LIQUOR SODÆ CHLORINATÆ.—SOLUTION OF CHLORINATED SODA

An almost colourless liquid possessing an alkaline reaction, an astringent taste and a faint chlorinaceous odour. It is prepared by well rubbing 4 of Chlorinated Lime with 30 of Distilled Water and mixing this with 6 of Sodium Carbonate previously dissolved in 10 of Distilled Water, and filtering.

The method of preparation adopted in the *BP* 1885 recommended the solution of the Chlorinated Lime to be filtered, the solutions to be

well mixed and again filtered. The *Companion*, 1894 edition, pointed out that this was unadvisable, and the method was altered in accordance with the *Companion* recommendation in the 1898 edition of the *B P*.

It should be kept in well-stoppered amber-tinted glass bottles and in a cool and dark place. It has the reputation of being an unstable solution, but this is an error. It undergoes but slight change, even when kept under ordinary conditions during several months, or even after keeping for a week in an open white glass bottle.

The Labarraque Solution was prepared by mixing together the unfiltered solutions of one part of Chlorinated Lime with 2 parts of Soda crystals.

The proportions used in U S and other Pharmacopœias will be found below.

Medicinal Properties—Antiseptic. Used internally in typhoid fever and in dysentery. Invaluable as a gargle in throat affections attended with fœtor, as in scarlet fever, diphtheria and septic tonsillitis, 1 fl oz in 12 to 16 fl oz of Water. Diluted with Water or Glycerin it forms an excellent application to sore nipples. It is also a powerful disinfecting agent, and is employed as a wash for foul ulcers.

For information on the treatment of typhoid and diphtheria by Chlorine see under 'Chlorine Liquor'.

A paper by Klein on the disinfecting action of solutions of Sodium Hypochlorite—*L* '96, ii 1509.

Dose—10 to 20 minims = 0.6 to 1.2 cc

Foreign Pharmacopœias—Official in Fr (Chlorure de Soude dissous), Chlorinated Lime 1, Sodium Carbonate 2, Water 45, Mex (Hipoclorito de Sodio liquido), Sodium Chloride 8, Manganese Dioxide 8, Sulphuric Acid 8, Sodium Carbonate 5, Distilled Water 20, Port (Solutio de Soda Chlorada), Calcium Hypochlorite 1, Sodium Carbonate 2, Water 40, Span (Solucion de Hipoclorito Sódico), Calcium Hypochlorite 1, Sodium Carbonate 2, Water 43, Swiss (Natrium Hypochlorosum Solutum), Calcium Hypochlorite 4, Sodium Carbonate 5, Water 120, U S, Chlorinated Lime 90, Monohydrated Sodium Carbonate 65, Water to weigh 1000. Not in the others.

Tests—Chlorinated Soda Solution has a specific gravity of about 1.054, it decolorises Indigo Sulphate Solution, and yields when acidified with Hydrochloric Acid a yellowish-green gas possessing a strong chlorinaceous odour and which first reddens and then bleaches moistened blue Litmus paper. It is officially required to indicate at least 2.51 pc of available Chlorine as determined by the titration of the Iodine liberated when 3.5 grammes of the solution are added to a solution of 1 gramme of Potassium Iodide in 100 cc of Water and the mixture acidulated with 3 cc of Hydrochloric Acid, at least 25.0 cc of Volumetric Sodium Thiosulphate Solution should be required. The *USP* requires it to contain at least 2.4 pc by weight of available Chlorine, as volumetrically determined by mixing a weighed quantity of 7 grammes of the solution with 50 cc of Water and 2 grammes of Potassium Iodide, adding 10 cc of Hydrochloric Acid and titrating the liberated Iodine with Tenth-

normal Volumetric Sodium Thiosulphate Solution, of which not less than 48 c.c. should be required, 1 c.c. of Tenth-normal Volumetric Sodium Thiosulphate Solution is equivalent to 0.05 p.c. of available Chlorine. The preparation is not official in the *P. G.*

The more generally occurring impurities are Calcium and Carbonates. When acidified with Acetic Acid and warmed till Chlorine vapours cease to be evolved, it should not yield a pronounced turbidity on the addition of Ammonium Oxalate Solution, in the absence of more than a trace of Calcium, the gas evolved when the liquor is acidified with diluted Hydrochloric Acid should not cause a turbidity when passed into Lime Water, in the absence of Carbonates.

Not Official.

LIQUOR POTASSÆ CHLORINATÆ (Eau de Javelle) — Prepared by the interaction of Bleaching Powder and Potassium Carbonate. Contains about 3 p.c. available Chlorine.

CALX SULPHURATA.

SULPHURATED LIME.

Syn. — CALCIUM SULPHIDUM.

A white, or greenish-white amorphous powder possessing a characteristic odour of Hydrogen Sulphide. Should contain not much less than half its weight of Calcium Sulphide CaS , eq. 71.53, with Calcium Sulphate and Carbon.

It may be prepared by the reduction of native Calcium Sulphate by Carbon.

It should be kept in amber-tinted glass stoppered bottles and in a cool and dry place, as it is gradually decomposed by exposure to moist air.

Medicinal Properties — Antisuppurative, internally for boils, pustules and abscesses. In the form of Pigmentum or Lotio Calci Sulphurati for the cure of scabies, also used as a depilatory.

Daily doses of 1 grain as a prophylactic of influenza — *B. M. J.* '95, 1975.

Dose. — $\frac{1}{4}$ to 1 grain = 0.016 to 0.065 gramme.

Prescribing Notes — Best prepared in pill, made with Glucose. If the total weight of each pill be 500 grains, $\frac{1}{4}$ grain may be made up to this weight with Milk Sugar. The pills are coated with Sandarach solution, and usually sent out in bottles.

Foreign Pharmacopœias — Official in Jap., Mex., Port. and U.S. Not in the others.

Tests. — The following tests for Calcium Sulphide are that when acidulated with Acetic Acid it evolves a gas having a powerful odour of Hydrogen Sulphide, leaving a residue of Calcium Sulphate and Carbon, and when filtered the filtrate yields with Ammonium Oxalate solution a white precipitate insoluble in Acetic, but soluble in Hydrochloric Acid. Both *B.P.* and *U.S.P.* employ the Copper Sulphate test as a means of determining the presence of a due proportion of Sulphide, the *B.P.* requiring that a solution of 1.4 grammes of

Copper Sulphate in 50 c c of Water shall, when acidified with Hydrochloric Acid and brought nearly to the boiling point, be completely precipitated by 0.8 gramme of Calx Sulphurata, indicating not much less than 50 p c of pure Calcium Sulphide, the *U S P* that a solution of 1.9 grammes of Cupric Sulphate, when treated as indicated below shall be completely precipitated by 1 gramme of the substance, indicating the presence of at least 55 p c of pure Calcium Sulphide. The *B P* employs Potassium Ferriocyanide Solution, the *U S P* excess of Ammonia Water to detect excess of Copper Calx Sulphurata is not official in the *P G*.

The Zinc process described under Barium Sulphide is also applicable to Calx Sulphurata.

Determination—The *U S P* gives a similar test, using 1 gramme of Sulphurated Lime with a cold solution of 1.9 grammes of Copper Sulphate in 50 c c of Water and the addition of 10 c c diluted Hydrochloric Acid in small portions. The mixture is directed to be digested on a water bath for 15 minutes and filtered. The addition of an excess of Ammonia Water to the filtrate should impart no colour to it.

Not Official

SOLUTIO CALCII OXYSULFURATI (Solutio Vleminghx) —1 of Calcium Oxide slaked with 1 of Water, and mixed with 2 of washed Sulphur of the foregoing mixture 2.5 is boiled with 20 of Water until it is so reduced as to yield 10 by weight when strained.—*Aust*

1 of Calcium Oxide is treated with 5 of Water, and 2 of washed Sulphur with 15 of Water, mix and boil for one minute, when cold filter and wash the residue with Water to yield 12.—*Swiss*

Calcium Sulfuratum Solutum—Calcium Oxide, 10, Sulphur, 25, Water, 100.—*Belg*

Various formulas have been given for Vleminghx's Solution the proportion of Calcium Oxide, Sulphur and finished product varies between 2, 4, 20, 3, 5, 20, 2.5, 5, 20, 4, 4, 20.

Lotio Calcii Sulphurati—Calcium Hydrate, 4, Sublimed Sulphur, 4, Water, 85. Boil together, evaporate and filter, to produce 20 of solution. To be diluted with an equal quantity of warm Water.—*Westminster*

Liquor Calcis Sulphuratæ—Quicklime, 2, Sublimed Sulphur, 5, Water, q s to produce 100.—*B P G*

CAMBOGIA.

GAMBOGE

FR., GOMMEGUTTE; GER, GUMMIGUTT, ITAL, GOMMAGOTTA, SPAN, GUTAGAMBA

A gum-resin obtained from *Garcinia Hanbun*, Hook f

It is imported from Siam, and consists of about 75 p c of Resin and 15 to 20 of Gum, the Resin being the active ingredient.

Indian Gamboge, obtained from *Garcinia Morella*, Desr, is official in the *Ind* and *Col Add* for India and the Eastern Colonies.

Solubility.—About three-fourths is soluble in Alcohol (90 p c), the solution is rendered an opaque yellow by Water, three-fourths is also soluble in Ether. A solution in Ammoniated Alcohol is not rendered turbid by the addition of Water.

Medicinal Properties.—A powerful hydragogue cathartic, in small doses, diuretic. It is employed in the treatment of dropsy, attended with obstinate constipation, and in cerebral congestion. As it is apt to occasion much sickness and griping, it is best given in small doses, repeated at short intervals, until it operates, but it should never be given to children or very old persons, or in inflamed conditions of the abdominal or pelvic organs.

Dose.— $\frac{1}{2}$ to 2 grains = 0.032 to 0.13 gramme

Ph Ger maximum single dose, 0.3 gramme, maximum daily dose, 1.0 gramme

Prescribing Notes—*It may be given in pill or emulsion, or dissolved in an alkaline solution, the last method has been recommended in dropsy*

Official Preparation—*Pilula Cambogiæ Composita*

Foreign P^r —Official in Aust^r (*Gummiresina Gutti*), Belg (*Guttiæ*) or (*Gutti*), Ital, Mex (*Goma Guta*), Port (*Gomma Guta*), Span, Swed (*Gummi Resina Gutta*), Swiss, U.S. (*Cambogia*) Not in the others

Descriptive Notes—It usually presents the cylindrical shape of the bamboo joints in which it is collected, it may be solid or hollow in the centre. If of good quality it has a smooth, even fracture, free from grittiness, of a bright orange colour. Inferior qualities have a dull and sometimes gritty fracture. The same remarks apply to Indian Gamboge.

Tests.—The distinguishing tests for Gamboge are that when rubbed with Water it forms a yellow emulsion, that it should be completely dissolved by the successive use of Alcohol (90 p.c.) and of Water. It has been suggested (*PJ '02*, n 495) that 75 p.c. should be soluble in Alcohol (90 p.c.), which agrees with the statement previously made in the *Companion* that three-fourths should be soluble in Alcohol (90 p.c.) This standard has been adopted by the *USP* using Alcohol (94.9 p.c.), but *PG* makes no reference to an Alcohol solubility.

The more generally occurring adulterants are Starch, mineral matter, and vegetable debris. Starch may be detected by the addition of Iodine to the cooled aqueous decoction, mineral matter by the ash left on incineration and vegetable matter by the increased insolubility in Alcohol (90 p.c.) The *BP* and *USP* require that when incinerated it shall yield not more than 3 p.c. of ash, the *PG* not more than 1 p.c.

Gamboge of good commercial quality contains from 60 to 80 p.c. of Resin (Gambogic Acid), from 15 to 25 p.c. of Gum, about 4 p.c. of Wax, moisture, mineral matter and a trace of Starch.

The *BP* states that it is completely dissolved by the successive action of Alcohol (90 p.c.) and Water, and the *USP* that not more than 25 p.c. should be insoluble in Alcohol (94.9 p.c.)

Preparation.

PILULA CAMBOGIÆ COMPOSITA. COMPOUND PILL OF GAMBOGI

Gamboge, 1, Barbados Aloes, 1, Hard Soap, 2, all in powder,

Compound Powder of Cinnamon, 1, massed with Glucose Syrup
(about 1 in 6)

Dose.—4 to 8 grains = 0.26 to 0.52 gramme

Foreign Pharmacopœias—Official in Fr (Pilule Anderson), Aloes, Gamboge, Oil of Anise, and Honey, Poit (Pilulas de Aloes e Gomma Guta), the same with Soap, Mex (Pildoras de Anderson), Aloes 8, Gamboge 8, Oil of Anise 0.4, Soap 4, Water *q s*, also (Pildoras de Boncio), Aloes 7, Gamboge 7, Ammoniacum 7, Soap 4, Water *q s*, U S (Pil Cathartice Comp), contains Gamboge about 1 in 12 (see Colocynth) Not in the others

CAMPHORA.

CAMPHOR

FR, CAMPHRE DU JAPON, GER, KAMPHER, ITAL, CANFORA, SPAN, ALCANTOR

Refined Camphor is a white or colourless translucent crystalline solid. It is obtained in the raw state from *Cinnamomum Camphora*, Nees and Ebern, in Formosa and Japan, it is resublimed in this country and elsewhere.

It may also be produced synthetically by the oxidation of Camphene. Camphene exists in many essential oils, but commercially it is obtained from Pinene Hydrochloride or Borneol Hydrochloride by treatment with Alcoholic Potassium Hydroxide.

On account of its volatility it should be kept in well closed vessels, and in a cool place.

Borneo Camphor (Borneol) is a solid substance obtained from *Dryobalanops aromatica*, Gartin, in Borneo and its neighbourhood. Borneol is used in the production of artificial Camphor, two compound esters are known, Borneol Salicylate (Salit) and Borneol Valerianate (Bornyval).

Solubility—1 in 700 of Water, 1 in $1\frac{1}{4}$ of Alcohol (90 p c), or by weight, 1 in 1, 4 in 1 of Chloroform, 12 in 7 of Ether, 1 in 4 of Olive Oil (slowly), 1 in $1\frac{1}{2}$ of Oil of Turpentine, 2 in 1 of Glacial Acetic Acid, insoluble in alkalis.

3 of Camphor rubbed with 1 of Carbolic Acid crystals form a clear solution. 3 of Camphor and 3 of Chloral Hydrate rubbed together liquefy. Camphor also forms a liquid when mixed with many other substances, Menthol, Thymol, Naphthol, Salol, Butyl Chloral, and Salicylic Acid.

Medicinal Properties—A stimulant sedative, antispasmodic, expectorant, diaphoretic, and anaphrodisiac. A local anæsthetic. A feeble antiseptic.

Stimulant in the prostration of febrile diseases, sedative in mania, delirium tremens and chorea, also useful in dysmenorrhœa, spasmodic asthma and chronic bronchitis, in hysteria, nymphomania and spermatorrhœa. Spirit of Camphor mixed with warm Water to bathe the nostrils is highly useful in hay fever, and relieves irritation of the nostrils in common cold, also used as an inhalation. The **Compound Tincture** is given with Tincture of Squill to allay spasmodic cough in bronchitis and phthisis. In large doses Camphor tends to cause cardiac depression, convulsions, and possibly collapse.

Externally, it is used as a counter-irritant to relieve pain in chronic rheumatism, neuralgia, and as an application to chilblains, also in chronic eczema and other painful skin diseases. The combination with Thymol, Phenol, or Chloral forms a good local anodyne for neuralgia.

10 grammes of 10 p.c. solution of Camphor in Olive Oil hypodermically injected for collapse.—*B.M.J.E.* '95, ii 68, *P.J.* '95, ii 380.

Dose.—2 to 5 grains = 0.13 to 0.32 gramme

Prescribing Notes.—*An excellent pill can be made by mixing Camphor, 36 grains, Curd Soap, 4 grains, 'Diluted Glucose,' 10 grains, and dividing into 12 or more pills as required. Its unpleasant taste is covered well by Milk, which is a good solvent for Camphor. The Spirit is given on Sugar, also in Milk. Camphor can be powdered quite readily with the addition of a small quantity of Alcohol (90 p.c.)*

Symptoms of poisoning by Camphor: convulsions, lividity, stupor, arrest of urinary secretion.

Official Preparations.—Aqua Camphoræ, Linimentum Camphoræ, Linimentum Camphoræ Ammoniatum, Spiritus Camphoræ and Tinctura Camphoræ Composita. Contained in Linimentum Aconiti, Linimentum Belladonnæ, Linimentum Opii, Linimentum Saponis, Linimentum Sinapis, Linimentum Terebinthinæ and Unguentum Hydrargyri Compositum. Of **Linimentum Camphoræ**: Linimentum Chloroformi, Linimentum Hydrargyri, Linimentum Terebinthinæ Aceticum.

Not Official.—Aqua Camphoræ Conc., Camphor Ball, Camphora cum Creta, Camphorated Quinine, Ceratum Camphoræ, Essentia Camphoræ, Spiritus Camphoræ, or, Æther Spirituosus Camphoratus, Spiritus Camphoræ Compositus, Vinum Camphoratum, Essential Oil of Camphor, Eau de Cologne, Salicylate, Oxycamphor, Phenol Camphor, Thymol Camphor, Resorcin Camphor, and Camphoric Acid.

Antidotes.—Stomach-tube or emetics, stimulants freely, and warmth to the extremities.

Foreign Pharmacopœias.—Official in all.

Descriptive Notes.—It occurs in commerce in the form of 'Bells,' in rectangular pieces (Camphor squares) or in a pulverulent condition (Flowers of Camphor). It possesses a characteristic, powerful and penetrating odour and a pungent aromatic taste, subsequently producing a feeling of coldness in the mouth. It is described by the *U.S.P.* as the dextrogyrate modification of the saturated ketone $C_{15}H_{11}CO$. Squares containing Stearic Acid have been met with on the Continent. Genuine Camphor of Japanese manufacture has often an odour of Saffrol, which is less noticeable in Chinese or Formosa Camphor. Artificial Camphor has usually a faintly terebinthinate odour, and is liable to contain traces of Chlorine. Recently under the name of Pearl Camphor an artificial Camphor made in Germany and having a very pure odour has been offered in commerce in the form of small cylindrical pieces about $\frac{1}{8}$ in (4 mm) in diameter.

Tests.—The following tests for Camphor are its distinctive odour and physical appearance, the specific gravity (which should be 0.995), the melting point, which should be $175^{\circ}C.$ ($347^{\circ}F.$), and the boiling point, which should be $205^{\circ}C.$ ($401^{\circ}F.$). The *B.P.* only gives the specific gravity, which it states should be about 0.995, the

USP gives 0.990 at 25° C (77° F), the *USP* and *PG* give the melting point as 175° C (347° F), the *USP* gives the boiling point as 204° C (399.2° F), the *PG* gives neither specific gravity nor boiling point

The more generally occurring impurity is mineral matter, which is detected by the residue left on ignition. Artificial or synthetic Camphor is sometimes used, and the *USP* includes a test for Chlorinated compounds, which are indicative of the synthetic article, the test which is peculiar to the *USP* is described below in small type under the heading of Silver Nitrate. The solution in Alcohol (90 p.c.) should be neutral to Litmus, should Stearic Acid be present the solution would be acid, and the quantity could be ascertained by determining the Acid value.

Silver Nitrate—The *USP* gives the following test to detect chlorinated products. If a small piece of Camphor be dropped into a small porcelain dish, and a clean beaker moistened on the inner surface with Distilled Water be inverted over the smaller dish immediately after igniting the Camphor, a part of the products of combustion will be absorbed by the Water, if the beaker be rinsed with a little Distilled Water and the liquid filtered, the filtrate should yield no turbidity upon the addition of a few drops of Silver Nitrate T.S.

Preparations

AQUA CAMPHORÆ CAMPHOR WATER

Dissolve 70 grains of Camphor in Alcohol (90 p.c.) *q.s.* to form $\frac{1}{2}$ fl. oz., add this gradually to 160 oz. of Distilled Water, with agitation to form a solution (1 in 1000)

The solution of the Camphor in Alcohol saves time and ensures a more uniform product. The alcoholic solution of Camphor may be kept ready for use.

Dose—1 to 2 oz. = 28.4 to 56.8 c.c. = $\frac{1}{18}$ to $\frac{1}{8}$ grain of Camphor

Foreign Pharmacopœias—Official in Belg., Camphor 2, Alcohol 4, Water 994, Dan. (*Mistura Camphorata*), contains Camphor, Alcohol, Mucilage of Acacia, Syr. Cerasi and Water, Norw. (*Emulsio Camphoræ*), Camphor, Mucilage of Acacia, and Water, Port., Camphor 1, Water 100, Span. (*Emulsio Alcanforado*), Camphor, Sweet Almonds, Powdered Sugar, and Water, Swed. (*Emulsio Camphoræ*), Camphor, Gum Acacia, and Almond Emulsion, U.S., dissolve 8 of Camphor in 8 c.c. of Alcohol (95 p.c.) and triturate the solution with 15 of Purified Talc, and, after allowing the greater part of the Alcohol to evaporate spontaneously, continue the trituration with Distilled Water gradually added to make 1000 c.c., then pour the mixture upon a well wetted filter, and pass the filtrate through the filter repeatedly until the Camphor Water is perfectly clear. Not in the others.

LINIMENTUM CAMPHORÆ. LINIMENT OF CAMPHOR *B.P. Syn* —CAMPHORATED OIL

A yellow oily fluid, possessing a strong characteristic odour of Camphor, prepared by dissolving 1 of Camphor in flowers, in 4 of Olive Oil (about 1 in 5)

Solution will be more readily effected if the Camphor is sifted before using, and if the oil is warmed to about 38° C (100.4° F), agitating in a bottle or covered vessel to prevent vaporisation of the Camphor.

Foreign Pharmacopœias—*Off. and Disp., New York*, 1894, 1914, with Olive Oil, Belg., 1 and 9, *off. and Disp., Dutch*, 1914, 1916, 1918, 1920, 1922, 1924, 1926, 1928, 1930, 1932, 1934, 1936, 1938, 1940, 1942, 1944, 1946, 1948, 1950, 1952, 1954, 1956, 1958, 1960, 1962, 1964, 1966, 1968, 1970, 1972, 1974, 1976, 1978, 1980, 1982, 1984, 1986, 1988, 1990, 1992, 1994, 1996, 1998, 2000, 2002, 2004, 2006, 2008, 2010, 2012, 2014, 2016, 2018, 2020, 2022, 2024, 2026, 2028, 2030, 2032, 2034, 2036, 2038, 2040, 2042, 2044, 2046, 2048, 2050, 2052, 2054, 2056, 2058, 2060, 2062, 2064, 2066, 2068, 2070, 2072, 2074, 2076, 2078, 2080, 2082, 2084, 2086, 2088, 2090, 2092, 2094, 2096, 2098, 2100, 2102, 2104, 2106, 2108, 2110, 2112, 2114, 2116, 2118, 2120, 2122, 2124, 2126, 2128, 2130, 2132, 2134, 2136, 2138, 2140, 2142, 2144, 2146, 2148, 2150, 2152, 2154, 2156, 2158, 2160, 2162, 2164, 2166, 2168, 2170, 2172, 2174, 2176, 2178, 2180, 2182, 2184, 2186, 2188, 2190, 2192, 2194, 2196, 2198, 2200, 2202, 2204, 2206, 2208, 2210, 2212, 2214, 2216, 2218, 2220, 2222, 2224, 2226, 2228, 2230, 2232, 2234, 2236, 2238, 2240, 2242, 2244, 2246, 2248, 2250, 2252, 2254, 2256, 2258, 2260, 2262, 2264, 2266, 2268, 2270, 2272, 2274, 2276, 2278, 2280, 2282, 2284, 2286, 2288, 2290, 2292, 2294, 2296, 2298, 2300, 2302, 2304, 2306, 2308, 2310, 2312, 2314, 2316, 2318, 2320, 2322, 2324, 2326, 2328, 2330, 2332, 2334, 2336, 2338, 2340, 2342, 2344, 2346, 2348, 2350, 2352, 2354, 2356, 2358, 2360, 2362, 2364, 2366, 2368, 2370, 2372, 2374, 2376, 2378, 2380, 2382, 2384, 2386, 2388, 2390, 2392, 2394, 2396, 2398, 2400, 2402, 2404, 2406, 2408, 2410, 2412, 2414, 2416, 2418, 2420, 2422, 2424, 2426, 2428, 2430, 2432, 2434, 2436, 2438, 2440, 2442, 2444, 2446, 2448, 2450, 2452, 2454, 2456, 2458, 2460, 2462, 2464, 2466, 2468, 2470, 2472, 2474, 2476, 2478, 2480, 2482, 2484, 2486, 2488, 2490, 2492, 2494, 2496, 2498, 2500, 2502, 2504, 2506, 2508, 2510, 2512, 2514, 2516, 2518, 2520, 2522, 2524, 2526, 2528, 2530, 2532, 2534, 2536, 2538, 2540, 2542, 2544, 2546, 2548, 2550, 2552, 2554, 2556, 2558, 2560, 2562, 2564, 2566, 2568, 2570, 2572, 2574, 2576, 2578, 2580, 2582, 2584, 2586, 2588, 2590, 2592, 2594, 2596, 2598, 2600, 2602, 2604, 2606, 2608, 2610, 2612, 2614, 2616, 2618, 2620, 2622, 2624, 2626, 2628, 2630, 2632, 2634, 2636, 2638, 2640, 2642, 2644, 2646, 2648, 2650, 2652, 2654, 2656, 2658, 2660, 2662, 2664, 2666, 2668, 2670, 2672, 2674, 2676, 2678, 2680, 2682, 2684, 2686, 2688, 2690, 2692, 2694, 2696, 2698, 2700, 2702, 2704, 2706, 2708, 2710, 2712, 2714, 2716, 2718, 2720, 2722, 2724, 2726, 2728, 2730, 2732, 2734, 2736, 2738, 2740, 2742, 2744, 2746, 2748, 2750, 2752, 2754, 2756, 2758, 2760, 2762, 2764, 2766, 2768, 2770, 2772, 2774, 2776, 2778, 2780, 2782, 2784, 2786, 2788, 2790, 2792, 2794, 2796, 2798, 2800, 2802, 2804, 2806, 2808, 2810, 2812, 2814, 2816, 2818, 2820, 2822, 2824, 2826, 2828, 2830, 2832, 2834, 2836, 2838, 2840, 2842, 2844, 2846, 2848, 2850, 2852, 2854, 2856, 2858, 2860, 2862, 2864, 2866, 2868, 2870, 2872, 2874, 2876, 2878, 2880, 2882, 2884, 2886, 2888, 2890, 2892, 2894, 2896, 2898, 2900, 2902, 2904, 2906, 2908, 2910, 2912, 2914, 2916, 2918, 2920, 2922, 2924, 2926, 2928, 2930, 2932, 2934, 2936, 2938, 2940, 2942, 2944, 2946, 2948, 2950, 2952, 2954, 2956, 2958, 2960, 2962, 2964, 2966, 2968, 2970, 2972, 2974, 2976, 2978, 2980, 2982, 2984, 2986, 2988, 2990, 2992, 2994, 2996, 2998, 3000, 3002, 3004, 3006, 3008, 3010, 3012, 3014, 3016, 3018, 3020, 3022, 3024, 3026, 3028, 3030, 3032, 3034, 3036, 3038, 3040, 3042, 3044, 3046, 3048, 3050, 3052, 3054, 3056, 3058, 3060, 3062, 3064, 3066, 3068, 3070, 3072, 3074, 3076, 3078, 3080, 3082, 3084, 3086, 3088, 3090, 3092, 3094, 3096, 3098, 3100, 3102, 3104, 3106, 3108, 3110, 3112, 3114, 3116, 3118, 3120, 3122, 3124, 3126, 3128, 3130, 3132, 3134, 3136, 3138, 3140, 3142, 3144, 3146, 3148, 3150, 3152, 3154, 3156, 3158, 3160, 3162, 3164, 3166, 3168, 3170, 3172, 3174, 3176, 3178, 3180, 3182, 3184, 3186, 3188, 3190, 3192, 3194, 3196, 3198, 3200, 3202, 3204, 3206, 3208, 3210, 3212, 3214, 3216, 3218, 3220, 3222, 3224, 3226, 3228, 3230, 3232, 3234, 3236, 3238, 3240, 3242, 3244, 3246, 3248, 3250, 3252, 3254, 3256, 3

Tests.—Camphorated Oil has a specific gravity of 0.920 to 0.926, and should theoretically contain 21.45 p.c. w/w of Camphor, which may be determined by heating a definite weight of the sample in a flat-bottomed dish on a water-bath until it ceases to lose weight. Olive Oil is stated (*Analyst* xxiii 281) to suffer a gain in weight of 0.15 p.c. when heated for two hours at 120° C (248° F), and hence this figure should be added to the loss in weight when testing the samples under those conditions in order to obtain the true amount of Camphor present. But it has been subsequently shown (*C.D.* '01, 168) that it is best to make no such correction but to take the percentage of loss in weight as equal to the quantity of Camphor present.

Samples of the Liniment are frequently deficient in Camphor, and the loss of Camphor by volatilisation has been pleaded in justification of such deficiency, but it is generally conceded that if properly prepared it will not, when kept under ordinary conditions, lose any appreciable amount. The *USP* uses Cotton Seed Oil in the preparation of the Liniment, and Sesame Oil is employed by some of the Foreign Pharmacopoeias. Mineral Oil or a mixture of a mineral and vegetable oil has been used as an adulterant, but their presence is readily detected by determining the percentage of Potassium Hydroxide required to saponify the residue remaining after the volatilisation of the Camphor. The refractive index of the oil is apparently almost unaffected by the presence of dissolved Camphor (*Analyst* xxv, 202), and the refractometer may be employed for the identification of the oil used. It is shown (*CD '01, ii 390*) that the substitution of other oils for Olive Oil may, with the exception of Arachis Oil, be readily detected. The determination of the optical activity has also been suggested (*Analyst* xxv, 202) as a means of ascertaining the percentage of Camphor present in a sample. The rotation is increased by nearly 1° for each percentage of Camphor present, and the observed rotation of a sample in a 200 mm tube gives at once, without calculation, the percentage of Camphor with sufficient accuracy for most purposes. It has been pointed out (*CD '01, i 167*) that they show a slight over-estimation, the error varying with the amount of Camphor present, when 25 p.c of Camphor is present the division will be 0.998, while with 1 p.c it will be 0.987.

LINIMENTUM CAMPHORÆ AMMONIATUM. AMMONIATED
LINIMENT OF CAMPHOR *B.P. Syn* — COMPOUND LINIMENT OF
CAMPHOR *N.O. Syn* — LINIMENTUM AMMONIATUM CAMPHORATUM

Camphor, 5, Oil of Lavender, $\frac{1}{2}$; Strong Solution of Ammonia, 10, Alcohol (90 p c), *q s* to make 40. (1 in 8)

Dissolve the Camphor and the Oil in a portion of the Alcohol (about 24) and add the Ammonia gradually with agitation. The Camphor which is at first thrown out will readily redissolve. Add Alcohol *q s* to make 40.

Rubefacient and counter-irritant. Most useful in the douloureux and chronic rheumatism. Painful neuralgia is relieved by applying lint previously soaked in the liniment, covering with a dry napkin until redness is produced, then lightly rubbing the part with Laudanum or Liquor Meconicus.

• Foreign Pharmacopœias—Official in Belg (*Linimentum Ammoniacale Camphoratum*), Liquid Ammonia 1, Camphorated Oil 9, also (*Camphoræ Linimentum Compositum*), Spirit of Soap 700, Spirit of Camphor 250, Liquid Ammonia 30, Oil of Rosemary 15, Oil of Thyme 5, Dan, Solution of Ammonia 5, Camphor 1, Rape Oil 14, Fr, Solution of Ammonia 1, Camphorated Oil 9, Ger, Solution of Ammonia 1, Camphorated Oil 3, Poppy Oil 1, Ital, Solution of Ammonia 1, Camphorated Oil 4, Mex, Solution of Ammonia 1, Camphorated Oil 9, Norw, Solution of Ammonia 2, Camphorated Oil 1, Rape Oil 2, Port, Liquid Ammonia 1, Camphorated Oil 4, Russ, Solution of Ammonia 1, Camphorated Oil 3, Sesame Oil 1, Span, Solution of Ammonia 1, Camphorated Oil 9, Swed and Swiss, Solution of Ammonia 1, Camphorated Oil 3. All by weight. Not in the others.

Linimentum Ammoniacum Camphora—Solution of Ammonia, 25, Liniment of Camphor, 25, Olive Oil, *q s* to produce 100—*B P C Supplement*

SPIRITUS CAMPHORÆ SPIRIT OF CAMPHOR *N O Syn* — TINCTURA CAMPHORÆ

Camphor, 1, Alcohol (90 p c), *q s* to make 10 (1 in 10)

Dose—5 to 20 minims = 0.3 to 1.2 c c

Foreign Pharmacopœias—Official in Aust, Belg, Dan, Dutch (*Solutio Camphoræ Spirituosa*), Fl (*Teinture de Camphré Conc*), Ger, Ital, Jap, Norw, Port, Swed, Swiss and US, 1 in 10, Hung, about 1 in 7, Russ, 1 in 13, Mex (*Alcohol Alcanforada*), 1 and 19, Span, 1 and 24, Fr has also a *Teinture de Camphre faible*, Camphor 1, Dilute Alcohol 39. All by weight except US.

Tests—Spirit of Camphor has a specific gravity of 0.843 to 0.847. It should contain 10 p c w/v of Camphor, which may be determined by its optical rotation.

A paper on the determination of Camphor in Spirit of Camphor appears in *CD* '99, 154.

A process requiring less manipulative skill, and which is claimed to give very exact results, appears in *YBP* '01, 47. A weighed quantity of 10 grammes of the spirit is introduced into a 50 c c burette, graduated in $\frac{1}{10}$ c c and shaken with 30 to 35 c c of a saturated solution of Sodium Chloride. 1 c c of Petroleum Ether is dropped on the Camphor layer when it has collected as much as possible on the surface, and solution of the Camphor effected by careful agitation. After several minutes the volume of the Benzin solution can be read off. After subtracting the volume of added Benzin each further 1.02 c c will correspond to 1 gramme of Camphor (sp gr 0.98).

TINCTURA CAMPHORÆ COMPOSITA. COMPOUND TINCTURE OF CAMPHOR *B P Syn*—PAREGORIC PAREGORIC ELIXIR

Tincture of Opium, 585 minims, Benzoic Acid, 40 grains,

Camphor, 30 grains, Oil of Anise, $\frac{1}{2}$ fl dm, Alcohol (60 pc), *qs* to make 20 fl oz

Dissolve the Benzoic Acid, Camphor, and Oil of Anise in a portion of the Alcohol (about 17 or 18), add the Tincture and finally Alcohol *qs* to make 20 fl oz

B P 1898 replaced the 40 grains of Opium by the quantity of Tincture of Opium, 585 minims, as previously suggested in the *Compendium*

The Pimpinella Oil is preferable as being more soluble in Alcohol (60 pc)

Dose—30 to 60 minims = 1.8 to 3.6 cc = $\frac{1}{8}$ to $\frac{1}{4}$ grain Opium

30 minims contain about $\frac{1}{80}$ gram of anhydrous Morphine (about $\frac{1}{60}$ grain of

pc w/v of anhydrous Morphine
Opium Benzoica, the equivalent in the Foreign Pharmacopœias of our Compound Tincture of Camphor shall contain 0.05 pc w/v of Morphine Tinctura Camphora *Co B P* contains 0.05 pc (more correctly 0.046 pc) w/v of anhydrous Morphine

Official Tincture of Opium contains 0.75 pc of anhydrous Morphine

All by weight, except U S. Swed (*Tinctura Opium Benzoica*), Opium 5, Benzoic Acid 5, Camphor 3, Oil of Anise 2, Diluted Alcohol to 1000. Belg, Fr and Swiss adopt the *Brussels Conference* standard

Tests.—Compound Tincture of Camphor has a specific gravity of 0.915 to 0.920, contains 0.2 to 0.35 pc w/v of total solids, the percentage of Absolute Alcohol should be about 58.0 pc by volume, 100 cc should contain nearly 0.05 gramme of anhydrous Morphine, it should afford well-marked reactions for Benzoic and Meconic Acids, and when diluted with Water should assume an opalescent appearance

It is frequently found deficient in Alcohol, in the requisite proportion of Tincture of Opium, the Benzoic Acid may be either of inferior quality or omitted, and Oil of Anise may be absent. The specific gravity of the sample affords a fair indication of the percentage of Absolute Alcohol, and may be supplemented if necessary by an actual determination of the Alcohol by distillation. The Benzoic Acid may be determined by rendering 10 cc of the Tincture alkaline by the addition of Sodium Hydroxide Solution and removing the Alcohol by evaporation. The aqueous liquid may then be extracted with Ether, the ethereal solution separated, the aqueous

fluid faintly acidified with Hydrochloric Acid and again shaken with Ether, the ethereal solution removed, the Ether evaporated spontaneously and the Benzoic Acid weighed, or the ethereal solution may be freed from mineral acid by carefully washing with Water and titrated with Twentieth-normal Volumetric Potassium or Sodium Hydroxide Solution. Each c.c. of Twentieth normal Solution represents 0.00605 gramme of Benzoic Acid. The separated Benzoic Acid should possess the melting point, and should otherwise correspond to the tests given under Benzoic Acid. Meconic Acid may be detected by diluting a little of the Tincture with Alcohol (45 p.c.) until of a pale straw colour and adding a drop of Ferric Chloride Test-solution, when a deep red coloration will be produced. The quantity of Morphine present is too small to permit the employment of the *B.P.* method of determination. A process depending on the extraction of the Morphine from the evaporated Tincture by hot Amylic Alcohol is described (*Y.B.P.* '05, 461, *Analyst*, '05, 336), the extracted Morphine being subsequently recognised by Ferric Chloride Test solution and the Nitric Acid colour test. It has been pointed out by Allen (*Analyst*, '02, 352) that cough mixtures, in addition to containing Paregoric, frequently contain Ipecacuanha in some form or other, and the alkaloids of the latter are liable to be mistaken for Morphine if colour reactions alone are relied upon. These colour reactions are given under the heading of Ipecacuanha and Psychotrine. A process for the analysis of the Tincture is recorded, and the use of hot Amylic Alcohol for the extraction of the Morphine is suggested in the paper.

Not Official

AQUA CAMPHORÆ CONC—Spirit of Camphor, 3 fl. dim., Distilled Water, 40 fl. oz.—*Pharm. Form (MacEwan)*

CAMPBOR BALL—Camphor, 2, White Beeswax, 5, Spermaceti, 3, Oil of Almonds, 8, Tincture of Tolu, $\frac{1}{2}$, melt and pour into $\frac{1}{2}$ oz. moulds.

The proportion of the Wax to Spermaceti varies in different forms, but the total of the two combined is generally much the same.

CAMPFORA CUM CRETA (Camphorated Chalk)—Camphor, 1, Precipitated Chalk, 8, powder the Camphor by rubbing it with a few drops of Alcohol (90 p.c.), mix in the Chalk, and pass the whole through a sieve.

This is used as a dentifrice, it is also made in the proportion 1 to 7 (*Mart*) and 1 to 9 (*B.P.C.*)

CAMPFORATED CHLOROFORM See **CHLOROFORM**

CAMPFORATED QUININE—Camphor, in powder, 8 grains, Ammoniated Tincture of Quinine, *q.s.* to make 1 fl. oz.

A very useful combination for an ordinary cold in the head. Dose—1 to 2 fl. dim.

Camphorated Quinine Capsules—Quinine Sulphate, 60 grains, Ammonium Carbonate (powdered finely), 100 grains, Powdered Camphor, 50 grains, Soft Paraffin and Liquid Paraffin, *q.s.* to make a thin paste and fill 100 capsules. Each capsule represents about 30 minims of Camphorated Quinine.

CERATUM CAMPHORÆ—Camphor, 2, White Beeswax, 8, Benzoinated Lard, 4, Oil of Almonds, 8, melt together and stir till cold.

U.S.P. **CERATUM CAMPHORÆ** is much weaker in Camphor—Camphor Liniment, 10, White Wax, 35, White Petrolatum, 15, Benzoinated Lard, 40, it contains 1 of Camphor in 50.

PHENOL CAMPHOR See ACIDUM CARBOLICUM

ESSENTIA CAMPHORÆ—Camphor, 1, Alcohol (90 p c), 20 Given for
coryza, 5 minims every hour in Water or on Sugar

This is half the strength of the official *Spiritus Camphoræ*

SPIRITUS CAMPHORÆ FORTIOR (Rubini's Essence)—A saturated
solution, in Alcohol (90 p c), contains about 1 in 2½

This has been incorporated in the *B P C* as **Essentia Camphoræ**, with the
names *Spiritus Camphoræ Fortior*, and Rubini's Essence of Camphor as synonyms,
as follows—Camphor, 2, Alcohol (90 p c), *q s* to make 5

ÆTHER SPIRITUOSUS CAMPHORATUS—Camphor 15, Spirit of
Ether 85—*Dan*, *Norw* and *Swed*

SPIRITUS CAMPHORÆ COMPOSITUS (*B P C*)—Camphor, 0 25,
Benzoic Acid, 0 50, Oil of Anise, 0 25, Liquid Extract of Liquorice, 1, Alcohol
(60 p c), *q s* to produce 100

SYRUPUS CAMPHORÆ COMPOSITUS—Benzoic Acid, 3 drm,
Glacial Acetic Acid, 3 oz 5 drm 20 minims, Vinegar of Squill, 2 pints, Vinegar
of Ipecacuanha, 40 fl oz, Anise Oil, 2 drm, Camphor, 2 drm, Tincture of
Opium, 10 oz 5 drm 20 minims, Sugar, 28 lb, Burnt Sugar, *q s*, Water, to
make 4 gall Dose—1 drm (= 1 minim of Tincture of Opium)—*Bristol Royal
Infirmary*

This has been incorporated in the *B P C*

CAMPHOID (Martindale)—Camphor, 20, Absolute Alcohol (100 p c) 20,
Pyroxylin, 1 Employed as a solvent for Iodoform, the odour of which it is said
to disguise—*P J '92*, 1 831, *B M J '92*, 1 1086

VINUM CAMPHORATUM (*Ger*)—Camphor, 1, Alcohol (90 p c), 1,
Mucilage of Acacia, 3, White Wine, 45 *Swiss*, Camphor 2, Alcohol (90 p c) 3,
Acacia 2, White Wine 93 All by weight

ESSENTIAL OIL OF CAMPHOR—Camphor Oil as it is distilled from
Camphor Wood contains some quantity of solid Camphor which is separated by
filtration and sometimes by refrigeration It has been used as an
application in

Two kinds of Camphor Oil are known commercially, Japan and China
Camphor Oil

Japan Camphor Oil—A yellow or yellowish-brown liquid possessing a
strong odour of Saffrol It has a specific gravity of 1 010 to 1 020, and an
optical rotation in a 100 mm tube of + 5 5° It dissolves readily in Alcohol
(90 p c)

A considerable portion of the Saffrol is frequently removed from the oil,
which is then commonly known in the trade as 'White Oil of Camphor' The
abstraction of Saffrol is indicated by a decrease in the specific gravity

China Camphor Oil—A pale yellow or brownish yellow liquid, possessing
a strong camphoraceous odour It has a specific gravity of 0 950 to 0 960, and
an optical rotation in a 100 mm tube of about + 30° It dissolves readily in
Alcohol (90 p c)

EAU SEDATIVE (*Lotion Ammoniacale Camphrée*, *Fr*)—Spirit
of Camphor, 10, Tincture of Camphor 60, Sodium Chloride, 60, Distilled Water, 1000
Belg, Sodium Chloride 60, Liquid Ammonia 60, Spirit of Camphor 10,
Water 870, *Mex*, Sodium Chloride 60, Liquid Ammonia 60, Spirit of Camphor
10, Water 1000, *Swiss*, Sodium Chloride 60, Water 880, Spirit of Camphor 10,
Liquid Ammonia 100

CAMPHOR SALICYLATE (Camphossil) —A crystalline, unctuous, deliquescent mass. Condensation product of Camphor and Salicylic Acid. Introduced as an antiseptic and antipyretic.

Dose — $7\frac{1}{2}$ grains = 0.5 gramme

OXYCAMPHOR —A white crystalline powder, soluble about 1 in 50 Water. Has been found useful in cases of dyspnoea, especially of pulmonary origin. Best given in cachets or gelatin capsules. It is easily altered by exposure to air. — *P J '02*, 11 132

Dose —15 to 30 grains = 1 to 2 grammes

Under the name of **Oxaphor**, a 50 p.c. solution of the above in Alcohol (90 p.c.) has been introduced. **Camphoroxol** is stated to be a 1 p.c. alcoholic solution of Camphor containing 3 p.c. Hydrogen Dioxide.

Thymol-Camphor and **Resorein-Camphor** are oily fluids obtained by heating Camphor with equal parts of Thymol and Resorein respectively.

CAMPHORIC ACID —Colourless, crystalline leaflets, or a white, crystalline powder, with a faint camphoraceous odour.

It is a di-basic acid prepared by the oxidation of Camphor. It should be kept in well closed vessels.

Solubility —1 in 160 of cold Water, 1 in 8 of boiling Water, 1 in 1.5 of Alcohol (90 p.c.), readily in Ether.

Dose —15 to 30 grains = 1 to 2 grammes, conveniently given in cachets.

Is a valuable remedy in cases of urinary calculi and of vesical catarrh. A 1 p.c. solution has been recommended in acute and chronic affections of the respiratory passages. — *P J (3) xix* 507

In 4 p.c. alcoholic solutions as spray or linctus, in laryngeal phthisis.

In cystitis, 15 grains 3 times a day. — *Y B P '02* 167

One gramme 3 or 4 times a day, or 2 grammes in the evening, checks the night sweating in phthisis. — *L M R '88*, 276

Foreign Pharmacopœias —Official in Dutch, Ger., Jap., Swiss and U.S.

Tests —Camphoric Acid has a melting point of 186° to 187° C (366.8° to 368.6° F), and is dextro-rotatory, a 10 p.c. alcoholic solution showing a value $[\alpha]_D = +47.8^\circ$. The aqueous solution is acid in reaction towards blue Litmus paper. 1 gramme of the acid should require for neutralisation not less than 10.0 c.c. of Normal Volumetric Potassium or Sodium Hydroxide Solution, indicating not less than 99.81 p.c. of pure Camphoric Acid.

The more generally occurring impurities are Chlorides, Sulphates, Nitrates, and mineral matter. The saturated aqueous solution should not be rendered turbid by Silver Nitrate nor by Barium Chloride Solution. When a solution of Ferrous Sulphate is poured carefully on to the cold saturated aqueous solution of the acid mixed with an equal quantity of Sulphuric Acid, no dark coloration should be developed at the line of junction of the two fluids. It should leave no weighable residue after ignition.

Not Official

CAMPHORA MONOBROMATA

MONOBROMATED CAMPHOR

$C_{10}H_{16}BrO$, eq 229.38

FR., CAMPHRE MONOBROMÉ, GER., MONOBROMKAMPFER, ITAL., CANFORA MONOBROMATA, SPAN., ALCANFOR MONOBROMADO

Colourless, prismatic needles, or scales, with a camphoraceous odour and taste.

It is a substitution product of Camphor, the Hydrogen radicle of the latter being replaced by the halogen Bromine.

It should be kept in well closed bottles.

Sol. b. insoluble in Water; soluble 1 in 12 of Alcohol (90 p c);
101 in 2 of Ether, 1 in 8 of Olive Oil, sparingly in Glycerin

Medicinal Properties.—Hypnotic and sedative. Given in hysteria, epilepsy, chorea, spermatorrhœa, and delirium tremens, but its use requires caution. It has been stated to be an antidote to Styrchnine.

Dose—2 to 5 grains = 0.13 to 0.32 gramme

Prescribing Notes—It can be given in pills with 'Diluted Glucose,' or can be dissolved in Almond oil and emulsified with Mucilage and Water. It is also given with Extract of Belladonna. Larger doses than 5 grains are sometimes given in delirium tremens.

Foreign Pharmacopœias—Official in Dutch, Fr., Ital., Jap., Mex. (Alcanfor Monobromado), Port., Span. (Alcanfor Monobromado), Swiss and U.S. Not in the others.

Tests—Monobromated Camphor has a melting point of 76° C (168.8° F), and a boiling point of 274° C (525.2° F). It should be neutral in reaction towards Litmus paper. When boiled with Silver Nitrate Solution a precipitate of Silver Bromide is formed. It is soluble in cold concentrated Sulphuric Acid without alteration in colour and without decomposition, and is again precipitated when this solution is poured into Water. When fused with metallic Sodium in a dry test-tube and the residue dissolved in Water, the resulting solution acidified with Nitric Acid yields with Silver Nitrate Solution a copious, faintly yellowish precipitate almost insoluble in weak Ammonia Solution.

The more generally occurring impurities are Bromides, Hydrobromic Acid, and mineral residue. The presence of Bromides is readily detected by the formation of an opalescence or precipitate when treated with Silver Nitrate Solution, Hydrobromic Acid by the reaction towards blue Litmus paper. It should be completely volatilised by heat leaving no weighable residue, showing the absence of mineral matter.

CANNABIS INDICA.

INDIAN HEMP

FR., CHANVRE INDIEN, GER., INDISCHER HANF, ITAL., CANAPE INDIANA,
SPAN., CAÑAMO

The dried flowering or fruiting tops of the female plant of *Cannabis sativa*, Linn., from which, of course, the Resin has not been removed, grown in India.

O Shaughnessy introduced Indian Hemp into this country, and Peter Squire made the extract for him.

The official variety may consist, according to the official monograph, of either the flowering or fruiting tops, and is frequently of very inferior quality, since the fruiting tops yield less Resin.

Preparations of *Cannabis Indica* show marked variation in physiological activity, owing to age, and perhaps other causes.

It is suggested by Dr. Marshall, the drug and its preparations should be kept in hermetically-sealed packages if they are to be kept for any considerable time before use. The drug should be purchased once a year only, when the new harvest comes in. This is generally in April or May—*P. J.* '02, 1342, 362, 892, '02, 11 131, 263, 284, *C. D.* '02, 11 296, *Y. B. P.* '02, 52, 168, 401.

A description of the names which are applied to the different forms of the drug, e.g., Ganja, Guaza, Bhang, Chur, Churrus or Charas, Haschish and Majun, and useful hints regarding the collection and storage of the drug—*P. J.* '02, 11 131.

The important constituent is a Resin (Extract of Indian Hemp); the active principle is stated to be a red Oil, *Cannabinol*, which is liable to become

oxidised and inert The ethereal extract from Charas yielded four distinct chemical substances (1) about 1.5 p.c. of a Terpene, boiling at 160° to 180° C (320° to 356° F), (2) 2 p.c. of a Sesquiterpene, boiling at 258° to 259° C (496° to 498° F), (3) 0.15 p.c. of a Paraffin, $C_{26}H_{54}$, melting point, 63° to 64° C (145° to 147° F), (4) 33 p.c. of a toxic red oil, Cannabinol, $C_{21}H_{30}O_2$, boiling at 265° C (509° F), under a pressure of 20 mm.—*J C S Trans* '96, 539, '99, 20

A Cannabinol prepared according to Wood, Spivey and Eastenfield's process was found to be physiologically inactive, and it was therefore concluded, though apparently without sufficient reason, that it is not the active principle of Cannabis, and so far as present information extends, the active principle has not yet been isolated.—*C D '02*, n 296, *P J '02*, n 131, 171, *Y B P '02*, 399

Medicinal Properties—Sedative, anodyne, and antispasmodic. Has been used with success in migraine and delirium, neuralgia, pain of last stages of phthisis, and in acute mania, also in menorrhagia and dysmenorrhœa. It is combined with Belladonna in whooping-cough, and in infantile convulsions, hepatic and renal colic, it is given in tetanus and hydrophobia.

Prescribing Notes—Usually prescribed in the form of Extract or Tincture.

Dose of the Extract $\frac{1}{4}$ to 1 gram (with a sufficiency of Liquorice Powder to form a pill), but as it varies considerably in strength it is better to commence with the smaller dose, toxic symptoms have been produced with 1 gram. *Dose of the Tincture*, 5 to 15 minims, which can be taken on Sugar, or diffused in Water by the aid of 1 fl. dr. of Mucilage of Acacia to each fl. oz. of Water, the Mucilage should be diluted with twice its volume of Water before the addition of the Tincture.

Two interesting cases of toxic symptoms, caused in one case by taking the whole of the active ingredient of a mixture in the last dose, owing to omission of Mucilage for suspension. The other, a nervous patient, for whom the *B P* minimum dose was prescribed, and who took a dose from the bottle without measuring, and inadvertently took rather more than a double dose.—*L '03*, i 1042

Official Preparations—*Extractum Cannabis Indicæ*. Of the **Extract**, *Tinctura Cannabis Indicæ*. The **Tincture** is contained in *Tinctura Chloroformi et Morphinæ Composita*.

Not Official—*Cannabinæ Tannas*, *Cannabinon*, and *Fluidextractum Cannabis Indicæ*.

Antidotes—In case of over-dose, after employing stomach tube, or emetics, hot brandy and-water may be given, vegetable acids, such as lemon juice, vinegar, and the like. *Stychnine* should be injected and a blister applied to the nape of the neck.

Foreign Pharmacopœias—Official in Austr., Belg., Dutch, Hung., Ital., Jap., Norw. (*F. luctus Cannabis*), Port. (*Canhamo*), Russ., Mex. (*Marihuana*), Swed., Swiss and U.S. Not in Ger.

It does not produce constipation or loss of appetite, on the contrary, it restores the appetite which has been lost by chronic Opium and Chloral drinking.—*L '89*, i 625

In chorea and pertussis.—*L '02*, i 1159

Descriptive Notes—Indian hemp is imported from Bombay under the name of Guaza, in compressed or flattened masses, consisting of the flowering and fruiting tops of the plant, matted together with its resinous secretion. From Calcutta it is sometimes imported in a rolled or cylindrical form under the name of Ganja (*P J* (4) xv. 129, xi p 782) but this form, which is much more active, rarely remains in this country, being exported to the West Indies (*P J* (4) x p 522). The best quality of either kind is seldom exported from India, since the natives are aware that it rapidly loses its activity on

keeping and therefore retain the current crop for home use, exporting that of the previous year (*PJ* (4) xiv p 342) The form of the drug official in the *B.P* is the compressed form of Guaza The upper leaves which accompany the flower are alternate and 1-3 partite, whilst the lower leaves have 5-7 linear serrate leaflets and are opposite The bracts as well as the leaves have characteristic resin glands and one-celled curved hairs with a cystolith contained in the enlarged base of each The bract below the fruit is ovate-lanceolate

During the last few years compressed *Cannabis Indica* has been imported from Zanzibar, Delagoa Bay, and from the North of France, but according to Dr W E Dixon is not nearly so active as the Indian drug (*PJ* (4) xx p 550) This difference in strength is said to be due to the fact that the female plant yields less resin if male plants are present in the fields In India the male plants are always removed before the plant flowers by experts employed for that purpose

Tests.—Three typical samples of Ganja, collected at the proper season and imported direct from India, when examined in the author's laboratory yielded a total extract to Alcohol (90 p c) of 15.52, 15.77 and 16.85 p c, when evaporated to dryness and again dissolved in spirit the Alcohol-soluble matter amounted to 14.45, 14.75 and 16.7 p c, leaving 1.07, 1.02 and 0.68 p c of insoluble brown extract The ash of the 3 samples amounted respectively to 12.70, 12.30 and 11.90 p c

Preparations.

EXTRACTUM CANNABIS INDICÆ. EXTRACT OF INDIAN HEMP

Exhaust Indian Hemp, in coarse powder, with Alcohol (90 p c) by percolation, evaporate to a soft extract

Dose.— $\frac{1}{4}$ to 1 grain = 0.016 to 0.06 gramme

Foreign Pharmacopœias—Official in Austr, Belg, Dutch, Hung, Ital., Port, Russ (Extracto de Marihuana), and Swiss and U S Not in the others U S has also *Fluidextractum Cannabis Indicæ* (1 in 1)

Commercial extracts have been shown (*PJ* '02, 1 234, 281, 301) to vary greatly in strength, and to contain a doubtful and variable amount of alcohol-soluble matter in Alcohol (90 p c) The use of an ethereal instead of the official extract, or, better still, one made with Absolute Alcohol, is suggested Spiritus Ætheris *B.P* is recommended as a menstruum for preparing the Tincture

TINCTURA CANNABIS INDICÆ. TINCTURE OF INDIAN HEMP.

Dissolve 1 of Extract of Indian Hemp in 18 of Alcohol (90 p c), filter if necessary, and add Alcohol (90 p c), *qs* to yield 20

(1 in 20)

22 minims contain 1 grain of Extract

Dose.—5 to 15 minims = 0.3 to 0.9 c c.

Foreign Pharmacopœias—Official in Jap and Port, 1 Extract in 20; the following are from Herb. Ind. Mex, 1 in 5, Russ and Swiss, 1 in 10, all by weight, U S, 1 in 10, and others.

Tests.—Tincture of Cannabis Indica has a specific gravity of 0.845 to 0.850, it contains about 4 p.c. w/v of total solids and about 87 p.c. w/v of Absolute Alcohol

Not Official

FLUIDEXTRACTUM CANNABIS INDICÆ (U.S.)—10 of Cannabis Indica, in No. 30 powder, exhausted by percolation with Alcohol (94.9 p.c.), reserving the first 9, evaporating the remainder (not above 50° C.) to a soft extract which dissolve in reserved portion, and add Alcohol (94.9 p.c.) q.s. to make 10

CANNABINÆ TANNAS—An amorphous, yellowish powder, sparingly soluble in Water, Alcohol, and Ether Soluble in acidulated Alcohol

Dose—4 to 8 grains = 0.26 to 0.52 gramme, mixed with Sugar and taken as a powder or in a cachet

Was introduced as a hypnotic, but its effects are very uncertain—*T. G.* '85, 329, 379

It is occasionally prescribed for menorrhagia

CANNABINON—A soft resinous substance, generally found as a 10 p.c. trituration with Milk Sugar, also introduced as a hypnotic, but the dose (1½ grains) was followed by excitement, collapse, and cramps—*T. G.* '85, 286, *L. M. R.* '86, 434, contra indicated in cardiac disease—*L.* '87, 1542

Dose—½ to 1 grain = 0.016 to 0.06 gramme

CANTHARIS.

CANTHARIDES

FR, CANTHARIDE, GER, SPANISCHE FLIEGEN, ITAL, CANTARIDE, SPAN, CANTARIDA

The dried Beetle, *Cantharis vesicatoria*, Latr

It is collected in Spain, France, Russia, Sicily, and Hungary

The powder should be dry and kept closely corked, for if at all damp it is apt to acquire a putrid odour A piece of Camphor kept in it prevents mites

Mylabris—The dried beetle, *Mylabris phalerata*, is official in the *Ind* and *Col. Add.* for India and the African and Eastern Colonies, other species of *Mylabris* may be used provided they yield an equal amount of Cantharidin

Medicinal Properties—Externally its effects are rubefacient and irritant, by continued application it is vesicant For the latter purpose the Emplastrum or Liquor Epispasticus is used, and is especially effective in inflammation of deep-seated parts, as in pleuritis, pericarditis, pneumonia, sciatica, neuralgia, and over the præcordial region in acute rheumatism, applied to rheumatic joints it removes pain and swelling, applied over the epigastrium it often checks obstinate vomiting and gastric pain It acts for a longer period, and is less irritating to the patient, than Ammoniacal or Acetic Acid embrocations It ought not to be applied to a paralysed limb Internally in small doses it is diuretic and aphrodisiac It is given in gleet, in impotence, and incontinence of urine due to paralysis, but it should be given cautiously, for it irritates the kidneys and sometimes produces strangury, and it should never be given to aged people or to children, or in cases of nephritis

Continuous counter-irritation of the spine by blisters in the neighbourhood of the cervical and lumbar enlargements the most successful treatment of rheumatoid arthritis—*L.* '07, 11895

The Tincture in 5-mm doses three times daily in Water arrests hæmorrhage from the kidney.—*B M J* '98, ii 1551

It is the basis of most of the applications used to increase the growth of hair

In chronic inflammation of the bladder it should *not* be used as a counter-irritant, on account of its irritating effects on the urinary organs, when absorbed. In such cases a solution of Silver Nitrate ($\frac{1}{2}$ drm to 1 fl oz of Water) is to be preferred

Thirty-two cases out of 56 of cystitis cured by teaspoonful doses of the following solution. Cantharidin, 1 milligramme, dissolved in 1 gramme of Alcohol, and diluted to 100 grammes with Water.—*B M J E* '95, ii 6

Ph Ger maximum single dose, 0.05 gramme, maximum daily dose, 0.15 gramme

Official Preparations—Acetum Cantharidis, Emplastrum Calefaciens, —
Cantharidis, Liquor Epispasticus, Tinctura Cantharidis, and
Cantharidis Colloidium Vesicans is prepared from Liquor Epispasticus

Not Official—Cantharidin, Potassium Cantharidate, Charta —
Emplastrum Vesicans, Linimentum Cinale, Liquor Cantharidis —
Unguentum Stimulans, and Boni's Blister.

Antidotes—Emetics or stomach-tube, followed by Barley Water, Gruel, white of Egg, inject Morphine for pain

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U S

Descriptive Notes.—The dried beetle, *Cantharis vesicatoria*, Latr., has shining coppery green, or green coloured wing cases, and is of an oblong shape, 18 to 25 mm long (1.5 to 3 cm, and 6 to 8 mm broad, *P G*), and has an unpleasant odour. The insects or powder should be dried when received into stock (preferably in the presence of quicklime) at a temperature not exceeding 40° C and kept from access of air in a stoppered bottle, the glass stopper being smeared with Vaseline, or they will be destroyed by mites and undergo partial decomposition. The *Mylabris phalerata*, Pall., which is given in the *Ind* and *Col Add* as a permissible substitute for Cantharis in India and the African and Eastern Colonies, has elytra or wing cases, which are black with two wavy or transverse bands, and a large spot of the same colour at the base of each elytron. It is oblong, 25 mm or more in length and 9 mm in breadth. Other species containing 'the same percentage' of Cantharidin as *M. phalerata* (amount not stated) may be also employed for official purposes in those countries. Under the name of Chinese Cantharides it is occasionally found in English commerce, mixed largely with the smaller species, *Cichorus*, Fabr., these insects forming a cheap source of Cantharidin, but the *M. Cichorus* contains less than *M. phalerata*. *M. bifasciata*, Oliv., a Cape of Good Hope insect yields about 1 p.c. of Cantharidin. The new crop of Cantharides can be procured in early autumn. The *U S P* requires that Cantharides should be thoroughly dried at a temperature not exceeding 40° C (104° F) and that the powder should contain few or no hairs, but the insect itself is hairy. The microscopical characters of powdered Cantharides are given in *P J.* (4) xxv. p. 185.

Tests.—Numerous processes have been devised for the determination of Cantharidin. That adopted by the *P G.* is essentially as

follows —A weighed quantity of 25 grammes of the powdered Cantharides is treated with 100 grammes of Chloroform and 2 c c of Hydrochloric Acid, the mixture is allowed to stand for 24 hours with occasional agitation, and 52 grammes of the Chloroform solution is filtered off through a dry, closely-covered filter. The Chloroform is distilled off and the residue is treated with 5 c c of Petroleum Ether, allowed to stand for 12 hours with occasional shaking, the liquid filtered through a 5 cm filter paper, which has previously been weighed after extraction with Petroleum Ether, the residue is washed on to the filter with 10 c c of Petroleum Ether without endeavouring to detach the crystalline residue adhering to the flask. Both the flask and the filter are washed with Water containing a drop or two of Ammonium Carbonate Solution (1 of Ammonium Carbonate in 3 by weight of Water and 1 part by weight of Ammonia Solution) till the washings are colourless, then washed with 5 c c of Water and weighed. The crystalline residue should amount at least to 0.1 gramme corresponding to 0.8 p.c. w/w of Cantharidin.

This standard is considered (*P J* '01, n 715) to be too high, the average yield of commercial Spanish flies is nearer 0.6 p.c.

Myiabras Cichorni is richer in Cantharidin than Cantharides, and the use of these flies as a source of the vesicant has therefore been suggested. The employment of Cantharidin in place of Cantharides for the production of the galenical preparations has been advocated in several quarters. If this view were supported by clinical evidence it would obviate the difficulties encountered by the variations of commercial samples, and would enable other species of Cantharis possibly containing a larger percentage of the active principle to be utilised. The new Belgian Pharmacopœia employs Cantharidin for the preparation of an ointment.

The ash of Cantharides should not exceed 8.0 p.c.

Preparations

ACETUM CANTHARIDIS VINEGAR OF CANTHARIDES

Cantharides, bruised, 2, Glacial Acetic Acid and Distilled Water, mixed in equal volumes, *q s* to yield 20, by maceration for 24 hours and subsequent percolation (1 in 10)

A corresponding preparation, *Acetum Myiabridis*, is official in the *Ind* and *Col Add* for India and the African and Eastern Colonies.

It has been suggested (*P J* '98, 1 259, *C D* '98, 1 422) to replace Cantharides by Cantharidin, dissolving 1 of Cantharidin in 200 of Glacial Acetic Acid and adding Acetic Acid *q s* to yield 2000. This formula has been incorporated in *B P C* under the title *Acetum Cantharidini*.

Foreign Pharmacopœias—Official in *Port*, about 1 in 6, *Dutch* (*Acetum Myiabridis*), 1 in 10. Not in the others.

Tests—Vinegar of Cantharides has a specific gravity of 1.064 to 1.070, should contain not less than 2.5 p.c. w/v of total solids, and 1 c c should require for neutralisation not less than 8 c c of Normal Volumetric Potassium or Sodium Hydroxide Solution, indicating not less than 47.66 p.c. w/v of absolute Acetic Acid.

COLLODIUM VESICANS. BLISTERING COLLODION

Blistering Liquid, 20, Pyroxylin, $\frac{1}{2}$, dissolve by agitation in a well-closed vessel

U S is made with Flexible Collodion

See also CANTHARIDIN, below

Foreign Pharmacopœias—Official in Dan, Ger, Jap, Mex (Collodion Cantharidæd), Norw, Port, Russ, Swiss and U S Not in the others

EMPLASTRUM CALEFACIENS. B P Syn—WARMING PLASTER

Infuse 1 of Cantharides, in coarse powder, in 5 of boiling Distilled Water, strain and evaporate to $1\frac{1}{2}$ on a water-bath, add Yellow Beeswax, 1, Resin, 1, Resin Plaster, 13, Soap Plaster, 8

(about 1 in 25)

A corresponding preparation, **Emplastrum Calefaciens Mylabridis**, is official in the *Ind* and *Col Add* for India and the African and Eastern Colonies

EMPLASTRUM CANTHARIDIS. CANTHARIDES PLASTER

Cantharides, in powder, 7, Yellow Beeswax, 4, Lard, 4, Resin, 4, Soap Plaster, 1

(nearly 1 in 3)

Melt the Resin first, and add to it the plaster, Wax, and Lard, when all are completely fluid add the Cantharides gradually with stirring, continue the same until cold

A corresponding preparation, **Emplastrum Mylabridis**, is official in the *Ind* and *Col Add* for India and the African and Eastern Colonies

It has been suggested (*P J* '98, 1 259, *C D* '98, 1 422) to replace Cantharides by Cantharidin, dissolving 1 of Cantharidin in Chloroform *q s* and stirring it with 999 of a mixture in equal parts of Yellow Wax, Prepared Suet, and Resin The solution is stirred into the melted mixture and the Chloroform should be dissipated in the formation of the plaster This formula has been incorporated in *B P C* under the title **Emplastrum Cantharidin**

Foreign Pharmacopœias—Official in Belg, Dutch, Fr, Hung, Ital, Mex, Span and Swed, about 1 in 8, Austr, Dan, Ger, Jap, Norw, Port, Russ and Swiss, about 1 in 4 Not in U S

Emplastrum Cantharidum Perpetuum, Swiss, 3 in 10, Dan, Nor and Swed (*Emp Canth cum Euphorbio*), about 1 in 7, Hung, 1 in $5\frac{1}{2}$, Ital (*Empiastro de Cantaride mite*), 1 in 21, Austr, Ger and Russ, 1 in 10 Not in the others Norw includes an **Emplastrum Cantharidis Colatum**, Ger includes an **Emplastrum Cantharidum pro usu veterinario**, about 1 in 5

LIQUOR EPISPASTICUS. BLISTERING LIQUID

10 of Cantharides, percolated with Acetic Ether to produce 20 of Liquor

(1 in 2)

A corresponding preparation, **Liquor Epispasticus Mylabridis**, is official in the *Ind* and *Col Add* for India and the African and Eastern Colonies

Span has **Tinctura Chloroformica de Cantaridas**, White Wax, 1, Cantharides, 100, Chloroform, *q s* to make 100 By weight

See also CANTHARIDIN, below

TINCTURA CANTHARIDIS. TINCTURE OF CANTHARIDES

Macerate 1 of Cantharides, in No 40 powder, with 80 of Alcohol

(90 p c)

(1 in 80)

Dose.—5 to 15 minims = 0.3 to 0.9 c c ; if frequently repeated, 2 to 5 minims = 0.12 to 0.3 c c.

Ger and U S are much stronger

Ph Ger maximum single dose, 0.5 gramme, maximum daily dose, 1.5 grammes

It has been suggested (*P J* '98, 1 259, *C D* '98, 1 422) to replace Cantharides by Cantharidin, dissolving 1 of Cantharidin in 100 of Chloroform and adding Alcohol (90 p c) *q s* to yield 10,000

This formula has been incorporated in *B P C* with an increase of the Chloroform to 125, under the title **Tinctura Cantharidini**

Foreign Pharmacopœias—Official in Austr, Belg, Dutch, Fl, Ger, Ital, Jap, Port, Russ, Span, Swed, Swiss and U S, 1 in 10, Mex, 1 and 10, Hung, 1 and 5. All by weight except U S

The *Brussels Conference* adopted a strength of 10 p c for the Tincture, employing Alcohol (70 p c)

Tests—Tincture of Cantharides has a specific gravity of about 0.835, it contains about 0.25 p c w/v of total solids and about 90 p c w/v of Absolute Alcohol

UNGUENTUM CANTHARIDIS CANTHARIDES OINTMENT

Cantharides, bruised, 1, Benzoated Lard, 10 digest at 120° F (48.9° C) for 12 hours and strain through calico, using gentle pressure towards the end (about 1 in 10)

Employed to promote discharge from a blistered surface. Being very painful this is seldom practised

A corresponding preparation, **Unguentum Mylabridis**, is official in the *Ind* and *Col Add* for India and the African and Eastern Colonies

It has been suggested (*P J* '98, 1 259, *C D* '98, 1 422) to replace Cantharides by Cantharidin, dissolving 1 of Cantharidin in Chloroform *q s*, and stirring it into a mixture of 499 of Yellow Beeswax and 2500 Olive Oil (by weight) previously melted. The Chloroform should be dissipated in the formation of the Ointment.

This formula has been incorporated in *B P C* under the title **Unguentum Cantharidini**, in which the proportions are given as 0.0325, 16, and 84

Foreign Pharmacopœias—Official in Fr (*Pommade Epispastique Verte*), about 1 in 83, and *P E Jaune*, 1 in 17½, Ger and Jap, Oil of Cantharides 3, Yellow Wax 2, Port, about 1 in 23, Ital (*Pomata di Cantharidi*), 1 in 10, Swed, 1 in 5 (fort, 1 in 4), Span, 3 in 10, Swiss, Cantharidine, 1 in 250, U S (*Ceratum Cantharidis*), 32 in 100, Mex (*Unguento de Cantharidas*), about 1 in 18. Not in Austr, Dutch or Hung. Ger and Swiss have **Unguentum Cantharidum pro usu veterinario** (1 in 5), Belg (**Unguentum Cantharidini**, *Cantharidin*), 1 in 2000, (**Unguentum Cantharidis cum Euphorbio**), *Cantharides*, 1 in 5

Ger and Jap have *Oleum Cantharidatum*, Mex has *Aceto de Cantharidas*

Not Official

CANTHARIDIN $C_{10}H_{12}O_4$, eq 194.62—White, inodorous, crystalline scales

Solubility—1 in 1150 of Rectified Spirit, 1 in 700 of Rectified Ether, sp gr 0.720, 1 in 55 of Chloroform, 1 in 150 of Acetic Ether, but even when dissolved at 60° F part separates on standing, 1 in 200 of Almond Oil, 1 in 65 of Oil of Cloves

Acetone is the best solvent for Cantharidin, which it dissolves 1 in 40, and as it is cheaper it possesses a double advantage over Acetic Ether. Acetone makes a good *Liquor Epispasticus*, it also dissolves Pyroxylin, and is therefore suitable for making *Collodium Vesicans*. Acting upon this suggestion *B P C* have included a **Collodium Cantharidini**—Cantharidin, 0.35 gramme, Acetone Collodion, *q s* to make 100 c c, but in the *B P C Supplement* the Cantharidin is first dissolved in 30 c c of Acetone, then Acetone Collodion added to make up 100 c c

Foreign Pharmacopœias,—Official in Belg, Fl, Mex, Port, Span and Swiss

Tests—Cantharidin melts at 218° C (424 4° F), and when heated further sublimes in white needles. The aqueous solution is neutral towards Litmus paper. Solutions of Cantharidin possess powerful vesicating properties, it dissolves without change of colour in concentrated Sulphuric Acid, and again separates when diluted with Water. It leaves no residue upon ignition.

POTASSIUM CANTHARIDATE—Colourless, needle-shaped crystals, soluble in Water, insoluble in Ether and in Chloroform. Should be preserved in well-stoppered bottles.

Liebreich's Solution contains 0.2 gramme Cantharidin and 0.4 gramme Potassium Hydroxide in 1000 c.c. of sterilised Water, 1 c.c. contains 0.0002 gramme Cantharidin in the form of Potassium Cantharidate. **Dose**—0.5 c.c., given also internally in diseases of tubercular origin, in lupus, and in _____ once been replaced by a tincture made with Cantharidin, 1, in Tincture of Orange Peel, 5000. **Dose**—0.5 c.c., and never more than 0.75 c.c., mixed with liqueur-glassful of Water.—*B M J* '02, ii 1231, *P J* '02, ii 708.

Official in Fr, Mex. and Span.

CHARTA EPISPASTICA (*B P* 1885)—Powdered Cantharides, 4, White Wax, 16, Spermaceti, 6, Olive Oil, 8; Resin, 3, Canada Balsam, 1, Distilled Water, 24. Conveniently spread on paper ruled in divisions of 1 square inch. Fr has Sparadiap Vesicant and Sparadiap de Cantharidate de Potassium.

EMPLASTRUM VESICANS—Cantharidin, 1, Chloroform, a sufficiency, Yellow Beeswax and Wool Fat, in equal proportions, 499 parts. The Chloroform is used to dissolve the Cantharidin, and is afterwards dissipated on a water bath.—*University*.

LINIMENTUM CRINALE—Cantharidin, 1 grain, Acetic Ether, 6 fl. drms., dissolved in 6 fl. oz. add Alcohol (90 p.c.), 6 fl. oz., Castor Oil, 2 fl. oz., Oil of Lavender, 15 minims.

This Liniment is highly recommended for application to the head where the hair is falling off, but after applying it a few times the head should be washed or the Cantharidin may accumulate, and cause too much irritation. It may be diluted with equal parts (or more) of Alcohol (90 p.c.) for delicate skins.

LIQUOR CANTHARIDIS CONCENTRATUS—1 fl. oz. = 1 oz. of Cantharides. It is obtained by re-percolation with Acetic Ether, and is standardised to contain 0.5 p.c. of Cantharidin. This Liquor forms a convenient substitute for Cantharides in making the various preparations, it effects a great saving of time and produces a better result.

Acetone is better as a solvent, but cannot at present be employed for official preparations.

UNGUENTUM STIMULANS (Erasmus Wilson's)—Cantharides, in Powder, 3 Lard, 12, macerate with a moderate heat for twenty-four hours, and filter through paper.

In place of the Cantharides, 6 of *L. _____* 3 of Liquor Cantharidis Concentratus may be employed, _____ extract, and mixed with the same on Lard.

BONI'S BLISTER—Camphor, 20, Chloral Hydrate, 30, melt and add powdered Cantharides, 10, digest for an hour at 150° F, filter.

CAOUTCHOUC.

INDIA-RUBBER

Fr, CAOUTCHOUC, Ger, KAUTSCHUK, Ital, CAUCCIÙ, Span, CAUCHO.

The prepared milk-juice of *Hevea brasiliensis*, and various other species. The best commercial variety is known as Para rubber.

Official Preparation—Tincture of Caoutchouc. The Liquor is used in the preparation of Chloroform emulsion.

Foreign Pharmacopœias—Fr, Ger, Jap, Mex, Span, Swiss and U S (Elastica) Not in the others

Descriptive Notes—In Brazil Para rubber is obtained from *Hevea brasiliensis*, Muell Arg, and other species, but in Ceylon from *Hevea brasiliensis* only

The *BP* statement that it is brownish black externally and mottled with a pale tint internally, except that mottling scarcely describes the gradual paling from the surface to the centre, applies also to Ceylon or biscuit Para rubber, this is now imported and is a remarkably pure product, though deficient in the antiseptic bodies and empyreumatic odour derived from the smoke of burnt Palm nuts that characterises the Brazilian Para rubber. Caoutchouc is easily cut with a knife if first wetted with Water

Tests—Caoutchouc melts at about 125° C (257° F), which figure is given in both *USP* and the *BP*, the *PG* gives 120° C (248° F). When melted it forms a fluid or semi-fluid mass, which on strongly cooling again becomes solid and still maintains its stickiness. It is insoluble in Water, Alcohol (90 p c) and in dilute solutions of the alkali Hydroxides. It dissolves in Benzol, Carbon Bisulphide, Chloroform, Petroleum, Ether and Oil of Turpentine. This statement must not be taken to mean that the rubber is entirely soluble in these liquids, but when treated with them it swells up and becomes gelatinous and soft, a portion being left in a disintegrated condition. This behaviour would suggest that rubber consists of constituent parts, one constituent part of which dissolves leaving the less soluble part in an insoluble but disintegrated condition

Preparation

LIQUOR CAOUTCHOUC SOLUTION OF INDIA-RUBBER

India rubber, 1, Benzol, 10, Carbon Bisulphide, 10

CAPSICI FRUCTUS

CAPSICUM

FR POIVRE DE GUINÉE, GFR, SPANISCHER PFEFFER, ITAL, PEPPERON, SPAN, PIMIENTO DE INDIAS

The dried ripe Fruit of *Capsicum minimum*

Imported from Zanzibar, Sierra Leone, etc, and distinguished in commerce as Guinea Pepper, Chillies, or Bird Pepper. That from Nepal has the finest flavour, and the powdered fruit is often preferred to the ordinary Cayenne Pepper

It yields its virtues to Water, Alcohol, Ether, Acetic Ether, and the fixed and volatile Oils

Medicinal Properties—Stomachic and carminative, used chiefly as a condiment. Given in dyspepsia and flatulent distension, and to promote appetite in alcoholism. Used externally as a rubefacient, and counter-irritant in rheumatism and lumbago and for chilblains

Dose.—½ to 1 gram = 0.01 to 0.06 gramme in pill

Tinct Capsici, 1½ dm (increased), Tinct Aurant, 4 dm. Syr Aurant, 4 dm Quinine Hydrochloride, 6 grams, Water, to 6 oz Take a tablespoonful as required, three to four times a day, in dipsomania

Official Preparations—Tinctura Capsici, and Unguentum Capsici The Tincture is contained in Tinctura Chloroformi et Morphinæ Composita

Not Official—Emplastrum Capsici, Extractum Capsici Liquidum, Gossypium Capsici, Linimentum Capsici, Liquor Capsici Compositus, Oleo-resina Capsici, Tinctura Capsici Ætherea, Tinctura Capsici Fortior, Unguentum Oleo-resina Capsici, and Capsicum with Wool Fat

Foreign Pharmacopœias—Official in Aust, Belg, Dan, Dutch, Ger, Jap, Mex (Chile), Port (Pimenta o), Russ, Swed, Swiss and U S Not in the others

Descriptive Notes—The fruits of *Capsicum minimum*, Roxb, which are officially called Capsicum, are known in commerce as Chillies or Bud Pepper, they vary considerably in pungency and colour Those of Sierra Leone are usually yellowish-red, without pedicel or calyx, and are the most pungent of all Those from Zanzibar are redder and usually have the stalk and calyx attached, and are somewhat less pungent The Japanese are bright red, much less pungent, and the larger variety exceeds the dimensions given in the B P Like all ordinary Capsicum fruits the pericarp is glabrous, translucent and coriaceous, the seeds are flat and 10 to 20 in number The official description limits it to those having the following characters—Colour, dull orange-red, shape, ' ' and obtuse, size, ½ to ¾ in (12 to 20 mm) long, and ¼ in (6 mm) in diameter, the calyx and slender peduncle may be present or not The bright red Cayenne Pepper of commerce is usually prepared from Natal or Egyptian varieties of *Capsicum annuum*, L, which are eight or nine times as large as the fruit of *Capsicum minimum* Nepal Cayenne Pepper is usually of yellowish-brown tint, and has an odour of Violets, and is prepared from the yellowish-red fruit of the Nepal variety of ' ' The bright red Bud Pepper that is given to canaries, and has hardly any pungency, is prepared from the fruit of *Capsicum annuum* var *grossum*, Sendtn, grown in Spain, and known there as 'Pimento' or from the fruit of *Capsicum tetragonum*, Miller, grown in Hungary, and known there as 'Paprika' In both countries the fresh fruit is used as a condiment with food Coconada Capsicums are said to be the produce of *Capsicum annuum*, L, var *abbreviatum*, Fingerh and Natal and Indian Capsicums of the var *acuminatum*, Fingerh The bright red Cayenne Pepper of commerce is largely made from the variety imported from Natal J. E Wallis has shown that the powder of *Capsicum minimum*, *Capsicum annuum*, and Japanese Chillies can be distinguished under the microscope and suggests that the following description should be included in the Pharmacopœia as a means of excluding substitutes for, or admixtures with, the official Capsicum—'The pericarp shows an epidermis of thick and ' ' cells which have few pits, are often arranged in groups of 5 or 7 in a row and have an evenly striated cuticle' (See Pharm Jour (4) xiii p 552, xv p. 3) The U S P requires that the powdered Capsicum contains few or no starch grains or sclerenchymatous fibres and refers the matter to C. C.

fastigiatum, Blume The large fruits of *Capsicum annuum*, 5 to 10 cm long, and 4 cm at the base, are official in the *P G* According to Geriand, Alcohol (90 p c) is the best and most perfect solvent of the active principle of Capsicum (*Y B P* '05, 453, *P J* (4) xxi p 153) The pungent principle is most abundant in the placenta which yields 0.9 p c, the rest of the fruit yielding only 0.2 p c The powder of Capsicums soon becomes mouldy, if not kept dry

Tests—Capsicum leaves about 6.0 p c of ash, which figure should not be exceeded

Preparations

TINCTURA CAPSICI TINCTURE OF CAPSICUM

Macerate 1 of Capsicum, in No 20 powder, with 20 of Alcohol (70 p c) (1 in 20)

Dose—5 to 15 minims = 0.3 to 0.9 c c

Foreign Pharmacopœias—Official in Belg, 1 and 10, Mex, 1 in 5, Dan and Dutch, 1 and 10, Ger, Jap, Russ, Swed and Swiss, 1 in 10, all by weight U S, 1 in 10 Not in the others

Tests—Tincture of Capsicum has a specific gravity of about 0.895, contains from 0.7 to 1.5 p c w/v of total solids and about 70 p c w/v of Absolute Alcohol

UNGUENTUM CAPSICI CAPSICUM OINTMENT

Bruised Capsicum, 120 grains, Spermaceti, 60 grains, Olive Oil (by weight), 1 oz, strain after digestion on a water-bath for one hour

It has been suggested to use half the quantity of Liquid Extract of Capsicum (2 in 1) in place of Capsicum

Not in the Foreign Pharmacopœias

Not Official

CAPSICUM WITH WOOL FAT—1 of Liquid Extract of Capsicum (2 in 1), incorporated with 9 of Hydrous Wool Fat This was suggested by Geriand as an improvement on the ointment

EMPLASTRUM CAPSICI (*Geriand*)—Liquid Extract of Capsicum (2 in 1), 10, Resin Plaster, 95, evaporate the Alcohol and mix the residue with the plaster This formula closely resembles that incorporated in *B P C*

EMPLASTRUM CAPSICI (*U S*)—Apply a thin coating of Oleo resin of Capsicum, by means of a brush, so as to form a thin coating over an area 15 centimetres square, leaving a margin round the sides

EXTRACTUM CAPSICI LIQUIDUM (*Geriand*)—Exhaust 100 of Capsicum Fruit in No 60 powder with Alcohol (90 p c), distil off the Alcohol until the needed extract weighs 50 This has been incorporated in *B P C* Fluid extractum Capsici (*U S P*) is half this strength

GOSSYPIUM CAPSICI—Geriand's form is to saturate evenly 9 of Cotton Wool under pressure, with a mixture of 2 of Liquid Extract of Capsicum (2 in 1) and 7 of Alcohol (90 p c), and then dry It is coloured with Eosin to keep the colour more uniform *B P C* formula is just half the strength of this

LINIMENTUM CAPSICI—Stronger Tincture of Capsicum, 35 c c, Oleic Acid, 12.5 c c, Oil of Lavender, 0.625 c c, Alcohol, q s to make 100 c c This preparation corresponds to Linimentum Capsici, *B P C*, and to the Liniment recommended in Martindale, 1906

Oak, Beech, Hazel, Willow, and Poplar are employed

Medicinal Properties—Antiseptic, absorbent and deodoriser Given in cases of distension by intestinal gas, and in foul eructations and diarrhoea in dysentery and typhoid, also in dyspepsia attended with flatus, acidity and pain It will absorb and neutralise poisonous alkaloids Externally, as a poultice, it cleanses and absorbs the fetor of ulcers and gangrenous parts

Dose—60 to 120 grains = 3.9 to 7.7 grammes

Prescribing Notes—*It has been given in powder diffused in Water, also in the form of capsules, cachets, and biscuits The most palatable way is to mix it with chocolate*

Foreign Pharmacopœias—Official in all except Dan, Jap, Norw and Swed, Mex (Carbon Vegetal)

Tests—It should, according to the official requirements, leave 7.5 p.c. of ash when burned at a high temperature with free access of air, the *P G* permits only an insignificant amount of ash, and that it should burn without flame The *USP* includes a test with Potassium Hydroxide Solution which ensures evidence of complete carbonisation

Potassium Hydroxide—If 1 gramme be boiled with a mixture of 3 c.c. of Potassium Hydroxide T.S. and 5 c.c. of Water for several minutes, the filtrate should be colourless or nearly so, *USP*

CARBONIS BISULPHIDUM.

CARBON BISULPHIDE

B P Syn—CARBON DISULPHIDE

CS_2 , eq 75.55

A colourless, very volatile, highly refractive, limpid liquid, having an ethereal and not unpleasant odour when quite pure, but usually possessing a very disagreeable odour due to impurity

Should be preserved in well-stoppered dark amber-tinted glass bottles, partially filled, or in tin cans, in a cool atmosphere and away from naked flames, and not exposed to light

It is produced by heating Charcoal and Sulphur together at a high temperature, the crude product being condensed and subsequently rectified

Solubility—About 1 in 500 of Water, readily soluble in Absolute Alcohol, Ether (sp. gr. 0.720), Chloroform, and the fixed and volatile Oils

It is a good solvent for Iodine, Phosphorus, Precipitated Sulphur, etc

Medicinal Properties—It is official as a solvent for India-rubber and Phosphorus It is a powerful poison, and is not often given internally

1 or 2 oz. daily of a saturated Solution in Peppermint Water have been given as a substitute for Beigeon's treatment of phthisis—*B M J* '88, 1.421

A claim has been made that this should not remain in obscurity, but retain its place as a valuable remedy in tuberculosis—*B M J E* '04, 11.72.

Internally in pneumonia, in 5 p c aqueous solution hourly -*B M J E* 06,
11 68

Official Preparations—Used in the preparation of Liquor Caoutchouc and Pilula Phosphori

Foreign Pharmacopœias—Official in Belg, Fl, Port, Spain and U S Not in

Tests—Carbon Bisulphide has a specific gravity of about 1.268, *USP* gives 1.256 to 1.257 at 25° C (77° F), and a boiling point of about 46° C (114.8° F), the *BP* and *USP* give 46° to 47° C (114.8° to 116.6° F). It burns with a bluish flame, yielding Carbon Dioxide and Sulphur Dioxide as products of combustion.

The more generally occurring impurities are dissolved Sulphur, Sulphur Dioxide, and Hydrogen Sulphide. Dissolved Sulphur is shown by the residue left on evaporation, Sulphur Dioxide by its bleaching action towards moistened blue Litmus paper, and Hydrogen Sulphide by Lead Acetate.

Litmus—Blue Litmus paper moistened with Water should not be affected by Carbon Bisulphide, *BP* and *USP*.

Residue.—When a portion of Carbon Bisulphide is allowed to evaporate spontaneously in a glass vessel, no residue should be left, *BP* and *USP*.

Lead Acetate—Lead Acetate T.S., agitated with Carbon Bisulphide, should not be blackened, *BP* and *USP*.

CARDAMOMI SEMINA.

CARDAMOM SEEDS

FR, CARDAMOMES, GER, KARDAMOMEN, ITAL, CARDAMOMO,
SPAN, CARDAMOMO MENOR

The dried, ripened Seeds of *Elettaria Cardamomum*. *BP* states that the seeds should be kept in their pericarps, and separated when required for use.

1 of Fruit yields about $\frac{1}{3}$ of Seeds

Medicinal Properties.—Stomachic, carminative, and flavouring agent, a useful adjuvant to papaveres to prevent griping.

Official Preparation.—Tinctura Cardamomi Composita. Contained in Extractum Colocynthis Compositum, Pulvis Cinnamomi Compositus, Pulvis Cretæ Aromaticus, Tinctura Gentianæ Composita, Tinctura Rhei Composita. Of the Tincture contained in Decoctum Aloes Compositum, and Mistura Sennæ Composita.

Not Official—Oleum Cardamomi, Tinctura Cardamomi, Tinctura Carminativa, and Mistura Carminativa.

Descriptive Notes.—The Cardamoms of commerce are derived from several species, but the official kind is limited to the fruits of typical *Elettaria Cardamomum*, Maton, by the measurements given, viz, $\frac{3}{4}$ to $\frac{1}{2}$ in (1 to 2 cm), and by the 'pale buff' colour. The varieties of this Cardamom, as met with in trade, are known as Malabar, Mysore, and Mangalore, whether imported from those districts or from Ceylon, where Cardamoms are largely cultivated. The Malabar variety consists of short, plump, firm capsules well filled

with seeds, those of Mangalore are similar, but more or less watery on the surface, and those of Mysore are longer and less compactly filled with seeds, and consequently can be more easily compressed between the fingers. These varieties may also be met with in a bleached form, obtained by moistening them and submitting them to the action of Sulphurous Acid gas, in which case they present a smoother surface, the natural longitudinal striations being somewhat obscured in the process. For galenical purposes the shorter fruits showing the natural striations are to be preferred since their natural colour shows their good quality and their plumpness indicates a large proportion of seed to husk, and seeds more fully matured than in the Mysore kind. The fruits are usually collected before they are quite ripe to prevent the pericarp splitting open. Such partially open fruits as do occur are apparently sorted out and husked by being passed between rollers, or by similar means, since a certain amount of 'split' seed is offered in commerce.

The seeds should not be removed from the pericarps until required for use. The loose seeds obtainable in commerce present the possibility of being obtained from other than the official species, and in any case are likely to be deficient in aroma from exposure to the air.

The distinguishing microscopical characters of the powdered official Cardamoms are the perisperm cells, containing small starch grains, and prismatic Calcium Oxalate crystals, the dark coloured polyhedral cells of the inner integument, and the thick walled linear cells with oblique ends, of the epidermal layer. The presence of the pericarp in the powder may be detected by the straight-walled, polygonal cells of the epidermal parenchyma, spiral vessels, and small cells containing brown resin.

The other varieties of Cardamom occurring in commerce at more or less regular intervals are the var *major* of the official kind, known as Wild Ceylon Cardamom, which have longer, greyish fruits, the Greater or Korarima Cardamom (*Amomum Korarima*, Perena), which is about $1\frac{1}{2}$ in (37 mm) long and $\frac{1}{4}$ in (19 mm) broad at the base, and of a dull brownish colour, the cluster Cardamom (*Amomum Cardamomum*, L.), which is whitish, spherical, nearly smooth, and about $\frac{1}{2}$ in (12.5 mm) in diameter, all of these have seeds resembling the true Cardamom in flavour. The Bengal Cardamom (*A. aromaticum*, Roxb), the Nepaul (*A. subulatum*, Roxb) and the bitter-seeded Cardamom, all having a brown pericarp, are more rarely imported, but the seeds, freed from the husk, and when offered in commerce in the form of powder for use in pills are not so easy of recognition as the fruit, and are best detected by a microscopical examination, see *PJ* (4) vi p 280. The official seeds are dark reddish-brown and 3 mm ($\frac{1}{8}$ in) in diameter, angular and transversely wrinkled.

Tests—Cardamoms are officially required to yield not more than 4 p.c. of ash. Determinations of the ash of Pericarps, Seeds, and Pulvis made in the author's laboratory yielded Pericarps (three samples), 10.4, 12.0, 13.4 p.c., Seeds (three samples), 2.38, 2.81, 3.85 p.c., Pulvis (three samples), 7.56, 6.33, 9.93 p.c., these results

seem to indicate that the Pulvis Cardamomi was not obtained from the seeds only as directed in the Pharmacopœia. Even whole fruits had but an average of 5.5 p c. A maximum ash limit of 6 p c has been recommended.

Foreign Pharmacopœias.—The Fruit is official in Austri, Dan, Dutch, Ger, Hung, Jap, Mex (Cardamomo menor), Norw, Port, Russ, Swed, Swiss and U S. Not in Ital.

Preparation

TINCTURA (1875) COMPOSITA. COMPOUND TINCTURE OF CARDAMOMS

Cardamom Seeds, bruised, 1 oz, Caraway Fruit, bruised, 1 oz, Raisins of commerce, freed from seeds, 8 oz, Cinnamon Bark, bruised, 2 oz, Cochineal, in powder, 220 grains, macerated with 80 fl oz of Alcohol (60 p c) (1 in 80)

Dose.— $\frac{1}{2}$ to 1 fl drm = 1.8 to 3.6 c c

Foreign Pharmacopœias—Official in U S, 1 in 40, contains Glycerin, and is made with the Fruit of the Cardamoms. Not in the others.

Tests.—Compound Tincture of Cardamoms has a sp. gr. of 0.945 to 0.950, it contains about 6 p c w/v of total solids and about 56 p c w/v of Absolute Alcohol.

Not Official.

OLEUM CARDAMOMI—A pale yellow aromatic oily liquid distilled from Cardamom Seeds, which contain about 4 to 6 p c.

Tests—Cardamom Oil is distilled chiefly from Ceylon Cardamoms. It has a specific gravity of 0.933 to 0.943, an optical rotation of $+26^{\circ}$ to $+34^{\circ}$, in a 100 mm tube. It is soluble in 4 parts and more of Alcohol (70 p c), and should possess a Saponification value of 132.

Schimmel states that Mysore (Ceylon) Cardamom Oil has a specific gravity of 0.895 to 0.905, but Parry has been unable to confirm these figures and shows that there is practically no difference between the two Oils.

TINCTURA CARDAMOMI—Cardamom Seeds, bruised, 1, Alcohol (60 p c), $q\ s$ to yield 10, by percolation.

Dose.—30 to 60 minims = 1.8 to 3.6 c c

The B P C Tincture, also 1 in 10, is made by maceration.

Foreign Pharmacopœias—Official in U S, 1 of Fruits in 5 of Alcohol (48.9 p c), by percolation, Port and Swiss, 1 in 5 (weight).

TINCTURA CARMINATIVA (B P C Formulary 1901)—Cardamom Seeds, bruised, 600 grains, stronger Tincture of Ginger (B P '85), 1 $\frac{1}{2}$ oz, Oil of Cinnamon, 100 minims, Oil of Caraway, 100 minims, Oil of Cloves, 100 minims, Alcohol (90 p c), $q\ s$ to yield 20 fl oz, macerate the Cardamoms in 15 fl oz of the Spirit for a week, decant, express, and dissolve the Oils in the mixed Tinctures, and add the remainder of the Alcohol.

Dose.—2 to 10 minims = 0.12 to 0.6 c c

This has been incorporated in the B P C.

By replacing the Cardamom Seeds with $\frac{1}{8}$ of Oil of Cardamoms the maceration is avoided.

MISTURA CARMINATIVA—Sodium Bicarbonate, 60 grains, Aromatic Spirit of Ammonia, 72 minims, Compound Tincture of Cardamoms, 144 minims, Glycerin, 240 minims, Dill Water, to 6 $\frac{1}{2}$ fl oz.

This corresponds to Mistura Carminativa (B P C).

Several formulas are given in Ph. Form.

CARUI FRUCTUS.

CARAWAY FRUIT

FR, CARVI, GER, KUMMEL, ITAL, CARVI, SPAN, ALCARAVEA

The dried Fruit of *Carum Carvi*, L

Cultivated in different parts of Europe The herb flowers in the second year, and the fruit ripens in July or August Yields from 8 to 7 p c of Oil, varying with the source of the Seeds

Medicinal Properties—Aromatic, stomachic, and carminative Used in flatulent colic, as an adjuvant to other medicines, to prevent griping of purgatives, and as a flavouring agent

Official Preparations—Aqua Carui, and Oleum Carui Contained in Confectio Piperis, Pulvis Opii Compositus, Tinctura Cardamomi Composita, Tinctura Sennae Composita The Oil is contained in Pilula Aloes Barbadosis

Foreign Pharmacopœias—Official in Austr, Ger, Mex (Alcaravea), Port (Alcaravie), Swed, Swiss and U S Not in the others

Descriptive Notes—The principal varieties of Caraway fruit met with in commerce in this country are the English, Dutch and Russian, which differ in size, colour and aroma The English command the highest price, and are light brown in colour and slightly larger than the Dutch, which are a dark brown and cheaper, and are the kind usually sold by grocers According to the official description they should be 'about' $\frac{1}{4}$ to $\frac{1}{2}$ in (4 to 6 mm) long and about $\frac{1}{8}$ in (1 mm) broad, tapering towards each end, and would include these two The Russian Caraways are small and mixed with a considerable quantity of stalks and debris and are chiefly used in veterinary medicine The Mogador Caraway is occasionally imported It is the largest of all, and is usually slightly enlarged at the upper end, and consequently would be excluded by the *B P* statement that they are tapering at each end The Dutch, Norwegian and East Russian are chiefly used in Germany for distillation The value of the oil depends upon the amount of Carvone it contains The exhausted seeds are dried and sometimes used for purposes of adulteration, but they may be detected by their darker colour, weaker taste, and shrivelled appearance, and (under a good lens) by the torn outer layer of cells Under the microscope the most noticeable features of the powder are the pitted walls of the cells of the outer epidermis, which, like those of Anise, are striated, but are more oblong in outline, and about twice as long as broad, the parallel, thin walled, elongated, oblong cells of the inner epidermis about four times as long as broad, the absence of raphides and hairs

Tests—Caraway Fruit leaves about 6 p c of ash on incineration, and 8 p c should not be exceeded Six samples of the Fruit examined in the author's laboratory showed from 5.72 to 7.1 p c, 5 samples of the powdered fruit gave from 5.87 to 7.15 p c

Preparations

AQUA CARUI. CARAWAY WATER

Caraway Fruit, 1, Water, 20, distil, 10.

(1 in 10)

Dose.—1 to 2 fl oz = 28.4 to 56.8 cc

Foreign Pharmacopœias—Official in Jap and Swed Not in the others

OLEUM CARUI. OIL OF CARAWAY

A colourless or pale yellow, mobile liquid, possessing a characteristic and aromatic odour and a spicy taste

The Oil distilled from Caraway Fruit It consists principally of a terpene, Dextro-limonene, and an oxygenated compound of a ketone nature, Carvone It is the latter to which the oil owes its medicinal properties

It should be kept in well-stoppered amber-coloured glass bottles and protected as much as possible from the light It should be kept in a cool place

Dose.— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 cc

Foreign Pharmacopœias—Official in Austri (Carvone), Ger, Jap (Carvonum), Port, Swiss and US, Swed (Carvone) Not in the others

Tests—Caraway Oil has a specific gravity of 0.907 to 0.920 and an optical rotation of from $+70^{\circ}$ to $+80^{\circ}$ in a 100 mm tube The *BP* gives the specific gravity but no optical rotation, neither does it make any mention of the solubility of the oil in Alcohol (90 p c), it gives the specific gravity as 0.910 to 0.920, the *USP* gives 0.900 to 0.910 at 25°C (77°F) The *USP* gives the optical rotation as $+70^{\circ}$ to $+80^{\circ}$ in 100 mm tube at a temperature of 25°C (77°F) The oil should yield a clear mixture with an equal volume of Alcohol (90 p c), and with 3 to 10 volumes of Alcohol (80 p c) The *USP* gives the Alcohol solubility As pointed out above, Carvone is official in place of the oil in several Foreign Pharmacopœias, and commercial oils are frequently met with from which the Carvone has been abstracted Such abstraction is shown by the specific gravity and by the optical rotation, oils from which the Carvone has been taken having a specific gravity of about 0.848 and an optical rotation of over $+100^{\circ}$

Carvone forms crystalline compounds with Hydroxylamine, with Hydrogen Sulphide, and with Phenylhydrazine, but its actual determination, owing to difficulties inseparable from the process, can only be made with approximate accuracy A measured quantity of 5 cc of the oil is treated in a test-tube with 5 cc of Phenylhydrazine and the tube allowed to stand in boiling Water for an hour The excess of Phenylhydrazine is removed by adding whilst hot 5 cc of Glacial Acetic Acid, and after $\frac{1}{2}$ hr Water to 20 cc The contents are then cooled, the crystals removed by filtration and washed with Water until of a pale yellow colour They may be recrystallised from a definite volume of Alcohol (90 p c)

Not more than 15 p c of the oil should distil below 185°C (365°F), and at least 55 to 65 p c should distil above 200°C (392°F), the fraction between 220° to 230°C (428 to 446°F) should amount to a

The higher the specific gravity and the greater the solubility in Alcohol (50 p c) the more Carvone is likely to be contained in the sample

Not Official

CARVONE—A colourless or pale yellow fluid possessing a characteristic aromatic odour and taste. When obtained from the Oils of Caraway and Dill it is stated to be dextrogyrate, and lævogyrate when obtained from Oil of Spearmint.

Tests—Carvone has a specific gravity of not less than 0.960 and a boiling point of 229° to 230° C (444.2° to 446° F). It should be soluble in 2 parts by weight of Alcohol (68 to 69 p c). It forms crystalline compounds with Hydroxylamine, Hydrogen Sulphide and Phenylhydrazine, and may be determined quantitatively by means of Hydroxylamine or Phenylhydrazine. Carvone which has been exposed to the air when dissolved in an equal volume of Alcohol (90 p c) yields a reddish violet coloration with Ferric Chloride Test solution, which disappears on the further addition of Ferric Chloride Test solution.

It is official in Austr., Ger., Jap. and Swed. in place of the Oil

CARYOPHYLLUM

CLOVES

FR., GIROFLE, GER., GEWURZNELKEN, ITAL., GAROFANI,
SPAN., CLAVO DE ESPECIA

The dried Flower-buds of *Eugenia caryophyllata*

Imported from Penang, Bencoolen, Amboyna, and Zanzibar. Yield from 15 to 18 p c of Oil

Medicinal Properties—Aromatic, stomachic, carminative, antispasmodic. Administered to check nausea, vomiting, and flatulence, and to promote digestion. But chiefly used as an adjuvant to other medicines. The oil, as a counter-irritant, is a useful ingredient in liniments for whooping-cough and bronchitis, it is also used as an anodyne in toothache.

Dose—5 to 10 grains = 0.32 to 0.65 gramme

Prescribing Notes—*The Oil may be given upon a lump of Sugar, and is a useful constituent of aperient pill masses. The Infusion is a nice flavouring for many mixtures.*

Incompatibles—See under Infusum Caryophylli

Official Preparations—Infusum Caryophylli, and Oleum Caryophylli. Used in the preparation of Infusum Aurantii Compositum. Contained in Pulvis Cistæ Aromaticæ. The Oil is contained in Pilula Colocynthis Composita, and Pilula Colocynthis et Hyoscyami.

Not Official—Infusum Caryophylli Concentratum and Eugenol

Foreign Pharmacopœias—Official in Austri., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex. (Clavo de Especia), Norw., Port. (Clavinho), Russ., Span., Swed., Swiss and U.S.

Descriptive Notes—Cloves consist of the dried flower-buds of *Eugenia caryophyllata*, Thunb., the lower portion of which is formed of a calyx tube, enclosing in its upper half the ovary filled with minute ovules. It derives its name from the French word for a nail, *clou*, from its resemblance to a short nail in shape. The finest varieties in English commerce are imported from Penang, Bencoolen and Amboyna, and in French commerce from Réunion and Madagascar.

Those from Ceylon and the Seychelles are of medium quality and size and darker coloured. Those from Zanzibar and Pemba are more slender and the globular head is often broken. These last two varieties form about four-fifths of the world's production. The official Cloves should be $\frac{3}{8}$ in (15 mm) long, and should emit oil when indented with the finger nail. The 'stems' or stalks of the flowers are imported separately, and used for distillation of oil. Cloves exhausted of oil by distillation have been used to adulterate cloves, but yield no oil when pressed with the nail and float when put in water. Powdered Cloves have been adulterated with clove stalks and with the fruit of Cloves, known in commerce as Mother Cloves. The former may be detected by the presence of sclerenchymatous cells and the latter by the presence of starch granules, neither of which occur in Cloves.

Tests—Cloves yield when incinerated about 5 p.c. of ash, and 8 p.c. should not be exceeded. Eight samples examined in the author's laboratory yielded from 4.78 to 5.4 p.c., 5 samples of the powder yielded from 5.2 to 6.97 p.c. of ash. The Ether extract should amount to 20 p.c. The B.P. limit of ash is 7 p.c., and the U.S.P. 8 p.c.

Preparations

INFUSUM CARYOPHYLLI. INFUSION OF CLOVES

Cloves, bruised, 1, Distilled Water, boiling, 40, infuse for fifteen minutes, strain (1 in 40)

Dose.— $\frac{1}{2}$ to 1 fl oz = 14.2 to 28.4 c.c.

Incompatibles—Lime Water, salts of Iron, mineral acids, Gelatin

OLEUM CARYOPHYLLI. OIL OF CLOVES

FR, ESSENCE DE GIROFLE, GÉR, NFKENOL, ITAL, ESSENZA DI GAROFANI, SPAN, ESENCIA DE CLAVO

A pale yellow, limpid, highly refractive liquid possessing a characteristic aromatic odour and taste, distilled from Cloves. The yield of oil is from 15 to 18 p.c.

It becomes darker in colour with age and on exposure to air, and should therefore be kept in well-stoppered, dark amber-tinted glass bottles, and protected as far as possible from contact with the air.

The oil contains from 70 to 85 p.c. of Eugenol, a phenol having the formula $C_{10}H_{12}O_2$, a sesquiterpene, Caryophyllene, Methyl Alcohol, Furfural, and a trace of Vanillin.

Solubility—1 in 60 of Alcohol, (60 p.c.), in all proportions of Alcohol (90 p.c.), Ether, and Strong Acetic Acid.

Dose.— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 c.c.

Foreign Pharmacopœias—Official in Austri (Eugenol), Belg. (Eugenol), Denm. (Eugenol), Fr, Ger (Eugenol), Hung. Ital. Jap, Mex, Norw. Port, Russ, Span, Swed (Eugenol), Switz and U.S.

Tests—Clove Oil has a specific gravity of 1.048 to 1.068, it is officially required to be not below 1.050, the U.S.P. gives 1.040 to

1.060 at 25°C (77°F). Some genuine oils are occasionally met with of a lower specific gravity than that given in the *BP*, but rarely lower than 1.045. Both the *BP* and the *USP* require the oil to form a semi-solid yellowish mass when shaken with an equal volume of strong Ammonia Solution, the *USP* also mentions that concentrated Potassium Hydroxide Solution produces a similar result. When dissolved in Alcohol (90 p.c.) it is officially required to yield a blue coloration on the addition of Ferric Chloride Test-solution. The *USP* dissolves 2 drops of the oil in 4 c.c. of Alcohol (94.4 p.c.) and adds a drop of Ferric Chloride Test-solution, when a bright green colour will be produced, but a drop of a solution of Ferric Chloride Test-solution diluted with 4 times its volume of Water produces a blue coloration changing to yellow. This is as far as the official tests take us.

The optical rotation of the oil is about -1° in a 100 mm tube. No appreciable quantity of the oil should distil below 246°C (474.8°F). Eugenol may be determined approximately by treating a weighed quantity of 10 grammes of the oil in a flask with a long graduated neck with 100 c.c. of a 10 p.c. Potassium Hydroxide Solution, adding sufficient of the Hydroxide Solution to bring the level of the aqueous liquid to the zero mark, and reading off the volume of the unabsorbed portion which rises to the surface. This volume multiplied by 0.908 (the specific gravity of Caryophyllene) gives approximately the percentage by weight of the latter. The results are only approximate, owing to the solubility of the Caryophyllene in the Potassium Hydroxide Solution and Potassium Eugenate. The *USP* describes this process, but works by volume and not by weight. Thus determined, the *USP* Oil of Cloves is required to contain at least 80 p.c. of Eugenol. No method of determination is given in the *PG*.

A more accurate process is that of Thoms, which consists in converting the Eugenol into Benzoyl-eugenol by means of Benzoyl Chloride. A weighed quantity of 5 grammes of the oil is treated in a beaker having a capacity of about 150 c.c., with 20 grammes of Sodium Hydrate solution (15 p.c.) and 6 grammes of Benzoyl Chloride. The mixture is well shaken until uniformly mixed. After cooling, 50 c.c. of Water are added, and the mixture heated until the crystalline mass has again become oily, and is again allowed to cool. The clear supernatant liquid is filtered off and the crystalline mass in the beaker is again treated with two successive quantities of 50 c.c. of Water. The moist Benzoyl-eugenol is treated with 25 c.c. of Alcohol (90 p.c. by weight) and heated on a water-bath until solution is effected. The beaker is removed from the water-bath and agitated until the Benzoyl-eugenol has separated in fine crystals. The mass is then cooled to 17°C (62.6°F), the crystalline precipitate transferred to a small weighed filter paper, the filtrate collected in a graduated cylinder and washed with Alcohol (90 p.c. by weight) until it measures 25 c.c. The filter and crystals are transferred to a weighing bottle, dried at 100°C (212°F) till constant in weight and then weighed. The solubility of pure Benzoyl-eugenol in Alcohol

(90 p c by weight) has been experimentally proved to be 0.55 gramme, and the latter weight should be added to the weight of the crystals obtained. 266.11 parts of Benzoyl-eugenol represent 162.86 parts by weight of Eugenol.

The quality of Clove Oil is reduced by the abstraction of a portion of Eugenol, the addition of oil from Clove stems, and the addition of Turpentine or Petroleum. The abstraction of Eugenol is shown at once by the altered physical characteristics of the oil as well as by a determination of the amount of this constituent. Turpentine or Petroleum is revealed by a low boiling point and by the solubility of the oil in Alcohol (90 p c). Clove Oil from the stems can only be satisfactorily detected by the difference in odour, though the presence of Acetyl-eugenol in Clove Oil and not in oil from the stems has been suggested as a means of distinction.

The *U S P* includes a test for Phenol with Ferric Chloride T S, requiring that no blue or violet coloration should be produced when the oil is shaken with 20 times its volume of hot Water, cooled, the excess of oil removed by filtration through a wet filter paper and the filtrate tested with a drop of Ferric Chloride Test-solution.

Determination—A measured quantity of 10 c c of the Oil is introduced into a flask with a long neck graduated in tenths, and 100 c c of Potassium Hydroxide Test-solution added, the mixture being shaken for five minutes. After complete separation of the liquids, sufficient of the Potassium Hydroxide Solution is added to raise the lower limit of the oily layer to the zero mark of the scale, and the volume of the residual liquid is read off. This should not amount to more than 2 c c, indicating the presence of at least 80 p c of Eugenol, *U S P*.

Not Official

INFUSUM CARYOPHYLLI CONCENTRATUM—1 of Cloves in No. 10 powder, macerated for seven days in $2\frac{1}{2}$ of Alcohol (20 p c), and subsequently percolated so as to make 5 of concentrated Infusion.

This corresponds to Infusum Caryophylli Concentratum, *B P C*, and closely resembles Inf. Caryoph. Conc. given in *Ph. Form.* It is intended for dilution, 1 of this and 7 of Distilled Water.

EUGENOL—A phenol, having the formula $C_{15}H_{11}O_2$, eq. 162.86, is the principal constituent of Clove Oil. It is a colourless, pale yellow, highly refractive liquid, possessing a powerfully aromatic odour and taste. It darkens on exposure to air and light, and should be preserved in well-closed, dark amber-tinted glass bottles, and kept as far as possible from contact with the air.

Tests—Eugenol has a specific gravity of 1.072 to 1.074. Its boiling point is 251° to 253° C (483° to 487° F). It dissolves with difficulty in Water, but is readily soluble in Alcohol (90 p c), Ether, and Glacial Acetic Acid. A clear liquid, readily becoming turbid on exposure to air, is formed when 1 gramme of Eugenol is mixed with 26 c c of Water and 4 c c of Sodium Hydroxide Solution (15 p c). A flocculent precipitate, partially adherent to the sides of the vessel, is produced when 5 drops of Eugenol are shaken with 10 c c of Lime Water. An alcoholic solution of Eugenol yields with Ferric Chloride Test-solution a blue coloration, and with diluted Ferric Chloride Test-solution (1 to 10) a blue coloration changing to greenish yellow. One part by weight of Eugenol should be soluble in two parts by weight of Alcohol (68 to 69 p c). Eugenol is converted into a crystalline body by means of Benzoyl Chloride, and this property may be utilised for its determination. The method is described under Oil of Cloves. Eugenol is official in place of Clove Oil in the new editions of the *Austrian*, *Belgian*, and *Dutch Pharmacopœias*. It was made official in the 10th edition of the *German Pharmacopœia*, which includes a test for the presence of Phenol.

Eugenoforn (Sodium Eugenol Carbinol)—Colourless foliaceous crystals, readily soluble in water, slightly soluble in alcohol (90 p c), insoluble in ether. Introduced as an intestinal and stomachic antiseptic.—*P J* '99, 11 40

Dose— $7\frac{1}{2}$ to 15 grains = 0.5 to 1 gramme, twice a day

CASCARA SAGRADA.

CASCARA SAGRADA

B P Syn—*RHAMNI PURSHIANI CORTEX*, SACRED BARK

FR, CASCARA SAGRADA, GER, SAGRADARINDE, AMERIKANISCHE KREUZDORNRIINDE, ITAL, CASCARA SAGRADA, SPAN, CASCARA SAGRADA

The dried Bark of *Rhamnus Purshianus*

Obtained from California, best collected in spring and early summer. Bark which has been gathered for two years is much preferred to the recently dried bark

Medicinal Properties—Tonic laxative. Acts principally on the large intestine. Indicated in obstinate and habitual constipation, especially of old or delicate persons, and in an atonic condition of the stomach and bowels, as in anæmia. It should not be given as a purgative, but in such a constant continuous manner that a normal condition will be brought about. It is better to give two small doses, say 20 minims of the liquid extract night and morning, than one large dose. The dose should be reduced gradually.

Prescribing Notes—Usually given in the form of Extract in Pills or Pilules, or one of the fluid preparations. The Extract is best made into Pills with the addition of one tenth of its weight of Gum Acacia in powder, and massed with Alcohol (90 p c). It is also advantageously combined with Extract of Belladonna, Extract of Nux Vomica, and Euonymin. Obtainable in the form of Compressed Tablets. Capsules may be had containing a very concentrated Fluid Extract, equivalent to 15 and 30 minims of the ordinary Fluid Extract, and other strengths as desired. In Mucuses and other fluid preparations it goes well with Aromatic Spirit of Ammonia and Spirit of Chloroform.

Elixir of Cascara (Kasak) is an agreeable and reliable preparation. See below.

Official Preparations—Extractum Cascaræ Sagradæ, Extractum Cascaræ Sagradæ Liquidum, and Syrupus Cascaræ Aromaticus.

Not Official—Capsules of Cascara, Elixir of Cascara, Extractum Cascaræ Liquidum Insuperum, Mistura Cascaræ Sagradæ, Mistura Cascara Sagrada Composita, Mistura Cascara Aperiens, Mistura Laxativa, Pilulæ Cascaræ Compositæ, Pilula Cascara et Belladonnæ et Nucis Vomice, Fluidextractum Rhamni Purshiani Aromaticum, Vinum Rhamni Purshiani.

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ital, Jap, Mex, Norw, Russ, Span, Swed, Swiss and US. Not in the others.

Descriptive Notes—The bark of *Rhamnus Purshianus*, DC, as met with in commerce, varies much in appearance and quality. Genuine Cascara Sagrada is more or less externally furrowed longitudinally, and of a reddish-brown tint, with lenticels about $\frac{1}{4}$ inch long, forming slender, whitish, transverse scars in places, it has a characteristic leather-like odour. When the outer surface is scraped the reddish-brown colour of the layer beneath becomes visible, it is of a duller red tint than that of *Rhamnus Frangula*, L. The inner surface is longitudinally striate with projecting medullary

rays, and in some pieces faintly, . . . transversely, and is turned red by alkalis. The *BP* limits the thickness to about $\frac{1}{16}$ inch (1.5 mm), *USP* 1 to 5 mm, which indicates that the thin bark is to be used, probably for the reason that older and thicker bark is usually more bitter. The *USP* directs that the bark should be kept at least one year before being used, but the *BP* does not give any such direction. The recently collected bark is stated to cause vomiting, hence the importance of the mandate. The inner surface varies from pale brown to dark brown, or walnut colour if badly dried. The transverse fracture of the bark is buff coloured or pale brown, but when the bark is kept it becomes darker, that which is thus darkened, as seen in transverse section, is therefore to be preferred, as indicating that it was not recently collected. An inferior variety of thick bark known in the United States as spurious or 'winter' bark, is said to be removed in winter by steaming the branches to soften the bark, and then cutting it off with knives. Another winter form is spoke-shaved, and therefore in chips. The new crop is collected from the end of April till July, and reaches London in August. Sometimes the bark of *R. Californicus*, Esch., and its var. *tomentella*, Benth., is substituted for it, but, according to Rusby, it is only bark that is received from Texas, Arizona, Colorado and New Mexico that is likely to contain it, since the species occurs sparingly only in North California and not in Oregon and Washington, whence supplies of *R. Purshianus* have come during recent years. The chief difference is that the bark of *R. Californicus*, Esch., is of a greyer tint externally, and the lenticels are less numerous and easily become obscured, and the transverse fracture is less dark and more yellow (J. G. Steele) than that of *R. Purshianus*, and the taste is intensely bitter. Under the microscope the bark of *R. Purshianus* is seen to have parallel medullary rays, consisting commonly of two rows of cells, whilst those of *R. Californicus* are shorter, crooked, and not parallel, and are composed of three or more rows (Prescott). The bark of *R. Purshianus* is apt to stain paper yellow, due to the presence of Frangulin. The powdered bark of *R. Purshianus* may be distinguished from that of *R. Frangula* by the presence of sclerenchymatous cells, mucilage is absent. In both, the contents of the parenchymatous cells turn purplish with caustic alkali (Vogl). The bark of Jilhan's *Frangula* has no sclerenchymatous cells and contains mucilage.

Tests—Cascara Bark yields on incineration about 5 p.c. of ash, 8 p.c. should not be exceeded. A limit of 6 p.c. of ash has been suggested. Specimens of good quality bark examined in the author's laboratory showed from 5.6 to 7.8 p.c. of ash.

Preparations

EXTRACTUM CASCARÆ SAGRADÆ. EXTRACT OF CASCARA SAGRADA. *BP Syn*—EXTRACTUM RHAMNI PURSHIANI

Cascara Sagrada, in No. 20 powder, is exhausted by percolation with Distilled Water and evaporated to dryness on a water-bath.

The powdered Bark is moistened with Water and allowed to swell, before it is packed loosely in the percolator

It is an aqueous exhaustion, in *B P* 1885 it was by percolation with Proof Spirit

Dose — 2 to 8 grains = 0 13 to 0 52 gramme

Extractum Rhamni Purshiana (*U S*) is made by exhausting 100 of Cascara Bark in No 60 powder by percolation with Alcohol (12 5 p c), evaporation to dryness, and mixing with sufficient peeled Russian Liquorice Root in No 80 powder to make the product 25

Foreign Pharmacopœias — Official in Belg, Fl, Ital, Mex and U S
Not in the others

EXTRACTUM CASCARÆ SAGRADÆ LIQUIDUM LIQUID
EXTRACT OF CASCARA SAGRADA *B P Syn* — **EXTRACTUM RHAMNI PURSHIANI LIQUIDUM**

5 of Cascara Bark exhausted by percolation with Distilled Water, the percolate evaporated to 3, 1 of Alcohol (90 p c) mixed with 1 of Distilled Water is added, and the whole is made up to 5 by the addition of more Water if necessary

It is almost the same as *B P* 1885

Dose — $\frac{1}{2}$ to 1 fl drm = 1 8 to 3 6 c c

Sometimes given with Ferri et Ammonii Citras and Ammonia

Foreign Pharmacopœias — Official in Austr, Belg, Dan, Dutch, Fr, Ital, Jap, Mex, Norw, Russ, Span, Swed, Swiss and U S, all with diluted Alcohol U S is 98 p c Alcohol Dan and Swed contain Glycerin Not in the others

Tests — Liquid Extract of Cascara has a specific gravity of 1 055 to 1 070, may contain from 17 to 27 p c w/v of total solids and about 20 p c w/v of Absolute Alcohol

SYRUPUS CASCARÆ AROMATICUS. AROMATIC SYRUP OF CASCARA

Liquid Extract of Cascara Sagrada, 8, Tincture of Orange, 2, Alcohol (90 p c), 1, Cinnamon Water, 3, Syrup, 6
(1 of Liquid Extract in 2 $\frac{1}{2}$)

Dose — $\frac{1}{2}$ to 2 fl dnm = 1 8 to 7 1 c c

Not Official

CAPSULES OF CASCARA — Two strengths, containing concentrated Extract equal to 15 and 30 minims respectively of Fluid Extract

FLUIDEXTRACTUM RHAMNI PURSHIANÆ AROMATICUM (*U S*) — Cascara Sagrada, in No 40 powder, 1000, Glycyrrhiza, in No 30 powder, 100, Magnesium Oxide, 125, macerate with 2000 of Water for 12 hours, then dry it at a gentle heat Percolate this with 250 c c of Glycerin mixed with 500 c c of Alcohol (94 9 p c) and 250 c c of Water, subsequently complete the percolation with diluted Alcohol until exhausted, reserve the first 800 of the percolate and evaporate the remainder to a soft Extract, dissolve this in the reserved portion Add 10 c c of Compound Spirit of Orange, and q s of Diluted Alcohol to make 1000 of fluid Extract

EXTRACTUM CASCARÆ SAGRADÆ LIQUIDUM INSIPIDUM — Liquid Extract of Cascara Sagrada, 100, Liquor Ammoniae Fortior, 7, heat them together on a water bath for 8 hours or until the bitterness has disappeared, and

finally make up the volume to 100 with the requisite quantity of Alcohol (90 p c)
and Water.

The formula given in *BPC* employs 5 of Potassium Hydroxide in place of the Ammonia given above. The *BPC Supplement* gives a formula for a *Miscible Extract of Cascara*. It is the aqueous fluid extract of the *BP* to which Solution of Potassium Hydroxide is added before evaporation, and the Alcohol (90 pc) is replaced by Glycerin. It is stated that the miscible extract should be used in the place of the 'tasteless' liquid extract when making *BPC* preparations.

Dose—30 to 60 minims = 1.8 to 3.6 c c

Many formulas have appeared from time to time, with the object of obtaining a tasteless extract without loss of activity, using either Lime, Magnesia, Potassium Hydride, or Ammonia, we prefer Ammonia, as, apart from the fact that it makes a better preparation, the excess of Ammonia is volatilised, whereas the Potassium Hydride remains in the finished solution. The word 'tasteless' is applied to any of them is a misnomer, and some of the preparations are practically inert. The Bark has a fairly strong flavour peculiar to itself, quite apart from the bitterness.

There is a similar preparation in *Aust.*, named *Extractum Rhamni Purshiani Fluidum*, in which Magnesia is employed.

ELIXIR CASCARÆ *Syn* AROMATIC CASCARA.—Liquid Extract of Cascara Sagrada, 34 5 Liquid Extract of Liquorice, 34 5, Glycerin, 29, Soluble Gluside, 0 75, Oil of Anise, 0 05, Oil of Peppermint, 0 05, Oil of Cloves, 0 025, Oil of Dill, 0 025, Oil of Cinnamon, 0 025, Alcohol, to make 100

This corresponds with the *BPC* formula, it is also given in *Ph. Form* as the Elixir Cascarae Glycerin of the *Australian Ph. Form*

Various formulas for Aromatic Cascara are given in the Hospital Pharmacopœia under the heading *Mistura Cascaræ Composita*, in most of which Liquid Extract of Liquorice forms an important flavouring ingredient.

MISTURA CASCARÆ SAGRADÆ Cascara Mixture.—Liquid Extract of Cascara Sagrada, 1 fl dm, Liquid Extract of Liquorice, 30 minims, Aior " Ammonia, 40 minims, Chloroform Water, to $\frac{1}{2}$ fl oz.—*London*.
 " " of Cascara, 30 minims, Liquid Extract of Liquorice, 30 minims, Aromatic Spirit of Ammonia, 20 minims, Chloroform Water, to 1 fl oz.—*St Thomas's*.

This formula has been incorporated in the *BPC*

MISTURA CASCARÆ SAGRADÆ COMPOSITA
Mixture—Liquid Extract of Cascara, 1 fl. oz., Liquid
30 minims, Sulphate of Soda, 60 grains, Solution of Ammonia, 5 minims,
Water, to 1 fl. oz.—*St. Mary's*

Liquid Extract of Cascara Sagrada, 20 minims, Liquid Extract of Liquorice, 30 minims, Tincture of Belladonna, 5 minims, Tincture of Nux Vomica, 5 minims, Aromatic Spirit of Ammonia, 20 minims, Chloroform Water, *q.s.* to make 1 fl. oz. — *St. Thomas's*

This formula has been incorporated in the *BPC*

Dose — 1 to 1 fl oz = 14 2 to 28 4 c c

Magnesium Sulphate, 60 grains, Glycerin, 1 fl dm, Liquid Extract of Cascara Sagrada, 1 fl drm, Liquid Extract of Liquorice, 60 minims, Tincture of Hyoscyamus, 20 minims, Tincture of Nux Vomica, 5 minims, Compound Decoction of Aloes, to 1 fl oz—*London*

MISTURA CASCARÆ APERIENS—Magnesium Sulphate, 30 grains,
Cascara Sagrada Mixture, to $\frac{1}{2}$ fl oz—*London*

MISTURA LAXATIVA—Liquid Extract of Cascara Sagrada, 1 fl. oz.,
Liquid Extract of Senna, 1 fl. oz., Sodium Bicarbonate, 5 grains, Chloro-
form Water, to 1 fl. oz. In the 1907 edition it is made up to
1 fl. oz. with Water.

PILULA CASCARÆ COMPOSITA (Martindale) — Extract of Cascara, 1½, Extract of Nux Vomica and Alcoholic Extract of Belladonna, of each ½.

Milk Sugar, 1 In grains for one pill, or in grammes for fifteen—*B M J* 93, 11 59b

PILULA CASCARÆ ET BELLADONNÆ ET NUCIS VOMICÆ—Extract of Cascara Sagrada, $\frac{1}{4}$ grain, Extract of Nuc Vomica, $\frac{1}{10}$ grain, Alcoholic Extract of Belladonna, $\frac{1}{10}$ grain Mix and divide into one grain pills—*B P C*

Dose—1 to 3

PILULA CASCARA ET EUONYMIN See EUONYMIN

VINUM RHAMNI PURSHIANI (*Aust.*)—Malaga Wine, 150, Fluid Extract of Cascara Sagrada, 100 Syrup of Orange, 50 Digest eight days and filter Dutch, Cascara Sagrada Bark 1, Malaga Wine 10

CASCARILLA.

CASCARILLA

FR, CASCARILL, GLR, CASCARI LINDB, IIAL, CASCARIGLIA, SPAN, CHACARILLA

The dried Bark of *Croton Eluteria*, J J Bennett

It contains from $\frac{1}{2}$ to 2 p c of an aromatic Oil

Medicinal Properties—Aromatic and stomachic With some physicians it is a favourite bitter tonic Used for the same purposes as Calumba

Prescribing Notes—*The Infusion quickly changes, and will scarcely keep good for a day in summer, but with an aromatic Tincture it keeps well*

The Tincture is frequently prescribed with diluted mineral acids, which, however, usually cause a separation of resin, & fl dim of Mucilage in an 8 oz mixture will keep the resin diffused

Official Preparations—Infusum Cascariellæ and Tinctura Cascariellæ

Not Official—Mistura Cascariellæ Composita, Infusum Cascariellæ Concentratum

Foreign Pharmacopœias—Official in Aust, Dan, Dutch, Ger., Ital, Jap, Norw, Port, Russ, Swed and Swiss Not in Fr, Hung, Mex or Spain An extract is official in Ger

Descriptive Notes—Cascarilla bark varies much in size and quality as found in commerce The best qualities are in quills, or in small curved pieces The outer dull brown or dark grey cork has longitudinal and transverse small cracks and a silver grey surface with minute black dots, a short resinous fracture, and a dark reddish-brown bast, showing thin whitish medullary rays but no sclerenchymatous cells It is bitter and agreeably aromatic The *BP* directions are not quite sufficient to characterise the true bark, since the 'silvery grey patches spotted with minute black dots' occur also in a false bark (referred to *Croton lucidus*, Linn), which causes vomiting and other deleterious effects, and Hartwich has recently shown that of eight Croton barks substituted for Cascarilla since 1901 all agree with it in having 'no groups of sclerenchymatous cells' although differing from Cascarilla bark in other characters (*P J* (4) xxiii p 485) A very slender bark, obtained by speckling the twigs, often occurs in commerce, this is available for pastilles and incense, but is excluded from use in pharmacy by the *BP* description of 'quills from 1 to 3 inches ($2\frac{1}{2}$ to $3\frac{1}{2}$ cm)

or more in length, and from about $\frac{1}{8}$ to $\frac{1}{2}$ inch (4 to 12 mm) in diameter. The general bark is characterised by its aromatic odour and taste, and the greyish-brown layer beneath the whitish coat, where the latter is exfoliated. Under the microscope the powdered bark is distinguished by the characteristic cells containing dark brown secretion, the cork cells thickened chiefly on one side, the absence of stone cells and the presence of starch (Koch). The properties of the bark are due to a bitter principle, resin, and 1.3 p.c. of volatile oil. The ash varies from 6 to 10 p.c. (YBP 1906, p. 209). During recent years it has been deficient in the amount of bitter principle (Naylor, YBP 1906, p. 209). The bark of *Croton lucidus*, which closely resembles that of Cascarilla in appearance, differs in absence of aroma, reddish-brown tint externally, and in the presence of sclerenchymatous cells. Other substitutes differ from true Cascarilla in odour, as well as in the presence of sclerenchymatous cells in the cortex (PJ (4) xv p. 7).

Tests.—Cascarilla leaves about 8 p.c. of ash on incineration, and rarely more than 10 p.c. The average ash of eight samples examined in the author's laboratory showed 8.7 p.c.

Preparations.

INFUSUM CASCARILLÆ. INFUSION OF CASCARILLA

Cascarilla, in No. 10 powder, 1, boiling Distilled Water, 20, infuse for 15 minutes, strain (1 in 20)

Half the strength of BP '85

Dose.— $\frac{1}{2}$ to 1 fl. oz. = 14.2 to 28.4 grammes

Incompatibles.—Lime Water and metallic salts

Not in the other Pharmacopœias

TINCTURA CASCARILLÆ. TINCTURE OF CASCARILLA

1 of Cascarilla, in No. 40 powder, percolated with Alcohol (70 p.c.), to yield 5 (1 in 5)

Dose.— $\frac{1}{2}$ to 1 fl. drm. = 1.8 to 3.6 c.c.

Foreign Pharmacopœias.—Aust., Dan., Ital., Jap., Norw., Russ., Swed. and Swiss, 1 in 5. Not in the others.

Tests.—Tincture of Cascarilla has a specific gravity of 0.895 to 0.905, contains from 2 to 3 p.c. w/v of total solids and about 67 p.c. w/v of Absolute Alcohol.

Not Official

MISTURA CASCARILLÆ COMPOSITA.—Tincture of Squill, 10 minims, Compound Tincture of Camphor, 20 minims, Infusion of Cascarilla, to 1 fl. oz.—*Royal Free*

Ammonium Carbonate, 5 grains, Tincture of Squill, 12 minims, Aromatic Syrup, 60 minims, Infusion of Cascarilla, to 1 fl. oz.—*Brompton*

Compound Tincture of Camphor, 15 minims, Vinegar of Squill, 15 minims; Infusion of Cascarilla, to 1 fl. oz.—*St. Thomas's*

This formula has been incorporated in the B.P.C.

INFUSUM CASCARILLÆ CONCENTRATUM.—Cascarilla Bark, in No. 40 powder, 40 parts; Tincture of Cascarilla, 7.5 parts, Alcohol (90 p.c.), 20

parts, Dilute Chloroform Water, 1 in 1000, sufficient to make 100 parts. Prepare by macero expression—*Farr and Wright, P J '06, 1 165 and '07, 1 621, C D '06, 1 252, Y B P 1907, 249*

This formula appears in the *B P C*

Not Official CASSIÆ OLEUM

OIL OF CASSIA

A yellowish or brownish liquid, becoming darker and thicker by age and exposure to the air, having the characteristic odour of Cassia, and a sweetish, spicy, and burning taste. It is a volatile Oil distilled from *Cinnamomum Cassia*.

It should be kept in well stoppered amber tinted glass bottles, in a cool place, and away from the light.

The principal constituent of Cassia Oil is Cinnamic Aldehyde, of which it should contain at least 75 p c. Cinnamyl Acetate and traces of Cinnamic Acid are also present. A stearoptene, Ortho methyl-coumaric aldehyde, has been shown to be a constituent of the oil.

Soluble in an equal volume of Alcohol, the solution being slightly acid to Litmus paper, also soluble in an equal volume of Glacial Acetic Acid.

This Oil is official in the German and U S Pharmacopœias under the name 'Oleum Cinnamomi'.

Medicinal Properties—It possesses the aromatic, carminative and anti septic properties of Cinnamon bark, but the oil is a powerful local stimulant.

Dose— $\frac{1}{2}$ to 3 minims = 0.08 to 0.18 c c

Foreign Pharmacopœias—Official in Belg, Ger, Jap, Norw, Swiss and U S

Tests—Cassia Oil has a specific gravity of 1.053 to 1.065. It should be optically almost inactive, and should never vary more than one degree to the right or left in a tube of 100 mm. It should be soluble in 3 to 4 parts of Alcohol (70 p c), and in all proportions in Alcohol (90 p c).

When shaken with an equal volume of Nitric Acid at 0° C (32° F), a crystalline mass should result. With Ferric Chloride Solution the alcoholic solution of the oil should give a brown coloration. The oil forms a crystalline compound with Sodium Bisulphite Solution (30 p c), and this reaction is utilized as a means of determining the percentage of Cinnamic Aldehyde. A measured quantity of 10 c c of the oil is shaken in a flask with a long thin neck graduated to one-tenth c c, with 10 c c of a 30 p c Sodium Bisulphite Solution, and warmed in a water bath until the contents are liquefied. When this has occurred more Sodium Bisulphite Solution is added, the mixture being constantly heated and occasionally shaken until the flask is quite three-fourths filled. The heating in the water-bath is continued until no solid particles are visible, and the odour of Cinnamic Aldehyde has disappeared. When this is effected the contents of the flask are allowed to cool, and sufficient of the 30 p c Sodium Bisulphite Solution added to bring the lower level of the oily layer to the zero mark on the graduated neck of the flask, and the number of c c is read off. The *U S P* requires that the residual liquid should not measure more than 2.5 c c, indicating at least 75 p c by volume of Cinnamic Aldehyde. The *P G* process is to take a measured quantity of 5 c c of the oil, and after mixing it with 45 c c of a 30 p c Sodium Bisulphite Solution, to heat it in a water bath for two hours with intervals of frequent shaking. Not more than 1.5 c c of oil shall remain undissolved, indicating at least 70 p c by volume of Cinnamic Aldehyde.

The more generally occurring sophistications are Colophony Resin and Petroleum, Lead and Copper. For the detection of Colophony Resin and Petroleum, the *U S P* mixes 1 c c of the oil with 8 c c of a mixture of 3 volumes of Alcohol (94.9 p c) and 1 volume of Water, when a clear solution should result, and if to this solution 2 c c of a saturated Lead Acetate Solution in a mixture of 3 volumes of Alcohol (94.9 p c) and 1 volume of Water be added,

no precipitate should be produced. The *PG* includes a somewhat similar test, dissolving the oil in 3 to 4 parts of Alcohol (90 p c), and treating the solution with half its volume of freshly-prepared Lead Acetate Solution. An additional test for Resin is given in the latter Pharmacopœia, 100 parts of the oil, heated on a water-bath until all volatile constituents have been dissipated, should not yield more than 8 parts of residue. The value of this test may be much enhanced by performing it in a tared fractionating flask, and recording the temperature at which the distillate passes over. A quantity of 50 grammes of the oil should be weighed into the flask, and the oil distilled over a direct flame. After the Water has passed over, the thermometer rapidly rises to 240°C (464°F), and the major portion of the oil passes over between 240°C (464°F) and 260°C (500°F). The appearance of white fumes indicates the end of the distillation, the residue should be viscid and tough, and not hard and brittle. The presence of Petroleum is detected by the solubility of the distillate in Alcohol (70 p c). The presence of Lead and Copper is due to the solvent action of the Cinnamic Acid produced by the Aldehyde oxidation on the metal of the containing vessels, and is readily detected by Hydrogen Sulphide. Lead is chiefly present in unrefined oils. The *PG* includes a colour test with Ferric Chloride Solution for Phenol, requiring that the colour produced on the addition of the Ferric Chloride Solution shall be brown, and not a green or blue.

CINNAMIC ALDEHYDE ($\text{C}_9\text{H}_8\text{O}$, eq 131.07) — This Aldehyde is the principal constituent of oils of Cassia and Cinnamon. It may also be prepared artificially by the action of Sodium Hydroxide upon a mixture of Benzaldehyde and Acetic Aldehyde.

A clear, colourless, or pale yellow, highly refractive liquid possessing a characteristic aromatic odour and a sweetish spicy and subsequently burning taste. It should contain not less than 95 p c of pure Cinnamic Aldehyde.

Its use in medicine is similar to that of Oil of Cassia.

Dose — $\frac{1}{2}$ to 2 minims = 0.03 to 0.12 c c.

Foreign Pharmacopœias — Official in Austria, Sweden and U.S.

Tests — Cinnamic Aldehyde has a specific gravity of 1.054 to 1.056, and boils about 247°C (476.6°F). It is optically inactive. It should conform to the tests given under Cassia Oil. It forms a crystalline compound with Sodium Bisulphite, and when mixed with an excess of a 30 p c solution of the salt should dissolve completely leaving practically no oily residue.

It should be free from the sophistications mentioned under Oils of Cassia and Cinnamon.

The *USP* method of determination is to introduce 12 drops of the Aldehyde into a carefully counterpoised 150 c c flask and carefully ascertain the exact weight. 5 c c of Distilled Water and a few drops of Rosolic Acid Solution are added and the solution exactly neutralised by the addition of Tenth-normal Volumetric Sodium Hydroxide Solution. A measured quantity of 50 c c of a 20 p c Sodium Bisulphite solution is then added, and the flask is immersed in a water-bath of boiling Water. Sufficient Semi-normal Volumetric Hydrochloric Acid Solution is added to maintain the neutrality of the liquid and a drop or two of Rosolic Acid Solution, the flask being kept continuously heated and frequently agitated. The number of c c of Semi-normal Hydrochloric Acid Solution used is noted when a permanent state of neutrality is reached. A blank test with the same materials without the Cinnamic Aldehyde is used as a control, and the number of c c of Semi-normal Volumetric Hydrochloric Acid used in the blank is subtracted from the number of c c used in the original. Each c c of the difference corresponds to 0.083 gramme Cinnamic Aldehyde.

Not Official

CASSIA BEAREANA

A small tree, attaining the height of 20 or 30 feet growing in equatorial East Africa. A decoction of the roots has been recommended in the treatment of

blackwater fever and in hæmaturia. The decoction is prepared by the natives by boiling about a dozen pieces of the root, about 1 inch long, in a gallon of Water, and it is administered in teacupful doses. The powdered bark is applied as a dressing to ulcers.—*L* '02, i 283, '03, i 190, *P J* '01, ii 616, '02, i 42 *C D* '03, i 872

A fluid extract (1 in 1) is also made, dose 30 to 60 minims = 1.8 to 3.6 c c

CASSIÆ PULPA.

CASSIA PULP

FR, PULPE DE CASSI, GER, ROHRENKASSIE, ITAL, CASSIA, SPAN,
CANAFISTULA

The Pulp from the Fruits of *Cassia Fistula*

Imported from the East or West Indies

Medicinal Properties—Laxative. Useful in small doses for habitual constipation. Large doses occasion nausea, flatulence, and griping, generally given in combination, as in Confection of Senna.

Dose—60 to 120 grains = 4 to 8 grammes, as a laxative, 1 to 2 oz = 28.4 to 56.8 grammes, as a purgative.

Official Preparation—Contained in Confectio Sennæ, 1 part in 8 nearly.

Foreign Pharmacopœias—Austri, Fruit and Pulp, Belg, Fruit, Ital, Mex, Port and U S, Fruit. Not in the others.

Descriptive Notes—The fruit of the *Cassia Fistula*, L, is a cylindrical, indehiscent pod, separated by thin internal transverse partitions into numerous cells each of which contain a single seed, immersed in a blackish pulp. The pods are chiefly imported from Dominica in the West Indies, but those from the East Indies, which are smaller, smoother, and have a blacker pulp are usually preferred, the pulp of this kind being considered more active. Some of the East Indian pods come from Sourabaya in Java, *vid* Amsterdam. Pods in which the seeds rattle when shaken are considered old and inferior. The pulp usually forms about 30 p c of the weight of the pods. The official description, *viz*, '1½ to 2 ft long (35 to 50 cm) and from ¼ to 1 in (18 to 25 mm) in diameter, the sutures being marked by two smooth longitudinal bands,' excludes the fruits of *Cassia grandis*, L, which has larger compressed pods, of which the ventral suture is marked by two prominent marginal ridges, and the surface of the pods has prominent veins. It also excludes the smaller fruits of *Cassia moschata*, H B and K, which have a brown pulp. The term viscid applied to the pulp implies that old pods with hard dry pulp should not be used. The extracted pulp will not keep in the viscid condition, soon becoming mouldy, especially in a damp place, and is therefore sometimes met with in commerce in the form of tough extract not easily miscible with the other ingredients of Confectio Sennæ unless first rubbed down with Water. It should therefore be prepared fresh for this purpose. Cassia pulp is said to be one of the ingredients used in Turkey for adulterating Opium.

Not Official

CASTOREUM

FR, CASTOREUM, GER, BIBERGEIL, ITAL, CASTOREO, SPAN, CASTORLO

The dried preputial follicles and then secretion, obtained from the Beaver, *Castor Fiber*, L, the oil sacs being rejected

Medicinal Properties—Moderately stimulant and antispasmodic, occasionally used in hysteria and spasmodic disorders

Dose—Of the powder 5 to 10 grains = 0.32 to 0.65 gramme

Prescribing Notes—*The Tincture when mixed with Water will yield a deposit after a time, it should therefore be prescribed with Mucilage of Gum Acacia, 8 fl drms in 8-oz mixture*

Foreign Pharmacopœias—Official in all except Belg, Dan, Dutch, Ger, Jap, Swed and U.S. Both the Canadian and Russian varieties are official in Russ. Austri not more than 40 p.c. insoluble in hot Alcohol, and not more than 4 p.c. of ash

Descriptive Notes—The Castoreum of commerce is chiefly imported from the Hudson's Bay Territory. It consists of two pyriform sacs about 2 in (5 cm.) long, usually compressed and wrinkled, and one of the sacs is rather longer than the other. The contents of the sac are of a reddish-brown colour, resinous, and softening readily when warmed. Castoreum has a characteristic odour. It is liable to deteriorate unless kept quite dry.

TINCTURA CASTOREI—Castor, in coarse powder, 1, Alcohol (90 p.c.), 20, macerate seven days, agitating occasionally, strain, press, and add Alcohol *q.s.* to yield 20 (1 in 20)

Dose— $\frac{1}{2}$ to 1 fl. drim = 1.8 to 3.6 c.c.

Foreign Pharmacopœias—Official in Austri, Hung, Norw and Port, 1 in 5, Fr, Ital, Russ and Swiss, 1 in 10, Mex, 1 and 10, Span, 1 in 25, all by weight. Not in Belg, Dan, Dutch, Ger, Jap, Swed or U.S.

Russ contains a Tincture made with Russian Castor, and also one made with Canadian Castor

CATECHU.

CATECHU

B.P. Syn—CATECHU PALLIDUM

FR, CACHOU, GER, KATECHU, ITAL, CATECU, SPAN, CATECÚ

An extract of Leaves and young Shoots of *Uncaria Gambier*, Roxb.

It contains from 80 to 40 p.c. of Catechu-Tannic Acid, from 10 to 40 of Catechin, some mucilage and mineral matter

Prepared in Singapore and in other places in the Eastern Archipelago

Terra Japonica is a trade term (now almost obsolete) applied both to Cutch and Gambier

Solubility.—Almost entirely soluble in boiling Water. 70 to 75 p.c. is soluble in Alcohol (90 p.c.) 50 to 60 p.c. is soluble in cold Water, and the solution is bright

Medicinal Properties.—A powerful astringent. Used in diarrhœa, dysentery, gastric and intestinal hæmorrhage and for other purposes for which Tannic Acid is used. Lozenges are the best medium for administering it in relaxed conditions of the throat and in ulcers of the mouth

Dose.—5 to 15 grains = 0.32 to 1 gramme

Incompatibles—The Alkalis, metallic salts, and Gelatin.

Official Preparations—*Pulvis Catechu Compositus*, *Tinctura Catechu*, and *Tiochiscus Catechu*

Not Official—*Mistura Catechu et Cretæ*, *Mistura Hæmatoxyli cum Catechu*

Foreign Pharmacopœias—Official in Dutch, Ger., Jap. and Port (Cato)
Not in the others See below, *CATECHU NIGRUM*

Descriptive Notes—Under the commercial name of Gambier, or more rarely *Terra Japonica*, several qualities of the drug may be met with. The inferior kinds are largely used for tanning, dyeing and calico printing. The form official in the *B.P.* consists of cubes about 1 in (25 mm) in diameter, reddish brown externally, and pale cinnamon-brown and porous and friable internally. Smaller cubes are also met with in commerce and occasionally parallelograms and discs, or lozenges with fluted margins, but the last two are usually paler in colour and contain Starch. They are used in India for chewing with the Betel pepper leaf, but are not admissible for pharmaceutical use, since official *Catechu* should not afford any characteristic reaction with the tests for Starch.

Tests—*Catechu* is required officially to be almost completely soluble in boiling Water, and to be soluble to the extent of 70 p.c. in Alcohol (90 p.c.)

It should not yield a pronounced blue coloration on the addition of Iodine Solution to its boiled and cooled aqueous solution, and it is officially required to yield not more than 5 p.c. of Ash when incinerated. A sample examined in the author's laboratory left 4.0 p.c. of ash. The presence of Black *Catechu* may be detected by the marked green fluorescence produced in the Petroleum Ether solution, when 3 grammes of *Catechu* are mixed with 25 c.c. of Normal Volumetric Sodium Hydroxide Solution and shaken with 50 c.c. of Petroleum Ether.

The extract official in the *U.S.P.* is prepared from *Ououparia Gambu*, Baillon, that of the *P.G.* from either *Ououparia Gambu* or *Acacia Catechu*, Willd. The *P.G.* states the highly-diluted alcoholic solution gives a green coloration with Ferric Chloride T.S. The residue insoluble in Water, after washing with hot Water, should when dried at 100° C (212° F) not amount to more than 15 p.c. The *P.G.* ash limit is 6 p.c., that of the *U.S.P.* not more than 5 p.c.

Preparations

PULVIS CATECHU COMPOSITUS COMPOUND POWDER OF
CATECHU

Catechu, 4, Kino, 2, *Klameia* Root, 2, Cinnamon Bark, 1,
Nutmeg, 1 (1 in 2½)

Keep it in a stoppered bottle

Dose—10 to 40 grains = 0.65 to 2.6 grammes

Not in the other Pharmacopœias, a powdered Black *Catechu* is official in Spain

TINCTURA CATECHU TINCTURE OF *CATECHU*

Catechu, in coarse powder, 4, Cinnamon Bark, bruised, 1,
Alcohol (60 p.c.), 20, prepare by the maceration process

Now 1 in 5 instead of 1 in 8

Dose — $\frac{1}{2}$ to 1 fl drim = 1.8 to 3.6 cc

Foreign Pharmacopœias —Official in US (Tinct Gambii Co), 1 in 20, Belg, Fl (Teinture de Cachou), Dutch, Ger, Ital, Jap, Port and Swiss, 1 in 5, Mex, 1 and 5, all by weight (except US), and with the exception of the Dutch, with **Black Catechu**. Not in the others.

Tests —Tincture of Catechu has a specific gravity of 0.978 to 0.983, should contain 15.5 to 18 p.c. w/v of total solids and about 52 p.c. of Absolute Alcohol. It yields a dirty green coloration with TS of Ferric Chloride.

TROCHISCUS CATECHU. CATECHU LOZENGE

1 grain of Catechu in each, with Simple Basis

Dose —1 to 6 lozenges

Foreign Pharmacopœias —Official in US, 1 grain Gambii in each, Fr and Dutch, about $1\frac{1}{2}$ grains in each. Not in the others.

Not Official

MISTURA CATECHU ET CRETÆ —Tincture of Catechu, 20 minims, Chalk Mixture, to 1 fl oz —*University*
Tincture of Catechu, 4, Chalk Mixture, q.s. to produce 100 —*B.P.C. Supplement*

MISTURA HÆMATOXYLI CUM CATECHU —Tincture of Catechu, 40 minims, Diluted Sulphuric Acid, 15 minims, Decoction of Logwood, to 1 fl oz —*St. Thomas's*

This formula has been incorporated in the *B.P.C.*, using Aromatic Sulphuric Acid.

Not Official

CATECHU NIGRUM

BLACK CATECHU

A dried extract from the wood of *Acacia Catechu*, Willd. It is also known as **Pegu Catechu** and **Cutch**. It generally occurs in irregularly shaped blackish-brown masses, astringent, and bitter in taste. The *Ind* and *Col Add* put the limit of ash at 6 p.c.

Solubility —About 80 to 90 p.c. is dissolved by cold Water, the solution being very turbid. The *Ind* and *Col Add* requires not less than 80 p.c. to be soluble in Alcohol (90 p.c.)

Dose —5 to 15 grains = 0.32 to 1 gramme

Official in the *Ind* and *Col Add* for India, Eastern Colonies and North American Colonies, within which it may be used in making the *B.P.* preparations for which Catechu is ordered.

Foreign Pharmacopœias —Official in Austri, Belg, Fl (Cachou de Pégu), Ger, Ital, Jap, Mex, Port (Cato), Russ, Span and Swiss, US **Ourouparia Gambir**. Not in the others.

Tests —The aqueous solution is acid in reaction towards blue Litmus paper, and yields a green coloration with Ferric Chloride Test-solution, the colour changing to purple on the addition of Sodium Hydroxide Solution. About 80 to 90 p.c. should be dissolved by cold Water, and in boiling Water it should be almost completely soluble. The matter insoluble in Alcohol (90 p.c.) should not amount to more than 20 p.c. The *P.G.* states that the residue insoluble in Water, after washing with hot Water, shall when dried at 100° C (212° F) not amount to more than 15 p.c. The ash should not amount to more than 6 p.c. Two samples examined in the author's laboratory left 4.2 p.c. and 5.0 p.c. of ash.

Not Official CAULOPHYLLUM

BLUE COHOSH

The Rhizome and Roots of *Caulophyllum thalictroides*, Mich

Descriptive Notes —The rhizome is of a greyish brown colour, knotty, $\frac{3}{4}$ to 4 inches (7.5 to 10 cm) long and $\frac{1}{4}$ to $\frac{1}{2}$ inch (6 to 8 mm) in diameter, with few branches, and broad concave stem scars at short intervals, the internodes being marked with transverse rings about $\frac{1}{16}$ to $\frac{1}{8}$ inch (1.5 to 3 mm) apart, and is furnished with matted undulated rootlets, about 4 inches (10 cm) long and 1 mm broad. The transverse section is whitish and often porous. The bark is thin, the woody wedges short, the medullary rays broad, and the pith large. The rootlets have a relatively thicker bark, and a tough woody centre. It contains starch. It is almost free from odour, and has a sweetish bitter and somewhat acid taste. The distinctive microscopic characters are the small, spherical, simple starch granules, the large and small porous vessels and the tracheids.

Caulophyllum contains a body analogous to Saponin, and termed for distinction Leontin, and a colourless, odourless, and tasteless, non-crystalline alkaloid, Caulophylline, which is soluble in Water, Alcohol (90 p c), Ether and Chloroform, and which on treatment with Hydrochloric Acid is converted into a crystalline salt, **Caulophylline Hydrochloride**.

Caulophyllin, an eclectic remedy in the form of a brown powder, has been recommended as an emmenagogue, sedative and diuretic. Also employed with success as an anthelmintic. Given in the form of a 1 in 20 decoction or infusion, or as a 1 in 5 tincture. Best given in form of a pill.

Dose —1 to 4 grains = 0.06 to 0.26 gramme. Of the decoction or infusion, 1 to 2 fl oz = 28.4 to 56.8 c c. Of the tincture, 1 to 2 fl drms = 3.6 to 7.2 c c.

A **fluid extract** (1 in 1) and a **compound fluid extract** are also given in doses of 30 to 60 minims.

FLUIDEXTRACTUM CAULOPHYLLI —1000 grammes of Caulophyllum, in No. 60 powder, exhausted by percolation with Alcohol (70 p c) to produce 1000 c c of fluid extract.

This was incorporated in the *B P C* employing Alcohol (60 p c), but was changed in the *B P C Supplement* to Alcohol (70 p c).

LIQUOR CAULOPHYLLI ET PULSATILLÆ (*Ph Form*) —Caulophyllum root (Blue Cohosh), 10 oz, Pulsatilla, 10 oz, Rectified Spirit, a sufficiency, Water, a sufficiency. Macerate the coarsely ground drugs in 60 oz of Rectified Spirit for forty-eight hours and transfer to a percolator. Reserve the first 12 oz of percolate and continue percolation with 60 oz of Water. Recover the spirit from this percolate and evaporate to 8 oz. Mix this with the reserved portion, acidify with dilute Sulphuric Acid 80 minims ($\frac{1}{8}$ fl oz), set aside for a day, and filter.

This formula has been incorporated in the *B P C*, but the formula has been altered in the *B P C Supplement* to Liquid Extract of Caulophyllum, 25, Liquid Extract of Pulsatilla, 5, Glycerin, 15, Alcohol (60 p c), *qs* to make 100.

A formula is also inserted in the *Supplement* for Liquor Caulophylli et Pulsatillæ Compositus.

CERA FLAVA

YELLOW BEESWAX

FR, CIRE JAUNE, GER, GELBES WACHS, ITAL, CERA GIALLA, SPAN, CERA AMARILLA

A hard, yellow, or yellowish-brown, waxy solid, formed by the Hive-Bee, *Apis mellifica*, L.

When quite fresh, is of a golden yellow, but on keeping gets darker.

Solubility.—Entirely in Oil of Turpentine insoluble in Alcohol (90 p c), slightly, and not uniformly, soluble in (cold) Ether, about 1 in 100 of boiling Alcohol (90 p c), 1 in 10 of boiling Ether

Medicinal Properties.—Chiefly used in medicine as an ingredient of plasters and ointments, and is preferable to white Beeswax as the ointments made with the yellow keep a longer time without becoming rancid

Official Preparation—Cera Alba. Used in the preparation of Emplastrum Calafaciens, Emplastrum Cantharidis, Unguentum Menthol, Emplastrum Picis, Unguentum Hydragyri Compositum, Unguentum Picis Liquidæ, Unguentum Resinæ and Unguentum Staphisagriæ

Not Official—Aseptic Wax

Foreign Pharmacopœias—Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex (Cera Amarilla), Norw., Port (Cera Amarilla), Russ., Span., Swed., Swiss and U S

Descriptive Notes—Yellow Beeswax is imported from many parts of the world, and as it is not in all cases produced by *Apis mellifica*, but by other species in Africa and India, it might become a local question whether any Beeswax except that of *Apis mellifica* is intended by the Pharmacopœial description. This difficulty might have been avoided by the addition of the words 'of other species'. The wax imported from East Africa often shows a minutely crystalline surface which appears to be characteristic of it

The value of Beeswax depends on its purity. Owing to the use of artificial foundations for the honeycomb, a certain percentage of paraffin wax, Paraffin is often found in Beeswax as an impurity. Some Beeswax is very impure and dark in colour, due to imperfect straining, and it is also sometimes deficient in odour

Tests.—The distinguishing tests for Beeswax are that it has a specific gravity of about 0.960, the *BP* gives 0.960 to 0.970, the *USP* 0.951 to 0.960 at 25°C (77°F), the *PG* 0.962 to 0.966, the method adopted by the latter Pharmacopœia for ascertaining the specific gravity being given in the small type below, a melting point of 61° to 64°C (141.8° to 147.2°F), the *USP* gives 62° to 64°C (143.6° to 147.2°F), the *PG* 63° to 64°C (145.4° to 147.2°F), the method adopted by the *BP* for the determination of the melting point being given in the small type below under that heading, and a solidifying point of 58° to 61°C (136.4° to 141.8°F). It is officially required to possess an Acid value of not less than 17.8, an Ester value of from 69.08 to 75.76, and a Saponification value of from 86.88 to 93.56. The *USP* gives no Acid or Ester value, but requires a Saponification value of from 90 to 96. The *PG* gives an Acid value of from 18.5 to 24.15, an Ester value of from 73.0 to 75.8, and a Saponification value of from 94.3 to 97.15. The inclusion of an Iodine absorption figure would have been an advantage, genuine Beeswax absorbing from 8 to 9 p c of Iodine. The methods adopted by the various Pharmacopœias for the determination of the Acid, Ester, and Saponification values are given below in small type. Samples of laboratory showed

Acid values ranging from 20.0 to 22, with an average of 21.2, Ester values from 68 to 77, with an average of 72.6, Saponification values of 88 to 99, with an average of 91.3, and a fairly constant Iodine value of 8.9 p.c.

The more generally occurring adulterants are Paraffin or Ceresin Wax, Fatty Acids and Tallow, Japan Wax and Resin, Soap, Starch, and insoluble matter. The solubility of the Wax in Water detects the presence of Soap, and the solubility in boiling Sodium Hydroxide Solution detects acids, *e.g.*, Stearic Acid, Tallow, Japan Wax, and Resin. The resulting solutions should neither be turbid nor when acidified with Hydrochloric Acid should they yield precipitates. Paraffin and Ceresin Wax are detected by heating the Wax with 5 times its weight of Sulphuric Acid for 15 minutes and diluting the mixture with Water. The *BP* says that no solid, wax-like body should separate, the *USP* says no notable amount of solid substance 'which cannot be decomposed by Sulphuric Acid on further treatment' should separate. The solubility of the Wax in Oil of Turpentine detects the presence of Starch and mineral matter. The washed residue when treated with boiling Water, cooled, and tested with Iodine solution shall yield no characteristic blue coloration. Stearic Acid and Resin increase the Acid value and decrease the Ester value, Paraffin and Ceresin Wax decrease both the Acid and Ester value, Carnauba Wax decreases the Acid value but has no effect upon the Ester value, Japan Wax has no influence upon the Acid value but increases the Ester value, whilst Tallow and vegetable Wax increase the Ester value. Stearic Acid, Paraffin and Ceresin Wax lower the Iodine absorption, whilst Resin and Tallow increase it.

Specific Gravity—The *PG* gives the following directions for taking the specific gravity. Let 2 parts of Alcohol be mixed with 7 parts of Water and the mixture allowed to stand at 15° C (59° F), until all air bubbles have disappeared from it, then let a small ball of yellow wax be introduced into it. This wax should float on the liquid or at least be suspended when the specific gravity of the diluted Alcohol has been brought to from 0.962 to 0.966 by the addition of Water. The ball of Beeswax requisite for this should be prepared as follows. Let the wax be melted at as low a temperature as possible and allowed to fall drop by drop into a beaker containing Alcohol. Before the fully-rounded mass so obtained is used for the determination of the specific gravity it should remain in the air for twenty-four hours, *PG*.

Melting Point—The *BP* method is to draw up into a capillary tube of 1 mm internal diameter some of the melted wax, and allow it to cool for three hours before taking the melting point. The tube is fitted to the bulb of a thermometer and both are immersed in Water contained in a glass vessel, which must be heated gradually until the wax liquefies.

Sodium Hydroxide—The *USP* gives the following test. If 1 gramme of yellow wax be boiled for half an hour with 35 c.c. of an aqueous solution of Sodium Hydroxide (1 in 7), the volume being preserved by the occasional addition of Water, the wax should separate on cooling without rendering the liquid opaque, and no precipitate should be produced in the liquid after filtration through glass wool or asbestos on the addition of Hydrochloric Acid (absence of fats, fatty acids, Japan Wax, and Resin). This test is also given in the *BP*, but no quantities are stated. In the *PG* test 1 gramme of Yellow Wax is boiled with 10 c.c. of Water and 3 grammes of Sodium Carbonate. The Wax should separate out over the saline solution on cooling, and the solution should be rendered not more than opalescent.

Hydrochloric Acid—Hydrochloric Acid should not produce a precipitate in Water which has been boiled with a portion of Yellow Wax, *U S P* and *B P*, but the latter does not specify boiling Water

Litmus—If 1 gramme of Yellow Wax be boiled for a few minutes with 20 c c of Alcohol and filtered after an hour, the cooled almost colourless liquid should neither redden blue Litmus paper nor after adding Water to it should it become strongly turbid, *P G*

Acid Value—5 grammes of Beeswax require for neutralisation of the acids not less than 16 c c of Normal Volumetric Alcoholic Solution of Potassium Hydroxide, using Phenolphthalein Solution as an indicator, *B P*, the *P G* direct the use of 5 grammes of the Beeswax, 50 c c of Alcohol, and after the addition of 20 drops of Phenolphthalein Solution, titration with Semi-normal Volumetric Alcoholic Potassium Hydroxide Solution, of which from 3.3 to 4.3 c c should be necessary for neutralisation

Ester Value—To the residual mixture left after the *B P* determination of the Acid value, a measured quantity of 20 c c of Normal Volumetric Alcoholic Potassium Hydroxide Solution is added, and the mixture saponified under a reflux condenser for one hour, the excess being titrated with Normal Volumetric Sulphuric Acid Solution, for which from 13.2 to 13.8 c c should be necessary, indicating that not less than 6.2 nor more than 6.8 c c has been absorbed by the Beeswax. In the *P G* test, after the further addition of 20 c c of Semi-normal Potassium Hydroxide Solution to the residue from the Acid value determination the mixture is warmed for half an hour on a water-bath, and the excess alkali is then titrated with Semi-normal Volumetric Solution of Hydrochloric Acid, when from 6.5 to 7 c c of the acid should be necessary for the neutralisation of the uncombined alkali

Sulphuric Acid.—If 5 grammes of Beeswax are heated with 25 c c of Sulphuric Acid for 15 minutes to 160° C (320° F), and the mixture diluted with Water, no solid wax-like body should separate, *U S P*, *B P* uses 25 grammes

Saponification Value—Yellow Wax saponified by Alcoholic Potassium Hydroxide T S should show a Saponification value of 90 to 96, these figures representing the number of milligrammes of Potassium Hydroxide required to saponify one gramme of Wax, *U S P*

Not Official

ASEPTIC WAX—Beeswax, 87, Almond Oil, 12, Salicylic Acid, 1. Melt the Beeswax and Oil, strain through muslin, add the Salicylic Acid, heat to 150° C (300° F) in an oil bath, allow to cool slightly, pour into stoppered bottles, which have been sterilised, and when cold add to each bottle sufficient aqueous solution of Mercuric Chloride (1 in 500) to cover the Beeswax

This Wax is made by us for Sir Victor Horsley, who uses it for arresting hæmorrhage from cranial bones, by smearing it over the bleeding surface. Put up in wide-mouthed stoppered bottles under aseptic conditions

This formula has been incorporated in the *B P C*

CERA ALBA.

WHITE BEESWAX

FR, CIRE BLANCHE, GER, WEISSES WACHS, ITAL, CERA BIANCA, SPAN, CERA BLANCA

A white, or almost white, waxy, somewhat translucent solid, or in thin circular white cakes, obtained by melting yellow Beeswax

Official Preparations.—Contained in *Pilula Phosphori*, *Suppositoria Acidi Carbolic*, *Unguentum Aquæ Rosæ*, and *Unguentum Cereæ*

Not Official.—*Ceratum*, *Unguentum Simplex*.

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Norw, Port (Cera Branca), Mex, Russ, Span, Swed, Swiss and U S

Descriptive Notes—The White Beeswax of the *B P* should consist of English, or at least of European Beeswax, since it is Yellow Beeswax made by the *Apis mellifica*, Linn, which has been bleached by exposure to moisture, air and light. The Beeswax sold in commerce in blocks under the name of Dentists' Wax is the purest obtainable, but usually has a faint yellowish tinge. That in flat circular cakes commonly contains 1 to 2 p c of Paraffin Wax, which is probably due to the fact that foundations made with Paraffin are laid down in hives for the bees to build upon.

Tests—Officially it is required to correspond to the tests for Yellow Beeswax, but during the process of bleaching by chemical means changes occur in the composition of the Wax which cause an alteration in the physical constants. It has a specific gravity of 0.960 to 0.970, a melting point of 62° to 64° C (143.6° to 147.2° F), an Acid value from 19 to 23, an Ester value from 74 to 84, a Saponification value from 93 to 107, and an Iodine absorption 1 to 10 p c.

Samples examined in the author's laboratory gave Acid values ranging from 11.8 to 24.6, with an average of 15.7, Ester values ranging from 71.7 to 100.8, with an average of 92, Saponification values ranging from 96 to 114.8, with an average of 107.7, the Iodine values ranged from 2.5 to 7.6, with an average of 5.5.

The more generally occurring adulterants are those mentioned under *Cera Flava*, and the same methods as there described may be employed for their detection.

Not Official

CERATUM (U S)—White Wax, 6, White Petrolatum, 4, Benzoinated Lard, 10, melt until the mixture is liquefied, and stir it constantly until it congeals. For use in southern latitudes, and during the heated season in other localities 1 of Benzoinated Lard may be replaced by an equal quantity of White Wax.

UNGUENTUM SIMPLEX—Formerly Official in *B P*, but now omitted.

Foreign Pharmacopœias—Official in Austr and Hung, Lard 8, White Wax 2, Belg, Lanolin 5, Vaseline 5, Dutch, yellow Wax 3, Sesame Oil 7, Mex, White Wax 1, Sesame Oil 3, Swiss, White Wax 30, Olive Oil 70, Ethereal Tincture of Benzoin 10, U S Benzoinated Lard 8, Yellow Wax 2, Ger (Unguentum Cereum), Olive Oil 7, Yellow Wax 3, Jap, Yellow Wax 1, Sesame Oil 2, Port (Cerato Simplex), White Wax 3, Almond Oil 7, Span (Cerato Simplex), White Wax 1, Almond Oil 3, Swed (Ceratum), White Wax 1, Spermaceti 1, Benzoinated Lard 3, Norw (Ung Cereum), and Russ (Ung Cereum), Olive Oil 3, Yellow Wax 1.

CERII OXALAS.

CERIUM OXALATE

$\text{Ce}_2(\text{C}_2\text{O}_4)_3, 10\text{H}_2\text{O}$, eq 719.22

A white, or almost white, odourless and tasteless granular powder. Officially it is stated to be prepared by the decomposition

of a soluble salt of Cerium with a soluble Oxalate. It has been prepared from the minerals Cerite and Thorite, but is now more generally obtained from Monazite. It consists principally of Cerium Oxalate. Commercial samples usually contain the Oxalates of Lanthanum and Didymium and of other rare earths of this group.

It has been pointed out (*C D* '00, 1 992) that the formula should show 10 molecules of Water of crystallisation, and not 9 as in the official formula, and that pure Cerium Oxalate free from Didymium yields a pure yellow, and not a brownish-red residue on ignition.

In spite of two references to this point in *Pharmacopœia Committee Reports* it is interesting to note that the *BP C* still retains the $9H_2O$ formula.

Solubility—Insoluble in Water, Alcohol (90 p c) and in Ether. Insoluble in cold, but decomposed by boiling Potassium or Sodium Hydroxide Solutions. Insoluble in cold, but soluble in hot, diluted Sulphuric or Hydrochloric Acid.

Medicinal Properties—Gastric sedative. Given in chronic vomiting, and vomiting during influenza, and of phthisis, also in dyspepsia, gastrodynia, and pyrosis. It has been recommended in sea-sickness, in doses of 10 to 20 grains every three hours. Given with success in spasmodic cough of gastric origin.

Cerium Oxalate in the gastric crisis of *Tabes*—*L* '96, 11 551.

Dose.—2 to 10 grains = 0.13 to 0.65 gramme.

Prescribing Notes—*It is taken in 5 to 15 grain doses as a powder mixed with a little Water, also given in cachets. It is also supplied in effervescent granules containing 1, 2, 3 and 5 grains in each diachm.*

Foreign Pharmacopœias—Official in Jap, Mex and Port (Oxalato de Cerio), U S. Not in the others.

Tests—The distinguishing tests for Cerium Oxalate are that at a dull red heat it is decomposed, leaving a reddish-brown powder, which is completely soluble in boiling Hydrochloric Acid, the solution yielding on the addition of a saturated Potassium Sulphate solution a white crystalline precipitate, Potassium or Sodium Hydroxide Solution yields a white precipitate which gradually turns yellow on contact with the air, and which does not dissolve in an excess of the reagent, whilst Ammonium Carbonate Solution yields a white precipitate more or less soluble in an excess of the reagent. In carrying out the test with Potassium Sulphate Solution the *USP* uses the salt itself and not the residue left on ignition, dissolves in Sulphuric Acid instead of Hydrochloric Acid, and uses a 1 in 10 Potassium Sulphate Solution in the place of a saturated solution. The *BP* makes no mention of the precipitates produced by Potassium or Sodium Hydroxide Solution.

It is officially required to lose 53 p c in weight when incinerated, but no direct indication is given of the composition of the ash. According to the *USP* it should leave a reddish-brown residue of Ceric and other rare earth oxides, amounting to not less than 47 p c of the salt. *BP* omits to mention that it should yield the reactions characteristic of Oxalates. Their presence may be detected on decomposing the salt by boiling with Potassium or Sodium Hydroxide.

Solution, adding a slight excess of Acetic Acid to the filtrate and then Calcium Chloride Solution, a white precipitate insoluble in Acetic Acid but soluble in Hydrochloric Acid should be produced

The more generally occurring impurities are Arsenic, Iron, Zinc, Calcium, Aluminium, Carbonates or Phosphates. These impurities are grouped collectively in the *B P*. The more important are Arsenic, which may be detected by the modified Gutzet's test, and Zinc, which may be detected by first boiling the salt with Potassium or Sodium Hydroxide Solution, cooling, filtering and adding Hydrogen Sulphide Solution to the filtrate. If this filtrate be previously divided into two portions, the second portion may be used in testing for Aluminium, which is precipitated on the addition of Ammonium Chloride Solution.

Iron may be detected by the addition of Potassium Ferrocyanide Solution to a solution of the salt in diluted Hydrochloric Acid. The *U S P* regards the absence of effervescence when the salt is dissolved in diluted Hydrochloric Acid as indicative of the absence of Carbonates, a test preferable to that of the *B P*, which requires that the reddish-brown powder remaining after decomposition at a dull red heat shall dissolve without effervescence in 'boiling Hydrochloric Acid'. Calcium and Phosphates are unlikely impurities and are not included in the *U S P*. Cerium Oxalate is not official in the *P G*.

Calcium Chloride—If the filtrate from the residue obtained by boiling the salt with Potassium Hydroxide T S be supersaturated with Acetic Acid, the addition of Calcium Chloride T S will produce a white precipitate insoluble in Acetic Acid, but soluble in Hydrochloric Acid, *U S P*.

Ammonium Carbonate—The solution in Hydrochloric or Sulphuric Acids yields with Ammonium Carbonate T S a white precipitate of Cerous and other rare earth carbonates, which are somewhat soluble in excess of the reagent, *U S P*.

Strychnine—If the residue left after heating Cerium Oxalate be dissolved in concentrated Sulphuric Acid, and a small crystal of Strychnine added, a deep blue colour will appear which will rapidly change to purple and then to red, *U S P*.

Time-limit Test—The Solution (1-20) in Diluted Hydrochloric Acid should not respond to the time limit test for heavy metals, omitting the addition of Ammonia Water, *U S P*.

Gutzet's Test—Five c.c. of a solution of the salt (1-10) in Diluted Hydrochloric Acid should not respond to the modified Gutzet's test for Arsenic, *U S P*.

Ammonium Chloride—On boiling the salt with T S of Potassium Hydroxide, and filtering, no precipitate should be produced in the filtrate by the addition of T S of Ammonium Chloride, *U S P*.

Ammonium Sulphide—The filtrate obtained on boiling the salt with T S of Potassium Hydroxide, and filtering, should not yield a precipitate with T S of Ammonium Sulphide, *U S P*.

CETACEUM

SPERMACEI

FR, BLANC DE BALEINE, GER, WALRAT, ITAL, CETINA,
SPAN, ESPERMA DE BALLENA

White, odourless, somewhat translucent, crystalline, pearly masses, unctuous to the touch, and having a bland mild taste. It

is a peculiar, concrete, fatty substance obtained from the Sperm Whale, *Physeter macrocephalus*, L., occurring chiefly in a cavity in the head, but also obtained from smaller cavities in the body

The Sperm Whale inhabits the Pacific and Indian Oceans

Cetin or Cetyl Palmitate when saponified yields Ethal (Cetyl Hydrate), and not Glycerin (Glyceryl Hydrate). Most Oils and Fats are Oleates, Palmitates, and Stearates of Glyceryl, which when saponified yield Glycerin and Oleates, Palmitates and Stearates of the metals

Solubility—Slightly in Alcohol (90 p c), 1 in 80 of boiling Alcohol (90 p c), 1 in 6 of Ether, 4 in 5 of Chloroform, and in the fixed and volatile Oils

Medicinal Properties.—Emollient It is much employed for ointments and cerates

Spermaceti can be powdered quite readily with the addition of Alcohol (90 p c), but when Alcohol is contra indicated it can also be powdered by the addition of 12 minims of fixed Oil of Almonds to each oz of Spermaceti

Official Preparations—Unguentum Cetacei Contained in Unguentum Aquae Rosae and Unguentum Capsici

Not Official—Mistura Cetacei, Cold Cream, Unguentum Cetacei sine Benzoino.

Foreign Pharmacopœias—Official in all except Belg. Mex. (Esperma), Port. (Espermaceti)

Descriptive Notes—Spermaceti is deposited from Sperm Oil, which is found in cavities of the head of the Sperm Whale, *Physeter macrocephalus*, L. The oil is cooled, the Spermaceti separated by settling, and pressed in bags to remove adhering oil, until hard and brittle. It is then melted in boiling Water to which a weak solution of Potash is added to remove impurities, washed and crystallised. The crystalline masses in which it occurs in commerce are quite characteristic in appearance. Chinese insect wax, which is but rarely imported, closely resembles it, but is much harder. It is a wax secreted by *Coccus Pera*, Westw., in China, on the twigs of Chinese species of Ash and Privet, and is used by the Chinese to form an outer layer on candles to prevent guttering. It has a much higher melting point than Spermaceti.

Tests.—The distinguishing tests for Cetaceum are the melting point, which should be about 48° C (118 4° F) and which is officially required to be from 46° to 50° C (114 8° to 122° F), but which is occasionally as low as 43° C (109 4° F), and the specific gravity, which should be from 0 942 to 0 946, and to which no reference is made in the B.P. The U.S.P. gives the melting point as 42° to 50° C (107 6° to 122° F), the P.G. 45° to 50° C (113° to 122° F). The B.P. adopts the same method for taking the melting point of Cetaceum as for Cera Flava. The U.S.P. gives the specific gravity as 0 935 to 0 944 at 25° C (77° F), 0 842 at 100° C (212° F), the P.G. gives an average specific gravity of 0 943. It should possess an Acid value of from 0 1 to 0 5, and a Saponification value of from 125 to 136. The B.P. places the limit of acidity at not more than 'one drop' of Normal Volumetric Sodium Hydroxide Solution

for the neutralisation of the alcoholic solution of 0.2 gramme of Spermaceti, using Phenolphthalein Solution as indicator, but gives no figure for the Ester value. The quantity (0.2 gramme) used in the official method of determination is too small, and it is preferable to employ from 1 to 5 grammes. The limit of acidity indicates an Acid value of 13.9, and is altogether too high even for old samples. The Acid value increases greatly with age. A sample examined in the author's laboratory in November, 1896, showed the merest trace of free acid, but when re-examined in July, 1901, exhibited an Acid value of 4.5. The Iodine absorption of pure Spermaceti is practically nil.

The more generally occurring sophistications are Stearic and Palmitic Acids, Stearin, Tallow, and Paraffin Wax. Stearin and Palmitic Acid may be detected by the reaction of the alcoholic solution towards Litmus and by the precipitate produced on dilution of the solution with Water. The *USP* and *PG* boil with anhydrous Sodium Carbonate and Alcohol, subsequently acidifying the solution with Acetic Acid, and state that the solution may become turbid, but should not give a precipitate. The solubility in boiling Alcohol (90 p.c.) detects the presence of Stearin, Tallow, and Paraffin Wax. Tallow and Stearin increase and Paraffin Wax diminishes the saponification value. The presence of Tallow may also be recognised by the increased Iodine absorption. Paraffin Wax notably diminishes the specific gravity.

Alcohol.—If Spermaceti be boiled with Alcohol (90 p.c.), and the mixture cooled and filtered, the filtrate should not afford a flocculent precipitate on the addition of Water, *BP* (an equal quantity of Water), *PG*. At ordinary temperatures Cetaceum gradually crystallises out from a solution in boiling Alcohol (90 p.c.), which is approximately 1 in 50, *PG*.

Acetic Acid.—If 1 gramme of Cetaceum be boiled with 1 gramme of anhydrous Sodium Carbonate and 50 c.c. of Alcohol, and the mixture cooled and filtered, the filtrate on being supersaturated with Acetic Acid may become turbid, but it should not afford a precipitate, *PG* and *USP*.

Preparations

UNGUENTUM CETACEI SPERMACEI OINTMENT

Spermaceti, 5, White Beeswax, 2, Almond Oil (by weight), 18, Benzoin, in coarse powder, 1. Melt together the Spermaceti, Beeswax, and Almond Oil, add the Benzoin, and frequently stirring the mixture, continue the application of heat for two hours, remove from the source of heat, strain, and stir the Ointment constantly until cold.

It would be better to omit the Benzoin, which was first added in 1865, as pointed out in previous editions, the Benzoin converts this emollient preparation into one which is irritating: see below.

The following are called **Unguentum Cetacei**—(all by weight).

Dan. Spermaceti 2, White Wax 1, Oil of Almonds 12, Rose Water 5.
Norw. Spermaceti 6, White Wax 6, Oil of Almonds 58, Rose Water 30.
Russ. Spermaceti 3, White Wax 3, Olive Oil 14, Rose Water 2.
Swed. Spermaceti 2, White Wax 1, Oil of Almonds 12, Rose Water 5.
Swiss. Spermaceti 2, White Wax 1, Almonds Oil 7, Ethereal Tincture of Benzoin, 1.

The following are called **Ceratum Cetacei**—(all by weight) —

Austr Spermaceti, White Wax, Sesame Oil, equal parts

Hung Spermaceti 8, White Wax 8, Lard 9

Port Spermaceti 1, White Wax 1, Oil of Almonds 3

Span Spermaceti 4, White Wax 4, Oil of Almonds 47, Rose Water 45

U S See **Unguentum Aquæ Rosæ**

Cold Cream is a synonym for Unguentum Cetacei, *Dan* and *Swed*, and Unguentum Leniens, *Belg* and *Ger*

The following are called **Unguentum Leniens**—(all by weight) —

Austr Spermaceti 15, White Wax 8, Sesame Oil 62, Water 15, Otto of Rose 2 drops

Belg White Wax 14, Almond Oil 56, Rose Water 30

Dutch Spermaceti 10, Yellow Wax 5, Adeps Lanae 10, Sesame Oil 50, Rose Water 25

Ger Spermaceti 8, White Wax 7, Almond Oil 57, Water 28, Otto of Rose 0 1

Unguentum Refrigerans—(all by weight) —

Swiss Spermaceti 10, White Wax 8, Arachis Oil 57, Castor Oil 5, Otto of Rose 1 drop, Rose Water 20

Pomata con Olio di Mandorle —*Ital* Spermaceti 1, White Wax 1, Oil of Almonds (by weight) 8

Cerato de Galeno —*Span* Almond Oil 55, White Wax 15, Agua de Rosas 30

Not Official

UNGUENTUM CETACEI SINE BENZOINO —Spermaceti 5, White Beeswax 2, Almond Oil 18

The *B P* ointment made with Benzoin is unsuited for many purposes for which this ointment is useful, such as eye ointments, &c.

Used as a cooling dressing Applied on lint to broken blisters &c. After walking, it affords great relief, and frequently enables one to continue the exercise without serious discomfort It is also recommended for smearing on the feet before starting for a long walk on rough ground

MISTURA CETACEI —Spermaceti 60 grains, Proof Spirit 15 minims, finely pulverise the Spermaceti by aid of the Spirit, and add by degrees half the yolk of an egg, at first only sufficient to make a stiff paste, which should be made very smooth by diligent trituration, then add the rest, and make up with Water to 4 oz

[This formula was given in Squire's *Companion* 1864]

COLD CREAM —White Beeswax, 1, Spermaceti, 1, Oil of Almonds, 8, Rose Water, 11, Otto of Rose to perfume it Melt together, by means of water-bath, the Oil, Spermaceti, and Beeswax, add the Otto, strain through muslin into the Rose Water, stir together whilst gently warming until Water globules are no longer visible, and the mixture is of proper consistence to pour into pots without separating This form has been used by the author for several years, but Cold Cream is more easily and more generally made with less Rose Water See also Unguentum Aquæ Rosæ under Rosæ Oleum

Cold Cream —Spermaceti, 60, White Wax, 30, Almond Oil, 215; Rose Water, 60, Tincture of Benzoin, 15, Otto of Rose, 10 drops —*Fr*

Not Official.

CETRARIA

ICELAND MOSS

The dried Lichen, *Cetraria Islandica*, L. A native of the north of Europe

It contains a bitter principle, **Cetrarin** (Cetraric Acid), which has been used as a tonic.

Medicinal Properties —Demulcent, nutritious, and slightly tonic

Iceland Moss Jujubes are useful for coughs

Foreign Pharmacopœias —Official in Austr, Belg, Dutch, Fl (Lichen d'Islande), Ger, Hung, Ital, Jap, Port, Span (Liquen Islandico), and Swiss, *Lichen Islandicus*, Mex (Liquen de Islandia) Not in Norw

Descriptive Notes —The frond of the lichen, *Cetraria islandica*, L., is more or less branched in a forked manner, of a brownish colour above, and greyish white below, marked on the under surface with numerous minute scattered chalky white pits. It is flat, channelled above, and has a crisp mode of growth. The wavy edges are furnished with a fringe of numerous minute short linear papillæ. The fructification, which consists of a flat, disc like, dark brown expansion near the margin of the frond, is rarely met with, and then mostly on the broader varieties of the plant. The taste is mucilaginous and slightly bitter.

DECOCTUM CETRARIÆ —Iceland Moss, 1, first wash with cold Water, then add Distilled Water, 20, boil ten minutes, strain with gentle pressure whilst hot and wash the marc to make 20 (1 in 20)

Dose —1 to 4 fl oz = 28.4 to 113.6 grammes

Official in Ital, 1 in 20, Fr (Tisane), 1 in 100, Ital has also **Infusion**, 1 in 20

SACCHARUM CETRARIÆ —Iceland Moss 1, Sugar 1, Water 100. Wash the Iceland Moss with Water to remove the bitterness, then boil with 100 of Water, strain and express lightly, and in the strained liquid dissolve the Sugar and evaporate on a water-bath. When sufficiently firm remove from the bath and dry in a cupboard to a powder or scale.

GELATINA CETRARIÆ (Iceland Moss Jelly) —Saccharated Cetraria 2 Sugar 1, Water 5. Mix, boil gently till scum collects on the surface, then withdraw the heat, remove the scum, and pour into pots to cool.

A similar preparation is given in Ital, Port and Span.

Paté de Lichen officinal containing 1 of Extract of Opium in 5000 —Fr

Not Official

CARRAGEEN

IRISH MOSS *Syn* —CHONDRUS

Fr, CARRAGAHEEN, GER, IRLANDISCHES MOOS, ITAL, FUCO CARAGEO, SPAN, CARRAGAEN

The dried seaweed *Chondrus crispus*, Lyngb. It is used as an article of food on the west coast of Ireland, where it abounds. Has been proposed as a substitute for Acacia as an emulsifying agent and for the suspension of some powders.

One part of *Chondrus* boiled for ten minutes with 30 parts of Water yields a solution which gelatinises on cooling, and is not coloured blue by T.S. of Iodine —U.S.P.

Foreign Pharmacopœias —Official in Belg, Dan, Dutch, Fl, Ger, Hung, Ital (Fuco Carageo), Jap, Mex (Liquen Carragaen), Port (Alga Perlada), Span and Swiss. Fl has a Tisane 1 in 200.

SACCHARUM CARRAGEEN —Made like Saccharum Cetrariæ

GELATINA CARRAGEEN (Irish Moss Jelly) —Made like Gelatina Cetrariæ

Official in Port

MUCILAGE OF MOSS —Irish Moss, $\frac{1}{2}$ oz, is boiled with 40 oz of Water for 15 minutes and made up to 34 oz —*Arnold's Formulary*

Decoction Chondri —Irish Moss, 2 50, Distilled Water, q s to produce 100 —B.P.C.

The B.P.C. Supplement gives the *syn*. Mucilage of Irish Moss

Not Official

CHALMOOGRA OIL *See* GYNOCARDIÆ OLEUM

Not Official
CHELIDONIUM.

GREATER CELANDINE

The entire Plant *Chelidonium majus*, L

The juice has been used in opacities of the cornea, and is a popular application for the cure of warts — *B M J* '97, i 25 and 354

Has been recommended chiefly by Demisonko in the treatment of cancer: *B M J* '97, i 25, 354 and 637, ii 123, *B M J E* '96, ii 88, '97 ii 47, *L* '96, ii, 649 and 1778, *L* '97, ii 737, *P J* '97, i 86 Unfavourably commented on *L J* '98, i 61. In the treatment of inoperable cancer, Celandine is worthy of trial — *L* '01, ii 967, *C D* '01, ii 1048

Chelidonium — This alkaloid forms colourless crystals, melting at 135° C (275° F), soluble in Alcohol (90 p c), insoluble in Water, and but slightly soluble in Ether

Dose — 1 to 3 grains = 0.06 to 0.2 gramme

The **Sulphate** is readily soluble in Water, the **Hydrochloride** less so, and the **Tannate** is insoluble in Water

CHIRATA.

CHIRETTA

FR, CHIRETTE, GER, OSTINDISCHER ENZIAN

The entire dried Plant, *Swertia Chirata*, Ham, collected when in flower

It is a native of, and is obtained from, Northern India

Under the title of **Andrographis**, the dried *Andrographis paniculata*, is official in the *Ind* and *Col Add* for India and Ceylon

Medicinal Properties — Bitter tonic and stomachic, without astringency, given in atonic dyspepsia. Containing no Tannin, it may be prescribed with Iron

Official Preparations — Infusum Chiratae, Liquor Chiratae Concentratus, and Tinctura Chiratae

Not Official — Infusum Chiratae Concentratum

Foreign Pharmacopœias — Official in Port and U S. Not in the others.

Descriptive Notes — The Chirata official in the *B P* is distinguished by its very bitter taste, by the opposite, entire, glabrous, ovate leaves, and by the pith being continuous, solid, and easily separable. It is met with in commerce in compact flattened bundles about 3 ft long and about 5 or 6 in thick, and weighing 1½ to 2 lb, and bound round with a slip of bamboo. Other allied species are used in different provinces of India, and some of them are occasionally imported and sold as the genuine drug. Of these *Swertia* *parviflora*, B & H, has a more woody, tougher and nearly hollow stem. *S. pinnatifida*, R & S, has pale angular stems with a large pith. These give a much less bitter infusion than genuine Chirata. Sometimes Chirata is falsely packed, Madder roots or other plants, or even stones, being concealed in the centre of the bundle. *Andrographis parviflora*, Nees, has distinctly quadrangular stems and irregular flowers, and only

3 or 4 seeds in each capsule, and is not packed in loose bundles. It is rarely imported and not likely to be confounded with *Chnata*. It is official in the *Ind* and *Col Add*. Under the microscope the leaves may be distinguished from those of *Chnata* by the presence of cystoliths below the upper epidermis, which are shorter than in most other medicinal Acanthaceous plants, by the stomata being placed between a large and small cell, and by the quadricellular glandular hairs (*Planchon* and *Collin*)

Preparations

INFUSUM CHIRATÆ

Chiretta, cut small, 1, boiling Distilled Water, 20 infuse for fifteen minutes, strain (1 in 20)

Now 1 in 20 instead of 1 in 40

Dose — $\frac{1}{2}$ to 1 fl oz = 14 2 to 28 4 c c

A corresponding preparation, *Infusum Andrographidis*, is official in the *Ind* and *Col Add* for India and the Eastern Colonies

LIQUOR CHIRATÆ CONCENTRATUS CONCENTRATED SOLUTION OF CHIRETTA

1 of Chiretta, in No 40 powder, percolated with Alcohol (20 p c) to yield 2 (1 in 2)

Dose — $\frac{1}{2}$ to 1 fl dm = 1 8 to 3 6 c c

Tests —Concentrated solution of Chiretta has a specific gravity of 0 990 to 1 010, it contains about 5 p c w/v of total solids and 19 p c w/v of Absolute Alcohol

A corresponding preparation, *Liquor Andrographidis Concentratus*, is official in the *Ind* and *Col Add* for India and the Eastern Colonies

U S has a **Fluid extract**, 1 in 1, using Alcohol 49 p c

TINCTURA CHIRATÆ

1 of Chiretta, in No 40 powder, percolated with Alcohol (60 p c) to yield 10 (1 in 10)

Dose — $\frac{1}{2}$ to 1 fl drm = 1 8 to 3 6 c c

Prescribed in 5 minim doses, with Acids and Tincture of Orange to form an acid tonic mixture

A corresponding preparation, *Tinctura Andrographidis*, is official in the *Ind* and *Col Add* for India and the Eastern Colonies

Tests —Tincture of Chiretta has a specific gravity of 0 920 to 0 925, it contains about 1 5 p c w/v of total solids and about 60 p c w/v of Absolute Alcohol

Not Official

INFUSUM CHIRATÆ CONCENTRATUM —Chiretta, in No 40 powder, 40, Alcohol (90 p c), 25, Dilute Chloroform Water (1 in 1000), sufficient to make 100. Prepare by repercolation —*Fun* and *Weight*, P J '06, 1 165 and '07, 1 621, C D '06, 1 252, Y B P 1907, 249

This formula appears in the B P C

CHLORAL HYDRAS.

CHLORAL HYDRATE

CCl, CH(OH)₂, eq 164 15

FR, HYDRATE DE CHLORAL, GER, CHLORALUM HYDRATUM, ITAL, CLORALIO IDRATO, SPAN, HIDRATO DE CLORAL

Transparent, colourless, rhomboidal crystals, having an aromatic penetrating odour, and an unpleasant, slightly bitter, acrid taste

It should be kept in well-stoppered amber-tinted glass bottles in a cool and dark place

Chemically it is Trichlorethylidene Glycol Anhydrous Chloral is produced by the action of dry Chlorine gas on Ethyl Alcohol, the pure Chloral being subsequently converted into Hydrate by the addition of the necessary amount of Water and purified by recrystallisation from suitable solvents

Solubility.—4 in 1 of Water, and measures $3\frac{1}{4}$, 5 in 1 of Alcohol (90 p c), 2 in 1 of Ether, 2 in 1 of Glycerin, 1 in 1 of Olive Oil, 1 in 3 of Chloroform, 1 in 10 of Oil of Turpentine (cold), 1 in 5 boiling, 1 in 68 of Carbon Bisulphide

Medicinal Properties—An excellent hypnotic, producing natural and placid sleep soon after its administration, in acute mania and delirium tremens it is given as a cerebral depressant Given in asthma and $\text{v' } \text{u' } \text{c' }$ and extreme cases of chorea, efficacious in large doses in sea-sickness Has been found useful as a spinal depressant and antispasmodic in tetanus, uræmic and puerperal convulsions, and by intravenous injection in Strychnine poisoning Of great value in labour, as it relieves pain, assists to dilate the os and relax the rigid perinæum, especially in primiparæ, without lessening the expulsive power of the uterus Given in nocturnal incontinence of urine It should not be given in advanced cardiac disease, nor in fatty heart Children stand it well

It is not suitable for insomnia due to pain, as an analgesic it is inferior to opium

In concentrated solution, applied locally, it acts as a vesicant

As a pungent irritant with Camphor and sometimes with Cocaine, it is useful for the relief of neuralgia, rheumatism, toothache and chilblains

In tetanus in 20 grain doses every five hours (*B M J* '04, ii 1460), and along with injections of antitetanic serum (*B M J* '04, ii 1429), in sea-sickness teaspoonful doses every five minutes of a mixture of 2 drms of the syrup with $\frac{1}{2}$ drm Ammonium Bromide made up to 1½ oz with Water, where this fails relief often follows 1 minim doses of Tincture of Iodine — *B M J* '04, ii 1405

The only satisfactory way of giving this drug in obstinate cases of sea sickness is by the rectum in doses of from 20 to 30 grains — *B M J* '05, i 1090

The tendency to eclampsia may often be controlled (*B M J* '05, ii 718) by the administration of $\frac{1}{2}$ drm doses, combined with a drm of Potassium Bromide and repeated if necessary every hour

It is shown (*B M J* '05, ii 250) to be of special use in sleeplessness and pain of gouty people with high blood pressure It seems a general law (*B M J* '05, ii 1005) that when a hypnotic contains Chlorine in its molecule its effects are not limited to the brain and central nervous system, but extend to the heart and the tissues in general

In the treatment of convulsions in early infancy (*Pr* lxxv 514), 2 to 3 grains may be given hypodermically or introduced into the bowel through a rubber catheter. For rectal injection 5 grains may be given to a baby of six months and 10 grains to one a year old. One grain every two hours in the youngest babies (*Pr* lxxv 517), and in children of one or two months 1 to 2 grains, continued in these doses until the fits have ceased, for at least 24 or 36 hours, in the treatment of idiopathic convulsions.

Effects from an overdose or repeated overdoses are excitement, convulsions, and delirium, followed by deep coma and quiet sleep from which the patient may never stir, he may, however, pass to death without any previous convulsions. It lowers temperature, and causes contraction of the pupil.

A case of puerperal eclampsia treated by Chloral Hydrate, Potassium Bromide, and Chloroform inhalation — *L* '97, ii 915

As a pigment to the interior of the nostrils in acute coryza, 10 grains in 4 drms Castor Oil — *Pr* lv 517

Applied spread over the surface of diachylon plaster, the skin having been previously rubbed over with Almond Oil or Vaseline, it acts as a vesicant, superior to Cantharides — *P J* '02, i 115

Dose — 5 to 20 grains = 0.32 to 1.3 gramme

Ph Ger maximum single dose, 3 grammes, maximum daily dose, 6 grammes

Prescribing Notes — 3 oz will dissolve in 1 fl oz of Water, and measure 2 fl oz and 5½ fl drms, if to this be added 23 minims of Water, every minim will contain a grain of Chloral. This solution is handy for dispensing.

It is usually given in solution, but the objectionable taste is difficult to mask, Chloral Hydrate, 20 grains, Syrup of Orange, 1 fl drms, Peppermint Water, to 1 fl oz, make a good draught for those who do not object to Peppermint.

Chloral Hydrate, 4 grains, Liquorice Root, in powder, 1 grain, Gum Acacia, in powder, ½ grain, make a good pill, with a trace of 'Diluted Glucose'.

The addition of 1 grain to the fl oz will keep hypodermic solutions otherwise liable to develop fungoid growths.

Incompatibles — When prescribed with Alkalis, Chloroform will be liberated.

Official Preparation — Syrupus Chloral

Not Official — Liquor Bromo Chloral Compositus, Chloral Camphoratum, Chloral cum Camphora et Cocaina, Chloral et Phenol, Suppositoria Chloral, Dormiol, and Chloral Tannum.

Antidotes — Stomach tube or emetics, keep up the temperature by hot blankets, hot water bottles, etc., injection of a pint of hot strong coffee into rectum, electric magnetism, inhalations of Amyl Nitrite, in bad cases hypodermic injection ½ grain of Strychnine Nitrate, artificial respiration — *Murrell* ½ of a grain of Picrotoxin has been found enough for 30 grains of Chloral — *B M J* '75, i 506

Foreign Pharmacopœias — Official in Austr, Belg, Ger, Hung, Jap, Russ, Swiss and US (Chloralium Hydratum), Dutch (Hydras Chlorali), Dan, Norw and Swed (Hydras Chloralicus), Fr, Ital (Clorale Idrato), Mex (Cloral Hidratado), Port (Hydrato de Chloral), Span (Hidratado de Cloral).

Tests — The distinguishing tests for Chloral Hydrate are the melting point of the crystals, which, when dried, should be about 58° C (136 4° F), the temperature at which the melted liquid again becomes solid (the solidifying point), which is officially required to be about 48 9° C (120° F), and the boiling point (when heated in a test-tube with pieces of glass contained in it), which is officially required to be from 94 4° to 96 7° C. (202° to 206° F). The *B P*

gives no figure for the melting point, but *PG* and *USP* state it to be about 58°C (136.4°F) when dry. The *USP* gives a range of from 35° to 50°C (95° to 122°F) for the solidifying point. The best solidifying point is considered by *USP* to be 122°C (252°F). If the sample is too much under-hydrated the solidifying point is lower and the boiling point is under 95°C (203°F), and the sample is prone to decompose and become acid on keeping. If over-hydrated the solidifying point is lower and the boiling point is above 98°C (208.4°F) and the sample is deliquescent, a slightly under-hydrated sample is the best for good-keeping qualities.

The aqueous solution should be neutral or but slightly acid to Litmus. The *USP* states that the aqueous solution gradually becomes an acid reaction, but that a neutral alcoholic solution remains permanently neutral.

An aqueous solution warmed with Potassium or Sodium Hydroxide Solution evolves immediately a powerful odour of Chloroform, the Chloral Hydrate being decomposed with formation of Chloroform and the Formate of the alkali Hydroxide. If to the cooled solution a few drops of Aniline Oil be added, and the liquid again warmed, the powerful, penetrating, and highly poisonous odour of Phenyl-isocyanide is evolved. When heated with an excess of Potassium or Sodium Hydroxide Solution the Chloroform at first formed is itself decomposed with the production of the corresponding Chloride of the alkali and a further quantity of Formate.

The *BP* process of quantitative determination is founded upon decomposition by an alkali Hydroxide Solution. It is officially required to indicate 98.5 p.c. of pure Chloral Hydrate as volumetrically determined from the quantity of Normal Volumetric Sodium Hydroxide Solution required to decompose 4 grammes. No requisite percentage or method of determination is given in the *PG*. The *BP* test has been severely criticised. If as in the official method of procedure the Chloral Hydrate be 'heated' with the Normal Volumetric Sodium Hydroxide Solution, results greatly in excess of the truth are yielded, attributable to secondary decomposition of the Chloroform by the excess of alkali. The term 'heated' may be variously understood by different operators. It has been pointed out (*PJ* '99, i 236, '01, i 387, '03, i 531) that if the reaction be allowed to proceed at the ordinary temperature fairly concordant results may be obtained, but the range of temperature must be restricted within narrow limits. A correction may also be made (*PJ* '07, ii 4) by allowing the secondary reaction to commence and ascertaining the extent to which it has proceeded by titration of the resultant Chloride with Deci-normal Volumetric Silver Nitrate Solution.

The *Companion* (17th Edition) suggested determination, when in very dilute solution, by reduction by the Copper-Zinc couple and titration with Deci-normal Volumetric Silver Nitrate Solution. A process described (*PJ* '07, ii 6) depends upon the reduction of the Chloral Hydrate by means of Aluminium Powder or Zinc filings and Acetic Acid. A weighed quantity of 0.25 gramme is boiled with 1 gramme of Aluminium Powder, 15 c.c. of Acetic Acid *BP*, and

40 c.c. of Water under a reflux condenser for half an hour. The mixture is then filtered, the filter and flask washed with Water, 50 c.c. of Deci-normal Volumetric Silver Nitrate Solution is then added, the Silver Chloride filtered out, and the excess of Volumetric Silver Nitrate Solution determined with Deci-normal Volumetric Ammonium Sulphocyanide Solution, adding 10 c.c. of strong Nitric Acid and 5 c.c. of a saturated Iron Alum solution as indicator. Each c.c. of Deci-normal Volumetric Silver Nitrate Solution used is equivalent to 0.005472 gramme of pure Chloral Hydrate.

Chloral Hydrate may be extracted from its aqueous solution by shaking out with Ether or Acetic Ether.

A simple process for the approximate determination of the amount of Chloroform yielded on treatment with Potassium Hydroxide may be conveniently conducted in a graduated tube, thus: Place in a tube 250 grain-measures of a 20 p.c. Potassium Hydroxide Solution, and add to it gradually (keeping it cold) 50 grains of the Chloral Hydrate, cork securely, and shake, allow the liquid to separate, and the number of grain-measures of Chloroform (at the bottom), to which must be added 1 for every 200 grain-measures of supernatant liquid, multiplied by 1.5 gives the grains of Chloroform, which should be not less than 35.

The more generally occurring impurities are mineral matter, Chloral Alcoholate, certain organic impurities and Chlorides. Mineral residue is readily detected when the drug is volatilised on Platinum foil. The *B.P.* employs the Iodoform test as a means of detecting Chloral Alcoholate. No yellow crystalline precipitate of Iodoform should be produced within an hour, when Iodine Solution, in sufficient quantity to yield a brown coloration, is added to a filtered mixture of 1 gramme of the hydrate warmed with 6 c.c. of Water and 0.5 c.c. of Potassium Hydroxide Solution, *B.P.* Organic impurities may be detected by shaking the chloroformic solution with concentrated Sulphuric Acid, whilst Hydrochloric Acid and Chlorides may be detected by Silver Nitrate Solution, the *B.P.* requires that the aqueous solution should not afford any precipitate with Silver Nitrate Solution, the *U.S.P.* requires that the 1 in 20 aqueous solution, slightly acidulated with Nitric Acid, should remain unaffected by Silver Nitrate T.S.

Sulphuric Acid—No colour should be imparted to Sulphuric Acid when it is shaken with a solution of Chloral Hydrate in Chloroform, *B.P.* The *P.G.* test directs 0.5 gramme of Chloral Hydrate to be vigorously shaken with 5 c.c. of Sulphuric Acid in a glass-stoppered test-glass of 3 cm. diameter, and which has been previously rinsed out with Sulphuric Acid. The Sulphuric Acid should not become coloured within one hour.

Silver Nitrate—An alcoholic solution (1-10) of Chloral Hydrate should not be affected at once by T.S. of Silver Nitrate, *P.G.*, that an aqueous solution (1-20) slightly acidulated with Nitric Acid should remain unaffected, *U.S.P.*, an aqueous solution should not afford any precipitate with T.S. of Silver Nitrate, *B.P.*

Preparation

SYRUPUS CHLORAL SYRUP OF CHLORAL

Dissolve 800 grains of Chloral Hydrate in 15 fl. drms. of Distilled Water, and add Syrup, *q.s.* to yield 10 fl. oz. (10 grains in 60 minims)

Dose.— $\frac{1}{2}$ to 2 fl drms = 18 to 71 cc

Foreign Pharmacopœias—Official in Belg and Fr, 1 in 20, with Peppermint, Mex, 1 in 20, Port, 1 in 50, Span, 1 in 32.5 All by weight Not in the others

Not Official

LIQUOR BROMO-CHLORAL COMPOSITUS—Chloral Hydrate, 1600 grains, Tincture of Indian Hemp, 400 minims, Tincture of Orange, 400 minims, Henbane Juice, 1600 minims, Syrup, $3\frac{1}{2}$ fl oz, Fluid Extract of Liquorice, $\frac{1}{2}$ fl oz, dissolve. Add 1600 grains of Potassium Bromide dissolved in 7 fl oz of Distilled Water, filter, wash with Distilled Water to produce 20 fl oz. Each fl drim contains 10 grains of Chloral Hydrate and 10 grains of Potassium Bromide

Dose.— $\frac{1}{2}$ to 2 fl drms = 18 to 71 cc—*BPC Formulary* 1901

BPC is practically the same strength, but calculated into parts per 100 fluid parts

Bromidia is somewhat similar in composition

It has been suggested that each fl drim should be made to contain 15 grains each of Chloral and Potassium Bromide, and that the filtration should be omitted, since it takes out the resins of the Indian Hemp. Suspension by mucilage recommended. Hyoscine Hydrobromate recommended to be substituted for Henbane—*CD '02*, n 314

SUPPOSITORIA CHLORAL—Chloral Hydrate, 5 grains, White Wax, 5 grains, Oil of Theobroma, 7 grains. Melt together the Wax and Theobroma Oil, and when partially cooled, mix in the Chloral Hydrate and pour into a mould

CHLORAL CAMPHORATUM—Chloral Hydrate, 1, Camphor, 1, rub together in a warm mortar until completely liquefied, and filter if necessary—*BPC Formulary* 1901, now incorporated in the *BPC*

As a **Pigmentum** this formula has appeared for many years in the Pharmacopœias of the London, Throat and Westminster Hospitals

Useful application for the relief of neuralgia

CHLORAL CAMPHORATUM CUM COCAINA—Chloral Hydrate, 9, Camphor, 9, Cocaine, 2

This has been incorporated in the *BPC*

CHLORAL ET PHENOL—Chloral Hydrate, 1, Carbolic Acid, 1

Is soluble in Water, Alcohol (90 p c), and in Glycerin

The Chloral Carbolatum of *BPC*

So long as the proportion of Carbolic Acid to Chloral does not exceed 1.7 to 1, the product will mix with Water in all proportions, beyond this limit the excess of Carbolic Acid separates on the addition of Water. As it corresponds to 8 molecular weights to 1, there is probably a chemical combination in these proportions—*PJ (3) xvi* 188

DORMIOL (Amylene Chloral)—A colourless liquid possessing a camphoraceous odour, usually supplied commercially as a 50 p c solution. mixes readily with Water. It is also supplied in capsules.

A good narcotic in mental diseases, and stated to produce no untoward effects—*L '99*, n 73, '02, n 1712, *BMJ '02*, n 1278, *PJ '03*, n 62

Dose.—5 to 20 minims = 0.3 to 1.2 cc

Prescribing Notes—It can be given in capsules, or in mixtures, covering the unpleasant taste with Syrup of Tolu, using equal parts of the Syrup and Water

CHLORAL TANNIN (Captol).—A brown, resinous substance, soluble in Water and in Alcohol

A solution has been introduced as a Hair Wash.

Not Official

CHLORALAMIDUM

CHLORALAMIDE CHLORALFORMAMIDUM, U S , CHLORAL FORMAMIDE

$\text{C}_3\text{H}_4\text{Cl}_2\text{NO}_2$, eq 191 00

Chloralamide is a compound of Chloral Anhydride and Formamide Colourless lustrous, odourless crystals, possessing a somewhat bitter taste Its aqueous solution should not be heated above $48\text{ }^\circ\text{C}$ ($120\text{ }^\circ\text{F}$), as above that temperature it undergoes hydrolysis, being reconverted into Anhydrous Chloral and Formamide It is permanent in weakly acidulated solutions, but decomposed by alkalis

It should be preserved in well stoppered amber tinted glass bottles

Care should be taken not to confound Chloralamide with Chloralimide

Solubility—1 in 21 of Water, 1 in 2 of Alcohol (90 p c), it dissolves very slowly in Glycerin but if sufficient time is allowed, 1 in 12 solution can be obtained, in about 3 days at $60\text{ }^\circ\text{F}$

Published solubilities of it in Water have varied considerably The *Companion* figure (1890) as above has been confirmed (*P J* (3) xxii 805), with the additional note that below $60\text{ }^\circ\text{F}$ the solubility decreases very rapidly —*C D* '92, 1 445

Medicinal Properties—Hypnotic It is stated to have much less influence on the heart than Chloral, and therefore may be used in cardiac disease, and that the dose need not be increased after continued use

Given in all kinds of insomnia —*L* '89, ii 849, 1192, '90, 1 339, *B M J* '89, ii 1326 '91, 1 1060, *M P* '89, ii 571, *P J* (3) xxi 104, *T G* 91, 634, 757, *Pr* xlvii 274 *B M J* '05, ii, 1007 In insomnia with 'irregular' heart after influenza —*B M J* '94, ii 1045

The safest of the hypnotics for the insomnia of cardiac disease —*B M J* '97, ii 857 '05, ii 250 Chloralamide is safer but slower in action than Chloral Hydrate —*L* '99, ii 143 20 to 30 grains in a little spirit, useful as a sleeping draught for patients suffering from acute Bright's disease —*Pr* lxxvii 645 658

In the insomnia of enteric fever—30 to 40 grains, repeated in lesser amount in two hours —*B M J* '04, ii 1452

Prescribed with Potassium Bromide as a remedy for sea sickness —*Pr* lvi, 145

Dose—20 to 50 grains = 1 3 to 3 24 grammes

Ph Ger maximum single dose, 4 grammes, maximum daily dose, 8 grammes

Prescribing Notes—It is prescribed in aqueous mixtures suspended with *Tragacanth*, or dissolved in weak Alcohol or Glycerin, see *Haustus* and *Mistura* given below

Foreign Pharmacopœias—Official in Ger (Chloralium formamidum), Mex (Chloralamido), U S (Chloralformamidum) Not in the others

Tests—Chloralamide has a melting point of 114 ° to $115\text{ }^\circ\text{C}$ (237 ° to $239\text{ }^\circ\text{F}$) The aqueous solution of the salt should be neutral in reaction towards Litmus paper It yields a turbid solution when warmed with Potassium or Sodium Hydroxide Solution, the solution clearing on the separation of the Chloroform produced by the decomposition, the evolved vapour possessing an alkaline reaction towards red Litmus paper

The more generally occurring impurities are inorganic matter, Chloral Alcoholate, Ethyl Carbamate, free acids, *e g*, Formic and Hydrochloric Acids, and products of decomposition Inorganic matter, Chloral Alcoholate, and Ethyl Carbamate are detected by the behaviour of the sample when carefully heated in an open dish no weighable residue should remain after ignition, and no inflammable vapours should be given off Free acids are detected by the reaction of the alcoholic solution towards moistened blue Litmus paper, and products of decomposition by Silver Nitrate Solution, no immediate turbidity should be produced on the addition of a few drops of Silver Nitrate Solution to a 10 p c alcoholic solution

Not Official

CHLORETONETRI CHLOR TERTIARY BUTYL ALCOHOL CHLOR-BUTYL ALCOHOL
ACETONE CHLOROFORM $C_7H_9Cl_3$ (OH) eq 176.09

Light, white, glistening crystals, having a strong camphoraceous odour and taste. It is volatile at the ordinary temperature of the air.

It may be obtained by the interaction of Chloroform, Acetone, and an alkali Hydroxide.

This must not be confused with Chloroform prepared from Acetone, which is also known as 'Acetone Chloroform'.

Solubility—1 in 125 of Water, 6 in 4 of Alcohol (90 p.c.), also soluble in Chloroform and Ether, readily soluble in Glycerin and in Clove Oil.

Introduced as a hypnotic and local anæsthetic. It is also stated to possess slight analgesic and antiseptic properties.—*T'G* xxiv 18, 98, *L* '00, 1 106.

In epilepsy.—*T'G* '01, 757.

As a hypnotic in 25 cases of mental disease, 1 to 1½ gramme doses. In restless subjects, 2 grammes may be given.—*B M J E* '02, 1 31.

The therapeutic and the toxic doses (*B M J E* '05, 11 4) are so near one another that this drug has been discarded as a hypnotic altogether.

To prevent post operative vomiting.—*P J* '03, 1 340.

5 grain doses every three hours to prevent sea sickness.—*L* '03, 1 615, 687, *C D* '03, 1 424.

5 grains Chloretone 15 minutes before embarking will generally ensure complete immunity during the Channel passage even in rough weather, and for longer voyages in rough weather it should be taken 20 minutes before meals two or three times a day, an efficient remedy in cholera, has a remarkably soothing effect in painful and irritable stomach conditions, a hypnotic in 10 grain doses (*L* '07, 1 880), skin eruption due to chloretone treatment of cholera.—*L* '07, 1 883.

Dose—5 to 20 grains=0.32 to 1.3 grammes.

Prescribing Notes—Conveniently given when dissolved in a mixture of Alcohol and Glycerin. It is suspended with difficulty by Mucilage of Gum Acacia or Tragacanth. Cachets and Powders should be enclosed in a bottle, but even under these circumstances there is considerable loss in a month or two.

Tests—Chloretone melts at 80° to 81° C (176° to 177.8° F), but when anhydrous the melting point is raised to 95° to 96° C (203° to 204.8° F). It should be readily and completely soluble in Alcohol (90 p.c.).

1 c.c. of an aqueous solution of the salt when warmed with 1 c.c. of Potassium or Sodium Hydroxide Solution and sufficient Iodine Solution to colour the liquid distinctly brown yields a pale yellow precipitate of Iodoform.

1 c.c. of a saturated aqueous solution warmed with 2 c.c. of Potassium or Sodium Hydroxide and one or two drops of Aniline evolves the powerful, penetrating and highly poisonous odour of Phenyl isonitrile. It should volatilise completely when heated, and should leave no weighable residue upon ignition.

CHLORETONE ELIXIR—Chloretone, 10 grains, Spirit of Peppermint, 10 minims, Compound Tincture of Cardamoms, 1 fl. drim., Glycerin, q.s. to make 2 fl. drim., dilute immediately before use with 1 fl. oz. of Water for a dose.

Not Official

CHLORI LIQUOR

SOLUTION OF CHLORINE

Syn—AQUA CHLORI

A yellowish green liquid, possessing a powerful characteristic odour of Chlorine.

It is not now included in the text of the *B.P.*, but is transferred to the Appendix

Medicinal Properties—Deodouriser, antiseptic, and disinfectant. When diluted it is used as a gargle in smallpox, scarlatina, diphtheria, and putrid sore throat, and as a wash for ulcers, cancerous sores, buboes, and large abscesses.

Strongly advocated by Burney Yeo in the treatment of enteric fever. The solution he uses is obtained by pouring strong Hydrochloric Acid over Potassium Chlorate, thus into a 12 oz bottle put 30 grains powdered Potassium Chlorate, and pour on it 1 fl drim strong Hydrochloric Acid, cork, shake, and allow gas to generate, then add Water little by little till bottle is filled. He says it gives much better results and is more pleasant to take than the Liquor Chlori of the *B.P.* '85. To 12 fl oz of this solution he adds 24 to 36 grains of Quinine and 1 fl oz of Syrup of Orange peel, he gives 1 fl oz of this mixture every two, three, or four hours, according to the severity of the case. It is prescribed as **Mistura Chlori c Quinina** (*Burney Yeo*).

Further experiments on its use recorded in the Bradshaw Lecture on the treatment of enteric fever (*B.M.J.* '04, 11 1450) have shown that the tendency to intestinal fermentation is lessened, and the strength of the circulation well sustained, with corresponding benefit to the general aspect of the case.

Dose—10 to 20 minims = 0.6 to 1.2 cc, in a wineglassful of Water.

Incompatibles—Salts of Lead and Silver.

Antidotes.—In case of poisoning by Chlorine Water, the antidotes are White of Egg, Milk, Flour.

Foreign Preparation—Official in Austr (*Aqua Chlori*), not less than 0.4 pc; Russ and US (*Liquor Chlori Co*), about 0.4 pc; Ger (*Aqua Chlorata*), contains 0.4 to 0.5 pc of Gas, Dutch (*Solutio Chlori*), 0.4 to 0.425 pc; Swiss (*Chlorum Solutum*), 0.4 to 0.5 pc; Port (*Solutio de Chloro*), Span (*Agua de Cloro*) Not in Belg, Dan, Fr, Ital, Jap, Mex, Norw or Swed.

Tests—Solution of Chlorine should possess a specific gravity of 1.003, should first redden and then bleach blue Litmus paper, should immediately decolorise Indigo Sulphate Solution, should liberate Iodine from Potassium Iodide Solution. The latter reaction is utilised for the quantitative determination of the percentage of Chlorine. It should contain not less than 0.5 pc as determined by adding a measured quantity of 10 cc of the Liquor to a solution of 1 gramme of Potassium Iodide dissolved in 25 cc of Water, not less than 14.2 cc of Deci-normal Volumetric Sodium Thiosulphate Solution being required to decolorise the liquid, using Starch Solution as an indicator. It should leave no weighable residue upon evaporation.

LIQUOR CHLORI COMPOSITUS (U.S.)—Potassium Chlorate, granulated 5 grammes. Hydrochloric Acid, 18 cc, Distilled Water, to 1000 cc. Add 1 cc of Potassium Iodide solution and mix with 20 cc of Distilled Water to the Potassium Chlorate. The capacity of about 2000 cc. Insert in the flask a stopper perforated to admit a funnel of the capacity of about 100 cc containing a 10 grammes of purified Cotton well wetted with cold Water, place the flask on a water-bath containing boiling Water for a period of from 2 to 3 minutes, when the flask is completely filled with a greenish yellow gas remove it from the bath and add cold Distilled Water through the Cotton in the funnel in two separate portions of 500 cc each. After the addition of each separate portion of cold Distilled Water stopper the flask securely, invert, and thoroughly agitate the contents. This solution should be freshly made when wanted. Average dose—4 cc (1 fl drim).

LIQUOR CHLORI—Potassium Chlorate, 50 grains, Hydrochloric Acid, 100 minims, Water, to 1000 minims. Acid to the Chlorate in a large bottle, when the Chlorine given off is abundant, add Water gradually, corking and shaking the bottle. The solution is recommended (*B.M.J.* '93, 1 1004) for the preparation of 'Euchlorine' solution for use as a gargle in diphtheria, contains an excess of

Potassium Chlorate Place 20 to 30 grains of Potassium Chlorate in a dry 8 oz bottle with 10 minims of strong Hydrochloric Acid, the fumes will fill the bottle, which on the addition of Water with shaking will make a good solution

These ingredients in varying quantities are given in other Hospital Pharmacopœias

A Chlorine solution strongly recommended for irrigation of the fauces in diphtheria is made by pouring 5 minims of strong Hydrochloric Acid on 9 grains of powdered Potassium Chlorate, and gradually adding an oz of Water — *L '03, n 1774*

Sodium Chlorate is a tasteless salt, and answers equally well for the formation of 'Euchlorine'

GARGARISMA CHLORI —Potassium Chlorate, 200 grains, Strong Hydrochloric Acid, 40 minims, Water, to 20 fl oz Place the Potassium Chlorate in a dry bottle, pour the Acid upon it, and set aside, loosely corked, for 10 minutes Then add the Water in 4 or 5 successive portions, shaking between each addition, so that the gas may be absorbed as completely as possible

Note —This gargle is usually employed diluted with one or more parts of Water It should be recently prepared as it deteriorates slowly on standing, and quickly if exposed to light —*St Thomas's*

The quantities given in the *B P C* are —Potassium Chlorate, 2 25, Hydrochloric Acid, 0 50, Distilled Water, sufficient to make 100 00 Same directions as above

VAPOR CHLORI (*B P* 1885) —Chlorinated Lime, 2 oz, cold Water, a sufficiency Put the powder into a suitable apparatus, moisten it with the Water and let the vapour that arises be inhaled

CHLOROFORMUM.

CHLOROFORM

TRICHLORO METHANE, METHENYL TRICHLORIDE

CHCl₃, eq 118 48

FR, CHLOROFORME, GER, CHLOROFORM, ITAL, CLOROFORMIO, SPAN.,
CLOROFORMO

A clear, colourless, heavy, mobile liquid, possessing a distinctive ethereal odour, and a sweet burning taste

It may be prepared by the action of Chlorinated Lime on Ethyl Alcohol or on Acetone The product obtained by its action on Methylated Alcohol is known as Methylated Chloroform

The *U S P* defines Chloroform as a liquid consisting of from 99 to 99 4 p c by weight of absolute Chloroform, and 0 6 to 1 0 p c of Alcohol, but the quantity of Alcohol is not now defined in the *B P* except that the product is worked to a specific gravity 1 490 to 1 495

It should be kept in well stoppered amber tinted glass bottles, in a cool place, and protected as far as possible from the light

Solubility —10 in 7 of Alcohol (90 p c), in all proportions of Ether and Alcohol, freely in Olive Oil and Oil of Turpentine In Water at 32° F 1 in 150, at 60° F 1 in 185, at 86° F 1 in 210, at 113° F 1 in 200, at 130° F 1 in 192 Will not dissolve in Glycerin

Chloroform acts on Vulcanite, and dissolves Caoutchouc, Gutta-percha, Mastic, Elemi, Tolu, Benzoin and Copal Amber, Sandarach, Lac and Beeswax are only partially soluble It also dissolves Iodine, Bromine, most of the alkalis, the fixed and volatile Oils, most Resins and Fats It dissolves Sulphur and Phosphorus sparingly

Medicinal Properties. A general anæsthetic Internally a sedative, carminative and antispasmodic Its chief use is to produce general anæsthesia by **inhalation** during surgical operations, uræmic and puerperal convulsions, and in obstetric practice Should be given with great caution in cases of fatty and dilated heart, in extensive lung disease and severe anæmia Internally, useful to relieve flatulent distension of stomach and bowels, and the cough of fibroid phthisis, in delirium tremens, and in sea-sickness Externally, with Camphor, relieves toothache and neuralgia Applied immediately after the sting of a wasp, takes away the pain A powerful auxiliary to the Liniments of Aconite and Belladonna

Its vapour and aqueous solution are antiseptic, and the addition of 1 minim to 1 fl oz of animal or vegetable infusion will preserve it Vinegar after Chloroform inhalation to prevent sickness (See p 9)

Chloroform should not be used as an anæsthetic in a room where gas is being burned, a mixture of Chloroform vapour and air being decomposed by a flame with the formation of irritating compounds—*L* '99, i 1728, *T* (1909), 601, *P J* '02, i 876

The dosage of Chloroform for inhalation A powerful and dangerous anæsthetic, not to be recommended in minor surgery The notorious uncertainty and danger in Chloroform administration is the uncertainty in the quantity administered 0.2 c.c. per minute recommended, in a mixture of Chloroform and air at an average percentage of 1.5 p.c.—*B M J* '98, i 1057-1062

An attempt to ensure its admixture with air in certain proportions is described in *L* '04, ii 1462 The Report of the Chloroform Committee was presented at the Oxford meeting of the British Medical Association, the Vernon Harcourt inhaler was introduced, and the adoption of a maximum strength of 2 p.c. Chloroform vapour as an adequate and safe limit for general surgical purposes recommended (*B M J* '08, ii 141, '04, ii 161, *L* '04, ii 1856), a further reference to the subject is made (*J C S Abs* 1904, ii 756), showing all that was necessary in the air was 2 p.c., and that danger lay beyond It has latterly been shown (*J C S* 1904, *Trans* 949, *L* '05, i 589) that Chloroform derived from Acetone is inferior in anæsthetic properties to Chloroform derived from Alcohol The difference is stated to be due to the presence of 0.05 p.c. Ethyl Chloride Acetone Chloroform to which this amount of Ethyl Chloride had been added, exhibited equally as good anæsthetic effects as Chloroform prepared from Ethyl Alcohol This statement has, however, been challenged by Messrs J F MacFarlan & Co (*L* '05, i 747), who think that Chloroform prepared from Acetone is by no means generally accepted as inferior to Chloroform prepared from Alcohol, and that up to the present insufficient evidence has been adduced to establish these views

Less Chloroform is required when preceded by Morphine Scopalamine injections (See p 650)

Dose—1 to 5 minims = 0.06 to 0.3 c.c.

Ph. Ger. maximum single dose, 0.5 gramme, maximum daily dose, 1.5 grammes

Prescribing Notes—Chloroform Water and Spirit of Chloroform are used as sweetening agents, and to preserve solutions from decomposition As a rule in 'mixtures' Chloroform is in such small quantities as to dissolve in the Water, in concentrated 'mixtures' Mucilage of Gum Acacia would be required to suspend it, it can be given in 'drops' dissolved in some strongly alcoholic menstruum

It is used with Camphor Liniment, Soap Liniment, Olive Oil, or Oil of Peppermint

Camphorated Chloroform, see Camphor

Official Preparations—Aqua Chloroformi, Linimentum Chloroformi, Spiritus Chloroformi Tinctura Chloroformi et Morphinæ et Scopolaminæ

Not Official—Chloroethoform, Chlorodyspnum, Fumario Chloroformi, Liquor

Chloroformi Compositus, Mistura Tussi Rubra Concentrata, Mistura Chloroformi Composita, Paroenum Chloroformi Camphoratum, Pomade de Chloroforme, Tinctura Chloroformi Composita, Chloroformum Camphoratum, Carbon Tetra chloride, A C E Mixture, Vienna Mixture, 'Methylene,' Regnaud's Anæsthetic Mixture, Pental, Vapor Chloroformi Compositus, Vasolimentum Chloroformi Camphoratum

Antidotes—In case of overdose of Chloroform, the antidotes are, fresh pure air and artificial respiration (*M T* '74, ii 219), and Amyl Nitrite—*L* '75, i 644 *B M J* '97, ii 352 Hypodermic injection of Starchine, altogether $\frac{1}{2}$ grain was used in divided doses of $\frac{1}{2}$ grain followed by $\frac{1}{2}$ grain—*B M J* '97, ii 1498

Foreign Pharmacopœias—Official in Austri and Belg, sp gr 1 485 to 1 490, Fr sp gr 1 495 to 1 500, U S, sp gr not below 1 476 at 25° C (77° F), Dan, Dutch, Ger, Hung, Norw, Swed and Swiss, sp gr 1 485 to 1 489, Ital, sp gr 1 490 to 1 493, Jap, sp gr 1 485 to 1 495, Mex, Port and Span, sp gr 1 480, Russ, sp gr 1 499 to 1 500

The new Austri, Dutch and Swiss Pharmacopœias include Chloroform and Chloroform pro narcosi. The Austri and Swiss Chloroform and Chloroform pro narcosi are required both to possess the same sp gr, the Dutch Chloroform possesses the sp gr 1 485 to 1 489, that 'pro narcosi' a sp gr of 1 498 to 1 500, and is prepared by the decomposition of Chloral Hydrate by Sodium Hydroxide. Fr has Chloroforme rectifié du commerce sp gr 1 495 to 1 500 which must not be used as an anæsthetic, also Chloroforme anæsthésique sp gr 1 498 which is prepared from the other

Tests—The distinguishing tests for Chloroform are the specific gravity, which is about 1 490, and the boiling point, which should be about 61° C (141 8° F). Pure Chloroform has a specific gravity of 1 5, and boils at 60 8° C (141 44° F). The *BP* gives the specific gravity as 1 490 to 1 495, the *USP* not below 1 476 at 25° C (77° F), the *PG* 1 485 to 1 489. The *BP* and the *PG* give a similar boiling point 60° to 62° C (140° to 143 6° F), the *USP* gives 60° to 61° C (140° to 141 8° F). When boiled with Potassium or Sodium Hydroxide Solution it is decomposed yielding a solution which gives with Silver Nitrate Solution, when acidified with Nitric Acid, a white curdy precipitate soluble in Ammonia Solution and which is rapidly blackened on heating. A few drops of Chloroform when warmed with 2 or 3 cc of an alcoholic Potassium or Sodium Hydroxide Solution and a drop or two of Aniline evolve the powerful, penetrating and highly poisonous odour of Phenyl-isocyanide. A few drops of Chloroform, when heated with Fehling's (Potassio-cupric Tartrate) Solution, yield a reddish deposit of Cuprous Oxide.

The more generally occurring impurities are pyrogenous oils, acid, free Chlorine, Chlorides, secondary products of decomposition and fixed matter. Acid, free Chlorine, and Chlorides are all extracted by means of Water, and if the sample be shaken for 5 minutes with twice its volume of Water, free Acid may be detected in the aqueous liquid by its reaction towards blue Litmus paper, Free Chlorine by any blue coloration produced on the addition of 1 cc of Cadmium Iodide Solution and 2 drops of Starch Mucilage, and Chlorides by the addition of Silver Nitrate Solution, when not more than a very slight opalescence should be produced. In testing for Free Chlorine the *BP* uses Cadmium Iodide Solution, the *USP* Potassium Iodide Test Solution, and the *PG* Zinc Iodide Solution. Pyrogenous oils may be detected by allowing a definite volume to evaporate from a large piece of filter paper placed on a warm plate, when no foreign odour

should be perceptible. The *BP* employs 20 c.c. for this test, the *USP* 10 c.c., whilst the *PG* specifies no particular quantity. The *BP* requires that no odour should be perceptible at any stage of the evaporation, the *USP* that an odour should not be perceptible during the later stages of the evaporation and the filter paper should remain odourless, the *PG* that the filter paper shall not retain any foreign odour after the evaporation of the Chloroform. Secondary products of decomposition may be detected by the behaviour of the specimen with concentrated Sulphuric Acid. After shaking the acid with 10 times its volume of Chloroform for 20 minutes, and allowing the mixture to remain at rest for 15 minutes, both the acid and the chloroformic layers should be perfectly transparent and nearly colourless, a portion of the Sulphuric Acid layer diluted with Water should remain transparent, should be very nearly colourless and should possess no disagreeable odour, and if the liquid be further diluted and tested with Silver Nitrate Solution no more than a diminished transparency should be caused. The *USP* divides the test into three separate headings indicating impurities decomposable by Sulphuric Acid, odorous decomposition products, and chlorinated decomposition compounds. Fixed matter may be detected by any residue remaining after the evaporation of the Chloroform.

Starch Solution and Cadmium, Potassium or Zinc Iodide—The aqueous portion obtained by shaking Chloroform with twice its volume of Water for 5 minutes, should not afford any colour with 1 c.c. of Cadmium Iodide T.S. and 2 drops of Mucilage of Starch, *BP*, when Chloroform is shaken with Zinc Iodide and Starch Solution, the Starch Solution should not become blue, nor the Chloroform coloured, *PG*. The *USP* requires that the aqueous solution should not become coloured with T.S. of Potassium Iodide.

Silver Nitrate—The addition of 4 drops of Silver Nitrate Solution should not produce more than a very slight opalescence in the aqueous portion obtained by shaking Chloroform with twice its volume of Water for 5 minutes, *BP*, should not be affected by T.S. of Silver Nitrate, *USP*. It should not yield any turbidity with T.S. of Silver Nitrate diluted with as much Water, *PG*.

Sulphuric Acid—Chloroform when shaken with one-tenth of its volume of Sulphuric Acid for 20 minutes and set aside for 15 minutes should acquire practically no colour in either the chloroformic or Sulphuric Acid layer, and both should be quite transparent, *BP*, the *USP* directs the use of 4 c.c. of Sulphuric Acid and 40 c.c. of Chloroform shaken in a 50 c.c. glass stoppered cylinder during 5 minutes, and that the liquids be allowed to separate completely so that both are transparent. The Chloroform should remain colourless and the acid should appear colourless or very nearly so when in a stratum of not less than 15 mm. in thickness. In the *PG* test 15 c.c. of acid are shaken with 20 c.c. of Chloroform in a stoppered glass cylinder of 3 cm. diameter previously rinsed out with Sulphuric Acid. The acid should not become coloured within 1 hour.

2 c.c. of the Sulphuric Acid liquid obtained on shaking the Chloroform as above described, when diluted $2\frac{1}{2}$ times its volume of Water should remain clear, and should possess a pleasant odour, *BP*, should be colourless and clear, and hot from the mixing should be odourless or give but a faint vinous or ethereal odour, *USP*. The liquid obtained in carrying out the *BP* test, immediately above, should still retain its transparency and freedom from colour, even when further diluted with 10 c.c. of Water and stirred with a glass rod and the transparency should not be more than slightly diminished on the addition of 4 drops of Silver Nitrate Solution, *BP*, should remain clear and

should not be affected by T S of Silver Nitrate, *U S P*. The addition of Silver Nitrate Solution should not more than slightly diminish the transparency of the aqueous portion obtained by shaking the Sulphuric Acid treated Chloroform with twice its volume of Water, *B P*.

Volumetric Determination—Chloroform may be determined in the absence of other reducing substances by Fehling's Solution. A more accurate method is to pass the vapour through a red hot tube containing Platinum wire gauze, which decomposes the Chloroform with the formation of Hydrochloric Acid. The products are collected in a bulb tube containing Water, and the acid produced is titrated with Volumetric Potassium or Sodium Hydroxide Solution. 108.57 parts by weight of Hydrochloric Acid are equivalent to 118.48 parts by weight of Chloroform. This method has been applied to the determination of Chloroform in animal tissues (*B M J* '01, 11 1859), but the Hydrochloric Acid is recommended to be determined with Volumetric Silver Nitrate Solution, the excess of Silver being determined with Volumetric Ammonium Thiocyanate Solution, using Ferrous Ammonium Sulphate Solution as an indicator. In using the combustion method of determination for Chloroform in blood, the blood should be mixed with an equal volume of a saturated aqueous solution of Urea, by which means (*B M J* '03, 11 cxlii) the blood remains fluid during the necessary heating and more than 90 per cent of the Chloroform is accounted for.

Preparations

AQUA CHLOROFORMI CHLOROFORM WATER

Chloroform, 30 minims, Distilled Water, *qs* to make 25 fl oz
(1 in 400)

Half the strength of *B P* 1885

Dose — $\frac{1}{2}$ to 1 fl oz = 14.2 to 28.4 cc, but ordered in smaller quantities as a flavouring agent

Foreign Pharmacopœias—Official in Austr (1 in 100), Belg, Dan, Fr, Norw and Swiss (1 in 200), Dutch, Solutio Chloroformi Aquosa (1 in 250), Ital (1 in 2000), Jap (1 in 400), Span (1 in 250), U S, Saturated Aqueous Solution. Not in the others.

Tests—Chloroform Water has a specific gravity of 1.001, should be neutral in reaction to Litmus paper, and when warmed with a little Alcoholic Potassium or Sodium Hydroxide Solution and a few drops of Aniline should evolve the powerful, penetrating, and highly-poisonous vapours of Phenyl-isocyanide.

LINIMENTUM CHLOROFORMI LINIMENT OF CHLOROFORM.

Chloroform, 1, Liniment of Camphor, 1 (1 in 2)

The Oil in the Camphor Liniment prevents rapid evaporation of the Chloroform.

Foreign Pharmacopœias—Official in Ger and Jap (*Oleum Chloroformi*), Chloroform 1, Olive Oil 1, Austr (*Linimentum Chloroformiatum*), Chloroform, Oleoso balsamic Mixture, Spirit of Ether, Spirit of Camphor, Spirit of Potash Soap, equal parts of each, Fr (*Liniment au Chloroforme*), Chloroform 1, Poppy Oil 9, Swed (*Linimentum Chloroformi Comp*), Chloroform 3, Camphor 3, Alcohol (90 pc) 5, Camphorated Soap Liniment 6, Tincture of Opium 3, Swiss (*Oleum Chloroformi*), Chloroform 1, Olive Oil 3. Jap has also *Linimentum Chloroformi*, Chloroform 1, Camphor Oil 1. All by weight. U S, Chloroform 3, Soap Liniment 7. Not in the others.

Tests—It should possess a specific gravity of 1.212, and contains about 37 pc w/v of total solid residue.

SPIRITUS CHLOROFORMI SPIRIT OF CHLOROFORM *B P Syn*
 —CHLORIC ETHER, SPIRIT OF CHLORIC ETHER

Chloroform, 1, Alcohol (90 p c), *q s* to make 20 (1 in 20)

Dose.—5 to 20 minims = 0.3 to 1.2 c c, for repeated administration, for a single administration 30 to 40 minims = 1.8 to 2.4 c c

Frequently prescribed as a sweetening agent, and to cover nauseous flavour.

Foreign Pharmacopœias —Official in Jap, 1 in 20, U S, Chloroform 6, Alcohol 94 Not in the others

Tests —Spirit of Chloroform has a specific gravity of about 0.860, and should leave no weighable residue on evaporation

TINCTURA CHLOROFORMI ET MORPHINÆ COMPOSITA.
 COMPOUND TINCTURE OF CHLOROFORM AND MORPHINE

Chloroform, 1½ fl oz, Morphine Hydrochloride, 87½ grains, Diluted Hydrocyanic Acid, 1 fl oz, Tincture of Capsicum, ½ fl oz, Tincture of Indian Hemp, 2 fl oz, Oil of Peppermint, 14 minims, Glycerin, 5 fl oz, Alcohol (90 p c), *q s* to make 20 fl oz (about 1 in 13)

Dose.—5 to 15 minims = 0.3 to 0.9 c c

10 minims contain Chloroform ¾ minim, Morphine Hydrochloride, 1½ grain, Diluted Hydrocyanic Acid ½ minim, Tincture of Indian Hemp 1 minim

It is nearly 4½ times stronger in Morphine than *B P* 1885, and in other respects differs considerably

The *B P* 1885 preparation was practically the same as *Liquor Chloroformi Compositus*, except that the former contained four times as much Morphine as

In *B P* 1898 the formula was completely changed, therefore *Liquor Chloroformi Compositus*, previously omitted in *Companion*, is re-inserted

The *B P C* have also added a formula under the name 'Chlorodyne' (see below)

Foreign Pharmacopœias —Official in Jap. Hung has a 'Chlorodyne', but it differs considerably from *B P* Not in the others

Tests.—Compound Tincture of Chloroform and Morphine has a specific gravity of 1.010 to 1.015, it should contain from 28.0 to 30.0 p c w/v of total solids and from 52 to 54 p c w/v of Absolute Alcohol

Not Official

LIQUOR CHLOROFORMI COMPOSITUS (*Squire*) —Chloroform, 4 fl oz, Ether, 1 fl oz, Alcohol (90 p c), 4 fl oz, Treacle, 4 fl oz, Extract of Liquorice, 2½ oz, Morphine Hydrochloride, 8 grains, Oil of Peppermint, 16 minims, Syrup, 17½ fl oz, Prussic Acid (2 p c), 2 fl oz Mix the Oil of Peppermint, Alcohol and Prussic Acid together, and dissolve the Morphine Hydrochloride in the mixture, add the Chloroform and Ether, dissolve the Extract of Liquorice in the Syrup, add the Treacle, and mix in the other ingredients

This formula first appeared in the *Companion* in 1864

Dose —5 to 10 minims = 0.3 to 0.6 c c

10 minims contain Chloroform about 1 minim, Diluted Hydrocyanic Acid ½ minim, Morphine Hydrochloride 1½ grain

CHLORODYNUM (*B P C*) —Chloroform, 6.00 Morphine Hydrochloride, 0.50, Tincture of Indian Hemp, 8.00, Tincture of Capsicum, 1.50, Liquid

Extract of Liquorice, 12 00, Mucilage of Acacia, 12 00, Tincture, 20 00, Glycerin, 22 00, Oil of Peppermint, 0 10, Alcohol, sufficient to produce 100 00

10 minims contain Chloroform about $\frac{1}{2}$ minim, and Morphine Hydrochloride about $\frac{1}{10}$ grain, and no Hydrocyanic Acid

The *B P C* Chlorodyne Lozenges contain about $\frac{1}{15}$ grain of Morphine Hydrochloride

EMULSIO CHLOROFORMI—Chloroform, 1 fl oz, Tincture of Quillaia, 1 fl drim, Water, to 20 fl oz—*London*

Chloroform, 1 fl oz, Tincture of Quillaia, 3 fl drim, Water, to 20 fl oz—*St Thomas*

The *B P C* quantities are very similar Chloroform, 5, Tincture of Quillaia, 2, Distilled Water, to make 100

MISTURA TUSSI RUBRA CONCENTRATA—Diluted Hydrobromic Acid, 15 minims, Compound Tincture of Chloroform, 10 minims, Compound Tincture of Cardamoms, 10 minims, Solution of Morphine Hydrochloride, 5 minims, Diluted Hydrocyanic Acid, 1 minim, Syrup of Wild Cherry, to 1 fl drim—*Australian Pharmaceutical Formulary*

Mistura Chloroformi Composita *Syn* Mistura Tussi Rubra—Morphine Hydrochloride, $\frac{1}{8}$ grain Diluted Hydrobromic Acid, 30 minims, Chloroform, $\frac{1}{2}$ minim, Tincture of Cudbear, 7 $\frac{1}{2}$ minims, Syrup of Wild Cherry, 90 minims, Syrup, to 2 fl drim—*B P C*

This formula has been changed very considerably in the *B P C Supplement*, and as now amended reads—Morphine Hydrochloride, 0 05, Diluted Hydrobromic Acid, 12 5, Cherry laurel Water, 3, Chloroform, 0 25, Syrup of Tolu, 25, Tincture of Cudbear, 9, and sufficient Syrup to produce 100

POMMADE DE CHLOROFORME—Chloroforme rectifié 10, Yellow Wax 5, Lard 85—*F*

TINCTURA CHLOROFORMI COMPOSITA—Chloroform, 2, Alcohol (90 p c), 8, Compound Tincture of Cardamoms, 10 (1 in 10)

It first appeared in *B P* 1885, but was omitted in 1898, and subsequently included in *B P C*

Dose—5 to 60 minims = 0 3 to 3 6 c c

The Chloroform will separate if this Tincture is prescribed in too little Water Has been given successfully for the prevention of sea-sickness

CHLOROFORMUM CAMPHORATUM—Camphor, 2, Chloroform, 1, dissolve—*B P C Formulary* 1901, incorporated in *B P C*

A remedy for toothache, and topically applied for rheumatism

ACE MIXTURE—Alcohol (90 p c), 1, Chloroform, 2, Ether, 3, mix

Used as an anæsthetic in place of Chloroform—*Med Chir Trans* vol 47, '64, 341, *B M J* '87, ii 975, 1078, 1185, 1314, 1359 Advantages over Chloroform—*B M J* '97, ii 160

ACE (*Martindale*)—Absolute Alcohol (sp gr 0 795), 1, Chloroform (sp gr 1 497), 2, Purified Ether (sp gr 0 720), 3

VAPOR CHLOROFORMI COMPOSITUS (*B P C*)—Alcohol (90 p c), 4, Chloroform, 8, Purified Ether, *q s* to make 25

VASOLIMENTUM CHLOROFORMI CAMPHORATUM—Camphor, 3, Chloroform, 3, Liquid Vasoliment (*see* p 864), 3, all by weight—*Hager*

Parogenum Chloroformi Camphoratum *Syn* Camphorated Chloroform Vasoliment—Camphor, 3, Chloroform, 2, Parogen (*see* p 864), 3—*B P C*

VIENNA MIXTURE—Ether, 3, Chloroform, 1, by weight

'METHYLENE' (formerly called Methylene Bichloride)—Introduced by B W Richardson in November, 1867 It is a limpid, dense fluid, sp gr varies, when dropped into Water about one fourth of it is dissolved, the remainder separates like Chloroform at the bottom of the vessel as a perfectly clear and

distinct fluid, and the whole has a sweet, pleasant odour, without the least smell of Ether

Recommended as an anæsthetic in place of Chloroform

REGNAULD'S ANÆSTHETIC MIXTURE—Chloroform, 4, Methyllic Alcohol, 1, mix

Used as an anæsthetic in place of Chloroform

CHLORÆTHOFORM—Chloroform (from Acetone), 100, Ethyl Chloride, 0.25

CARBON TETRACHLORIDE—A colourless, volatile, heavy liquid. It may be prepared by the action of dry Chlorine gas on Carbon Bisulphide vapour, or by replacing the Hydrogen ion of Chloroform with the Chlorine ion

It should be kept in dark amber-tinted glass-stoppered bottles, and in a cool atmosphere

Has been employed to produce anæsthesia, but its principal use is as an inhalation in hay fever, and as an application on Pline for neuralgia

Danger attending its use as a hair-wash (*B M J* '07, ii 764, 776), or dry shampoo—*L* '07, i 1709

Tests—Carbon Tetrachloride has a specific gravity of 1.599 to 1.600 and a boiling point of 77° to 78° C (170.6° to 172.4° F). When warmed with Potassium or Sodium Hydroxide Solution, it is decomposed with the formation of Potassium or Sodium Chloride and Carbonate, on the addition of dilute Nitric Acid, and the faintly acidified Silver Nitrate Solution a white precipitate, insoluble in Nitric Acid, but soluble in Ammonia Solution. When warmed with an alcoholic Potassium or Sodium Hydroxide Solution and a few drops of Aniline it evolves the powerful, penetrating, and highly-poisonous vapours of Phenol-isocyanide

It may be contaminated with other Chlorine compounds or with chlorinated decomposition products, *e.g.*, Hydrochloric Acid. The former may be detected by the darkening in colour produced when a portion of the specimen is mixed with an equal volume of concentrated Sulphuric Acid, the latter by shaking the sample with twice its volume of Water and noting the reaction of the aqueous liquid towards Litmus paper and Silver Nitrate Solution, it should neither redden blue Litmus paper nor should it produce a turbidity with Silver Nitrate Solution

PENTAL (Trimethylethylene)—A colourless, mobile, inflammable liquid. Has been recommended as a general anæsthetic for short operations. Whittle states that several deaths have been attributed to it, and that it causes albuminuria—*M A* '95, 40, *L* '94, i 1080, '96, i 45, 710, 950, *T G* '93, 34, '94, 555, *B M J E* '93, ii 28, *B M J* '96, i 730

CHRYSAROBINUM.

CHRYSAROBIN

FR, CHRYSAROBINE, GER, CHRYSAROBINUM, ITAL, CRISAROBINA, SPAN, CHRYSAROBINA

An odourless and tasteless, yellow, crystalline powder, obtained from Araoba

Purified Chrysarobin was introduced into medicine incorrectly as **Chrysophanic Acid**, and it is still known by this name, which, however, only correctly applies to the oxidised product

Araoba yields from 55 to 80 p.c. (average 71 p.c.) of Chrysarobin—*P J* (3) xxii 544

Medicinal Properties.—In form of **unguentum** or **pigmentum**, it has been found efficient in chronic psoriasis, and is a powerful parasiticide in ringworm and other parasitic skin diseases, but as it may cause erythema it requires watching, it should not be allowed to touch the healthy skin. The ointment stains the skin

yellow, also the linen Has been given internally for psoriasis, eczema and acne, but it is very irritating, producing purging, griping and vomiting even in very small doses

To remove the stains from linen first remove all grease with Benzol and then apply a solution of Chlorinated Lime In some cases a little Caustic Soda solution also may be necessary—*C D* '99, 1 652

Alopecia areata, treated almost exclusively with Chrysarobin stick—Chrysarobin, 80, Colophony Resin, 5, Yellow Wax, 35, Olive Oil (by weight), 80 (*B M J E* '95, 11 103), and with excellent result by ointment 2 dm to oz—*B M J* '07, 11 491

Chrysophanic Acid is not an efficient substitute for Chrysarobin in the treatment of psoriasis—*B M J E* '96, 11 96

Used in the form of an ointment (*B M J* '05, 1 699) either alone or combined, according to circumstances, with Tar or Salicylic Acid, it cures chronic psoriasis

Dose $\frac{1}{10}$ to 1 grain = 0.006 to 0.06 gramme

Official Preparation—Unguentum Chrysarobini

Not Official—Unguentum Chrysarobini Compositum, Pigmentum Chrysarobini, Chrysarobin Plaster Mulls, Anthrarobin, Eurobin, Lenirobin

Foreign Pharmacopœias—Official in Austr (Araroba Depurata), Belg, Dan, Dutch, Ger, Ital, Jap, Norw, Russ, Swed, Swiss and US (Chrysarobinum), Mex (Crisarobina), the purified product Not in the others

Tests—Chrysarobin melts, according to the *USP*, at about 157° C (314.6° F) It varies in its behaviour towards different solvents, in Water it is only slightly soluble, in Petroleum Spirit it partly dissolves It is almost completely soluble in hot Alcohol (90 p c) and completely soluble in Chloroform, the *BP* mentions that it partially dissolves in Potassium Hydroxide Solution, assuming a deep brownish-red colour, the *USP* that it is soluble in dilute or concentrated Potassium Hydroxide solutions, forming a red coloured liquid with green fluorescence, the *PG* states that when boiled with 2000 parts Water it does not completely dissolve and yields a filtrate which does not affect Litmus paper, and which is not affected by Ferric Chloride Test-solution It dissolves to a reddish-yellow solution in concentrated Sulphuric Acid and is reprecipitated unchanged on dilution with Water A carmine red colour should be assumed in the course of a day by Ammonia Solution which has been shaken with Chrysarobin It may be distinguished from Chrysophanic Acid by mixing 1 mgm with 2 drops of fuming Nitric Acid and adding Ammonia Solution, a violet coloration is produced, whereas Chrysophanic Acid produces a yellow coloured liquid, when Chrysarobin is shaken with Lime Water for a few minutes a violet coloration is imparted to the liquid When heated in an open crucible it melts, and when ignited with free access of air it is officially required not to leave more than 1 p c of ash, the *PG* says 0.2 gramme should leave no weighable residue, the *USP* says it is entirely consumed

Preparation

UNGUENTUM CHRYSAROBINI. CHRYSAROBIN OINTMENT

2 of Chrysarobin dissolved in 48 of Benzoated Lard by the aid of heat, and subsequently stirred till cold (1 in 25)

Official in US, 1 in about 17

Not Official

UNGUENTUM CHRYSAROBINI COMPOSITUM (*Unna*)—Chrysarobin and Ichthyol, of each, 5, Salicylic Acid, 2, Yellow Vaseline, 88

PIGMENTUM CHRYSAROBINI—Chrysarobin, 1, Gutta Percha solution, 9—*Guy's*

Chrysarobin, 60 grains, Chloroform, 10 dm, pure Gutta Percha, 60 grains, dissolve Painted on with a stiff brush Acts effectually, and does not stain the linen—*B M J* '87, 11 1139

A 5 to 10 p c solution of Chrysarobin in equal parts of Chloroform and Glycerin Used in ringworm, applied till erythema and a slight oedema are produced—*B M J* '04, 1 16

Chrysarobin, 1, solution of Gutta Percha, *q s* to make 10—*B P C*

CHRYSAROBIN PLASTER MULLS (*Unna*)—Contain $\frac{1}{10}$ grain to the square inch, also five times this strength

ANTHRAROBIN ($C_{14}H_{10}O_2$, eq 224.38)—A yellow, or light yellowish brown, odourless, tasteless powder. A reduction product from Alizarin. Slightly soluble in Water, but readily in Alcohol (90 p c) and solution of Borax

Tests—The aqueous solution yields with Lead Acetate solution a reddish brown precipitate, with Ferric Chloride Solution, a brownish-violet precipitate. It dissolves in Sodium Hydroxide Solution (15 p c) with the production of a brownish-yellow colour which changes to violet on absorption of Oxygen from the air. It should leave not more than 2 p c of residue on incineration.

A substitute for Chrysarobin. For an ointment it is rubbed with Olive Oil and diluted with Lard.

Its action is similar to Chrysarobin, but it is slower and does not produce the same irritation. The part should be previously washed with Potash Soap, and the alcoholic tincture is preferred to the ointment. The strength of the ointment used is 1 in 10—*B M J* '88, 1 1234, *L M R* '88, 234, and '89, 243

Eurobin and **Lenirobin** are Chrysarobin Acetates, soluble in Acetone and Chloroform, they have been used for the same purposes as Chrysarobin. It is stated that they do not stain the normal skin, or the linen, like Chrysarobin.

CIMICIFUGÆ RHIZOMA.

CIMICIFUGA

B P Syn—ACTÉE RACEMOSÆ RADIX

FR, RACINE D'ACTÉE À GRAPPES, GER, SCHLANGENWURZEL

The dried Rhizome and Roots of *Cimicifuga racemosa*

The active principle is probably a resinous amorphous substance

Medicinal Properties—Bitter stomachic, analgesic. Given in neuralgia, myositis, rheumatism, " " " " and sciatica. Relieves the pain of dysmenorrhœa and pleurodynia.

Official Preparations—Extractum Cimicifugæ Liquidum, and Tinctura Cimicifugæ

Not Official—Cimicifugin

Foreign Pharmacopœias.—Official in U S. Not in the others.

Descriptive Notes.—The size of the official rhizome of *Cimicifuga racemosa*, Ell, is $\frac{1}{2}$ to 1 inch (12 to 25 mm) in diameter and 2 to 6 inch (5 to 15 cm) long, with slightly curved branches marked with transverse leaf scars, and the remains of ascending stems. In transverse section the large horny pith is

surrounded by a zone of narrow woody wedges and large medullary rays, and a relatively thin bark. The rootlets, which are usually more or less broken off, show in transverse fracture about four woody wedges arranged like a Maltese cross, set in a dark cortical portion. The taste is bitter and acid. It is sometimes confused with *Helleborus niger*, L., but that rhizome is smaller, $\frac{1}{10}$ to $\frac{1}{10}$ inch (5 to 7.5 mm), and has more erect branches, with short woody wedges 8 to 12 in number and a thick bark, and the woody wedges in the roots taper outwards so that the central column has a cylindrical and stellate appearance.

Tests—*Cimicifuga* may be distinguished from Black Hellebore by Ferric Chloride Test-solution, the *BP* says that the Rhizome and Roots are blackened by the reagent, but the colour is really a greenish black. No official limit of ash is given, but it generally leaves about 5 to 7 p.c. of ash and it should not amount to more than 10 p.c.

Preparations

EXTRACTUM CIMICIFUGÆ LIQUIDUM LIQUID EXTRACT OF CIMICIFUGA *BP Syn*—LIQUID EXTRACT OF *ACTÆA RACEMOSA*

20 of *Cimicifuga* percolated with Alcohol (90 p.c.) until exhausted, reserving the first 15, and evaporation of the further portion to a soft extract which is dissolved in the 15, and the whole made up to 20 with Alcohol (90 p.c.) (1 in 1)

Dose—5 to 30 minims = 0.3 to 1.8 c.c.

Foreign Pharmacopœias—Official in U.S., also a powdered extract prepared by evaporation of the fluid extract and admixture with powdered Licorice root. Not in the others.

Tests—Liquid Extract of *Cimicifuga* has a specific gravity of 0.875 to 0.890, it contains from 8 to 10 p.c. w/v of total solids and about 80 p.c. w/v of Absolute Alcohol.

TINCTURA CIMICIFUGÆ TINCTURE OF CIMICIFUGA *BP Syn*—TINCTURE OF *ACTÆA RACEMOSA*

2 of *Cimicifuga*, in No. 40 powder, percolated with Alcohol (60 p.c.), to yield 20 (1 in 10)

Dose—30 to 60 minims = 1.8 to 3.6 c.c.

The Tincture formerly in the *Companion* as 'Not Official' was twice the strength of this, and is still ordered as *Tinctura Actææ Racemosæ (Square)* to distinguish it from the Official Preparation.

Foreign Pharmacopœias—Official in U.S., 1 in 5. Not in the others.

Tests—The specific gravity of the tincture should be between 0.918 to 0.925, it contains from 1.0 to 2.8 p.c. w/v of total solids and about 58 p.c. w/v of Absolute Alcohol.

Not Official

CIMICIFUGIN—A brown powder, a large proportion of which is soluble in Alcohol (90 p.c.)

Dose—1 to 5 grains = 0.06 to 0.32 gramme

It is stated in *USD* that it is an impure Resin obtained by precipitating a saturated tincture of the root with Water.

Not Official

CINCHONÆ CORTEX

CINCHONA BARK

The dried Bark of *Cinchona Calisaya*, *C. officinalis*, *C. lancifolia*, and other species of *Cinchona*, from which the various alkaloids of the bark may be obtained

The official salts of Quinine, which are Quininæ Hydrochloridum, Quininæ Hydrochloridum Acidum, and Quininæ Sulphas, may be prepared from the Bark of various species of *Cinchona* and *Remijia*

Only Red *Cinchona* Bark is official for the galenical preparations

Foreign Pharmacopœias—Official in Austr., Dan., Jap., Norw., Russ. and Swed., any species, especially *Succirubra*, Dutch, Ger. and Swiss (*Cinchona Succirubra*), Fr. (*Quinquina Jaune* and *Quinquina Rouge*), Mex., any species, Hung. (*China Calisaya* and *Succirubra*), Port. (*Cinchona Flava*, *Fusca* and *Rubra*), Span. (*Cinchona Calisaya*, *Peruviana* and *Succirubra*), Belg., Swiss and Ital. (*Cinchona Succirubra*, *Ledgeriana* and *Calisaya*), U.S., any species of *Cinchona*, especially *Ledgeriana*, *Calisaya* and *Officinalis*, the latter used for Compound Tincture only

CINCHONÆ RUBRÆ CORTEX.

RED CINCHONA BARK

FR., QUINQUINA ROUGE, GFR., CHINARINDE, ITAL., CHINA ROSSA,
SPAN., QUINA ROJA

The dried Bark of the stem and branches of cultivated plants of *Cinchona succirubra*, Pav.

The dried Bark of *Cinchona Succirubra* only is official in the *B.P.* and *P.G.* It is official also in the *U.S.P.* under the heading *Cinchona Rubra*, under *Cinchona* is given the dried bark of *Cinchona Ledgeriana*, Howard, *Cinchona Calisaya*, Wedd., *Cinchona officinalis*, L., and of hybrids of these with other species of *Cinchona*. The *B.P.* Bark when used for preparing the official galenical preparations is required to yield from 5 to 6 p.c. of total alkaloids, not less than half of which should consist of Quinine and Cinchonidine, as assayed by the process outlined below. This is not considered an excessive demand, as almost the whole of these mixed alkaloids might consist of Quinine, and it affords no criterion of the amount of Quinine present. It has been pointed out (*P.J.* (3) xvi 407) that a bark may contain the requisite total alkaloids and the official percentage of Quinine and Cinchonidine, and still contain only a trace of Quinine, what, therefore, is really wanted in the *Pharmacopœia* is a Quinine standard for the Bark. The *French Codex* (1908) requires the Bark to contain at least 5 p.c. of total alkaloids and to yield at least 1.5 grammes of crystallised basic Quinine Sulphate containing 8 molecules of Water of crystallisation, this quantity corresponding to 1.257 p.c. of basic Quinine Sulphate, dried at 100° C. (212° F.), or to 1.092 p.c. of anhydrous Quinine. This is the first instance in which a Quinine standard has been adopted by an important Pharmacopœia. An outline of the process adopted for the determination of the alkaloids is too lengthy for inclusion here, but the essential details are given at the end of the *Materia Medica*. The galenical preparations of the *B.P.* are standardised to contain a definite percentage w/v of total alkaloids. The *U.S.P.* *Succirubra* Bark or its hybrids is required to yield not less than 5 p.c. of anhydrous *Cinchona* alkaloids when assayed by the process indicated for the other varieties of the Bark. The other varieties of *Cinchona* bark official in the *U.S.P.* are required to yield not less than 5 p.c. of total anhydrous *Cinchona* alkaloids, of which at least four-fifths shall consist of anhydrous Ether-soluble alkaloids. The galenical preparations of the *U.S.P.* are standardised to contain a definite percentage of Ether-soluble alkaloids.

The *PG* gives no definite requirement, but if the result of the volumetric determination be expressed in terms of the mean combining weights of Quinine and Cinchonidine it should yield not less than 5.07 p.c. of alkaloids. The new *Swiss Ph* adopts a minimum of 6.5 p.c. of alkaloids.

Medicinal Properties—Tonic, bitter, stomachic and astringent. It is valuable in neuralgia and in convalescence from acute diseases, in diarrhoea, excessive perspiration, chronic discharges from mucous membranes, and in dipsomania. (See also *Quinine*.)

Official Preparations—Extractum Cinchonæ Liquidum, Infusum Cinchonæ Acidum, Tinctura Cinchonæ, Tinctura Cinchonæ Composita, and is a source of the Alkaloid Quinine.

Not Official—Decoctum Cinchonæ, Elix. Cinchonæ, Mistura Cinchonæ, Mistura Cinchonæ Acida, Sirop de Quinquina, Tinctura Chinæ Composita, Vinum Chinæ, also Ferratum, Cinchonidinæ Hydrobromidum, Cinchonidinæ Sulphas, Cinchoninæ Iodo Sulphas, Cinchoninæ Sulphas, and Acidum Chinicum.

Foreign Pharmacopœias—Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Norw., Port., Russ., Span., Swed., Swiss and U.S.

Descriptive Notes—Red Cinchona bark is now chiefly imported from Ceylon and Java, although some is occasionally offered from the African Island of St. Thomé. The tree grows rapidly, and consequently the bark shinks a good deal in drying, and presents, especially in the branch bark, a shrivelled or longitudinally wrinkled character, it has a reddish colour when broken, and a bitter and astringent taste. Its most marked feature is the presence of reddish warty lenticels. In the variety with leaves hairy beneath, formerly cultivated in Jamaica, these occur very sparingly. These two characters distinguish the red Cinchona from the other barks in use, since the warts are absent in that of *C. Calisaya*, Wedd., and in it the ridges or wrinkles are replaced by longitudinal fissures, which are at first shallow, but become deeper in older barks, and the epidermal layer often exfoliates, showing transverse cracks in the layer beneath. The variety *Ledgeriana*, Howard, is remarkable for its relatively greater thickness as compared with that of other species, but externally resembles *Calisaya*, except that the surface is usually rougher. In *Cinchona officinalis*, Hook., there are numerous transverse cracks with thickened edges, broken into points, so that the bark is rougher to the touch than other kinds. *Cinchona lancifolia*, Mutis, and its varieties are characterised by a whitish spongy epidermal layer and by a loose fibrous fracture. A hybrid of *C. officinalis*, L., and *C. succubra*, Pav. (*Cinchona robusta*, Hort.), presenting the thick-edged cracks of the one and the warty character of the other, is remarkably rich in alkaloid, and is sometimes offered as 'Ledgeriana' bark. Small chips of red barks obtained by spoke-shaving do not present marked characters, and should only be purchased on analysis. The official bark is in quills or somewhat curved pieces coated with periderm, it may vary considerably in length, 2 to 12 in (5 to 30 cm.) or more, and the thickness of the bark itself may vary from about $\frac{1}{10}$ to $\frac{1}{4}$ in ($2\frac{1}{2}$ to 6 mm.), the fracture is shortly fibrous in the smaller, and finely fibrous in the larger pieces, the powder should be brownish or reddish-brown.

Tests Cinchona is one of the few instances in which the *BP* adopts a standard for the drug and indicates a method for the determination of its alkaloidal strength. The process official in the *BP* 1898 is an adaptation of that of the *BP* 1885, which is in turn based upon a process recommended by Squibb, it depends upon the liberation of the alkaloids from the combinations in which they exist in the bark by means of Calcium Hydroxide and their extraction by means of a mixture of 3 parts by volume of Benzol and 1 part by volume of Amyl Alcohol, the alkaloids in turn being shaken out from this solvent by a mixture of Diluted Hydrochloric Acid, and Water, which solution, after careful neutralisation with Ammonia Solution, is concentrated and the Quinine and Cinchonidine precipitated by Sodium Potassium Tartrate Solution, the Tartrates of the remaining alkaloids being precipitated from the filtrate from the Quinine and Cinchonidine by the addition of a slight excess of Ammonia Solution. The *BP* process may be briefly outlined as follows. A weighed quantity (20 grammes) of the finely powdered Bark is treated with 6 grammes of Calcium Hydroxide. The mixture after being moistened with 20 c.c. of Water is well incorporated, and allowed to stand for an interval of one or two hours. It is then transferred to a flask, mixed with 130 c.c. of a mixture of 3 parts by volume of Benzol and 1 part by volume of Amyl Alcohol and extracted by boiling under a reflux condenser for about 30 minutes. The Benzolated Amyl Alcohol is removed, passed through a filter, and the residue in the flask again boiled with a further quantity of the same mixture of Benzol and Amyl Alcohol, the liquid removed as before, and the process repeated a third time if necessary, the residue in the flask being finally transferred to the filter and washed by percolation with the mixture of Benzol and Amyl Alcohol until exhausted of alkaloids. This may be determined by evaporating a few drops of the Benzol-Amyl Alcohol Solution on a watch-glass, acidifying the residue with a drop or two of Diluted Sulphuric Acid, and adding a drop or two of Potassium-mercuric Iodide (Mayer's) Solution. The filtrates are mixed, transferred to a separator, and well shaken whilst warm with a mixture of 2 c.c. of Diluted Hydrochloric Acid and 12 c.c. of Water the liquids are allowed to separate, the acid aqueous solution of the alkaloidal Hydrochlorides is removed and the extraction of the alkaloids remaining in the Benzolated Amyl Alcohol solution accomplished by repeatedly shaking with Water made slightly acid with Hydrochloric Acid. The mixed acid liquids should, whilst warm, be exactly neutralised with Ammonia Solution concentrated to a volume of 16 c.c., and the Quinine and Cinchonidine precipitated as tartrates by the addition of a solution of about 1.5 grammes of Sodium Potassium Tartrate dissolved in 3 grammes of Water, the whole well stirred with a glass rod, and allowed to remain at rest for about an hour. The precipitated Quinine and Cinchonidine Tartrates are filtered, washed, dried at a temperature of the water-oven and weighed. They should contain four-fifths of their weight of alkaloids, and if this quantity be multiplied by 5 the product will be percentage by weight of Quinine and Cinchonidine.

The filtrate from the Quinine and Cinchonidine Tartrates is made slightly alkaline by the addition of Ammonia Solution, the precipitate collected on a filter, washed, dried, presumably also at a temperature of the water-bath, and weighed. This precipitate consists of the alkaloids other than Quinine and Cinchonidine, and if their weight be multiplied by 5 the product represents the percentage by weight present in the Bark, and when added to that of the Quinine and Cinchonidine obtained by the previous process yields the percentage by weight of total alkaloids.

The *BP* process is lengthy and tedious, it requires careful manipulation, and the closest attention to details is necessary to obtain accurate results. The exhaustion of Bark by the hot Benzolated Amyl Alcohol requires considerable time and patience. The exact neutralisation of the Hydrochloric Acid solution of the alkaloids requires great care, as does also the evaporation of the solution to the prescribed volume, and after evaporation the reaction of the liquid should again be ascertained and if necessary again exactly neutralised, unless exactly neutral there will be a liability to loss of alkaloid. It by no means follows that although the liquid has been neutralised before evaporation it will remain neutral during evaporation, and a further addition of Ammonia Solution is generally necessary.

The *USP* employs Ether-chloroform as a solvent for the alkaloids, and divides the process into two parts: (1) for anhydrous Cinchona alkaloids, and (2) for Ether-soluble alkaloids. The outlines of the process are essentially as follows:—A weighed quantity of 15 grammes of Cinchona Bark in No. 80 powder (or finer) is shaken vigorously in an Erlenmeyer flask with a mixture of 250 c.c. of Ether and 50 c.c. of Chloroform, and allowed to stand for 10 minutes. A measured quantity of 10 c.c. of Ammonia Solution is added, and, with frequent intervals of shaking, the mixture is allowed to stand for 5 hours. A measured quantity of 15 c.c. of Water is added, the mixture vigorously shaken and allowed to stand a few minutes. A measured quantity of 200 c.c. of the clear supernatant liquid is then transferred to a separator and the alkaloids extracted by vigorously shaking with 15 c.c. (or sufficient to make the liquid distinctly acid) of Normal Volumetric Sulphuric Acid Solution. The lower acid liquid is drawn off after the two layers have been separated, and the Ether-chloroform solution is again shaken vigorously, with a mixture of 5 c.c. of Normal Sulphuric Acid and 5 c.c. of Water, after separation, the acid liquid is again removed, the shaking is repeated a third time, using 5 c.c. of Water only, and the aqueous liquid is removed. The mixed acid liquids are filtered into a graduated cylinder, the containing vessel and filter are washed with sufficient Water to bring the volume of the contents of the cylinder to 50 c.c., and this measured quantity is then divided into two equal portions of 25 c.c. each. No. 1 quantity of 25 c.c. is placed in a separator, is rendered alkaline by a sufficiency of Ammonia Solution, and the alkaloids removed by shaking carefully for 1 minute with a mixture of 3 volumes of Chloroform and 1 volume of Ether. The lower layer, after separation of the liquids is complete, is drawn off into a tared flask. The

contents of the separator are again shaken with 20 cc of a similar mixture of Chloroform and Ether for 1 minute, and this is followed by a third shaking with 10 cc of the Chloroform-ether mixture, the chloroformic liquids being in each case removed after the liquids have separated into two layers. The mixed Chloroform-ether solutions are evaporated to dryness on a water-bath, the dried residue is mixed with 3 cc of Ether, and again evaporated to dryness. It is then dried in an air-bath at a temperature of 110° C (230° F) until the weight remains constant. This weight multiplied by 20 indicates the percentage by weight of total Cinchona alkaloids. The second quantity of 25 cc is rendered alkaline with a sufficiency of Ammonia Solution, and shaken moderately for 2 minutes with 25 cc of Ether, the temperature of the liquid being maintained below 20° C (68° F), and the liquids allowed to stand for 10 minutes at 15° C (59° F). After separation of the two liquids the aqueous layer is removed and the ethereal solution is transferred to a tared flask. The separator is rinsed out with 5 cc of Ether and the washings added to the main quantity. The Ether is carefully evaporated on a water-bath, the flask and contents dried for 2 hours at a temperature of 110° C (230° F), cooled and weighed. The weight multiplied by 20 yields the percentage by weight of anhydrous Ether-soluble alkaloids. The *USP* adds a note to the effect that the Ether-soluble alkaloids include Quinine, Quinidine, and Cinchonidine.

The above process works well, is easily manipulated and yields the alkaloids in a very fair state of purity. Determinations carried out in the author's laboratory have shown an average of about 5.84 p.c. of total alkaloids and 4.32 p.c. of Ether-soluble alkaloids.

The *PG* describes a method for the determination of the percentage of total alkaloids, but gives no process by which the amount of Quinine and Cinchonidine may be judged. A qualitative test is introduced, which requires that 5 cc of the reserve portion remaining after the quantity for the volumetric determination has been removed, when mixed with 1 cc of Chlorine Water, shall, on the addition of Ammonia Water, yield a fine green coloration.

The process for the quantitative volumetric determination of the alkaloids is as follows:—A weighed quantity of 12 grammes of the finely powdered Bark dried at 100° C (212° F) is mixed in a well-stoppered flask or bottle with 90 grammes of Ether and 30 grammes of Chloroform, a measured quantity of 10 cc of Sodium Hydroxide solution (15 p.c.) is added, and with frequent intervals of vigorous shaking the mixture is allowed to stand for 3 hours. A measured quantity of 10 cc of Water, or sufficient to cause the powdered Bark to sink on shaking, is added, and after the Chloroform-ether solution has separated as a clear layer, a weighed quantity of 100 grammes is filtered through a dry well-covered filter into a flask, and half of the liquid distilled, the remainder is transferred to a separator, the flask is washed out with three successive quantities of 5 cc of a mixture of 3 parts by weight of Ether and 1 part by weight of Chloroform, and the alkaloids are extracted from the mixed Chloroform-ether liquids by agitation with 25 cc of Decinormal Volumetric

Hydrochloric Acid Solution The acid layer is drawn off after the liquids have completely separated and after sufficient Ether has been added to the mixture to cause the Chloroform ether layer to float on the acid liquid, it is filtered through a small paper moistened with Water, into a flask of 100 c c capacity. The extraction of the Chloroform-ether solution is thrice repeated, using 10 c c of Water for each extraction, and the separated aqueous liquids are passed through the same filter paper, the latter is washed with Water, and the mixed filtrates and washings are diluted to 100 c c. A measured quantity of 50 c c is removed, a freshly prepared solution of a small crystal of Hæmatoxylin in 1 c c of Alcohol (90 p c) added, and sufficient Deci-normal Volumetric Potassium Hydroxide Solution added to change the yellow colour to a bluish-violet, the mixture being shaken after each addition. Not more than 4.3 c c should be necessary. No factor is recorded by which the result of the above volumetric test may be calculated into its equivalent in alkaloids. Assuming that the mixture contains equal proportions of Quinine and Cinchonidine, a factor of 0.030931 may be employed, which indicates 5.07 p c of alkaloids. That the alkaloids are not always present in these proportions is evidenced by the observed discrepancies between the results of gravimetric and volumetric determinations. The new *Swiss Ph* states that 1 c c of Deci-normal Volumetric Hydrochloric Acid is equivalent to 30.4 mg of alkaloids.

The use of Hydrochloric Acid for the titration of Quinine instead of Sulphuric Acid eliminates the troublesome fluorescence which is produced when the alkaloid is taken into solution in the latter acid, and which may often seriously interfere with the end reaction. It must be borne in mind that the behaviour of Quinine towards certain indicators of neutrality is somewhat anomalous. With Hæmatoxylin or Cochineal the point of neutrality is reached with the formation of the Hydrochloride ($C_{20}H_{24}N_2O_2 \cdot HCl$), but this salt is alkaline in reaction towards Methyl Orange, and the point of neutrality with this indicator is only reached with the formation of the Acid Hydrochloride ($C_{20}H_{24}N_2O_2 \cdot 2HCl$). Thus, using Hæmatoxylin Solution as an indicator, 1 c c of Deci-normal Volumetric Hydrochloric Acid Solution is equivalent to 0.03218 gramme of anhydrous Quinine, whilst using Methyl Orange Solution 1 c c of the Deci-normal Volumetric Solution is equivalent to 0.01609 gramme of anhydrous Quinine. The behaviour of Cinchonine and Cinchonidine towards these indicators is still more anomalous. It may therefore be doubted whether the application of a purely volumetric method of determination is advisable, and the volumetric result should always be controlled by a gravimetric determination.

The ash varies from 2 to 4 p c.

. Preparations

EXTRACTUM CINCHONÆ LIQUIDUM. LIQUID EXTRACT OF CINCHONA

A dark reddish-brown liquid prepared from Red Cinchona Bark by treatment with Distilled Water acidulated with Hydrochloric Acid

and containing a small proportion of Glycerin, it is officially required to contain 5 p c w/v or 5 grains of Red Cinchona alkaloids in 110 minims, the *USP* Fluid Extract is required to contain 4 p c w/v or 4 grains of anhydrous Ether-soluble alkaloids in 110 minims. A fluid extract does not appear in the *PG*, which, however, has two solid extracts, an aqueous and an alcoholic

Dose—5 to 15 minims = 0.3 to 0.9 cc

22 minims contain 1 grain of alkaloids

Foreign Pharmacopœias—Official in Austri, Belg, Dan, Dutch, Jap, Mex, Norw, Swed, Swiss and U S, 1 in 1, Solid Extracts—Austri and Hung, Aqueous, Belg, Dutch, Ital, Jap, Mex, Russ, Span and Swiss, Alcoholic, Fr, Ger, Mex and Port, both Aqueous and Alcoholic. Belg has also Chinese Fluidextractum cum Kalio Iodati. Not in the others.

Tests—The specific gravities of commercial fluid extracts of Red Cinchona Bark vary between 1.100 and 1.150, the percentage w/v of total solids from 33.4 to 53.0 p c and the percentage w/v of total alkaloids from 4.6 to 5.46 p c. One commercial fluid extract, purchased as *BP*, assayed in the author's laboratory, possessed a specific gravity of 1.080, contained 27.5 p c w/v of total solids and only 2.6 p c of total alkaloids.

The *BP* adopts a standard of total alkaloids, the *USP* of anhydrous Ether-soluble alkaloids, the former Pharmacopœia requires a mixture of 3 parts by volume of Benzol and 1 part by volume of Amyl Alcohol for the initial extraction of the alkaloids, the latter a mixture of Ether and Chloroform.

The outlines of the official process are essentially as follows.—A measured quantity of 5 cc of the Liquid Extract is diluted with five times its volume of Water, introduced into a separator, rendered alkaline with 15 cc of Potassium Hydroxide Solution, and the liberated alkaloids extracted by well shaking the mixture with 30 cc of a mixture of 3 parts by volume of Benzol and 1 part by volume of Amyl Alcohol, the Benzol-Amyl Alcohol solution is transferred to another separator and the agitation repeated with another 30 cc of a similar mixture, the Benzol-Amyl Alcohol layer being again drawn off into the second separator, the mixed Benzol-Amyl Alcohol liquids are washed with a little Water, rejected, and the alkaloids extracted with 30 cc of a mixture of 1 volume of Diluted Hydrochloric Acid and 5 volumes of Water, the acid solution of the alkaloidal Hydrochlorides is separated, and the extraction repeated with a further 30 cc of a similar mixture of acid and Water. The mixed acid liquids are rendered strongly alkaline with Ammonia Solution, and the liberated alkaloids extracted by agitation with three successive quantities of 10 cc of Chloroform, the chloroformic layers are each in turn separated, mixed, transferred to a weighed dish, the Chloroform is evaporated off, and the residue dried at 110° C (230° F). This weight multiplied by 10 gives the percentage by volume of total alkaloids present in the sample. The *BP* process is stated (*YBP* '05, 362) to give rise to obstinate emulsions, which may be overcome by using 10 cc alcoholic, in place of 15 cc of aqueous, Potassium Hydroxide solution. A suggestion

is also made to weigh instead of to measure the quantity of Liquid Extract

The *USP* process is carried out on the following lines — A measured quantity of 10 c c of the Fluid Extract is introduced into an Erlenmayer flask, rendered alkaline by the addition of 10 c c of Ammonia Solution, and the alkaloids extracted by shaking vigorously for 10 minutes with a mixture of 100 c c of Ether and 25 c c of Chloroform. 66 c c of the clear supernatant liquid is transferred to a separator, the vessel in which the liquid is measured being washed out with 5 c c of Ether, which is in turn added to the contents of the separator. The alkaloids are then removed from the Ether-Chloroform solution by shaking it vigorously for several minutes with a sufficiency (10 c c) of Normal Volumetric Sulphuric Acid Solution, and the acid layer is transferred into another separator. The complete extraction of the alkaloids from the Chloroform-Ether solution is ensured by a further extraction with 5 c c of Normal Volumetric Sulphuric Solution and 5 c c of Water, which is in turn followed by an extraction with 5 c c of Water. The acid aqueous and the aqueous liquids are separated, mixed with the acid layer already contained in the second separator, the temperature of the mixed liquids being maintained below 25° C (77° F), 25 c c of Ether added and sufficient Ammonia Solution to yield an alkaline reaction to red Litmus paper, after vigorous agitation for 2 minutes the temperature is reduced to below 15° C (59° F), and the liquids allowed to stand for 10 minutes at that temperature. The ethereal layer is separated, transferred to a tared flask, the separator washed with 5 c c of Ether, the washings being added to the main quantity, and the Ether evaporated at a moderate heat on a water-bath, the residue being dried for half an hour in an air bath at 110° C (230° F), cooled and weighed, the heating being repeated and the weight taken when constant. The weight of this residue multiplied by 20 gives the percentage w/v of anhydrous Ether-soluble alkaloids present in the Fluid Extract.

The process has been tried in the author's laboratory, and works well, the resulting alkaloids are fairly free from colour, the average percentage of anhydrous Ether-soluble alkaloids in commercial Fluid Extracts was found to be 4.5 p c.

INFUSUM CINCHONÆ ACIDUM ACID INFUSION OF CINCHONA.

Red Cinchona Bark, 1, Aromatic Sulphuric Acid, $\frac{1}{4}$, Distilled Water, boiling, 20, infuse for one hour, and strain (1 in 20)

Dose — $\frac{1}{2}$ to 1 fl oz = 14.2 to 28.4 c c

Foreign Pharmacopœias — Official in Russ (C Rubra), 1 in 8, with Phosphoric Acid, Fr (Tisanne), 1 in 50, Span, 1 in 33 $\frac{1}{2}$, with Acidum Sulphuricum Alcoholisatum. Not in the others.

TINCTURA CINCHONÆ TINCTURE OF CINCHONA

A clear reddish or brownish-red liquid, prepared by treating red Cinchona bark, in No 40 powder, with sufficient Alcohol (70 p c) to form a tincture which shall contain not less than 0.95 nor more than

1.05 pc w/v of total alkaloids The *USP* Tincture is required to contain 0.75 pc w/v anhydrous Ether-soluble alkaloids The *PG* tincture is calculated to contain about 1 pc w/v of total alkaloids

Dose— $\frac{1}{2}$ to 1 fl drm = 1.8 to 3.6 cc

22 minims contain $\frac{1}{2}$ grain of alkaloids

Foreign Pharmacopœias—Official in Fr, Teinture de Quinquina Rouge, Dan, Noiw, Russ and Swed, Tinctura Chinæ (from any species), Dutch and Ger, Tinctura Chinæ, and Hung, Tinctura Chinæ Simplex (from *C. Succirubra*), Ital, Tinctura di China, Jap, Tinct Chinæ, Mex, Tintura de Quina, Port, Tintura de Quina (from *C. Flava*), Span, Tintura Alcoholica de Quina (from *C. Calisaya* and *C. Loja*), Swiss, Tinctura Cinchonæ, U.S., Tinctura Cinchona (*C. any species not Red*), all 1 in 5, and all by weight, except U.S. Not in Aust. Belg (*C. various species, especially Succirubra*), contains 1 pc w/v total Alkaloids, including at least 0.2 pc Quinine U.S., Cinchona (*USP*), in No. 60, Glycerin, 75, and sufficient of a mixture of Alcohol (95 pc) 675, 250, to produce 1000 by percolation, containing 0.75 pc w/v Ether-soluble Alkaloids

Tests—Tincture of Cinchona has a specific gravity of 0.915 to 0.920, contains from 3.5 to 8.5 pc w/v of total solids and from 62.5 to 66.5 pc w/v of Absolute Alcohol The *BP* requires that 10 cc of Tincture, when assayed to the process described in the large type under *Extractum Cinchonæ Liquidum*, shall yield not less than 0.095 gramme nor more than 0.105 gramme of alkaloids The *USP* standardises the Tincture to a percentage w/v of anhydrous Ether-soluble alkaloids A measured quantity (50 cc) of the Tincture is evaporated to about one-fifth its volume on a water-bath, the liquid transferred to a bottle of about 180 cc capacity, the dish rinsed with 10 cc of diluted Alcohol, and the determination completed as in the case of the fluid extract The weight of anhydrous Ether-soluble alkaloids obtained, multiplied by 4, shows the percentage w/v present in the Tincture

TINCTURA CINCHONÆ COMPOSITA. COMPOUND TINCTURE CINCHONA

A brownish-red liquid possessing an aromatic odour and bitter taste, which is officially required to contain not less than 0.45 nor more than 0.55 pc w/v of the total alkaloids of Red Cinchona Bark, when assayed as described below The Compound Tinctures official in the *USP* and *PG* are prepared from Red Cinchona Bark containing the official percentage of alkaloids required by each Pharmacopœia, but the alkaloidal content is not verified by a determination See also below

Tincture of Cinchona, 20 fl oz, Dried Bitter-Orange Peel, well bruised, 2 oz, Serpentry Rhizome, in No. 40 powder, 1 oz, Cochineal, in powder, 56 grains, Saffron, 110 grains, Alcohol (70 pc), q s to yield 40 fl oz

Made with standardised Tincture of Cinchona instead of the Red Cinchona Bark ordered in the previous edition of *BP*

Dose— $\frac{1}{2}$ to 1 fl drm = 1.8 to 3.6 cc.

22 minims contain $\frac{1}{2}$ grain of alkaloids.

Foreign Pharmacopœias—Official in Austr, Ger, Hung, Jap and Russ, Tinct Chinæ Comp, also Swiss (Tinct Cinch Co), with Cinchona, Gentian, Orange Peel and Cinnamon (various strengths), Belg (Tinct Whyttii or Tinct Huxham), Cinchona, Orange Peel, Cinnamon and Saffron Dan, Dutch, Norw and Swed (Tinct Chinæ Comp), similar to the above but without Cinnamon, Mex (Tintura de Quina Compuesta), and Span (Tinctura Alcoholica de Corteza de Naranja Compuesta, Tintura corroborante de Whytt), Bitter Orange Peel, Cinchona and Gentian, Port (Tinct de Quina Comp), Cinchona, Orange Peel and Serpentry, U S, Red Cinchona (*USP*), 100, Bitter Orange Peel, 80, Serpentry, 20, Glycerin, 75, and sufficient of a mixture of Alcohol (95 p c) 675, with Water 250, to produce 1000 by percolation Not in Fr

Huxham's Tincture of Bark (Original Formula in 1788)—Powdered Peruvian Bark, 4 oz, Orange Peel, 8 oz, Serpentry Root, 80 grains, Saffron, 160 grains, Cochineal, 80 grains, Brandy, 40 fl oz, digest 3 or 4 days

Tests—Compound Tincture of Cinchona possesses a specific gravity of 0.910 to 0.920, contains about 5 p c w/v of total solids and about 63.0 p c w/v of Absolute Alcohol. A measured quantity of 10 cc, when assayed by the official process as outlined in the large type under *Extractum Cinchonæ Liquidum*, should yield an amount of alkaloids corresponding to not less than 0.45 nor more than 0.55 p c w/v of total alkaloids. Neither the *USP* nor the *PG* gives a process for the determination of the alkaloids, the presence of the soluble principles from the other constituents of the Tincture invalidating the results.

The residue obtained by the evaporation to dryness of 2 cc of the *BP* Compound Tincture should impart a yellow colour to Chloroform, and if the chloroformic solution be filtered and evaporated to dryness, the residue when moistened with a drop of concentrated Sulphuric Acid will acquire a beautiful indigo-blue tint, indicating the presence of Saffron. The *USP* and *PG* Compound Tinctures are made from Red Cinchona Bark, and do not contain Saffron.

Not Official.

DECOCTUM CINCHONÆ—Red Cinchona Bark, in No. 20 powder, 1½, Distilled Water, 20, boil 10 minutes, when cold, strain, and pour on the marc sufficient Water to make 20 (1 in 16)

Dose—1 to 2 fl oz = 28.4 to 56.8 cc

Official in Belg, 1 of Fluid Extract in 10, Dan, 1 in 8 with Hydrochloric Acid, Dutch, 6 in 100, Ital, 1 in 20, Norw and Swed, 1 in 10 with Hydrochloric Acid, Port, Cinchona Flava 1 in 10, also Fusca 1 in 10, Russ, Cinchona Rubra, 1 in 7.5, containing Sulphuric Acid, Span, Cocimento de Quina Calisaya and Cocimento de Quina de Loja, each about 1 in 66, also Cocimento de Quina y Valeriana and Cocimento Antiseptico, Dan and Norw have a Dec Chinæ c Senega

ELIXIR CINCHONÆ (*USNF* 1896)—Tincture of Cinchona, 12, Syrup, 10, Glycerin, 10, Aromatic Elixir, 48. Each fl oz represents about 14 grains of Yellow Cinchona. A similar preparation is made with Detannated Tincture of Cinchona for use in combination with preparations of Iron.

This has been adopted by the *BPC*, but in the latest edition of *USNF* (1906) the preparation is made with the alkaloids, and not with Tincture of Cinchona.

MISTURA CINCHONÆ (*for children*)—Diluted Nitric Acid, 30 minims, Tincture of Cinchona, 2 fl drms, Glycerin, 1 fl drms, Distilled Water, to 1½ fl oz
—*Middlesea*

Dose—1 to 2 fl drms

MISTURA CINCHONÆ ACIDA—Liquid Extract of Cinchona, 10 minims, Diluted Nitric Acid, 10 minims, Aromatic Syrup, 80 minims, Water, to 1 fl oz —*St Thomas's*

This formula has been incorporated in the *B P C*

Liquid Extract of Cinchona, 10 minims, Diluted Nitric Acid, 10 minims, Aromatic Syrup, 60 minims, Water, to 1 fl oz —*Brompton*

Other hospitals include *Mistura Cinchonæ Acida*, but they are made with *Decoctum Cinchonæ*

SIROP DE QUINQUINA—Percolate 1000 of Red Cinchona in No 26 powder with 1000 of Alcohol (80 p c), displacing with Water to obtain 1000 of percolate, distil off 445 and dissolve in the residue when cold 1000 of Sugar —*Fr.*

TINCTURA CHINÆ COMPOSITA—Cinchona Bark, 6, Orange Peel, 2, Gentian Root, 2, Cinnamon Bark, 1, Diluted Spirit (60 p c), 50 —*Ger*

VINUM CHINÆ (*Ger* and *Jap*)—Dissolve Gelatin, 1, in warm Water, 10, mix with Sherry, 1000, add powdered Cinchona Bark, 40, allow to stand for eight days at 15° to 20° C Press, and to the expressed liquor add Sugar, 100, Tincture of Orange, 2, allow to stand in a cool place for fourteen days, and filter.

Austr, Vinum Chinæ—Dissolve 1 of Gelatin in 20 of boiling Water, and mix with 780 of Malaga Wine, after 24 hours, add 50 of Fluid Extract of Cinchona, 50 of Tincture of Orange, and 100 of Clarified Honey

Belg, Chinæ Vinum—1 of Fluid Extract in 50 of stronger Wine

Fr, Vin de Quinquina Officinal—Cinchona, 25, Alcohol (60 p c), 75, Dilute Hydrochloric Acid, 2, Red Wine, 920

Dutch, Vinum Chinæ—1 Cinchona Succirubra percolated with a mixture of 1 of diluted Alcohol, 4 of Malaga Wine, and 8 of Water *g s* to produce 40, in which dissolve 10 of Sugar

Hung, Vinum Chinæ—Extract of Cinchona, 1, Malaga Wine, 80, Simple Tincture of Cinchona, 20

Ital, Vino Chinato—Cinchona, 1, Marsala Wine, 30

Mex, Vino de Quina—Cinchona, 8, Sherry Wine, 100

Norw, Vinum Chinæ—Cinchona, 50, Citric Acid, 1, Alcohol, 20, Malaga Wine 1000

Russ, Vinum Chinæ—Tincture of Cinchona, 1, Sherry Wine, 4

Port, Vino de Quina—Cinchona flavum, 1, Port Wine, 20, Vinho de Quina Cinzenta, Cinchona fuscum, 1, Madeira Wine, 10, Vinho de Quina Composto, Cinchona flavum, 4, Gentian, 1, Bitter-Orange Peel, 1, Port Wine, 100, Vinho de Quina Ferruginoso, Iron and Potassium Tartrate, 1, Vinho de Quina Cinzenta, 200

Span, Vino de Quina—Loja Bark, 1, Sherry Wine, 16 6, Vino de Quina Ferruginoso, Crystallised Ferrous Sulphate and Citric Acid, of each, 1, Distilled Water, 10, Quinine Wine, 500

Swiss, Vinum Cinchonæ—80 of Fluid Extract, 20 of diluted Alcohol, 40 of Milk, 1 of Citric Acid, 910 of Malaga Wine

B P C, Vinum Cinchonæ—Elixir Cinchona, 1, Detannated Sherry, to make 8

Dutch, Vinum Chinæ Feriatum—1 of Ferri *r* h Ammonium Citrate, dissolved in 4 of Water, and added to 95

Austr, Vinum Chinæ Feriatum—1 of Gelatin, dissolved in 20 of boiling Water, is added to 955 of Malaga Wine, after 24 hours, add 5 of Iron and Quinine Citrate dissolved in 20 of Water

Norw Vinum Chinæ Feriatum—Iron and Ammonium Citrate, 1, Cinchona Wine, 100

Swed, Vinum Chinæ Feriatum—Iron and Quinine Citrate, 1, Syrup, 10, Marsala Wine, 89

B P C, Vinum Cinchonæ Ferratum.—Iron and *r* h C, 1, Cinchona Wine, 200

CINCHONIDINÆ HYDROBROMIDUM ($C_{10}H_{12}N_2O$, HBr , H_2O , eq. 990 28) —Long, light yellow, odourless prismatic crystals, possessing a very bitter taste It contains 71 23 p c of Cinchonidine and 4 58 p c of Water Soluble 1

in 40 of Water Under the name of 'Blennostasine,' a combination similar to this has been introduced for the treatment of affections characterised by catarrhal hypersecretion

Tests—An aqueous solution of the salt yields with Potassium Sodium Tartrate solution a white precipitate soluble in diluted Hydrochloric Acid, with Ammonia Solution it yields a white precipitate soluble in Chloroform The aqueous layer when separated from the Chloroform and rendered faintly acid with Nitric Acid yields with Silver Nitrate Solution a yellowish curdy precipitate soluble with difficulty in Ammonia Solution, insoluble in Nitric Acid

When ignited with free access of air 0.5 gramme of the salt should leave no weighable residue

An aqueous solution should yield no precipitate on the addition of a solution containing a soluble Sulphate

CINCHONIDINÆ HYDROBROMIDUM ACIDUM ($C_{16}H_{19}N_2O$, $2HBr$, $2H_2O$, eq. 488.51)—Light yellow prismatic crystals, readily soluble in Water It should contain 59.78 p.c. of Cinchonidine and 7.32 p.c. of Water

Tests—An aqueous solution of the acid salt responds to tests described under Cinchonidine Hydrobromide

The aqueous solution should yield no precipitate on the addition of a solution of a soluble Sulphate

When ignited with free access of air 0.5 gramme of the salt should leave no weighable residue

CINCHONIDINÆ SULPHAS ($C_{16}H_{19}N_2O$, H_2SO_4 , $3H_2O$, eq. 735.08)—Colourless, odourless, silky, acicular crystals, having a very bitter taste It contains 79.46 p.c. of Cinchonidine and 7.29 p.c. of Water

In doses of one and a half to twice those of Quinine, is stated to form a reliable substitute and frequently to be better tolerated —*P*, lxxiii 682

Solubility—1 in 100 of Water, 1 in 60 of Alcohol (90 p.c.), insoluble in Chloroform and Ether

Dose—1 to 10 grains = 0.06 to 0.65 gramme

Foreign Pharmacopœias—Official in Fr. and U.S. Not in the others

The salt is capable of forming a number of Hydrates, according to the strength of solutions from which it is crystallised From a moderately concentrated solution it crystallises with $6H_2O$, from a hot concentrated solution it crystallises with $3H_2O$ The formula for the salt official in the *French Codex* (1908) shows 6 molecules of Water of crystallisation, which is equivalent to 13.6 p.c. of Water It contains 74.06 p.c. of Cinchonidine

Tests—Cinchonidine Sulphate loses its Water at $100^\circ C$ ($212^\circ F$), and the anhydrous salt reabsorbs moisture on exposure to moist air It has a melting point of 205° to $206^\circ C$ (401° to $402.8^\circ F$), slightly below which temperature it darkens in colour An aqueous solution of the salt is neutral in reaction towards Litmus paper, and yields on the addition of Ammonia Solution a white precipitate, only slightly soluble in an excess of the reagent, but soluble in Ether, a portion of the salt subsequently crystallising out Another portion of the aqueous solution, acidified with diluted Hydrochloric Acid, yields with Barium Chloride Solution a white precipitate insoluble in Hydrochloric or Nitric Acids

The more generally occurring impurities are excess of Water, readily carbonisable organic impurities, Quinine or Quinidine Sulphates, Cinchonine Sulphate, and mineral matter Excess of Water is readily detected by the loss of weight of the specimen at a temperature of $100^\circ C$ ($212^\circ F$) The theoretical percentage of Water in the $3H_2O$ salt is 7.29 p.c. The salt should not lose more than 8 p.c. when dried at this temperature The $6H_2O$ salt of the *Fr. Codex* (1908) loses 13.6 p.c. Readily carbonisable organic impurities may be detected by the behaviour of the salt when treated with concentrated Sulphuric Acid, a pure specimen should not become more than faintly coloured, Quinine or Quinidine Sulphates may be detected by the marked fluorescence produced in a 1 in 1000 solution of the salt by diluted Sulphuric Acid, not more than a faint blue fluorescence should be noticed, Cinchonine Sulphate may be detected by precipitating the Cinchonidine as an insoluble Tartrate and testing the filtrate with

a drop of Ammonia Solution A weighed quantity of 0.5 gramme is macerated at 15° C. (59° F.), with 20 c.c. of Water, 0.5 gramme of Potassium Sodium Tartrate is added and the maceration continued with intervals of 10 minutes for 1 hour, the temperature being maintained at 15° C. (59° F.) A drop of Ammonia Solution added to the filtered liquid should not produce more than a slight turbidity. This test also serves to detect Quinidine Sulphate. Mineral matter may be detected by the residue left on ignition, the salt should leave no weighable residue when ignited with free access of air.

CINCHONINÆ IODO-SULPHAS (Antiseptol) —A brown, or reddish-brown, odourless powder, insoluble in Water, soluble in Alcohol (90 p.c.), and in Chloroform. It contains about 50 p.c. of Iodine. Introduced as a substitute for Iodoform. Used in the form of a 1 in 8 ointment for lupus. Has also been given internally in doses of 1 to 5 grains = 0.06 to 0.32 gramme.

CINCHONINÆ SULPHAS ($C_{19}H_{22}N_2O_2$), $H_2SO_4 \cdot 2H_2O$, eq. 717.20 —Hard, white shining odourless, prismatic crystals, having a very bitter taste.

It is the sulphate of an alkaloid obtained from various species of Cinchona Bark. B.P. 1885 said from Cinchona and Remijna Bark. It contains theoretically 81.44 p.c. of Cinchonine and 4.98 p.c. of Water.

Solubility —1 in 70 of Water, 1 in 9 of Alcohol (90 p.c.), 1 in 60 of Chloroform, sparingly in Ether.

Dose —1 to 10 grains = 0.06 to 0.65 gramme.

Foreign Pharmacopœias —Official in Mex., Port. and U.S. Not in the others.

Tests —Cinchonine Sulphate when heated to 100° C. (212° F.) readily loses its Water of Crystallization, when rendered anhydrous at this temperature it melts at about 150° C. (302° F.). Its aqueous solution is neutral in reaction towards Litmus paper, and is dextrorotatory, and yields on the addition of Ammonia Solution a white precipitate. The aqueous solution when acidified with diluted Sulphuric Acid gives a white precipitate. Water added yields no green coloration on the addition of an excess of Ammonia Solution. The addition of Barium Chloride solution to an aqueous solution of the salt yields a white precipitate insoluble in Hydrochloric Acid. One part of the powdered anhydrous Sulphate should dissolve in 80 parts by weight of Chloroform.

The more generally occurring impurities are excess of moisture, Quinine or Quinidine or Cinchonidine Sulphate, readily carbonisable organic impurities and mineral matter. Excess of moisture is readily shown by the loss in weight of 1 gramme of the salt at 100° C. (212° F.) which should not amount to more than 5.0 p.c., the theoretical percentage as above indicated being 4.98 p.c., Quinine and Quinidine Sulphates produce a marked blue fluorescence in a 1 in 1000 solution of the salt in diluted Sulphuric Acid. Cinchonidine Sulphate is detected, and additional confirmation of the presence of Quinine is detected when 1 part of the anhydrous salt is treated with 80 parts by weight of Chloroform, anhydrous Cinchonine Sulphate will dissolve, anhydrous Cinchonidine Sulphates are insoluble in Chloroform, readily organic impurities may be detected by concentrated Sulphuric Acid, should not yield more than a pale yellow coloration, mineral matter may be detected by the residue left on ignition, the pure salt leaving no residue on incineration.

Cinchonidinæ Sulphas Acidus and Cinchoninæ Sulphas Acidus are also known. These salts are more readily soluble in Water.

Cinchonidinæ Salicylas and **Styracis Salicylas** have been used, the former as a tonic and antiperiodic, the latter as a prophylactic against malaria.

ACIDUM CHINICUM Chinic Acid, Kinic Acid, Quinic Acid, $C_7H_8O_6$, eq. 190.65 —Colourless, transparent, rhombic prisms or flat, crystalline masses, having a strongly acid but not a bitter taste.

Solubility —1 in $2\frac{1}{2}$ of Water, 1 in 42 of Alcohol (90 p.c.), insoluble in Ether.

Tests —Quinic Acid possesses a melting point of 161° to 162° C. (321.8° to 323.6° F.). Its aqueous solution is laevogyrate. A little of the powder

distilled with Manganese Dioxide and Sulphuric Acid yields Quinone, which condenses on the cool side of the tube in the form of deep yellow prisms. The acid may be titrated with Normal Volumetric Sodium Hydroxide Solution, using Phenolphthalein Solution as an indicator, a weighed quantity of 1 gramme of the acid should require about 5.2 c.c. of the Volumetric Solution corresponding to about 99 p.c. of pure Chinic Acid. It should leave no residue when ignited with free access of air.

It has been introduced in the treatment of the Uric Acid diathesis and in gout. It is more generally employed in the form of a salt, e.g., Lithium Quinate, *q.v.p.* 738.

Dose — 1 to 5 grains = 0.06 to 0.32 gramme

CINNAMOMI CORTEX.

CINNAMON BARK

FR, CANNELLE DE CEYLAN, GER, CHINESISCHER ZIMMT (CASSIA), ITAL, CANNELLA DEL CEYLAN, SPAN, CANELA DE CEYLAN

The dried inner Bark of shoots from the truncated stocks of *Cinnamomum Zeylanicum*. The bark from cultivated trees is alone official. Imported from Ceylon, and commercially known as Ceylon Cinnamon.

Medicinal Properties — Calminative, astringent, aromatic stimulant, and antiseptic, chiefly used as an adjuvant to other medicines, and as a flavouring agent. Often employed with Chalk in diarrhoea. An essence has been used as a prophylactic against influenza.

60 grain doses for dysentery — *B.M.J.* '95, 1 530, *L.* '95, 1 567. Has been lauded for cancer, but the majority of evidence is not in its favour — *M.A.* '95, 163.

Inhalation of Oil of Cinnamon in the treatment of consumption — *B.M.J.* '96, 11 1374.

The vapour of the Oil of Cinnamon exerted no retarding or inhibitive influence on the growth of the tubercle bacillus — *B.M.J.* '99, 1 203.

Dose — 10 to 20 grains = 0.65 to 1.3 gramme in powder

Official Preparations — Of the Bark, Aqua Cinnamomi, Oleum Cinnamomi, Pulvis Cinnamomi Compositus, and Tinctura Cinnamomi, used in the preparation of Decoctum Hæmatoxyli, Pulvis Catechu Compositus, Pulvis Cretæ Aromaticus, Pulvis Kino Compositus, Tinctura Cardamomi Composita, Tinctura Catechu, and Tinctura Lavandulæ Composita. Of the Water, Mistura Cretæ, Mistura Guaiaci, Mistura Olei Ricini, Mistura Spiritus Vini Gallici, Syrupus Aromaticus and Syrupus Cascariæ Aromaticus. Of the Oil, Spiritus Cinnamomi. Of the Compound Powder, Pilula Aloes et Ferri and Pilula Cambogiæ Composita. Of the Spirit, Acidum Sulphuricum Aromaticum.

Not Official — Pulvis Aromaticus, Tinctura Cinnamomi Composita, Tinctura Aromatica.

Foreign Pharmacopœias — Official in Austri, Dan, Dutch, Fr (Cannelle), Ital (Cannella), Mex (Canela), Norw, Port (Canella), and Swed use Ceylon Cinnamon only. Ger, Hung, Jap and Russ use Chinese Cinnamon or Cassia only. Belg, Span, Swiss and U.S. use both kinds.

Descriptive Notes — By the name of Cinnamon in this country the bark of *Cinnamomum Zeylanicum*, Breyn, imported from Ceylon, is understood. In Germany the Cortex Cinnamomi, official in the P.G., is the bark known as Cassia in this country, but as Chinese

Cinnamon in Germany and in the United States. In the *USP* the Ceylon Cinnamon is official as *Cinnamomum Zeylanicum*, but instead of Cassia or Chinese Cinnamon there is also official a kind known as Saigon Cinnamon, which is the bark of an undetermined species of *Cinnamomum*. Of the Cinnamon tree about six varieties are cultivated in Ceylon, and the different grades are distinguished by being packed in rolls of quills of different sizes, the more slender the rolls the better the quality, therefore the limit of size given in the *BP* $\frac{3}{8}$ inch (9 mm) in diameter indicates the quality intended. The scrapings of the tips of the shoots and the broken fragments of quills have been regularly imported into Europe since 1867 under the name of 'Cinnamon chips' and have been used for the distillation of the oil. The thick trunk bark is sometimes offered in commerce, but has very little aroma, and probably finds its way into the cheaper kinds of mixed spice. Cassia bark in powder is sometimes substituted for that of Cinnamon, but it may be detected by the different flavour, and under the microscope by the presence of cork cells, which are absent from Cinnamon, by the larger and broader bast fibres, and the larger starch grains. Cassia bark is known to drug brokers under the name of 'Cassia lignea' to distinguish it from 'Cassia vera,' which is a hard mucilaginous bark derived from *Cinnamomum Burmanni*, DC, with an allied but different odour, and apparently imported from Padang in Sumatra. Chinese Cassia occurs in small quills 2 to 3 inches (5 to 7.5 cm) long made into packets of about 12 inches (30 cm) long and 3 inches (7.5 cm) in diameter, Cassia vera in quills 12 to 15 inches (30 to 37.5 cm) or more in length, Saigon Cassia, which goes chiefly to the United States, occurs in quills 3 to 4 inches (7.5 to 10 cm) long, and has a more intensely sweet taste and stronger flavour. The *PG* directs that Cassia should not have a mucilaginous taste and that the medullary rays are usually only 2 cells thick, thus excluding the Padang Cassia vera. Other species of Cassia imported into this country may be distinguished under the microscope even in powdered form, see *Museum Report, Pharm Soc* 1903, pp. 50, 51. Some commercial samples of powdered Cinnamon apparently contain a large proportion of Cinnamon bark that has been distilled.

Tests.—Cinnamon Bark leaves on incineration about 4 p.c. of ash, and 6 p.c. is seldom exceeded. Eight samples examined in the author's laboratory gave from 2.8 to 4.26 p.c., with an average of 3.5 p.c., 6 samples of the powder gave from 4.32 to 5.2 p.c., with an average of 4.74 p.c. The *USP* gives not over 4 p.c. No limit of ash is given in the *BP*.

Preparations

AQUA CINNAMOMI. CINNAMON WATER

CINNAMON BARK, bruised, 1, Water, 20, distil 10 (1 in 10)

The distilled 'Aqua' is very turbid from suspended Oil. There is no recognised rule in dispensing as to whether it should be filtered or not, but it is customary to do so.

Dose —1 to 2 fl oz = 28 4 to 56 8 c c

Foreign Pharmacopœias —Official in Austr, Belg, Dan, Dutch, Ger, Jap, Russ, Swed and Swiss, 1 in 10, Fr (Eau de Cannelle), 1 in 5, Ital (Acqua dist di Cannelle) Mex (Agua destilada de Canela), 1 in 4, Hung, 1 in 5, also Aqua Cinnamomi Spirituosa, 3 in 10, Port, 1 in 8, Span (Agua destilada de Canela) C 270, Water 2000, Alcohol (90 p c) 100, distil 1200 Norw and U S, made with Oil 1 in 500

Tests —An approximate idea of the amount of oxidation of the Cinnamic Aldehyde which has occurred may be obtained by acidifying a measured quantity with 25 p c Sulphuric Acid Solution and adding Deci-normal Volumetric Potassium Permanganate Solution till the fluid acquires a pink coloration, remaining permanent for several seconds. The amount of Cinnamic Acid may be determined by titration with Deci-normal Volumetric Sodium Hydroxide Solution. 10 c c of a freshly Distilled Water will require from 12 to 14 c c of the Deci-normal Volumetric Potassium Permanganate Solution, and about 0 1 c c of the Deci-normal Volumetric Sodium Hydroxide Solution, a Water which has been distilled and stocked for some time may require only 4 c c of the Permanganate Solution and about 1 5 c c of the Deci-normal Volumetric Sodium Hydroxide Solution.

OLEUM CINNAMOMI OIL OF CINNAMON

FR, ESSENCE DE CANNELLE DE CEYLAN, GER, ZIMMTEL (CASSIA), ITAL, ESSENZA DI CANNELLA, SPAN, ESENCIA DE CANELA

A light yellow liquid, obtained by distillation from Cinnamon Bark, and possessing the agreeable, delicate, aromatic odour of the Ceylon Cinnamon, and a spicy, sweet, burning taste. It darkens in colour by exposure to light and air. It should be kept in dark amber-tinted, well-closed glass bottles, and protected as far as possible from the air and light.

It usually contains 65 to 75 p c of Cinnamic Aldehyde, from 4 to 8 p c of Eugenol, and some Phellandrene. Yield of oil is about 0 5 to 1 p c.

Cinnamic Acid, an oxidised product of the oil, is described under Acidum Cinnamicum, p 39.

Solubility —10 in 3 of Alcohol (90 p c), 1 in 45 of Alcohol (60 p c)

Medicinal Properties —Possesses the aromatic and antiseptic properties of Cinnamon Bark, without its astringency. It is a powerful local stimulant when administered internally.

Of late years the medicinal virtues of Cinnamon have received a good deal of attention. The Oil has already been used as an inhalation in phthisis. It has been shown in the Bradshaw Lecture on the treatment of enteric fever (*B M J* '04, ii 1451, '05, i 414) that 2½ minims doses given at the commencement, followed by increasing doses up to 5 minims, have given favourable results. An appreciable, though slight, inhibitory influence on the growth of typhoid bacillus begins to be exerted by the oil in a dilution of about 1 in 2600, and when the strength approaches 1 in 1000 its antiseptic effect is complete. The quality of the drug must be above reproach.

Dose —½ to 3 minims = 0 03 to 0 18 c c

In pill or on Sugar

Foreign Pharmacopœias—Official in Dutch, Fr, Ital, Mex (Acete Volatil de Canela), Port and Span use Oil of Cinnamon, Dan, Ger, Hung, Jap, Norw, Swiss and U S use Oil of Cassia Austr and Swed, Cinnamalum (Cinnamic Aldehyde) in place of Oil of Cassia, U S, Cinnaldehydum as well as Oil of Cassia, Belg, Oils of Cinnamon and of Cassia

Tests—Cinnamon Oil should possess a specific gravity of from 1.023 to 1.040, the official figures are from 1.025 to 1.038. Optically it is almost inactive, the rotation not varying more than 1° in a tube of 100 mm. It should dissolve to form a clear solution in 2 parts by weight of Alcohol (70 p c). It is officially required to show the absence of more than 50 p c of non-aldehydic constituents as determined by well shaking a measured quantity of 10 c c with 5 times its volume of a boiling Sodium Hydrogen Sulphite Solution (30 p c), the oily layer which separates being required to measure when cooled to 15.5°C (60°F), not more than 5 c c. The official test is unsatisfactory, and the directions quite inadequate. The Sodium Hydrogen Sulphite Solution should be added in small portions at a time, and care should be taken to heat after each addition until the solid compound liquefies. The oil official in the *BP* is that derived from Ceylon Cinnamon, that of the *USP* and *PG* from Cassia Cinnamon. The *BP* oil should contain not more than 50 p c of non-aldehydic constituents, the *USP* not less than 75 p c, and the *PG* not less than 70 p c of Cinnamic Aldehyde. A determination of the percentage of Cinnamic Aldehyde present in a specimen may be made by the process given under the tests for Oil of Cassia.

The chief adulterant of Cinnamon Oil is oil distilled from Cinnamon leaf. It may be qualitatively detected by dissolving a measured quantity of the oil in 5 times its volume of Alcohol (90 p c), and adding a few drops of Ferric Chloride Test-solution, no decided blue coloration should be produced. If present in quantity it would cause an increase in the specific gravity, the percentage of Cinnamic Aldehyde would be lowered, and the Eugenol content increased. The percentage of Eugenol may be determined approximately by treating the oil with a 5 p c Potassium Hydroxide solution and measuring the diminution in volume. If more accurate results are desired, the Eugenol may be determined by conversion into Benzoyl-eugenol as described in the tests under *Oleum Caryophylli*.

The tests of the *USP* and *PG* are compared under Oil of Cassia.

PULVIS CINNAMOMI COMPOSITUS. COMPOUND POWDER OF CINNAMON *BP Syn*—PULVIS AROMATICUS

Cinnamon Bark, 1, Cardamom Seeds, 1, Ginger, 1, all in powder (1 in 3)

Dose.—10 to 40 grains = 0.65 to 2.6 grammes

Foreign Pharmacopœias—Official in Port (Pó de Canella Comp), Cinnamon 7, Cardamoms 7, Ginger 6, Pulvis Aromaticus, Dutch same as Brit, Swiss, Cinnamon 1, Cardamoms 1, Ginger 1, Sugar 7, U S, Cinnamon 7, Ginger 7, Cardamoms 3, Nutmeg 3. Not in the others.

SPIRITUS CINNAMOMI. SPIRIT OF CINNAMON

Oil of Cinnamon, 1, Alcohol (90 p c), *q s* to yield 10

B P 1885 was 1 in 50

Dose—5 to 20 minims = 0.3 to 1.2 c c

Foreign Pharmacopœias—Official in Belg, 1 in 100, Jap, Cassia Oil 1 in 50, U S, 1 in 10, Dutch, Ital, Mex and Port (distilled from the Bark). Not in the others

Tests—Spirit of Cinnamon has a specific gravity of from 0.850 to 0.855, it leaves about 0.24 p c w/v of residue on evaporation over a water-bath, this residue, when dissolved in Alcohol (90 p c) yields a green coloration on the addition of Ferric Chloride Test-solution

TINCTURA CINNAMOMI TINCTURE OF CINNAMON

1 of Cinnamon Bark, in No 40 powder, percolated with Alcohol (70 p c), to yield 5

B P 1885 was 1 in 8, with Rectified Spirit

Dose— $\frac{1}{2}$ to 1 fl drm = 1.8 to 3.6 c c

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U S, 1 in 5, all by weight except U S

Tests—Tincture of Cinnamon has a specific gravity of from 0.898 to 0.906, contains from 1.8 to 3.0 p c w/v of total solids and from 65 to 69 p c w/v of Absolute Alcohol

Not Official.

PULVIS AROMATICUS (*B P* 1864)—Cinnamon 4, Nutmeg 3, Saffron 8, Cloves $1\frac{1}{2}$, Cardamoms 1, Refined Sugar 25

This has been incorporated in the *B P C* as follows —

Pulvis Aromaticus Compositus—Cinnamon Bark 10.66, Nutmeg 8, Saffron 8, Cloves 4, Cardamom Seeds 2.66, Refined Sugar 66.66

TINCTURA CINNAMOMI COMPOSITA (*P L*)—Cinnamon, 1 oz, Cardamoms, $\frac{1}{2}$ oz, Long Pepper, $2\frac{1}{2}$ drm, Ginger, $2\frac{1}{2}$ drm, Proof Spirit, 40 fl oz

This has been incorporated in the *B P C* as follows —Cinnamon Bark, bruised, 2.50, Cardamom Seeds, bruised, 1.25, Long Pepper, bruised, 1, Ginger, bruised, 1, Alcohol (60 p c), sufficient to produce 100

Port (*Tinctura di Canella Composta*), Cinnamon 10, Cardamoms 4, Cloves 4, Ginger 4, Alcohol (85 p c) 100

TINCTURA AROMATICA (*Ger, Russ and Swiss*)—Cinnamon Root, in coarse powder, 5, Ginger, 2, Galangal Root, 1, Cloves, 1, Cardamoms, 1, Diluted Alcohol, 50

Ger use 60 p c, *Russ* 70 p c, and *Swiss* 68 to 69 p c Alcohol

Austr, same form but with Zedoary Root in place of Galangal Root

Dan and *Norw*, Cinnamon, 4, Ginger, Galangal Root, Cloves and Cardamoms, of each 1, Alcohol (68 p c), 40

Jap, Cloves 2, Cinnamon 10, Cardamoms 2, Ginger 5, Alcohol (68 p c) 100, extract in the cold for 7 days, press, filter, to the filtrate add Spirit of Lemon 5

COCÆ FOLIA.

COCA LEAVES

FR, FEUILLE DE COCA, GER, COCABLATTER, ITAL, FOGLIA DI COCA, SPAN, COCA DEL PERU (HOJADE)

The dried leaves of *Erythroxylum Coca*, and its varieties

Coca leaves contain an amount of alkaloids varying from 0 to 1.5 p c. The average amount is about 0.5 p c. The leaves frequently contain very little alkaloid, owing to the alkaloids readily undergoing decomposition when the leaves are exposed to heat and moisture. The amount of Cocaine in a good sample of leaves is about 70 p c or even less of the total alkaloids. The leaves official in the *U S P* are required to yield not less than 0.5 p c of the Ether-soluble alkaloids of Coca, those official in the new *Swiss Ph* a minimum content of 0.7 p c of alkaloids.

Medicinal Properties—A nerve and muscular tonic, stimulant and restorative. Useful during convalescence, in debility and nervous exhaustion, and to prevent fatigue. The leaves are chewed by the natives of Peru and Bolivia to sustain them during the day, that they may defer eating till the evening.

It has been recommended for the cure of the craving for Opium and for Alcohol, but the craving for Cocaine, which is acquired by the excessive use of Coca, is possibly worse than either.

Official Preparations—*Extractum Cocæ Liquidum*. Used in the preparation of Cocaine and Cocainæ Hydrochloridum.

Not Official.—*Elixir Cocæ*, *Extractum Cocæ*, *Tinctura Cocæ*, and *Vinum Cocæ*.

Foreign Pharmacopœias—Fr, Ital, Jap, Port and U S (*Coca*), Mex and Span (*Coca del Peru*), Swiss (*Folium Cocæ*). Not in the others.

Descriptive Notes.—The Coca leaves of commerce are of three varieties. The Bolivian or Huanuco, the Peruvian or Truxillo, and the Coca leaves cultivated in Java. The first are derived from *Erythroxylum Coca*, Lamarck, and the second from a plant which has been named by Rusby, *Erythroxylum Truxillense*. The third is described by botanists as derived from *E Spruceanum*, Burck. The Bolivian leaves are oval, dark olive green when fresh, with a dark mid-rib, and are usually not broken. The Peruvian are thinner, pale green, oblanceolate and narrower, and are generally much broken. The Java leaves are more lanceolate, darker green, and the mid-rib is reddish towards the base. The leaves as they arrive in commerce vary in size and quality. In the *B P* the size of the Bolivian is defined as $1\frac{1}{2}$ to 3 inches (37 to 75 mm) long and 1 to $1\frac{1}{2}$ inches (25 to 37 mm) in breadth, and oval, but the Peruvian leaves are only described as smaller, narrower, and more brittle than the Bolivian. They are, however, different in shape, being more or less oblanceolate and more tapering towards the base. The Java leaves are not described in the *B.P*. In the Bolivian Coca the mid-rib has a prominent ridge on its upper surface which is not present in the Peruvian. The lateral lines, formed of collenchyma, where

the leaf is folded when young, are more prominent in the Bolivian than in the other varieties. Under the microscope the characteristic features are the papillose polygonal cells of the under surface, the papillæ presenting the appearance of a circle in the centre of each cell, the pericyclic fibres, the prismatic crystals, and the stomata between two narrow cells parallel with the guard cells. Coca leaves for use in pharmacy should not smell or taste mouldy, and should produce a slightly numbing effect on the tongue. They lose alkaloids if exposed to damp, or if not carefully dried.

Tests—Coca Leaves of the *BP* are not required to yield any definite percentage of alkaloids, and no method of determination is given. The *USP* method is carried out on the following lines—A weighed quantity of 10 grammes of the leaves in No 60 powder is transferred to an Erlenmeyer flask and allowed to soak for 10 minutes in 50 c c of a mixture of 1 part by volume of Chloroform and 4 parts by volume of Ether. After the addition of a mixture of 2 c c of Ammonia Solution and 3 c c of Water, the flask is set aside for one hour, with intervals of frequent shaking. The contents of the flask are then transferred to a small percolator having a Cotton-Wool plug packed in the neck and connected with a separator containing a mixture of 6 c c of Normal Volumetric Sulphuric Acid Solution and 20 c c of Water. The leaves are packed into the percolator with a glass rod after the liquid has passed through, the flask is washed with 10 c c of the Chloroform-Ether mixture and the residue in the flask transferred to the percolator with several successive portions of 5 c c of the Chloroform-Ether mixture, and percolation continued with this menstruum, using in all 50 c c. The alkaloids are now removed from the Chloroform-Ether solution by shaking the separator vigorously, and the acid layer removed after complete separation. The Chloroform-Ether is shaken a second and a third time with 10 c c of a similar mixture of Sulphuric Acid and Water, the mixed acid liquids are transferred to a second separator, rendered distinctly alkaline with Ammonia Solution, and the liberated alkaloids shaken out first with 25 c c, then with 20 c c, and finally with 15 c c of Ether. The mixed ethereal solutions are evaporated on a water bath at a gentle heat, the residue dissolved in 3 c c of Ether and the Ether again evaporated. The residue is dissolved in 4 c c of Decinormal Volumetric Sulphuric Acid Solution, and the excess of acid is titrated with Fiftieth-normal Volumetric Potassium Hydroxide Solution, using 5 drops of Cochineal or Iodeosin Test Solution as an indicator of neutrality. If the number of c c of Fiftieth-normal Solution required be divided by 5, the quotient subtracted from 4, and the remainder multiplied first by 0.03 and then by 10, the product will represent the p c of Ether-soluble alkaloids present in the leaves.

The ash of Coca Leaves amounts to from 6 to 8 p c.

Preparation

EXTRACTUM COCÆ LIQUIDUM. LIQUID EXTRACT OF COCA
Percolate 20 of Coca Leaves in powder with Alcohol (60 p c)

until the drug is exhausted. Reserve the first 15 of percolate and evaporate remainder at a temperature below 80° C (176° F) to a soft extract, which dissolve in the reserved portion, and add Alcohol (60 p c), *q s* to yield 20 (1 in 1)

Note—As the Coca Leaves would be but imperfectly exhausted by the first 15 parts of the Alcohol, and as the active constituents are damaged or destroyed by heat, a fluid extract prepared by repercolation is much to be preferred. When thus prepared from carefully dried green leaves it contains 25 p c of solid Extract (dried at 212° F)

Dose.— $\frac{1}{2}$ to 1 fl ðim = 1 8 to 3 6 c c

Foreign Pharmacopœias—Official in Fr, Mex, Swiss and US. Not in the others

A dark green fluid extract prepared from Coca leaves. The *BP* product is not standardised, the *USP* preparation is required to contain 0 5 p c w/v of the Ether-soluble alkaloids of Coca, the *PG* does not contain a Fluid Extract

Tests—Fluid Extract of Coca possesses a specific gravity of 0 990 to 1 030, yields about 19 0 p c w/v of total solids, and contains about 50 p c w/v of Absolute Alcohol. The *BP* does not include a process for the determination of the alkaloids, the *USP* gives a method of determining the Ether-soluble alkaloids, the essential features of which are as follows.—A measured quantity of 10 c c of the fluid is introduced into a separator, rendered alkaline by the addition of 2 c c. of Ammonia Solution, and the alkaloids extracted by shaking for 1 minute with 25 c c of Ether. The separated aqueous liquid is shaken with a further quantity of 20 c c of Ether, the aqueous portion separated, the mixed ethereal solutions are shaken well for 1 minute with a mixture of 5 c c of Normal Volumetric Sulphuric Acid Solution and 5 c c of Distilled Water, the extraction being repeated with a mixture of 1 c c of Normal Volumetric Sulphuric Acid Solution and 9 c c of Water, the acid liquids in each case being separated and transferred to a second separator. Sufficient Ammonia Solution is now added to render the liquid distinctly alkaline, and the liberated alkaloids are shaken out with 20 c c of Ether, the extraction being completed with two further quantities each of 15 c c of Ether. The separated ethereal solutions are mixed, transferred to a 100 c c flask, the Ether evaporated and the residue dried. It is dissolved in 5 c c of Deci-normal Volumetric Sulphuric Acid Solution, and the excess of acid is titrated with Fiftieth-normal Volumetric Potassium Hydroxide Solution, using Cochineal or Iodocarmine Test Solution as an indicator of neutrality. If the number of c c of Fiftieth-normal Solution required be divided by 5, the quotient subtracted from 5, the difference multiplied first by 0 03 and then by 10, the product will represent the percentage w/v of the Ether-soluble alkaloids of Coca present in the sample. The average results of the examination by a special process, given in the reference, of 7 samples of Liquid Extract prepared by the official process and 7 'miscible' Liquid Extracts is recorded as 0 02, 1 421. The average yield of the 'official' samples was 0 38 p c, and they varied from 0 20 p c w/v to 0 816 p c w/v; the 'miscible' 0 091 p c of alkaloid, and they

valued from 0.014 to 0.294 p.c. w/v. A specimen of commercial 'miscible' Liquid Extract examined in the author's laboratory by the *U.S.P.* process showed 0.465 p.c. of alkaloids.

Not Official

EXTRACTUM COCÆ —A solid alcoholic green extract, prepared from carefully dried leaves.

Dose —2 to 10 grains = 0.13 to 0.65 gramme, in pills, pastils, or lozenges.

Foreign Pharmacopœias —Official in *Fr.* Codex, *Ital.* and *Span.* Not in the others.

ELIXIR COCÆ —Coca Leaves, 1, Simple Elixir, 6 —*Martindale*

Miscible Liquid Extract of Coca, 16.5, Simple Elixir to make 100 —*B.P.C.*

The Miscible Liquid Extract of Coca is 100 of *B.P.* Liquid Extract evaporated to 50, decanted from the deposit, which is washed with 10 of Water, the washings mixed with the concentrated fluid, and finally made up with Alcohol (60 p.c.) to 100.

TINCTURA COCÆ —Coca Leaves, 1, Alcohol (60 p.c.), 5 —*Fr.* and *Ital.*

Swiss, the same quantities, but with Alcohol (68 to 69 p.c.) All by weight.

This has been incorporated in the *B.P.C.* with Alcohol (60 p.c.) by measure.

VINUM COCÆ *Syn.* VIN DE COCA (*Fr.*) —Dried Leaves of Coca, 6, Vin de Malaga, 100, macerate for 10 days, and filter.

Wine of Coca can also be made by adding an equivalent quantity of the Liquid Extract to Wine.

Coca Wine, if sufficiently weak to be used as a beverage, requires a wine licence. The Excise has drawn the line at Wines containing $\frac{1}{2}$ grain of alkaloid to the oz., which would be at least twice as strong as the above.

Foreign Pharmacopœias —Official in *Fr.*, 6 in 100, *Mex.*, 3 in 100, *Span.*, 1 in 33 $\frac{1}{2}$, *Swiss.*, 1 of Fluid Extract in 20. *U.S.* about 1 in 15. Not in the others.

Elixir of Coca, 1, Detannated Sherry, to make 8 —*B.P.C.*

COCAINA.

COCAINE

METHYL-BENZOYL ECGONINE

$C_{17}H_{21}NO_4$, eq. 300.93

Large, colourless, odourless, monoclinic prisms, having a bitter taste, followed by anæsthesia of the mucous membrane. It is an alkaloid obtained from the leaves of *Erythroxylum Coca*, and its varieties.

Solubility —About 1 in 1300 of Water (Paul), 1 in 10 of Alcohol (90 p.c.), 1 in 50 of Olive Oil, 1 in 4 of Oleic Acid, 2 in 1 of Chloroform, 1 in 4 of Ether, 1 in 14 of Oil of Turpentine. Insoluble in Glycerin.

These figures have been incorporated in the *B.P.C.*

Official Preparation —Unguentum Cocainæ.

Not Official —Guttæ Cocainæ Oleosæ, Nebulæ Cocainæ Compositæ, Nebulæ Cocainæ Oleosæ, Oleatum Cocainæ, Unguentum Cocainæ, Unguentum Suprarenalin et Cocainæ.

Foreign Pharmacopœias —Official in *Fr.*, *Mex.*, *Span.* and *U.S.* Not in the others.

Tests—The *diagnostic* tests for Cocaine are the melting point, which should be 98°C ($208\ 4^{\circ}\text{F}$)—*B P* says 96° to 98°C (204.8° to $208\ 4^{\circ}\text{F}$), *USP* 98°C ($208\ 4^{\circ}\text{F}$), *Fr Codex* (1908) 98°C ($208\ 4^{\circ}\text{F}$)—the laevorotatory nature of its solutions, the alkaline reaction of its aqueous solution towards Litmus and Methyl Orange Solutions, the marked anæsthesia which it produces on the mucous membrane, and its mydriatic effect on the pupil of the eye. When exactly neutralised with Hydrochloric Acid the solution yields with Potassium Permanganate Solution a purple-violet precipitate, possessing a very characteristic microscopic appearance. This crystallisation takes place best in a solution of about 5 p.c. strength. When a crystal is moistened with one or two drops of fuming Nitric Acid, evaporated to dryness on a water-bath, and the residue moistened with a few drops of an alcoholic Potassium Hydroxide Solution, a peculiar characteristic fruity odour is produced. This test is characteristic of Cocaine, no other alkaloid extracted by Benzene from an ammoniacal solution behaving at all similarly. The salts of Cocaine are neutral to most indicators of neutrality, and the pure alkaloid may therefore be readily determined by titration with Normal or Deci-normal Volumetric Hydrochloric Acid Solution, 1 c.c. of Normal Acid representing 0.30093 grammes of the pure alkaloid. Iodocin or Cochineal Solution is the most suitable indicator for the purpose.

The impurities likely to be present in the alkaloid are also those more generally examined for in the Hydrochloride, and the methods by which they may be detected will be found under Cocaine Hydrochloride. Cocaine readily undergoes hydrolysis, and aqueous solutions are decomposed even on boiling, the decomposition being greatly facilitated by the presence of acid. The *B P* states, 'its solution in water acidulated with Hydrochloric Acid and the dry salt obtained on evaporating this solution afford the reactions mentioned under Cocaine Hydrochloride', the *B P C* has construed this expression into 'when its solution in Hydrochloric Acid is evaporated to dryness, the residue should respond to the tests given under Cocaine Hydrochloride', the *USP*, evidently with a view to minimising the amount of decomposition taking place, requires that it an alcoholic solution of Cocaine be carefully neutralised with Hydrochloric Acid and the solution evaporated to dryness, the residue should respond to the reactions and tests given under the Hydrochloride.

A solution of the alkaloid in water acidified with Nitric Acid should yield no opalescence or precipitate with either Silver Nitrate or Barium Chloride Solution. The alkaloid should yield no weighable residue on ignition. Only the Hydrochloride is official in the *L G*.

Preparation

UNGUENTUM COCAINÆ. COCAINE OINTMENT

Dissolve 1 of Cocaine in 4 (by weight) of Oleic Acid at a gentle heat, and mix with 20 of Lard. (1 in 25)

Oleatum Cocainæ—Cocaine, 5, Alcohol, 5, Oleic Acid, 50, Olive Oil, *q s* to produce 100—*U S*

Guttæ Cocainæ Oleosæ—Cocaine, 8 grains, Castor Oil, 1 oz—*St George's*

Not Official

NEBULA COCAINÆ COMPOSITA—Cocaine, 2 grains, Menthol, 4 grains, Eucalyptus Oil, 6 minims, Camphor, 4 grains, Spray Oil, 1 fl oz—*Bournemouth Formulary*

Nebula Eucalypti et Mentholis et Cocainæ, B P C, closely resembles the above—Cocaine, 0.5, Menthol, 1, Oil of Eucalyptus, 1.25, Camphor, 1, Liquid Paraffin, to produce 100

A modification of the above appears in the *B P C Supplement* as follows—**Nebula Cocainæ Composita**—Compound cocaine spray is prepared by dissolving 0.415 of Cocaine in sufficient compound Menthol and Thymol spray to produce 100

NEBULA COCAINÆ OLEOSA—Cocaine, 25 grains, Oil of Sweet Almonds, 1 fl oz Dissolve by heat—*Central Throat*

UNGUENTUM COCAINÆ—Cocaine, 2 grains, Soft Paraffin, 100 grains—*London Ophthalmic*

The title for this in *St Thomas's* and *B P C* is **Unguentum Cocainæ Dilutum** (pro oculis) The Cocaine should be finely powdered and rubbed with a small quantity of the Soft Paraffin, the remainder added, and dissolved with the aid of a gentle heat

Unguentum Cocainæ (Ophthalmic)—Cocaine Hydrochloride, 8 grains, Soft Paraffin, to 1 oz—*London*

UNGUENTUM ATROPINÆ ET COCAINÆ—*See Atropine*

UNGUENTUM SUPRARENALIN ET COCAINÆ—Suprarenalin, $\frac{1}{2}$ grain, Boric Acid, 1 grain, Cocaine Hydrochloride, 5 grains, Distilled Water, 15 minims, Hydrous Lanoline, 250 grains, Vaseline, 250 grains—*Bournemouth Formulary*

This has been incorporated in the *B P C* under the title **Unguentum Adreninæ et Cocainæ**, employing Adrenine

COCAINÆ HYDROCHLORIDUM.

COCAINE HYDROCHLORIDE

HYDROCHLORATE OF COCAINE—*B P '85*

FR CHLORHYDRATE DE COCAINE, GER, COCAINHYDROCHLORID, ITAL,
CLORIDATO DI COCAINA, SPAN, CLORURO DE COCAINA

Colourless, odourless, transparent, prismatic crystals, or acicular crystals, or a white glistening crystalline powder Taste slightly bitter, producing upon the tongue a tingling sensation followed by numbness of some minutes' duration

Solubility—2 in 1 of Water, 1 in $2\frac{1}{2}$ of Alcohol (90 p c), 1 in $2\frac{1}{2}$ of Glycerin, about 1 in 20 of Chloroform, almost insoluble in Ether, insoluble in fixed Oils

Medicinal Properties—Local anæsthetic, mydriatic Has been largely used for producing local anæsthesia in examinations of and operations on the eye and throat, and in dentistry ($\frac{1}{4}$ to $\frac{1}{2}$ grain

being injected into the gum), 2 p c solutions being used for the eye and 20 p c for the throat. It is used locally in producing anæsthesia of other mucous membranes, as the urethra, vagina, nose and rectum; in the form of spray containing $\frac{1}{2}$ to 2 p c, with or without other medicaments such as Adrenalin 1 in 5000, in aqueous solution, or $\frac{1}{2}$ p c of Cocaine with 1 p c of Menthol in Liquid Paraffin (see also p 772), in the form of Bougies, Pessaries, or Suppositories containing $\frac{1}{2}$ grain of the salt in each with Oil of Theobroma. Anæsthesia of the deeper seated tissues for minor operations is produced by local infiltration of Cocaine, combined generally, with Adrenalin. Injected locally for sciatica and for neuralgia. It has been used successfully as a preventive of seasickness, in doses of $\frac{1}{4}$ to 1 grain in solution, and in doses of $\frac{1}{8}$ grain every half-hour in the vomiting of pregnancy. As an ointment it is used in painful skin diseases, as shingles, in facial neuralgia and in pruritus.

Pastilles are made of various strengths from $\frac{1}{30}$ to $\frac{1}{8}$ grain in each, usually $\frac{1}{10}$ or $\frac{1}{15}$ grain. It is also supplied in granular effervescent form containing Cocaine Hydrochloride $\frac{1}{30}$, $\frac{1}{10}$, $\frac{1}{5}$, $\frac{1}{4}$ grain in each teaspoonful.

Hypodermic Tablets are supplied containing $\frac{1}{10}$, $\frac{1}{5}$, $\frac{1}{4}$, $\frac{1}{2}$ grain, also Cocaine Hydrochloride $\frac{1}{10}$ grain, Homatropine Hydrobromide $\frac{1}{10}$ grain, in each.

Hypodermic solutions are used containing 4 to 10 p c of the salt.

For external application in neuralgia, 10 or 20 p c solution of the alkaloid in Oil of Cloves, and a weaker solution 5 p c for toothache and earache. Cocaine applied on Lint or Cotton-Wool to a rigid os uteri is followed by m.

—*B M J* '98, ii 1874, '00, i 1340

In pertussis, dose $\frac{1}{10}$ grain three times daily for infants, increasing it according to the age, $\frac{1}{8}$ grain being given to children of 5 or 6 years —*L* '95, i 1429, *B M J E* '95, ii 28.

Combined with Opium in the internal treatment of cancerous disease —*B M J* '96, ii 718.

Four cases in which toxic symptoms have followed anæsthesia of the throat —*B M J E* '96, ii 95.

Used with a laryngeal syringe, shown (*B M J* '04, ii 1221) to be a satisfactory method of producing local anæsthesia during operation on the larynx.

Uncertain as a mydriatic, and cannot be relied upon to produce maximum dilatation of the pupil —*B M J* '99, ii 775.

As a method of the usual method of using Cocaine in operation upon the eye (*B M J* '04, ii 1303), an ointment has been advocated in combating photophobia (*B M J* '04, ii 1301), being stated not to produce desiccation of the corneal epithelium.

In cocainisation of the spinal canal, 2 c c of a freshly prepared sterilised 2 p c solution ($\frac{1}{2}$ grain), and the quantity should not be exceeded or toxic symptoms may result. Cocainisation following operation is checked by Phenacetin in 10-grain capsules or Hyoscine Hydrobromide —*L* '02, i 912, 1051.

$\frac{1}{2}$ -grain doses into spinal canal, preceded in some cases by hypodermic injection of 10 minims Liquor Strychninæ —*L* '02, ii 864.

Injection of Cocaine into the nerve-trunks about their point of division before an operation, and the administration of Morphine before it, tend to prevent shock (*L* '05, ii 579). For the induction of spinal anæsthesia in the treatment of Strychnine poisoning and of tetanus, 1 or 2 c c of a 1 p c solution of Cocaine Hydrochloride is injected into the spinal subdural space. Not more than $\frac{1}{8}$ grain should be injected at once, and it is well to commence with a much smaller quantity.

1 or 2 c c of a 3 p c solution of Eucaine B Hydrochloride may be used. The solution may be sterilised by boiling without loss of activity. Cocaine, and unpleasant or dangerous effects particularly have been used —*L* '05, ii 887.

Several fresh communications on the useful combination of Cocaine and Adrenalin have been made. The combined use is shown (*B M J E* '04, ii 60) to cause increase of the analgesic property and to lessen toxic effect. Solution recommended, 10 c c of a 1 in 200 Cocaine Hydrochloride Solution, 10 minims of a 1 in 1000 Adrenalin Solution. Their separate use has sometimes been advocated (*B M J* '04, ii 1227) in operation on the larynx, the Cocaine being used as a spray, a more diffuse effect being required. Adrenalin Solution has been used locally, its application being most desired where bleeding is taking place.

Suggested as probable that in the long run weaker solutions than 2 p c, say 1 in 100 to 1 in 400, will be used for intraspinal injection of Cocaine. The use of Eucaine suggested instead of Cocaine on account of its lesser toxicity and greater stability during sterilisation by heat—*L* '01, i 187.

Lumbar injections of 0.1 gramme (= $\frac{1}{10}$ grain) during labour—*L* '01, ii 365, 645.

The physiological effects of cocainisation of the spinal canal—*L* '01, ii 1280.

Dangers of anaesthesia by injection of Cocaine into the spinal canal—*L* '01, i 975.

An objection to the lumbar method of producing anaesthesia being employed as a routine practice on a large scale is the poisonous and treacherous character of the drug hitherto used, viz, Cocaine—*B M J* '07, ii 869.

For local anaesthesia in the extraction of teeth, the best results are obtained with 1 p c solution of Cocaine combined with 5 p c of Adrenalin Chloride. Danger of syncope and other accidents from Cocaine, due in most cases to carelessness or ignorance in the method, the same amount of Cocaine is more dangerous in a concentrated than in a weaker solution—*B M J* '07, i 895.

Use of 10 p c solution for extraction of teeth strongly deprecated, 1 p c solution perfectly effective, dose should never exceed 1 grain—*B M J* '07, i 788, 848. Death from urethral injection of 3 grains—*B M J* '06, ii 868.

Cocaine intoxication and its demoralising effects—*B M J* '02, i 1020, 1041.

Dose— $\frac{1}{10}$ to $\frac{1}{2}$ grain = 0.01 to 0.03 gramme.

Ph Ger maximum single dose, 0.05 gramme, maximum daily dose, 0.15 gramme.

Prescribing Notes—*Unless a preservative be used, solutions should be freshly prepared to prevent the development of a fungus. As solutions of Cocaine are damaged by heat, they must not be sterilised by boiling. Salicylic Acid is the best, if not the only effectual preservative for aqueous solutions of Cocaine, but it is very irritating to the eye. As Borax is incompatible with this salt, an equivalent quantity of Boric Acid should be prescribed.*

Incompatibles—Alkalis and alkaline Carbonates, Borax, Carbolic Acid, Mercurous and Mercuric Chlorides, and the majority of soluble Silver salts.

Official Preparations—Injectio Cocainæ Hypodermica, and Lamellæ Cocainæ. Used in the preparation of Trochiscus Krameriae et Cocainæ.

Not Official—Guttæ Cocainæ Hydrochloridi, Nebula Cocainæ, Pastillus Cocainæ, Pastillus Cocainæ et Morphinae, Trochisci Cocainæ, Trochisci Cocainæ et Morphinae, Cocainæ Citras, Cocainæ Hydrobromidum, Cocainæ Lactas, Cocainæ Nitrates, Cocainæ Oleas, Cocainæ Phenylas, Cocainæ Salicylas, Cocainæ Sulphas, Eucaine, Eucaine Hydrochloride, Eucaine Lactate, Orthoform, Orthoform Hydrochloride, Benzoyl-Pseudotropine, Holocaine, Holocaine Hydrochloride, Acoine Nirvanin, Nervocidine, Alypin, Novocaine, Stovaine.

Antidotes—Inhalation of Nitrite of Amyl—*B M J* '87, i 625, 695, 1401, 88, i 757. Strychnine and Digitalin—*L* '98, i 718.

Foreign Pharmacopœias—Official in Austr., Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Norw., Russ., Span., Swed., Swiss and U.S. Not in the others.

Tests—Cocaine Hydrochloride possesses a melting point according to the *B.P.* of from 180° to 186° C (356° to 366.8° F), the *U.S.P.* states 189° C (372.2° F), mentioning that the presence of minute quantities of impurities may reduce the melting point to

180° C. (356° F), or even less, the *Fr Codex* (1908) gives 186° C (366 8° F), the *PG* gives 183° C (361 4° F) It should be perfectly free from colour, should be readily and completely soluble 2 in 1 of Water, forming a perfectly colourless solution, which should be absolutely neutral to Litmus paper Its solutions are laevogyrate Its aqueous solution yields with Ammonium Carbonate Solution and with Potassium, Sodium, or Ammonium Hydroxide Solution a white precipitate, amorphous when precipitated from strong solutions, but rapidly becoming crystalline If this precipitate be dissolved in Ether, the ethereal solution separated, and the Ether carefully evaporated, the residue should respond to the distinctive tests given in the large type under 'Cocaine' The salt should dissolve without change of colour in pure concentrated Sulphuric Acid or in pure Nitric Acid On warming its solution in the former acid, it chars, at the same time evolving an agreeable aromatic odour, and yielding a crystalline sublimate of Benzoic Acid Its aqueous solution affords, with Potassio-mercuric Iodide (Mayer's) Solution, a white precipitate, precipitation occurring even in very dilute solution, with Auric Chloride Solution, a yellow precipitate, with Sodium Bichlorate Solution, a white precipitate, with Picric Acid Solution, a yellow precipitate, rapidly becoming crystalline, with Mercuric Chloride Test Solution, slightly acidulated with Hydrochloric Acid, a white precipitate soluble in hot Water, with Platinic Chloride Solution, a yellow crystalline precipitate, with Palladous Chloride Solution (5 p c), followed by the addition of Chlorine Water, a red precipitate, with Chromic Acid Solution or with Potassium Bichromate Solution, followed by the addition of Hydrochloric Acid, a yellow crystalline precipitate An aqueous solution of the salt should yield with Silver Nitrate Solution a curdy white precipitate, insoluble in Nitric Acid, and which, when filtered and washed is readily soluble in Ammonia Solution or in Potassium Cyanide Solution

A mixture of equal parts of the salt and Mercuric Chloride is blackened when moistened with diluted Alcohol

Iodine or Iodo-potassium Iodide (Wagner's) Solution precipitates Cocaine from its aqueous solutions, in very dilute solution the precipitate appears of a rose colour, in stronger solutions, brown Upon the reaction of Cocaine with Iodine solution has been founded (*PJ* '01, 1553, '01, 222, *JSCI* '01, 1031, *JCS Trans*, '01, 675) a process for the determination of Cocaine The Cocaine solution should contain about 1 gramme of the alkaloid in the form of a salt in 100 cc The Deci-normal Volumetric Iodine Solution should be added in excess, and the excess of Volumetric Iodine Solution titrated with Deci-normal Volumetric Sodium Thio-sulphate Solution Cocaine can be fairly accurately determined by this method, in the presence of Ecgonine, but not in the presence of Benzoyl Ecgonine As, however, neither Ecgonine nor Benzoyl Ecgonine are extracted from aqueous alkaline solution by Petroleum Ether or Ether, a method of separation is available Cocaine is readily extracted by these immiscible solvents Assuming the production of Cocaine Di-iodo-hydriodide as a result of the reaction, one

molecular quantity of Cocaine is necessary for each molecular quantity of Iodine used

The more generally occurring impurities are Cinnamyl-Cocaine, Cocamine and other products derived from Cocaine, amorphous alkaloids, Sulphates, excess of moisture, and mineral matter. A great deal of controversy has raged round the tests adopted for the detection of these impurities. As a test for the presence of Cinnamyl-Cocaine, Cocamine and other products derived from Cocaine, the *BP* utilises the Permanganate Test. An excess of Potassium Permanganate Solution is added to a 1 p c solution of the Cocaine salt, when a copious red precipitate is produced, which is required not to undergo any alteration in colour within an hour. It is not clear how the *BP* proposes to observe the alteration in colour of the red crystalline precipitate in the presence of an excess of Potassium Permanganate Solution. The value of results yielded by the Potassium Permanganate Test depends entirely upon the method of carrying it out, and the conditions appear to have been completely misinterpreted, the test as officially described is therefore worthless. The Cocaine solution requires to be of such a dilution that Cocaine Permanganate is not precipitated, and the Potassium Permanganate Solution requires to be sufficiently weak to just colour the liquid. The test may be well applied as follows — Dissolve 0.1 gramme of the salt in 5 c c of Water acidulated with 3 drops of Diluted Sulphuric Acid and add 0.5 c c of a 1 in 1000 Potassium Permanganate Solution. The colour should not disappear within an hour. The *USP* test is on similar lines to the above, but 3 drops of Deci-normal Volumetric Potassium Permanganate Solution are used, and the violet colour which is produced should not fade in half an hour. The *PG* uses 5 drops of Potassium Permanganate Solution (0.1 p c w/w), and states that when protected from dust no perceptible decolorisation should occur in half an hour.

According to Paul and Cownley, the most efficient test for ascertaining the purity of the salt for medicinal purposes is MacLagan's Test. 1 grain of the salt is dissolved in 2 fl oz of Water, 3 drops of Ammonia Solution (*BP*) added, and the mixture stirred briskly with a glass rod, within a few minutes a crystalline precipitate should be thrown down, leaving no turbidity in the supernatant liquid. The *BP* idea of the test is as follows — A weighed quantity of 0.1 gramme of the salt is dissolved in 100 c c of Water and 0.25 c c of Ammonia Solution added. It should afford a clear solution from which a crystalline deposit should gradually separate on stirring. The quantities given in the *BP* translated into the terms of MacLagan's Test indicate 0.86 grain of the salt in 2 fl oz of Water and 5 drops of Ammonia Solution, or 1 grain of the salt in a little over 2½ oz of Water and 5 drops of Ammonia Solution, it will therefore be observed that the proportions are not strictly maintained. The *USP* maintains the same relative proportions of Cocaine salt to Water as in MacLagan's Test, but uses 4 instead of 3 drops of Ammonia Solution, and specifies 15 minutes as a limit of time for the appearance of the crystalline precipitate, the mixture

should be vigorously stirred, and the sides of the beaker rubbed occasionally with the stirring rod. The *PG* adopts the same proportions of salt and Water as the *BP*, but after the addition of the Ammonia Solution allows the liquid to remain at rest for an hour, when no opalescence should be produced. The essential feature of the test is the strict maintenance of the original proportions.

Maclagan's Test has been subjected to a good deal of adverse criticism on the continent. Gunther (*CD* '99, i 457) claimed to have discovered a new base (Ethyl-benzoyl-ecgonine), possessing a melting point of 110° to 111° C (230° to 231° F), and to have shown that the salts of Cocaine as generally found on the market, and as hitherto obtained, are not solely a compound of the alkaloid Cocaine with an individual acid, but that the Cocaine is associated with an isomeric alkaloid. The isomeric Hydrochloride gives the Maclagan's Ammonia reaction quickly and distinctly even in 1 in 2500 solution, whereas a 1 in 1000 Cocaine Hydrochloride solution does not give any crystallisation whatever on the addition of Ammonia Solution as prescribed by the test. He concludes, therefore, that the crystallisation is not due to the Cocaine at all, but to the isomeride. Although endeavours have been made (*PJ* '99, i 25) in various ways to obtain evidence of the existence of this high melting point base, no base having a melting point of 111° C (231° F) could be obtained, and only 0.00006 of a base melting at 104° to 108° C (219° to 222° F), which was quite insufficient to account for the crystalline precipitate in Maclagan's Test.

Notwithstanding the adverse criticism to which the Maclagan's Test has been subjected, it has been conclusively shown (*PJ* '98, i 449, 473, 586, '99, i 431, 523, 524, '99, ii 25, 66, *CD* '98, i 511, '99, i 897, *Merck's Annual Report*, '99, 51) that it affords the best guarantee of the purity of Cocaine Hydrochloride, and that any sample which does not satisfy the test should not be regarded as sufficiently pure for pharmaceutical purposes.

Schaefer (*CD* '99, i 591, *PJ* '99, i 336) formulates a new test depending upon the relative solubilities of Cocaine Chloride and the residual alkaloidal Chlorides in Water and in Water acidulated with Hydrochloric Acid. A weighed quantity of 0.05 gramme of the specimen is dissolved in 20 c.c. of Water, mixed with 5 c.c. of a 3 p.c. Chromic Acid solution, and 5 c.c. of a 10 p.c. Hydrochloric Acid Solution is added, the temperature being maintained at 15° C (59° F). If more than traces of foreign Coca-bases be present, the solution becomes at once cloudy, if the Cocaine Hydrochloride be pure, a clear solution will result.

A new alkaloid isomeric with Cocaine, and called by Schaefer, Cocainidine, is stated (*CD* '99, i 602, *PJ* '99, i 359) to have been found in Coca Leaves, and in commercial samples of Cocaine Hydrochloride. Schaefer's Chromic Acid Test has been critically examined in the author's laboratory (*CD* '99, i 641, 702). Six specimens of pure Cocaine Hydrochloride obtained from manufacturers of the highest repute were subjected to the test. All gave distinct turbidity, either immediately or after a few seconds. A specimen of Cocainidine

Hydrochloride was also examined, and gave a distinct turbidity at once. Dr Schaefer's Chromic Acid Test therefore produces a turbidity in solutions of the best commercial samples, and also of his Cocamidine Hydrochloride. The base obtained by treating an aqueous solution of Cocamidine Hydrochloride with Ammonia Solution, when washed, and dried over Sulphuric Acid, had the same melting point as the base obtained on similarly treating one of the best samples of Cocaine Hydrochloride, viz., 98°C (208.4°F).

It was subsequently mentioned (*CD* '99, 1 745) that the specimen of Cocamidine Hydrochloride submitted contained Isotropyl-Cocaine.

It has been demonstrated (*CD* '99, 1 897, *PJ* '99, 1 523) that the concentration of the Hydrochloric Acid plays an important part in the test, as does also the age of the Chromic Acid solution. The same sample of Hydrochloride gave a precipitate on the addition of 10 p c acid, but with 7.5 p c the solution remained clear, whilst another sample was satisfactory with 10 p c of acid, but precipitated with 12.5 p c. A freshly-prepared Chromic Acid solution, which remains quite clear when added to solution of the sample, after 24 to 48 hours' standing will produce a precipitate.

Schaefer endeavours (*PJ* '99, 1 66) to meet the criticisms which have been levelled against the test by stating that the finest commercial brands of Cocaine Hydrochloride answer the test satisfactorily. The Chromates of the amorphous alkaloids are far less soluble in solutions containing the higher percentage of Hydrochloric Acid. An acid of 10 p c was decided upon, and if the reaction is carried out with a stronger acid it is necessary to do so side by side with a specimen of chemically pure Cocaine, as at a low temperature Cocaine Chromate causes a turbidity in the more acid solution. His own experience fails to confirm Merck's remarks *re* the age of the Chromic Acid solution. The all-important feature of the test is that a temperature of 15°C (59°F) should be maintained. Notwithstanding this the value of the Chromate Test is generally held to be questionable, and there is no doubt that the MacLagan Test is far preferable. Cownley (*PJ* '99, 1 336, '99, 11 66) is of opinion that probably the only salt that would pass the test would be one prepared from synthetic Cocaine.

Both *USP* and *PG* includes a test with Chromic Acid Solution. The *USP* employs 5 c c of a 2 p c solution of the Cocaine salt, the *PG* a solution of 0.5 gramme of the alkaloidal Hydrochloride in 5 c c of Water, and both add 5 drops of a 5 p c Chromium Trioxide Solution. A yellow precipitate is produced, which redissolves on shaking the mixture, but is reprecipitated as a permanent orange-coloured crystalline precipitate on the addition of 1 c c of Hydrochloric Acid.

Messrs Zimmer and Co point out (*PJ* '99, 11 315) that a salt which does not give a crystalline precipitate by MacLagan's Test within 5 minutes should be rejected as being too impure, since the time required to obtain a precipitate serves as an index of purity.

The aqueous solution of Cocaine Hydrochloride when acidified with Diluted Hydrochloric Acid shall yield no opalescence or

precipitate with Barium Chloride Solution, indicating the absence of Sulphates

The formula given in the *B P* represents the anhydrous salt. It is officially required to lose not more than 1.0 p.c. of moisture as determined by drying a weighed quantity for 20 minutes at a temperature of 95° to 100° C (204° to 212° F), the *P G* states that it suffers no loss of weight at 100° C (212° F). The Brussels Convention recommends only the anhydrous salt should be recognised. The absence of mineral matter is at once detected by the residue left on a glass plate; no weighable residue should remain when 0.5 to 1 gramme of the salt is heated to redness with free access of air.

Preparations

INJECTIO COCAINÆ HYPODERMICA. HYPODERMIC INJECTION OF COCAINE

Dissolve $\frac{1}{2}$ gram of Salicylic Acid in 6 fl drms of boiled Distilled Water, add 33 grains of Cocaine Hydrochloride, dissolve, and if necessary add Distilled Water (recently boiled and cooled), *qs* to produce 6 fl drms (1 in 10)

Dose—By subcutaneous injection, 2 to 5 minims = 0.12 to 0.3 cc

11 minims contain 1 grain of Cocaine Hydrochloride

Foreign Pharmacopœias—Official in Mex and Span 1 in 100

LAMELLÆ COCAINÆ. DISCS OF COCAINE

Gelatin discs, containing $\frac{1}{100}$ grain of Cocaine Hydrochloride

Four times the strength of *B P* '85, which contained $\frac{1}{400}$ grain

Ophthalmic discs, each containing about 0.0005 gramme = $\frac{1}{2000}$ grain Cocaine Hydrochloride, are official in Ital Ph

They are also supplied containing Cocaine $\frac{1}{100}$ grain with Atropine $\frac{1}{1000}$ grain, Cocaine $\frac{1}{100}$ grain with Physostigmine $\frac{1}{1000}$ grain, and Cocaine $\frac{1}{100}$ grain with Homatropine $\frac{1}{100}$ grain

TROCHISCUS KRAMERIÆ ET COCAINÆ. See KRAMERIA

Not Official.

GUTTÆ COCAINÆ HYDROCHLORIDI—Cocaine Hydrochloride, 10 grains, Distilled Water, 1 fl oz—*London Ophthalmic*

NEBULA COCAINÆ—Cocaine Hydrochloride, 48 grains, saturated solution of Boracic Acid, 1 fl oz—*Central Throat*

PASTILLUS COCAINÆ— $\frac{1}{10}$ grain of Cocaine Hydrochloride in each (Throat), $\frac{1}{20}$ grain (*St Thomas's*). *Fr* has Tablettes de Chlorhydrate de Cocaine, each containing $\frac{1}{4}$ grain of Cocaine Hydrochloride

PASTILLUS COCAINÆ ET MORPHINÆ—Cocaine $\frac{1}{10}$ grain, Morphine Hydrochloride, $\frac{1}{30}$ grain—*Martindale*, incorporated in the *B P C*

Useful for coughs

TROCHISCI COCAINÆ.— $\frac{1}{10}$ grain—*Central Throat and Throat*

TROCHISCUS COCAINÆ ET MORPHINÆ—Cocaine Hydrochloride, $\frac{1}{20}$ grain, Morphine Hydrochloride $\frac{1}{40}$ grain—*St George's*

COCAINÆ CITRAS—Colourless, hygroscopic crystals, readily soluble in Water Used in dentistry

COCAINÆ HYDROBROMIDUM—Transparent prisms, soluble in Water

COCAINÆ LACTAS—A white semi solid, readily soluble in Water
Used as an injection in tubercular cystitis

COCAINÆ NITRAS—Large, tabular crystals, readily soluble in Water and in Alcohol (90 p c) Used in ophthalmic practice and in urethral surgery in conjunction with Silver Nitrate

Tests.—The aqueous solution yields the tests distinctive of Cocaine given under Cocaine and Cocaine Hydrochloride The aqueous solution decolorises Indigo Sulphate Solution containing an excess of Sulphuric Acid When a solution of Ferrous Sulphate is poured carefully upon a well-cooled mixture of equal parts of Sulphuric Acid and a solution of the salt, a brown or purple brown coloration is formed at the junction of the two fluids When warmed with Copper and Sulphuric Acid reddish-brown fumes are evolved It should leave no weighable residue when ignited with free access of air

COCAINÆ OLEAS—A crystallisable salt, insoluble in Water, soluble in Oleic Acid and fixed Oils Is useful when a salt of Cocaine is required in a fatty basis such as an ointment or suppository

COCAINÆ PHENYLAS (Cocaine Carbolate)—A yellow, or yellowish-brown, semi solid mass Insoluble in Water, soluble in Alcohol (90 p c) and in Ether Introduced as a local anæsthetic, analgesic and sedative Combined with Acetanilide it is stated to have been found useful in gastralgia in doses of $1\frac{1}{2}$ grains daily 1 drop of a 10 p c alcoholic solution of the salt has been found useful in conjunctival catarrh Has also been found useful in dentistry Owing to its insolubility is not so rapidly absorbed, and the action is more prolonged

Dose—Internally, $\frac{1}{12}$ to $\frac{1}{8}$ grain = 0.005 to 0.01 gramme

COCAINÆ SALICYLAS—Short, thick, somewhat deliquescent crystals, soluble 5 in 1 of Water, $2\frac{1}{2}$ in 1 of Alcohol (90 p c)

Dose— $\frac{1}{8}$ to $\frac{1}{2}$ grain = 0.01 to 0.032 gramme

Has been recommended hypodermically in asthma

Tests—Cocaine Salicylate dissolves readily in Water, the aqueous solution yields the reactions distinctive of Cocaine given under Cocaine and Cocaine Hydrochloride

The diluted aqueous solution yields with Ferric Chloride Test-solution a violet coloration

COCAINÆ SULPHAS—In prisms, or as a white, granular powder, soluble in Water

EUCAINÆ—Under this name two basic principles have been introduced
Eucaine (A) (Methylester of Benzoyl *n* methyl tetra methyl-gamma oxy piperidine carboxylic Acid) **Eucaine (B)** (Benzoyl vinyl di aceton alkaline) Synthetic products resembling Cocaine both in chemical and physiological action

Eucaine (B) is the base in general use It is insoluble in Water, but readily soluble in Alcohol (90 p c) and in Ether Soluble 1 in $1\frac{1}{2}$ of Aniline Oil

EUCAINÆ HYDROCHLORIDE—There are two salts bearing this name, marked A and B, and prepared from the corresponding bases Eucaine A and Eucaine B The B salt is that generally used in medicine, and it is the practice to dispense it when Eucaine Hydrochloride is ordered unless the A is specified.

Eucaine B Hydrochloride ($C_{15}H_{21}NO \cdot HCl$, eq 281.54)—A fine white odourless crystalline powder, possessing a bitter taste followed by a feeling of numbness of the tongue

Solubility—1 in 40 of Water, 1 in 12 of Alcohol (90 p c), 1 in 4 of Aniline Oil

Medicinal Properties—A powerful local anæsthetic It is not so generally effective as Cocaine, but is less toxic Solutions of Eucaine salts may be sterilised by boiling without undergoing decomposition

The B salt is superior to Eucaine Hydrochloride (A) for use in ophthalmic work, as it is free from the irritating effects of the latter, and is an equally powerful local anæsthetic. Used in 2 p.c. aqueous solution 2 drops applied every three minutes until 10 drops have been used.—*B M J* '97, i 184, '97, ii 1560, *L* '00, i 1106

A 2 p.c. solution recommended for hypodermic use, 40 minims in two doses of 20 minims each distributed over three or four places.—*L* '99, ii 552

5 to 8 p.c. usual strength of solution necessary to produce anæsthesia for minor surgical operations. Usual dose 20 minims, and as much as 120 minims used without unfavourable results.—*L* '99, i 137, '99, ii 318

10 to 15 minims of an approximately 5 p.c. solution made with equal parts of Aniline Oil and Alcohol (90 p.c.) for the production of local anæsthesia of the ear.—*L* '00, i 1125

Solution recommended by Baker.—Eucaine Hydrochloride B, 1, Sodium Chloride, 8, Sterilised Water, 1000, Injection of 10 c.c. As much as 10½ oz injected without any ill effects. Such an amount, however, rarely necessary. Powders containing sufficient of the two salts for two ordinary operations may be kept ready, and can be dissolved in the necessary quantity of water and boiled before use.—*L* '99, i 282, '00, i 156

Addition of 0.8 p.c. Sodium Chloride to solution of Eucaine improves its analgesic properties, and has also other desirable effects

An improved solution (Baker's) for the production of local anæsthesia.—B Eucaine Hydrochloride, 0.2 gramme, Sodium Chloride, 0.8 gramme, Adrenalin Chloride, 0.001 gramme, Distilled Water, 100 grammes.—*L* '03, ii 204

Hermiotomy performed under local anæsthesia produced by the injection of 40 minims of a 1 p.c. solution, followed by 20 minims more of the same solution dropped into the wound during operation.—*L* '03, ii 580

Hypodermic injection of 40 minims of a 7½ p.c. solution Eucaine Hydrochloride (equal to 2½ grains of the drug) before operation of suprapubic cystotomy.—*L* '00, i 928

The use of a solution of Cocaine Hydrochloride 10, B Eucaine 10, Aniline 50, Alcohol (90 p.c.) 50, for the production of local anæsthesia in the ear, nose and throat, in order to obviate the dangers of using strong Cocaine solutions. To avoid change of colour, the solutions are best kept separately, e.g., as a 20 p.c. solution of Cocaine in Alcohol (90 p.c.), and a 15 to 20 p.c. solution of Eucaine (B) in Aniline Oil.—*L* '01, i 698

30 minims of a 5 p.c. solution injected around bed of the finger-nail causes swelling and unhealthy blueness of the skin of finger tip.—*L* '01, i 1510. Pointed out in reference to above that Eucaine solutions should be boiled immediately before use, injected at body temperature, and the use of a syringe previously used for Morphine should be avoided.—*L* '01, i 1648

Solutions recommended in ophthalmic work, 2 p.c., in the urethra and bladder, 2 p.c., for the nose and throat or as a paint or spray for mucous surfaces generally, 5 to 10 p.c., and in dental work, 2 to 5 p.c.—*B M J E* '03, i 36

The relative toxicity of Cocaine and Eucaine.—*T G* '99, 689

With reference to the use of strong solutions of these salts for hypodermic injections, it is pointed out they should not be used of greater strength than 3.0 p.c., stronger solutions, being hypotonic with the blood, are liable to cause sloughing of the tissues. Much useful information on the subject is given in a paper in the *B M J* '04, ii 1862, and the formula for a suitable solution is there given as Beta-Eucaine Hydrochloride, 0.2 gramme, Sodium Chloride, 0.8 gramme, Adrenalin Chloride solution (1 in 1000), 10 minims, Distilled Water, sufficient to make 100 c.c.

On the pharmaceutical side, the incompatibility of Salicylic Acid with Eucaine may be drawn attention to. This is a point of some importance, as the Pharmacopœia directs Salicylic Acid to be used as a preservative for Injectio Cocaine Hypod., but an attempt to carry this practice out with the Eucaine salt will result in precipitation, as the Salicylate is much less soluble.

Spinal anæsthesia induced by Eucaine B in the treatment of tetanus.—*L* '05, ii 888. The solution used consisted of Eucaine B Hydrochloride, 1½ grains, Morphine Sulphate, ½ grain, Sodium Chloride, 8 grains, Water, to

3½ oz From 15 to 16 c c of cerebrospinal fluid were withdrawn, and injections of from 3 to 4 c c of the above fluid given at various intervals

In sciatica (*B M J E* '05, i 44), 72 to 100 c c of 10 p c solution of Eucaine in saline solution are injected into the nerve at its point of emergence

It is by no means uncommon to be asked to make up solutions containing as much as 4 or 5 p c Although this can be accomplished easily by the aid of heat, the salt does not remain in solution, and even 3.2 p c solutions when prepared by the aid of heat do not remain bright long even when kept in hermetically sealed capsules, but soon deposit tufts of crystals On inquiry of the manufacturers, a letter resulted acknowledging the correctness of the *Companion* figures, and pointing out that as the solution has to be used at the body temperature, any salt which crystallises out will again be taken into solution The use of the stronger solutions of Eucaine has, however lately been deprecated, and the valuable work recorded in the *B M J* has shown that inasmuch as they are hypotonic with the blood, they are liable to produce necrosis of the tissues if used for the purposes of hypodermic injection

Foreign Pharmacopœias—Official in Dan and Swiss (Trimethylbenzoxypiperidinium-hydrochloricum)

Tests—Eucaine (B) Hydrochloride possesses a melting point of 268° C (514.4° F) A weighed quantity of 0.1 gramme dissolved in 10 c c of Water yields on the addition of 1 drop of Ammonia Solution a crystalline precipitate, which redissolves, but is again thrown down on the further addition of Ammonia The precipitate caused by 4 drops of Ammonia Solution completely dissolves on the further addition of 20 c c of Water On again adding 4 c c of Ammonia Solution the precipitate forms again, and is again dissolved on the addition of 10 c c of Water, but no further precipitate is formed on the addition of Ammonia Solution, only a milky cloudiness, disappearing on the addition of Water

A 1 p c aqueous solution yields with Potassium or Sodium Hydroxide Solution a precipitate of the free base, which dissolves readily in Ether Mercuric Chloride Solution produces no precipitate The aqueous solution yields a precipitate with Mayer's reagent and lemon yellow precipitate with Picric Acid Solution If a crystal be moistened with Nitric Acid and evaporated to dryness, it leaves a colourless residue, which evolves a characteristic odour of Benzoic Acid Ethyl-Ester when moistened with an alcoholic Potassium Hydroxide Solution

The aqueous solution acidified with diluted Nitric Acid yields on the addition of Silver Nitrate Solution a white curdy precipitate insoluble in Nitric Acid, readily soluble in Ammonia Solution

It may be distinguished from Alpha-Eucaine by the 1 p c aqueous solution yielding no precipitate on the addition of a few drops of 10 p c Potassium Iodide Solution, Alpha-Eucaine Solution yielding under similar conditions a crystalline precipitate

It may be distinguished from Cocaine by mixing a little of the salt with some Mercurous Chloride and moistening the mixture with Alcohol (90 p c), when no darkening in colour should be noticed Cocaine under similar conditions immediately darkens in colour Eucaine (B) Hydrochloride should dissolve without change of colour in concentrated Sulphuric or Nitric Acid

It should leave no weighable residue upon ignition with free access of air

Eucaine Lactate ($C_9H_{11}NO_5$, eq 334.72)—A white odourless crystalline powder possessing a bitter taste, and subsequently producing a feeling of numbness of the tongue It has been introduced as a local anæsthetic, which is claimed to be more soluble than the Hydrochloride

Solubility—1 in 4 of Water, 1 in 8 of Alcohol (90 p c)

It is usually employed in the form of a 2 to 3 p c solution

ORTHOFORM—This base is Para-amido-meta-hydroxybenzoic Acid Methyl Ester, a synthetic product introduced as a substitute for Cocaine A white, odourless, tasteless, crystalline powder, or in colourless crystals melting at 120° C Soluble, 1 in 450 of Water, 1 in 6 of Alcohol (90 p c), 1 in 12½ of Ether

Another base, Meta-amido para-hydroxybenzoic Acid Methyl Ester, has been introduced under the name of 'Orthoform New' Solubility is practically the same as above

Medicinal Properties.—Local anæsthetic employed in ulcerations of the upper air passages Useful where nerve endings are exposed, but has no action on unbroken skin and but little on healthy mucous membrane Best administered as a spray, using 10 p c solution made with Alcohol (45 p c), but the powder may be employed either alone or mixed with an equal quantity of Lycopersodium for insufflation, or in the form of a 10 p c ointment, a saturated solution of Orthoform in Collodion is used as a varnish Said to be of value as an anodyne in ulcer or cancer of the stomach in doses of 8 to 16 grains An aqueous solution of the Hydrochloride is used as a paint —*B M J* '98, 1 362, *Pr* lx1 505

Non-toxic and powerfully antiseptic On account of its sparing solubility it is but slowly absorbed Nearly 2 oz have been employed in the course of a week for dusting wounded surfaces without injurious effect —*B M J E*, '97, 11 55, *P J* '97, 11 277, *B M J* '98, 1 362

As an ointment it is useful in burns, in ulcers of the leg and in syphilitic ulcers —*L* '98, 1 1024, *B M J E* '98, 1 76, *P J* '98, 11 661

Used (suspended in Glycerin) for intra-uterine medication —*L* '98, 1 1434

Cotton-Wool plug steeped in an alcoholic solution introduced into the cavity of a tooth for the relief of toothache —*T G* '99, 270, *P J* '99, 1 83

In fissure of the nipple —*T G* '99, 337

As an insufflation in stomatitis in children —*B M J E* '99, 1 75

Insufflated, dusted on, or used as an ointment is most efficient (*B M J* '05, 11, 1008) in allaying pain, in burns, ulcerative stomatitis, tuberculosis and malignant ulceration, whether of the larynx or other regions Or it may be given internally up to 8 grains for gastric ulcer, carcinoma, or nervous dyspepsia

As an emulsion, Orthoform, 25, Olive Oil, 100, as an insufflation, 10 to 20 c mgrains or as a 10 p c aqueous solution of the Hydrochloride for laryngeal application —*B M J E* '99, 1 20, 64

ORTHOFORM HYDROCHLORIDE —A white, crystalline powder, which is soluble, 1 in 8 4 of Water, 1 in 17 of Alcohol (90 p c) Insoluble in Ether It may be employed for internal administration or for urethral injection, but is too acid for hypodermic injection or application to the eye —*L* '97, 11 733, *B M J E* '97, 11 55 Injection of a 10 p c solution in gleet —*L* '97, 11 738

Dose.—1 to 5 grains = 0 06 to 0 32 gramme

BENZOYL-PSEUDOTROPEINE (Tropacocaine, Tropain) —First obtained from Java Coca Leaves and afterwards made synthetically The Hydrochloride has been used to produce anæsthesia of the eye during operations, it is much less toxic than Cocaine —*B M J* '92, 11 406, '94, 11 598, *L* '94, 11 598, *T G* '94, 653, *MA* '93, 52

0 05 gramme (= $\frac{1}{4}$ grain) in 1 c c (16 minims) Water as an injection into the spinal canal to produce analgesia —*B M J E* '02, 1 75

0 05 gramme (= $\frac{1}{4}$ grain) dissolved in 5 c c (80 minims) of cerebrospinal fluid and reinjected to induce anæsthesia without undesirable concomitants —*Merck's Report*, '02, 166

Intraspinal injection of 1 c c of a 5 p c solution in puerperal eclampsia —*B M J E* '02, 11 6

Intraspinal injection in doses of 0 07 gramme ($1\frac{1}{4}$ grain) —*L* '05, 11 561

Of the drugs that now hold the field in lumbar anæsthesia, Stovaine, Novocaine, Alypin, and Tropacocaine, the most recent publications indicate a growing preference for the last named as the most reliable and the least dangerous —*B M J* '07, 11 1002, and 873

For the treatment of 1 c c of a 5 p c solution, addition of Adrenalin wholly unnecessary —*B M J* '07, 11 873

HOLOCAINE (Para-diethoxy-ethenyl-diphenyl-amidine) —A synthetic product introduced as a substitute for Cocaine In colourless crystals which melt at 121° C (249 8° F) Insoluble in Water, readily soluble in Alcohol (90 p c) and Ether

A powerful base, forming sparingly soluble salts with acids

HOLOCAINE HYDROCHLORIDE —The Hydrochloride of the above base. Occurs in colourless crystals, soluble in Water, Alcohol, and Ether

Solubility—1 in 50 of Water, 1 in 6 of Alcohol (90 p c)

Medicinal Properties—Used in the form of 1 p c solution in ophthalmic surgery. Produces complete and rapid anaesthesia without pain, and neither dilates the pupil nor affects the blood-vessels. On account of its toxicity, it cannot be used hypodermically. Its instillation into the eye causes a slight feeling of burning which rapidly passes off—*L* '97, i 1466, *B M J* '98, ii 619, *B M J E* '97, i 55, 75, 87, 92, '98, i 99, *Pr* lx 503

A 1 p c solution did not show the slightest cloudiness when allowed to stand in an open vessel for two months—*P J* '97, i 368

It is stated to possess the following advantages (1) it does not cause mydriasis, (2) does not affect accommodation, (3) causes deeper anaesthesia of the iris, (4) often proves efficient in cases of painful inflammation where Cocaine fails, (5) produces no toxic effects unless injected subcutaneously or swallowed, (6) has no effect on the corneal epithelium, (7) is strongly bactericidal in action. The solutions should be preserved in porcelain and not in glass vessels—*T G* '99, 322, 612, *B M J E* '99, ii 20, *Pr* lxiv 476, *M A* '00, 28

As a local anaesthetic in ophthalmic practice should not be used in stronger doses than 1 p c, as it is poisonous—*L* '05, ii 885

It is stated (*L* '06, ii 15) to be a most valuable addition to Cocaine in all operations in which it is necessary to cut the iris. The favourite combination recommended is Cocaine Hydrochloride, 2 p c, Holocaine Hydrochloride, 1 p c, dissolved in solution of Adrenalin Hydrochloride, 1 in 1000, and freshly prepared immediately before being used

ACOINE (Di-para anisyl-mono phenetyl guanidine hydrochloride)—A white, crystalline powder, soluble 1 in 50 of Water. Introduced as a substitute for Cocaine as being less toxic

A useful solution for producing anaesthesia is Acoine, 1, Sodium Chloride, 8, Distilled Water, 1000. Concentrated solutions should not be employed, as they give rise to irritation. The solutions, moreover, should not be exposed to the light—*L* '99, i 1372, *B M J* '99, i 1340, *P J* '99, i 538, *C D* '99, i 701

In subconjunctival injections as a local anaesthetic, no pain was produced when a mixture of equal parts of a 1 in 1000 solution of Mercury Cyanide and a 1 in 100 Acoine solution was injected—*L* '99, ii 1082

Solutions of 1 in 100 and 1 in 300 produce satisfactory anaesthesia in an unirritated eye, when there was much congestion it failed—*T G* '99, 697, *B M J E* '99, ii 76

NIRVANIN (Hydrochloride of Diethyl-glycocoll para-amido ortho-hydroxy-benzoic Methyl Ester)—Small white prisms, readily soluble in Water. Introduced as a local anaesthetic in surgical and dental operations. As a substitute for Cocaine and Orthoform, generally used in the form of a 2 p c solution. A 5 p c solution causes irritation when dropped into the eye. As much as 7 grains may be injected hypodermically without injury. A 1 p c solution has a marked bactericidal action—*P J* '99, i 95, 481, *C D* '99, i 701

NERVOCIDINE—A yellow, hygroscopic, amorphous powder, readily soluble in Water, slightly soluble in Alcohol (90 p c) and in Ether. It is obtained from an Indian plant 'Gasu Basu'. Introduced as a local anaesthetic. The irritation which it produces, the length of time required to produce anaesthesia, and its liability to produce toxic symptoms, however, preclude its general use. At present its employment is restricted to dental work—*L* '02, i 127, *P J* '02, ii 211

ALYPIN Primary Benzoyl-tetramethyldiamino- β -ethyl dimethylcarbinol Monohydrochloride $C_{18}H_{28}N_2O_2 \cdot HCl$, eq 312.39

A non-hygroscopic odourless crystalline powder

Solubility—1 in 1 of Water, 1 in $1\frac{1}{2}$ of Alcohol (90 p c), insoluble in Ether

Dose— $\frac{1}{10}$ to $\frac{1}{2}$ grain = 0.0064 to 0.032 gram

It was introduced as a local anaesthetic. It is stated (*L* '05, ii 321) to be easily absorbed by the mucous membranes and the subcutaneous tissue. It has a similar anaesthetic action to Cocaine. Solutions should always be freshly prepared, they may be sterilised by boiling without impairing their anaesthetic action

Enthusiastic account of it as a local anæsthetic. A 1 p c solution was used, it can be sterilised by boiling without spoiling, and it produces no bad effects, either general or local. Severe operations of considerable duration were performed with complete anæsthesia. The anæsthesia was given locally and never by lumbar puncture.—*B M J E* '07, ii 84

Nearly the equal of Cocaine in anæsthetic action, complete anæsthesia of the eye can be produced by a 1 or 2 p c solution in a minute.—*B M J E* '07, i 52

Tests—Alypin loses a small quantity of moisture when dried at a temperature of 100° C (212° F), the loss being equivalent to about 4.5 p c. The dried salt melts at about 170° C (338° F). It dissolves readily in Water, yielding a solution which is neutral in reaction towards Litmus paper. The aqueous solution yields with the usual alkaloidal precipitants, e.g., Potassiummercuric Solution, Iodo-potassium Iodide (Wagner's) Solution, Picric Acid Solution, etc. It also yields precipitates with Potassium or Sodium Hydroxide Solution and with Ammonia Solution, but is not precipitated by dilute Sodium Bicarbonate Solution. The solution acidified with diluted Nitric Acid yields on the addition of a solution of a white curdy precipitate insoluble in Nitric Acid, and if the precipitate be separated and washed, it is soluble in Ammonia Solution and Potassium Cyanide Solution. If a minute quantity of the salt be placed on the tongue it produces a characteristic sense of numbness resembling that produced by Cocaine. When ignited with free access of air the salt should leave no weighable residue.

NOVOCAINE—Para-aminobenzoyl-diethylamino ethanol Hydrochloride $C_{13}H_{20}N_2O_2.HCl$, eq 270.66

A white odourless crystalline powder which is readily soluble in cold Water. The aqueous solutions are neutral in reaction towards Litmus paper, and can be boiled without decomposition. It is introduced as a local anæsthetic, and is stated to be free from irritant action on living tissues. It is used chiefly in the form of solution, or as tablets, the powder having been withdrawn from the market. For hypodermic use the solutions vary in strength from a $\frac{1}{2}$ to 2 p c. For infiltration anæsthesia and for anæsthesia of thick layers of tissue, 1 to 2 p c isotonic solutions are used, for anæsthesia of the nerve-centres, 1 to 2 p c trunks 1 to 2 p c isotonic solutions are employed, for medullary anæsthesia a 5 p c isotonic solution has proved most useful. In ophthalmic practice 5 and 10 p c solutions are chiefly employed and produce no dilatation of the pupil or irritation, solutions of similar strength are employed in operations or explorations of the throat and nose, 10 to 20 p c solutions for anæsthesia of the larynx and pharynx, and in dental practice 1 to 2 p c isotonic solutions.

The dose for internal administration is $\frac{1}{2}$ to 1 gram.

Spinal and local anæsthetic. Advantages over Stovaine.—*B M J* '07, ii 876

85 cases, results uniformly good, should always be combined with Adrenalin.—*L* '07, ii 1686

160 cases, writer very well satisfied.—*F T* '07, 90

A satisfactory local and spinal anæsthetic.—*B M J E* '08, i 23

The safest and most perfect of known local anæsthetics in teeth extraction.—*B M J* '07, i 1172

STOVAINE—The Hydrochloride of α -methyl-2-methyl-prop-1-anol Benzoylamine $C_{14}H_{19}NO_2.HCl$, eq 269.63

Colourless, glistening, lamellar crystals, or a white, inodorous, crystalline powder.

Solubility.—1 in $1\frac{1}{2}$ of Water, 1 in 4 of Alcohol (90 p c), insoluble in Ether.

Dose.— $\frac{1}{2}$ to $\frac{1}{2}$ grain = 0.01 to 0.3 grammes

It is a spinal anæsthetic and said to be only half as toxic as Cocaine.

20 grains have been frequently used in the form of a 2 p c solution in distilled Water or physiological solution is the most useful, if a minimum of a 1 in 1000 Adrenalin solution be added to every 3 c.c., a still better result is obtained. Maximum dose of Stovaine is 40 to 50 grains, and of Adrenalin 0.001 gramme.—*B M J E* '05, i 92.

In work upon the nose, throat and ear, a 5 p c solution was found (*B M J E* '05, 11 43) to be equal in its effects to a 10 p c solution of Cocaine. As a local anæsthetic for the larynx Stovaine gave fair results. No appearances of poisoning have been observed after its application. $\frac{1}{2}$ to 1 p c aqueous solutions have been used by infiltration for the production of local anæsthesia. $\frac{1}{2}$ to $\frac{3}{4}$ p c solutions of Stovaine act as powerfully as 1 p c solutions of Cocaine—*B M J E* '05, 11 95.

The chief physiological difference from Cocaine is that it is a vaso dilator, not a vaso constrictor, and further, it seems to have a tonic effect upon the heart. Hence the vascular system seems to escape all the harmful effects of Cocaine. Of great value for the production of anæsthesia by intraspinal injection in acute general peritonitis. The minimum dose that can be given without fear of respiratory paralysis is 0.5 c c of a 10 p c solution. If the anæsthesia is required low down in the leg, quite a small dose, often as little as 0.3 c c of a 10 p c solution, is sufficient. In acute cases the method of gradual injection is imperative. A commencing dose of 0.6 c c may be given as a minimum, and if at the end of 7 minutes it is obvious that the dose is too small, an extra 0.3 c c should be given until the extent of the anæsthesia required is obtained—*B M J* '06, 1 1089.

Notes on 100 cases, an excellent anæsthetic though a little uncertain in its action—*B M J* '07, 11 14.

In 78 p c of the cases injected nephritis followed, and lasted from 6 $\frac{1}{2}$ to 30 days. The kidneys were previously healthy. Kidney mischief is therefore an absolute contra-indication—*B M J* '07, 11 1003.

For heavy men a dose of 7 to 8 cc is necessary, 5 to 6 for a person of medium weight. In most cases anæsthesia is obtained after five minutes, and lasts from three quarters to one hour. For operations on the abdominal wall it is advisable to make the puncture in the third lumbar space—*B M J E* '07, 11 56.

The minimal dose that can be given without fear of respiratory paralysis is 0.05 gramme. As quite a small amount of Sodium Carbonate renders Stovaine inactive, the Water in which the syringe is boiled ought not to contain any. Has a distinct influence in protecting from surgical shock. Method of administering, dosage, etc., fully considered—*B M J* '07, 11 869.

Barker finds a 5 p c solution in Distilled Water freezes at about -0.58°C , Blood Serum freezing at -0.56°C . If this were the only test, the solution should be isosmotic with the blood. If, however, a drop of blood is added to a little of a 4 or 5 p c solution of Stovaine, in five minutes the red blood corpuscles swell and become pale, and in ten minutes are almost invisible. In a really isotonic fluid, such as normal Saline (0.91 p c Sodium Chloride) or normal Glucose Solution (5 p c Glucose) the salts are seen unchanged in 24 or 48 hours. The formula suggested by Barker (*B M J* '07, 1 670) is Stovaine, 10 grammes, Glucose, 5 grammes, Sterilised Distilled Water, to produce 100 c c.

A second series of 100 cases of spinal analgesia in which this drug was employed is recorded by Barker—*B M J* '08, 1 248. The solution used contained 5 p c of Stovaine, and 5 p c of Glucose, in Water. It had a specific gravity of 1.023 as against 1.007 of the cerebrospinal fluid. The average amount of the solution usually injected was 1 c c = 0.05 gramme of Stovaine.

A report of 50 cases of analgesia produced by the intraspinal injection of Stovaine—*L* '08, 1 1058.

Suspicion expressed that some of the ill effects reported abroad after spinal analgesia were due to the Adrenalin principle added, and not to the anæsthetic drug at all—*B M J* '07, 1 665, '08, 244.

Disadvantages: the analgesia is not reliable and of short duration, the bowels are frequently opened on the operating table, may cause respiratory paralysis, many deaths and several cases of permanent paralysis have followed the spinal injection of Stovaine—*B M J* '07, 11 876.

Favourable results in 100 cases—*B M J* '07, 11 12.

Fatal paralysis in a man after injection of 0.05 gramme—*L* '07, 1 45.

Tests—Stovaine melts at 175°C (347°F). It dissolves readily in Water, forming a solution which is neutral in reaction towards Litmus paper. A weighed quantity of 0.5 gramme of Stovaine, evaporated with 1 c c of a mixture of equal parts of Hydrochloric and Nitric Acid on a water-bath, yields a colourless residue which has a pungent odour, and if to the residue 1 c c of Potassium Hydroxide

Solution be added and the mixture evaporated, the residue has a fruity odour and only drops separate on the addition of Water. Its aqueous solution is precipitated by the chief alkalis, Potassio-mercuric Iodo-potassium solution, Picric Acid, yields precipitates on the addition of Potassium or Sodium Hydroxide Solution, and on the addition of Ammonia Solution. The aqueous solution, when acidified with Nitric Acid, yields on the addition of Silver Nitrate Solution a white curdy precipitate insoluble in Nitric Acid, and which when separated and washed dissolves readily and completely in Ammonia Solution or in Potassium Cyanide Solution. 0.5 gramme of the salt when ignited with free access of air should leave no weighable residue.

COCCUS.

COCHINEAL

FR, COCHENILLE, GER, COCHENILLE, ITAL, COCCINIGLIA, SPAN, COCHINILLA

The dried fecundated female insect, *Coccus Cacti*, reared on *Nopalea cochenillifera*, and on other species of *Nopalea*

When dried in the sun the insects are of an ash-grey colour with a silvery surface, but when killed by immersion in boiling Water they have a reddish appearance, and if dried by artificial heat they are black

Used as a colouring agent

Official Preparation.—Tinctura Cocci. Used in the preparation of Tinctura Cardamomi Composita and Tinctura Cinchonæ Composita

Not Official.—Carmine, Glycerinum Carmini, Liquor Carmini, Liquor Coccineus, Glycerinum Cocci, Liquor Cocci, and Syrupus Coccionellæ

Foreign Pharmacopœias.—Official in US (*Coccus*), Jap and Swiss (*Coccionella*), FR (*Cochenille*), Port (*Cochonilha*), Mex and Span (*Cochinilla*). Not in the others

Descriptive Notes.—The dried insect forming this drug is named *Coccus Cacti*, Linn, in the *BP*, and *Pseudococcus Cacti*, Burmeister, in the *USP*. The dried insect is imported chiefly from Teneriffe, and is met with in commerce in four principal forms, known as silver grain, black grain, madres or zacatille, and granilla or siftings. The black grain consists of the insect dried by artificial heat, the silver grain is dried in the sun. The 'madres' consist of the female insect collected in March after the young are hatched, and the granilla consists chiefly of young insects sifted out. For the manufacture of Carmine the madres are preferred as, weight for weight, they yield more colour than before the young have left the mother. They are black and very concave on the under surface, not flat or slightly convex as in the ordinary silver and black grain. The insect is sometimes adulterated with Sulphate of Barium or of Lead and other mineral matter to increase its weight or improve its colour. It is sold at a lower price than the black variety which is more rarely adulterated, and then only with Iron Sand, which is visible under a good lens. The size is given both in *BP* and *USP* as 5 mm (1/4 in) long. *BP* states that it is somewhat oval in outline, flat or concave beneath, convex above, transversely wrinkled, purplish-black or purplish-grey, easily reduced to powder, which is dark-red or purple-coloured. *USP* describes it as

somewhat oblong and angular in outline, flat and concave beneath, convex above, externally purplish-grey or purplish-black, transversely wrinkled, easily pulverisable, yielding a dark-red powder

Tests—The *BP* requires that no insoluble powder should separate when the specimen is macerated in Water, and that the ash should not amount to more than 6 p c. The *USP* limit of ash is also 6 p c. The ash of Cochineal varies very much. Out of 44 samples examined in the author's laboratory 17 came within the *BP* limits, 3 yielded between 6 and 8 p c of ash, 23 exceeded 8 p c, and 1 sample contained as much as 37.4 p c of ash.

A comparison of the colouring power of the Cochineal may be made by powdering the sample with some broken glass, macerating for 24 hours in Water, with intervals of frequent stirring, and filtering through paper. The clear filtered liquid may be compared with a similar product prepared from a standard specimen.

Preparation

TINCTURA COCCI TINCTURE OF COCHINEAL

1 of Cochineal in powder, macerated with 10 of Alcohol (45 p c)
(1 in 10)

Dose—5 to 15 minims = 0.3 to 0.9 c c

Foreign Pharmacopœias—Official in Dan, 1 in 5, Fr and Mex, 1 in 10. By weight. Not in the others.

Tests—Tincture of Cochineal has a specific gravity of about 0.950, contains about 2.5 p c w/v of total solids and about 45 p c w/v of Absolute Alcohol.

Not Official

CARMINE—Prepared from Cochineal, an excellent colouring agent for powders and ointments. It is also used as a staining agent in microscopy.

GLYCERINUM CARMINI—Carmine, 3, Distilled Water, 3, Solution of Ammonia, *BP*, 4, dissolve and add gradually Glycerin, 18, heat in a water-bath till free from ammoniacal odour. When cold add solution of Ammonia, 1, to prevent gelatinisation, and Distilled Water, q s to 24.—*Martindale*

BPC is almost identical with this.

LIQUOR CARMINI—Carmine, 6, Water of Ammonia (10 p c), 35, Glycerin, 35, Water, q s to yield 100.—*USNF* 1896

This has been incorporated in the *BPC*, but in the *BPC Supplement* it may be made in a similar way to *Liquor Cocci*, replacing the Cochineal by 6 of Carmine.

USNF 1906 has altered the figures to 6.5, 36.5, 36.5 in 100.

LIQUOR COCCINEUS—Cochineal, in No. 50 powder, 6, Potassium Carbonate, 3, Alum 3, Potassium Bitartrate, 6, Glycerin, 50, Alcohol (90 p c), 3, Distilled Water, q s to yield 100.—*USNF* 1896

GLYCERINUM COCCI—Cochineal, unbruised, 20, Potassium Carbonate, 1, Potassium Citrate, 10, Glycerin, 20, Distilled Water, sufficient to produce 100.—*BPC*

LIQUOR COCCI—Cochineal, 20, Potassium Carbonate, 1, Potassium Citrate, 10, Alcohol, 20, Distilled Water, to produce 100. Dissolve the Potassium Carbonate in 60 of the Distilled Water and digest the unbruised Cochineal in the solution on a water bath for 6 hours or until exhausted, then strain, cool, add

the Alcohol and Potassium Citrate, and make up the required volume with Distilled Water — *B P C*

This is not an economical preparation, half the quantity of Cochineal will produce a solution of practically the same depth of colour. It is also an advantage to just bruise the Cochineal to a very coarse powder, but when not bruised it is necessary to assist the straining by gentle pressure, otherwise a considerable proportion of the liquid will be left in the marc. The process may be modified with advantage as follows — Cochineal (in coarse powder), 10, Potassium Carbonate, 1, Potassium Citrate, 10, Alcohol, 20, Distilled Water, *q s* to make 100. Dissolve the Potassium Carbonate in 60 of Distilled Water, and digest the Cochineal in the solution on a water-bath for 3 hours, replace the Water lost by evaporation, then strain and cool, add the Alcohol and Potassium Citrate, pass more Distilled Water through the strainer to make the total volume 100. Filter. This modification applies also to the Glycerinum Cocci, adding the Glycerin and Potassium Citrate to the strained fluid.

SYRUPUS COCCIONELLÆ — Cochineal, 10, Potassium Carbonate, 1, Rose Water, 150, Cinnamon Water, 150, digest for 4 hours, then filter, in each 100 parts of the filtrate dissolve Sugar, 160, and Alum, 0.1, boil and strain, all by weight — *Austrian Elenchus*

CODEINA.

CODEINE

A crystalline alkaloid (Methyl Morphine) obtained from Opium or synthetically from Morphine.

Solubility — 1 in 80 of Water, 1 in 24 of boiling Water, 1 in 2 of Alcohol (90 p c), 1 in 2 of Chloroform, 1 in 30 of Ether, 1 in 12 of Benzol, 1 in 85 of Liquor Ammoniac, 1 in 58 of Ether, sp gr. 0.720.

Medicinal Properties — It stops or lessens the glycosuria in diabetes (an entire abstinence from starchy food being strictly observed) in doses of 1 grain 3 times a day, gradually raised to 2 grains. Useful in relieving the hacking cough of phthisis, in ovarian pain, and as a mild hypnotic.

It has a powerful action in allaying abdominal pain, and it can be pushed to a much greater extent than Morphine without causing drowsiness or interfering with the respiration or with the action of the bowels — *B M J* '88, 1. 1214.

In $\frac{1}{4}$ to $\frac{1}{2}$ grain doses combined with Phenacetin has been stated to give relief from the severe headache and general paroxysms in malaria — *Pr* lxxii 682.

Dose — $\frac{1}{4}$ to 2 grains = 0.016 to 0.13 gramme.

Sus., maximum single dose, 0.1 gramme, maximum daily dose, 0.4 gramme.

Prescribing Notes — For coughs it is usually given in the form of lozenges or pastils, or as a pill, using Powder of Gum Acacia and 'Tr. U. S. G. A. S.' as excipients. For diabetes it is sometimes combined with Extract of Cascara. Codeine Phosphate in solution is used for hypodermic injection.

Official Preparations — Symplic Codeinæ from Codex Pharmacopœia.

Not Official — Codemæ Pastillæ, Tinctura Codemæ, Pilula Codeinæ Composita, Codeinæ Iodas, Apocodemæ Infusio.

Foreign Pharmacopœias — Official in Dan., Dutch, Fr., Hung., Ital., Mex., Port., Russ., Span., Swed., Swiss and U. S. Not in the others.

Tests—Codeine possesses a melting point of 156°C (312°F), the *BP* does not give a melting point, the *USP* gives 154°C (310°F), *Fr. Codex* (1908) 155°C (311°F). The aqueous solution of the alkaloid is alkaline towards Litmus paper and is laevogyrate. Pure Sulphuric Acid yields no coloration with Codeine in the cold, but on warming a blue coloration is slowly produced, the blue coloration is immediately produced if a trace of Ferric Chloride, Ammonium Molybdate Solution, or Potassium Ferricyanide is present. The *BP* adds that on the addition of a minute trace of Diluted Nitric Acid the colour changes to a bright scarlet, becoming orange. Codeine is distinguished from Morphine by the following tests—When moistened with Nitric Acid the liquid becomes yellow, but not red. A 1 in 50 solution of Codeine in Water, acidulated with Hydrochloric Acid, yields with Potassium Hydroxide Solution a whitish precipitate, but is not precipitated by the addition of Ammonia Solution. A saturated aqueous solution acidulated with Hydrochloric Acid should yield on the addition of Ferric Chloride Test-solution and a very dilute Potassium Ferricyanide solution only gradually a dirty green, but no blue coloration. The *BP* wording of the latter test has been subjected to criticism (*PJ* '00, ii 149). As the text reads a neutral solution of Codeine Hydrochloride would be used in making this test, which would obviously be quite different in its character from the solution employed if a comma were placed after the word Water, so as to read 'A saturated solution of Codeine in Water, acidulated with Hydrochloric Acid'. Exception is taken in the same reference to the *BP* statement that the test shows the absence of Morphine and other impurities. This is considered too broad as it will by no means detect all other impurities nor even any considerable proportion of possible impurities.

0.1 gramme when heated to redness with free access of air leaves no weighable residue.

Codeine is not official in the *PG*.

Colour Reactions—The following colour reactions are given in the *BP* and *USP*. Sulphuric Acid dissolves the alkaloid without coloration, *BP*, either without coloration or producing a slight pinkish tint which disappears within two minutes, but on heating a violet colour is developed. (The presence of nitrous compounds causes a pink colour in the cold), *USP*. The solution of Codeine in Sulphuric Acid gives a blue or bluish-black colour with (a) 2 drops of T.S. of Ammonium Molybdate, (b) a trace of Ferric Chloride, (c) or Potassium Ferricyanide, the addition of a minute trace of Diluted Nitric Acid changes this colour to a bright scarlet, becoming orange, *BP*. Codeine yields with Sulphuric Acid and (a) a trace of Ferric Chloride, a violet-blue coloration, (b) a drop of Nitric Acid, a blood red coloration, (c) a trace of Selenious Acid, a green coloration, (d) a drop of T.S. of Formaldehyde (added to the Codeine and Sulphuric Acid previously mixed), a violet-blue coloration, *USP*. A mixture of Codeine and Nitric Acid yields a yellow coloration, but should not be red, *BP*, the *USP* states that if 0.05 gramme of Codeine be sprinkled upon 2 c.c. of Nitric Acid (sp. gr. 1.200) the crystals will turn red, but the acid will only acquire a yellow colour (difference from and absence of Morphine). A solution of 0.08 gramme of Codeine in 2 c.c. of Sulphuric Acid yields with 1 drop of a diluted Nitric Acid Solution (1 drop of Acid in 200 c.c. of Water), a bluish-red tint, gradually changing to blue, *USP*. There should not be any blue colour developed, but only slowly a dull green on the addition of T.S. of Ferric Chloride.

and a very dilute solution of Potassium Ferricyanide to a saturated solution of Codeine in Water acidulated with Hydrochloric Acid, *BP*. In the *USP* test quantities are given a small crystal of Potassium Ferricyanide is dissolved in 10 c.c. of Water and to this is added 1 drop of T.S. of Ferric Chloride and 1 c.c. or a 1 p.c. solution of Codeine, when no blue colour should be developed at once.

CODEINÆ PHOSPHAS. CODEINE PHOSPHATE

This crystalline product ($C_{18}H_{21}NO_3, H_3PO_4)_2, 3H_2O$, eq 842 20, is the most soluble salt of Codeine.

Fine white acicular crystals, or as a white odourless crystalline powder possessing a bitter taste and feebly acid reaction.

Solubility—1 in 4 of Water, 1 in 200 of Alcohol (90 p.c.)

Dose.— $\frac{1}{4}$ to 2 grains = 0.016 to 0.13 gramme

Ph. Ger. maximum single dose, 0.1 gramme, maximum daily dose, 0.3 gramme

Foreign Pharmacopœias—Official in Belg., Dan., Fr., Ger., Jap., Norw., Russ., Swed., Swiss and U.S.

Tests.—Codeine Phosphate should answer the tests distinctive of Codeine given in the large type under the heading of Codeina. It melts at a temperature of about $235^{\circ}C$ ($455^{\circ}F$). The aqueous solution yields on the addition of Silver Ammonio-nitrate Solution a light yellow precipitate readily soluble in Ammonia Solution and in cold dilute Nitric Acid, with Magnesium Ammonio-sulphate Solution it affords a white crystalline precipitate, with Ammonium Methyl containing Nitric Acid, it yields on warming a yellow precipitate, which is soluble in Ammonia and which is reprecipitated as a white crystalline precipitate on the addition of Magnesium Ammonio-sulphate. The reaction of a 5 p.c. aqueous solution towards Litmus paper is slightly acid. This solution yields with Potassium Hydroxide Solution a whitish precipitate, but no precipitate on the addition of Ammonia Solution.

Codeine Phosphate of the *BP* contains theoretically 70.52 p.c. of Codeine, *USP* 69.05 p.c. The *BP* gives no process for quantitatively determining the amount of alkaloid present, the *USP* requires that a weighed quantity of 0.2 gramme of the salt when precipitated with Potassium Hydroxide Solution and shaken out with Chloroform should yield not less than 0.13 gramme of Codeine, corresponding to not less than 65.0 p.c. of alkaloid.

The more generally occurring impurities are excess of moisture, Chlorides, Sulphates, Morphine and mineral matter. The formula given for the salt in the *BP* shows $1\frac{1}{2}H_2O$, whilst that of the *USP* and the *Fr. Codex* (1908), indicates $2H_2O$. All three Ph. state that at $100^{\circ}C$ ($212^{\circ}F$) it loses all of its Water of crystallisation. The *BP* formula $1\frac{1}{2}H_2O$ would indicate a loss of 6.36 p.c. of Water, the *USP* and *Fr. Codex* a loss of 8.31 p.c., the *PG* mentions that at $100^{\circ}C$ ($212^{\circ}F$) the salt loses 8 p.c. in weight. The aqueous solution when acidified with diluted Nitric Acid should yield no opalescence on precipitation with Silver Nitrate Solution or with Barium Chloride Solution indicating the absence of Chlorides and Sulphates. The presence of Morphine is indicated by Ferric

Chloride Test-solution which would yield a blue coloration The *USP* and *Fr Codex* employ a mixture of Potassium Ferricyanide Solution and Ferric Chloride Test solution as a test for Morphine

0.1 gramme of the salt leaves no weighable residue when ignited with free access of air

Colour Reactions—0.01 gramme of Codeine Phosphate gives with 10 c.c. of Sulphuric Acid a colourless solution, *BP*, the *USP* states that the acid produces either no colour or a slight pinkish tint which disappears in 2 minutes Codeine Phosphate gives with Sulphuric Acid containing (a) a trace of Ferric Chloride (1 drop of T.S. of Ferric Chloride in 10 c.c., *PG*) a violet-blue colour, *PG* and *USP*, (b) a trace of Selenious Acid, a green colour changing rapidly to blue and then slowly back to grass green (Morphine gives a blue colour changing to green and then to brown), *USP*, (c) a drop of T.S. of Formaldehyde, a violet blue colour (Morphine gives an intense purple), *USP* The solution of a small crystal of Potassium Ferricyanide in 10 c.c. of Water with the addition of a drop of T.S. of Ferric Chloride should not immediately assume a blue colour when mixed with 1 c.c. of a 1 p.c. Solution of Codeine Phosphate, *PG* and *USP* No blue colour should be developed with Codeine Phosphate and T.S. of Ferric Chloride, *BP*

Codeinæ Hydrochloridum is official in Austr., Dutch and Mex. It is crystalline and soluble in Water. **Codeinæ Salicylas** is also crystalline, and readily soluble in Alcohol and Ether, but only slightly soluble in Water. **Codeinæ Sulphas** is official in U.S. Doses same as Phosphate

Preparation

SYRUPUS CODEINÆ SYRUP OF CODEINE

Codeine Phosphate, 40 grains, Distilled Water, $\frac{1}{4}$ fl. oz., Syrup, $19\frac{1}{2}$ fl. oz. (1 grain in 240 minims)

BP directs the Codeine Phosphate to be dissolved in the Distilled Water, but 40 grains of Codeine Phosphate will not dissolve in $\frac{1}{4}$ fl. oz. Distilled Water; it is better to use 180 minims

Dose— $\frac{1}{2}$ to 2 fl. drms = 1.8 to 7.1 c.c., containing $\frac{1}{8}$ to $\frac{1}{2}$ grain Codeine Phosphate

It is 50 p.c. stronger than the Syrup described in previous editions of the *Companion*

Foreign Pharmacopœias—Official in Belg., 9 in 1000, *F1*, Ital., Mex. and Swiss, 1 in 500, Span., 1 in 600. Made with the Alkaloid. Dutch, 1 of Hydrochloride in 400

Not Official

CODEINE PASTILS—Contain $\frac{1}{8}$ grain = 0.008 gramme of Codeine in each. One for a dose when the cough is troublesome. An improvement on Codeine Jelly

Official in Ital., $\frac{1}{8}$ grain = 0.005 gramme in each

LINCTUS CODEINÆ—Syrup of Codeine, 20 minims, Glycerin, 20 minims, Lemon Juice, 18 minims, Chloric Ether, 2 minims—*Brompton*
Syrup of Codeine, 80 minims, Citric Acid, 1 grain, Emulsion of Chloroform, 8 minims, Glycerin, 10 minims, Mucilage of Tragacanth, to 1 fl. drm—*St. Thomas's*

This has been incorporated in the *BP C*

Syrup of Codeine, $\frac{1}{2}$ fl. drms, Syrup of Virginian Prune, $\frac{1}{2}$ fl. drms—*Guy's*

PILULA CODEINÆ COMPOSITA—Codeine, $\frac{1}{2}$ grain, Kaolin, $\frac{1}{2}$ grain, Extract of Cascara, 2 grains, Hard Soap, to 4 grains—*Guy's*

CODEINÆ IODAS—A combination of Iodic Acid with the alkaloid. Has been introduced as an analgesic.

Dose.— $\frac{1}{2}$ grain = 0.082 gramme by hypodermic injection.

Apocodema—Produced by heating Codeine with Zinc Chloride, it forms brown amorphous resinous masses

Apocodemæ Hydrochloridum is supplied as a brown, amorphous powder, soluble in Water. Dott doubts the existence of Apocodeme, and states that the commercial products sold under this name are not of a very definite nature

It has been used by subcutaneous injection in 30-minim doses of a 1 p c solution to produce increased peristalsis of the bowel, and has also been used internally as an expectorant in bronchial affections and as a sedative in mental disturbance, in doses of 0.02 to 0.06 gramme ($\frac{1}{2}$ to 1 grain)

A suitable combination for the internal administration is Apocodeme Hydrochloride, 0.5 gramme, Syrup of Raspberry, 25 grammes, Distilled Water, 100 grammes, in doses of $\frac{1}{2}$ to 1 fl dr = 1.8 to 3.6 c c

This salt, which has been frequently referred to in medical literature, is again mentioned (L '06, 1 1191) as a laxative. It may be administered in doses of 2 c c of a 3 p c solution

COLCHICUM.

FR, COLCHIQUE, GER., ZEITLOSENKNOLLEN, ITAL, BULBO DE COLCHICO, SPAN, BULBO DE COLQUICO

The fresh Corm of *Colchicum autumnale*, as well as the dried, ripe Seeds, are official

The use of Colchicum Seeds only, was agreed by the Brussels International Congress

Medicinal Properties—It is a specific in gout, and will cure the acute form, controlling the pain and inflammation, and preventing the attack. Useful in the headache, dyspepsia, eczema, and other conditions which occur in gouty subjects. May be combined with other or given with saline purgatives in cases of hepatic congestion in gouty patients. It may produce gastric or intestinal irritation, even in ordinary doses, and should then be discontinued for a time. The Extract is frequently prescribed with Dover's Powder to relieve painful gout

Dose—Of the dried Corm, 2 to 5 grains = 0.13 to 0.32 gramme, but usually given in the form of Extract or Wine

Incompatibles—Tincture of Iodine, Guaiacum, and vegetable astringents

Official Preparations—Extractum Colchici and Vinum Colchici from the Corm, Tinctura Colchici Seminum from the Seeds

Not Official—Extractum Colchici Aceticum, Extractum Colchici Cormi, Fluidextractum Colchici Seminum, Mistura Colchici, Pilule Colchici et Hydrargyri, Tinctura Colchici Composita, Tinctura Colchici Florum, Vinum Colchici Seminum, Colchicina, and Colchicinæ Salicylas

Antidotes—In case of poisoning with Colchicum, emetics and demulcent drinks, and, if coma be present, Brandy, Ammonia, and powerful stimulants may be given. Hypodermic injection of $\frac{1}{2}$ c c of a 3 p c solution

COLCHICI CORMUS. COLCHICUM CORM

The fresh Corm of *Colchicum autumnale*, collected in early summer, also the Corm, dried at a temperature not exceeding 65° C (150° F), after being stripped of its coats and transversely sliced.

Colchicum Corms contain about 0.5 p.c. of Colchicine, but the *B.P.* makes no requirement that they shall contain a definite percentage of alkaloid, the *U.S.P.* requires that they shall yield not less than 0.35 p.c. of Colchicine, and indicates a method of determination.

Foreign Pharmacopœias—Official in Mex., Port. and U.S. Not in the others.

Larger equivalent doses of the corm than of the wine or tincture can be given without undesirable effects, and the powdered corm is stated to give better results in acute gout.—*B.M.J.* '04, ii 1460

Descriptive Notes—It should be noted that the extract is prepared from the fresh corm collected in early summer. *Colchicum autumnale*, L., is a very local plant in this country, and there is therefore some difficulty in obtaining the fresh corm. The best period is in July when the leaves have turned yellow or in August when the plant is in flower, as the corm is then in mature condition. According to Schroff's experiments the corms are best dried entire in sun and air, and preserved, they lose none of their activity even if kept several years (*Pharmacographia*). Although the fresh corm is, according to the *B.P.* an inch broad (25 mm.) and an inch and a half long (35 mm.) it is often larger if obtained from full grown plants, and even the dried corm in slices may exceed an inch in diameter and $\frac{1}{10}$ to $\frac{1}{8}$ in thickness (2 or 3 mm.). The reniform shape is characteristic, for although the corms of some Fritillaries and the Hermodactyls of the East have the same shape they are not met with in Western commerce. Under the microscope the compound starch grains (0.1 to 0.15 mm., *Planchon* and *Collin*), usually three or four, each with a stellate hilum, and without stræ, and the irregular epidermal cells with pitted walls, are sufficiently characteristic. According to Vogl the cambium tissue contains a yellowish amorphous substance which, when a section of the corm is treated with concentrated Sulphuric Acid, colours the cellulose tissue gamboge yellow and the vessels orange red. The dried corm if long kept and especially if allowed to become damp loses its medicinal effect to a certain extent.

Tests—The *U.S.P.* process of determination is essentially as follows.—A weighed quantity of 10 grammes is macerated for twelve hours, with frequent intervals of shaking (or for four hours if a mechanical shaker be employed), in an Erlenmeyer flask with 100 c.c. of a mixture of 77 c.c. of Ether, 25 c.c. of Chloroform, 8 c.c. of Alcohol (94.9 p.c.), and 3 c.c. of Ammonia Water. The liquid is filtered, and 50 c.c. of the filtrate is evaporated to dryness at a gentle heat, the residue is dissolved in 10 c.c. of Ether, 5 c.c. of Water added, the mixture well stirred and the Ether evaporated. When cool the aqueous solution is filtered into a small separator, the insoluble matter being kept as much as possible in the beaker or dish. The residue is redissolved in Ether, 5 c.c. of Water added, the Ether evaporated as previously. The beaker or dish and the filter are washed with a little Water, and the combined aqueous solutions are well shaken with 15 c.c. of Chloroform. After separation of the chloroformic liquid, the aqueous portion is shaken with three

successive portions of 10 cc each of Chloroform, the chloroformic layer being separated in each case, mixed with the first Chloroform shaking, and the mixed chloroformic liquids evaporated to dryness. The residue is dissolved in a little Alcohol (94.9 pc), the Alcohol evaporated, the residue dissolved in 5 cc of Ether, 5 cc of Water added, and the mixture stirred for a few seconds. The Ether is evaporated, the aqueous liquid filtered through a wet filter paper into a separator, the vessel and filter washed with 5 cc of Water, the washings being added to the contents of the separator. The aqueous liquid is shaken out with 15 cc of Chloroform, the Chloroform transferred after complete separation to a tared flask, the aqueous portion extracted with three successive portions each of 10 cc of Chloroform, which are separated as previously and transferred to the tared flask containing the first shaking. The Chloroform is completely removed by evaporation, the residue is dissolved in Alcohol (94.9 pc), which is in turn evaporated, and the residue is dried at 100° C (212° F) until constant. If this weight be multiplied by 20 it indicates the pc of Colchicine present in the Corms.

Preparations

EXTRACTUM COLCHICI. EXTRACT OF COLCHICUM

A soft extract prepared from the juice of fresh *Colchicum Corms* which have been deprived of their coats. The clarified juice is heated to 100° C (212° F) to coagulate Albumen, and the strained liquid is evaporated to a soft extract at a temperature not exceeding 71.1° C (160° F).

100 lb of Corms yield about 4 lb of Extract.

The *BP* Extract is not a standardised preparation and no process of determination appears in the *Pharmacopœia*. The Extract official in the *USP* is standardised to contain 1.4 pc of Colchicine. The *PG* does not contain an Extract of Colchicum Corms.

Dose.— $\frac{1}{4}$ to 1 grain = 0.016 to 0.06 gramme

Foreign Pharmacopœias—Official in Belg, Fr, Ital, Mex and Span (Alcoholic Extract of Seeds), Mex (Alcoholic from Corms), also (Fluid Extract of Corms and Seeds), Port and US Extract from Corms with Acetic Acid. US has Fluid Extract of Seeds. Not in the others.

Tests.—The *USP* method for the determination of Colchicine in Colchicum Extract is essentially as follows.—A volume of 4 grammes of the extract is dissolved in 20 cc of Water, transferred to a 100 cc flask and sufficient Alcohol (94.9 pc) added to bring the volume of the liquid to 100 cc. After the contents of the flask have been well shaken, they are allowed to stand 5 minutes, filtered, and 50 cc of the filtrate collected, evaporated to dryness in a porcelain dish, 10 cc of Ether and 5 cc of Water are added to the residue, and the Ether removed by evaporation. When cool, the aqueous solution is filtered into a separator, the insoluble matter being retained as far as possible in the vessel used for the evaporation. The residue remaining in this vessel is again treated with 10 cc of Ether and 5 cc of Water, the Ether being removed as previously. The dish and filter are rinsed with a little Water, and the

mixed aqueous liquids collected in a separator After rendering the liquid alkaline by the addition of a sufficiency of Ammonia Solution, the Colchicine is extracted by successive quantities of 20, 15 and 10 c c of Chloroform respectively The separated chloroformic solutions are mixed and evaporated to dryness, and the residue is mixed with two successive small quantities of Alcohol (94.9 p c), the latter being removed in each case by evaporation 5 c c of Water and 10 c c of Ether are added to the residue, the liquid shaken and the Ether evaporated When cool, the aqueous liquid is filtered into a separator, the flask and filter being rinsed with Water The Colchicine is extracted by successive shakings with 20 c c, 15 c c and 10 c c of Chloroform The separated chloroformic liquids are mixed, transferred to a tared flask, evaporated to dryness, the residue dissolved in 2 small successive quantities of Alcohol (94.9 p c), the latter removed by evaporation and the residue dried till constant at 100° C (212° F) The weight multiplied by 50 shows the p c of Colchicine present in the Corm Extract

VINUM COLCHICI COLCHICUM WINE

4 of Colchicum Corm in No 20 powder, macerated in 20 of Sherry
(1 in 5)

Dose—10 to 30 minims = 0.6 to 1.8 c c

Diluted Acetic Acid appears to be about as good a solvent as Sherry, but Alcohol (45 p c) was better than either —*P J* '97, i 173 Further notes on the same —*P J* '98, i 131

Foreign Pharmacopœias—Official in Port, 1 and 10 Madeira, Mex, 1 in 10 Sherry See also Vinum Colchici Seminum

Tests—Colchicum Wine possesses a specific gravity of about 1.013, contains about 8.5 p c w/v of total solids and about 20 p c w/v of Absolute Alcohol

The Wine official in the *U S P* is prepared with a standardised fluid extract made from Colchicum Seeds, and should contain 0.04 p c w/v of Colchicine

COLCHICI SEMINA COLCHICUM SEEDS

FR, SEMENCE DE COLCHIQUE, GER, ZWITLOSENSAMEN, ITAL, SEMI DI COLCHICO, SPAN, SEMILLA DE COLQUICO

The dried ripe seeds of *Colchicum autumnale*, L

The Seeds are official in *B P*, *U S P* and *P G* They usually contain 0.6 to 1.0 p c of Colchicine, but neither the *B P* nor the *P G* requires them to yield a definite percentage of alkaloid nor includes a method of determination The *U S P* requires that they shall yield not less than 0.45 p c of Colchicine

Foreign Pharmacopœias—Official in Aust, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Span, Swed, Swiss and U S

The *Brussels Conference* recommends only the Colchicum seed

Descriptive Notes—Colchicum seeds are pale brown and inodorous when freshly gathered, but become darker in drying and exude a saccharine matter consisting of Glucose The percentage of this varies, and must be taken into consideration in estimating the extractive of galenical preparations made with them The seeds are

extremely hard and tough and difficult to powder. They have a bitter acid taste, and are nearly spherical, about $\frac{1}{16}$ to $\frac{1}{8}$ inch (2 to 3 mm) in diameter, but pointed by a strophiole appendage at the hilum. The diameter given in *BP* is 2.5 mm, *USP* 2 mm, *PG* 3 mm. The seeds ripen in June.

Tests—The method of determination recommended by the *USP* is essentially as follows.—A weighed quantity of 10 grammes is macerated, with frequent intervals of shaking, for 12 hours (or for 4 if a mechanical agitator is employed), in an Erlenmeyer flask, with 100 cc of a mixture of 77 cc of Ether, 25 cc of Chloroform and 8 cc of Alcohol (94.9 p.c.), and 3 cc of Ammonia Solution. A measured quantity of 50 cc of the filtered liquid is transferred to a beaker or dish and evaporated nearly to dryness. The residue is dissolved in 10 cc of Ether, 5 cc of Water added, the mixture stirred well, and the Ether evaporated. When cool the aqueous liquid is filtered into a separator, the insoluble matter being retained as largely as possible in the beaker. This residue is redissolved in Ether, and after the addition of 5 cc of Water, the previous operation is repeated. The beaker and filter are washed with a little Water and the Colchicine extracted from the mixed aqueous liquids by agitation with 15 cc of Chloroform. The agitation is thrice repeated with successive quantities each of 10 cc of Chloroform. The chloroformic liquids are separated, transferred to a tared flask, the Chloroform completely removed by evaporation, the residue twice dissolved in small successive quantities of Alcohol (94.9 p.c.), the latter being in each case removed by evaporation, and the residue finally dried at a temperature of 100° C (212° F) till constant in weight. This weight multiplied by 20 gives the percentage of Colchicine present in the seeds. The ash of Colchicum Seeds should not exceed 6.0 p.c.

The *USP* has a 1 in 1 Fluid Extract prepared with Colchicum Seeds and standardised to contain 0.4 p.c. w/v of Colchicine.

Preparation

TINCTURA COLCHICI SEMINUM. TINCTURE OF COLCHICUM SEEDS

1 of Colchicum Seeds, in No. 30 powder, percolated with Alcohol (45 p.c.), to yield 5. (1 in 5)

BP 1885 was 1 in 8, altered in *BP* 1898 to 1 in 5, see also Foreign Pharmacopœias given below.

Dose.—5 to 15 minims = 0.3 to 0.9 c.c.

Ph. Ger. maximum single dose, 2.0 grammes, maximum daily dose, 6.0 grammes.

Foreign Pharmacopœias—Official in Austr., Belg., Dan., Dutch, Fr., Jap., Span. and Swiss 1 in 10, Hung., 1 in 5, Ger., Ital. and Swed., 1 and 10, U.S., 1 in 10, all from Seeds. Mex., 1 in 5 with Corms. Port., 1 in 5 with Seeds and Corms. All by weight except U.S. Not in the others.

The *Brussels Conference* recommended a strength of 10 p.c. of the Seeds with Alcohol (70 p.c.). Belg., Dan., Fr. and Swiss adopt the *BC* Standard.

Tests.—Tincture of Colchicum Seeds possesses a specific gravity of from 0.950 to 0.955, contains from 1 to 3 p.c. w/v of total

solids and about 43 p c w/v of Absolute Alcohol The Tincture official in the *BP* is not a standardised preparation, and consequently no process is given for the quantitative determination of the Colchicine

The *USP* Tincture is required to contain 0.04 p c w/v of Colchicine A measured quantity of 100 c c is evaporated on a water-bath to about a tenth of its volume Sufficient Alcohol (94.9 p c) is added to redissolve any separated matter, 1 c c of Ammonia Solution added, and the Colchicine removed by shaking three times in succession with separate portions of 15 c c, 15 c c and 10 c c of Chloroform The Chloroform solutions are separated, mixed and evaporated nearly to dryness The residue is dissolved in 10 c c of Ether, and 5 c c of Water added, the mixture well stirred, and the Ether removed by evaporation When cool the aqueous solution is filtered into a small separator, the insoluble matter being retained as far as possible in the beaker This residue is redissolved in a little Ether, 5 c c of Water added, the process repeated as previously The beaker and filter are washed with a little Water, and the alkaloid is extracted from the aqueous solution by agitation, first with 15 c c, and thrice subsequently with successive quantities of 10 c c each of Chloroform The chloroformic liquids are separated in each case, transferred to a tared flask, the Chloroform removed completely by evaporation, the residue twice dissolved in a little Alcohol (94.9 p c), the latter being in each instance removed by evaporation, and the residue ultimately dried at a temperature of 100° C (212° F) till constant in weight This weight will represent the percentage w/v of Colchicine present in the Tincture

Not Official

EXTRACTUM COLCHICI ACETICUM (*BP* 1885)—Crushed fresh Corms, previously peeled, 112, Acetic Acid, 6, stir together, press, and after subsidence heat the clear liquor to 212° F (100° C), strain through flannel, and evaporate at 160° F (71.1° C) to a soft extract

100 lb of Corms yield about 5 lb of Extract

Dose— $\frac{1}{2}$ to 2 grains, in pill, with an equal weight of Liquorice Powder

EXTRACTUM COLCHICI CORMI (*US*)—1000 grammes of Colchicum Corms in No. 60 powder is percolated with 350 c c of Acetic Acid (56 p c) mixed with 1500 c c of Water, and the percolation completed with Water, the liquor is evaporated at a temperature not exceeding 80° C (176° F) in a porcelain vessel to a pulular consistence It is adjusted to a strength of 1.4 p c of Colchicine by means of Sugar of Milk

FLUIDEXTRACTUM COLCHICI SEMINIS—About a 1 in 1 Fluid Extract prepared from Colchicum Seeds, and a mixture of Alcohol (95 p c) 2 parts and Water 1 part It is standardised to contain 0.4 p c of Colchicine.—*USP*

MISTURA COLCHICI—Colchicum Wine, 15 minims, Potassium Bicarbonate, 20 grains, Magnesium Sulphate, 15 grains, Peppermint Water, to 1 fl oz —*St Thomas's*

The *BPC* formula is the same, except in using Magnesium Carbonate, 10 grains, in place of Potassium Bicarbonate, 20 grains

Colchicum Wine, 15 minims, Carbonate of Magnesia, 10 grains, Bicarbonate of Potassium, 15 grains, Peppermint Water, to 1 fl oz —*Royal Free*

PILULÆ COLCHICI ET HYDRARGYRI—Acetic Extract of Colchicum, $\frac{1}{2}$ grain, Mercury Pill Mass, $\frac{1}{2}$ grain, Compound Extract of Colocynthis, $\frac{1}{2}$ grain, to make one pill —*BPC*

Sir Benjamin Brodie's Gout Pills—Compound Extract of Colocynth, 16 grains, Extract of Rhubarb, 16 grains, Mercury Pill, 16 grains, Acetic Extract of Colchicum, 6 grains, divided in 12 pills—*Pharm. Form*

This has been incorporated in the *B P C* under the title *Pilulæ Colchici et Hydrargyri Compositæ*

TINCTURA COLCHICI COMPOSITA (*Ph. Lond.*)—1 of bruised Colchicum Seeds, macerated with 8 of Aromatic Spirit of Ammonia

Dose—15 to 30 minims = 0.9 to 1.8 c c

This has been incorporated in the *B P C*

TINCTURA COLCHICI FLORUM (*Squæ*)—Fresh Flowers, 2, Alcohol (90 p c), by weight, 1, after seven days, filter

B P C has incorporated this preparation, but employs Alcohol (70 p c) by volume in place of Alcohol (90 p c) by weight

Dose—10 to 30 minims = 0.6 to 1.8 c c This preparation closely resembles the *Lau. Medicinalis*

Tests—Tincture of Colchicum Flowers possesses a specific gravity of about 0.970, contains about 4 p c w/v of total solids and about 39 p c w/v of Absolute Alcohol. It is standardised to contain 0.06 p c of Colchicine

VINUM COLCHICI SEMINUM—1 of Colchicum Seeds, in fine powder, macerated with 10 of Sherry

Dose—10 to 30 minims = 0.6 to 1.8 c c

Ph. Ger. maximum single dose, 2 grammes, maximum daily dose, 6 grammes
B P C same strength as above, but with Detannated Sherry

Foreign Pharmacopœias—Official in Dutch, 1 and 10 M^g and 5 and 10 M^g, Hung, 1 in 5 and Norw, 1 and 10 Sherry, Ital, 1 and 10 Marsala, Port, 1 and 10 Madeira, U.S., Fluid Extract, 1 in 10, with White Wine and Alcohol. All by weight except U.S.

COLCHICINA Colchicine $C_{22}H_{25}NO_6$, eq 396.24—A yellowish powder, soluble in Water and Alcohol (90 p c)

Dose— $\frac{1}{10}$ to $\frac{1}{2}$ grain = 0.00054 to 0.002 grammes

Colchicine is Tri-methyl-acetyl-colchicemic Acid, and crystallises in shining white needles. Colchicine is the Methyl Ester of Colchicemic

Colchicine has been shown (*B M J* '04, ii 1697, *L* '04, ii 1784) to be a slow poison, acting on the medulla, which it paralyzes

A solution of $\frac{1}{10}$ grain in Methyl Salicylate enclosed in Gelatin capsule is known under the name of 'Colchisal'

Foreign Pharmacopœias—Official in Fr, Hung, Mex and U.S.

Tests—Colchicine melts at 148° to 147° C (289.4° to 296.6° F) *Fr. Codex* gives 145° C (293° F). It is neutral in reaction towards Litmus. Its aqueous solution is laevogyrate. Its solution in dilute mineral acid gradually becomes meniscus yellow. Concentrated Nitric Acid produces, on the colour changing to yellow, and ultimately to green, on dilution with Water the violet solution changes to yellow, and on the addition of Sodium Hydroxide Solution in excess, to a fine orange or red colour, with very minute quantities of Colchicine the colour produced is rose-red. In concentrated Sulphuric Acid the alkaloid dissolves with the production of an intense yellow colour, which changes to a greenish-blue on the addition of Nitric Acid. It then turns to red, and finally to yellow. An aqueous solution gives no immediate coloration with Ferric Chloride. But on warming a garnet-red coloration is produced, an alcoholic solution gives a garnet-red coloration. Colchicine is stated to form a compound with Chloroform which is readily decomposed by Water. *Fr. Codex* gives the formula of this compound as $C_{22}H_{25}NO_6 \cdot 2CHCl_3$. The absence of Chloroform may be ensured by mixing 0.1 gramme of the alkaloid with 0.3 gramme of Calcium Chloride (free from Chlorides) moistening with Water, evaporating to dryness, and igniting. The residue is dissolved in dilute Nitric Acid filtered, and Silver Nitrate Solution added, no turbidity or precipitate should be produced.

0.1 gramme of Colchicine should leave no weighable residue when ignited with free access of air

COLCHICINÆ SALICYLAS—Yellow, amorphous powder, soluble in Water, in Alcohol (90 p c), and in Ether. It dissolves 1 in 100 of Methyl Salicylate. It should be preserved in well-closed bottles of a dark amber tint. Has been recommended in the treatment of gout and rheumatism as combining the properties of its two constituents.

Dose— $\frac{1}{10}$ to $\frac{1}{32}$ grain = 0.00054 to 0.002 gramme

Tests—Colchicine Salicylate yields the reactions distinctive of Colchicine given under that heading.

An aqueous solution of the salt yields a violet coloration with Ferric Chloride Test Solution. The salt should leave no weighable residue when ignited with free access of air.

Not Official

COLLINSONIA

The Root of *Collinsonia Canadensis*, L. (Stone Root)

Various preparations of this have been recommended in acute cystitis, and in the treatment of renal calculi.—*B M J* '87, 11 712, *L* '88, 1 868

Dose—15 to 60 grains = 1 to 4 grammes

TINCTURA COLLINSONIÆ—Collinsonia Root, 1, Alcohol (60 p c), 10

Dose—30 to 120 minims = 1.8 to 7.1 c c

This has been incorporated in the *B P C*

A 1 in 1 Fluid Extract is also made

Dose—15 to 60 minims = 0.9 to 3.6 c c

COLOCYNTHIDIS PULPA.

COLOCYNTH PULP

FR, COLOQUINTE, GER, KOLOQUINTHEN, ITAL, COLOQUINTIDE,
SPAN, COLOQUINTIDA

The dried pulp of the Fruit of *Citrullus Colocynthis*, Schrader, freed from Seeds. The fruit is imported chiefly from Smyrna, Trieste, France and Spain.

Medicinal Properties—It is a powerful drastic, hydiagogue cathartic, dangerous in large doses. It should not be prescribed alone, but in combination it is very commonly prescribed as an aperient in the form of Compound Extract or Pill, and combined with Henbane, which prevents griping. It is not to be given in pregnancy, nor when gastric or intestinal inflammation is suspected. The Tincture is ordered in Mixtures.

Dose—2 to 8 grains = 0.13 to 0.52 gramme

Ph Ger maximum single dose, 0.3 gramme, maximum daily dose, 1 gramme

Official Preparations—Extractum Colocynthidis Compositum and Pilula Colocynthidis Composita. Pilula Colocynthidis Composita is used in the preparation of Pilula Colocynthidis et Hyoscyami.

Not Official—Pilulæ Catharticæ Compositæ, Pilulæ Catharticæ Vegetabiles, Pilulæ Colocynthidis et Hydragyri, Tinctura Colocynthidis

— **Foreign Pharmacopœias**—Official in Austr., Belg., Dan., Dutch, Fr. (Coloquinte), Ger., Hung., Ital. (Coloquintida), Jap., Norw., Port. (Coloquintides), Russ., Mex. (Coloquintida), Swed., Swiss and U.S.

Descriptive Notes.—Colocynth fruits are imported from Asia Minor, Smyrna, Almeria in Spain, Mogador, Egypt and Cyprus, also from Persia, and more rarely from Marseilles and Trieste.

The kinds most frequently met with in commerce are the Turkish and Spanish, both of which have been peeled after drying, the Spanish less carefully, and shows more traces of the brown rind. The Mogador fruit is larger and unpeeled, it is brown externally when dry, though marbled with green and white when fresh, the Persian is peeled before drying, and consequently presents a shrunken appearance. It yields, however, the same proportion of pulp in relation to the seeds as the other varieties. Two forms of powdered Colocynth are sold, the one containing the seeds and the other freed from them as nearly as possible. The former is cheaper and is excluded by the Pharmacopœia direction 'freed from seeds,' and is used for keeping away moths from furs. The peeled fruit is alone official, occurring in more or less broken balls, about 2 in (5 cm) or less in diameter, *BP*, about 5 to 10 cm in diameter, *USP*. The Mogador variety exceeds the diameter given in *BP*, and is unpeeled and therefore excluded, whilst the Persian variety is not.

Tests—The boiled and cooled aqueous decoction of the pulp should yield no distinctive blue coloration with Starch Solution. The official test also adds that 'only traces of fixed oil should be removed by Ether.' The author has pointed out in the *Companion* (17th Edition) that the removal of the Seeds commercially is carried out very imperfectly, and as the Seeds contain about 15 p.c. of Oil it is doubtful whether a single trade sample could be found which would pass the official Ether Test, even on the supposition that the Pulp itself was free from Ether-soluble constituents. The Pulp, however, perfectly free from Seeds yields to Ether about 3 p.c. of extractive of an oily nature, so that the official test should be completely modified. Confirmation of the above results appears (*Analyst*, xxi, 31). Not merely Oil but also some gummy matter is extracted by Ether, both from the Seeds and the Pulp, and the use of a different solvent is therefore suggested. A limit for fixed Oil, as shown by extraction with Petroleum Spirit has been recommended, it should amount to from 1 to 2 p.c. The *BP* mentions that it yields when dried at 100° C (212° F) and incinerated, at least 9.0 p.c. of ash. The author has found the ash of the Pulp to vary between 8.6 and 14 p.c., and that of the Seeds between 2.2 and 4.0 p.c., on these figures Colocynth Pulp with an allowable 10 p.c. of Seeds would yield not less than 8 p.c. of ash. It should also be noted that the ash both of Pulp and Seed is very deliquescent. The figures given (*Analyst*, xxi, 31) for the Pulp are from 7.8 to 12.1 p.c., for the Seeds 1.7 to 3.2 p.c. The hygroscopic nature of the ash is commented on and a determination of the sulphated ash suggested. A limit of 9.0 to 12.0 p.c. of ash has been recommended. No ash limit is suggested in either the *USP* or *P.G.*

Preparations

EXTRACTUM COLOCYNTHIDIS COMPOSITUM COMPOUND
EXTRACT OF COLOCYNTH

Colocynth Pulp, 6, Extract of Barbados Aloes, 12, Scammony Resin, 4, Curd Soap, in shavings, 4, Cardamom Seeds, in the finest powder, 1, Alcohol (60 p c), 160

B P directs the Colocynth to be macerated in the Alcohol for four days, press out the Tincture, remove the Alcohol by distillation, and add the Extract of Aloes, Scammony Resin and Soap, evaporate to a firm extract, adding the Cardamoms towards the end of the process, but it is better to evaporate the Colocynth Extract to dryness, powder it, and mix with the other ingredients to form Pulv Ext Coloc Co, the product weighs about 24

6 of Compound Extract is about equal to $1\frac{1}{2}$ of Pulp (Simple Extract $\frac{3}{4}$), Extract of Aloes 3, Resin of Scammony 1, Curd Soap 1, Cardamoms $\frac{1}{2}$, Water $\frac{1}{2}$

Dose —2 to 8 grains = 0 13 to 0 52 gramme

Ph Ger maximum single dose of the Simple Extract, 0 05 gramme, maximum daily dose, 0 15 gramme

Commonly prescribed with Extract of Hyoscyamus, to prevent griping

Foreign Pharmacopœias —Official in Port, Colocynth 30, Aloes 55, Scammony 22, Hard Soap 15, Cardamoms 3, Swed, Colocynth 5, Aloes 10, Resin of Jalap 3, Cardamoms 1, Soap 2, Russ, Extract Colocynth 3, Aloes 10, Scammony 8, Extract of Rhubarb 5, U S, Extract Colocynth 16, Purified Aloes 50, Resin Scammony 14, Cardamoms 6, Soap 14, all alcoholic Not in the others Austr, Belg, Dan, Dutch, Ger, Hung, Ital, Jap, Mex, Port, Russ, Swiss and U S have a Simple Extract made with Alcohol

PILULA COLOCYNTHIDIS COMPOSITA. COMPOUND PILL OF
COLOCYNTH

Colocynth Pulp, 1, Barbados Aloes, 2, Scammony Resin, 2, Potassium Sulphate, $\frac{1}{4}$, Oil of Cloves, $\frac{1}{4}$, Distilled Water, *q s*
(about $\frac{1}{4}$) (about 1 in 6)

B P Dose —4 to 8 grains = 0 26 to 0 52 gramme

The *minimum* dose is somewhat high, as it is frequently prescribed in smaller doses The same may be said of the next pill, which is only two-thirds of the strength

For dispensing, keep the powders and oil ready mixed, and make up the mass as required with Water, or better still with Alcohol (60 p c)

This mass, when made with Scammony instead of Scammony Resin and divided into 5 grain pills, forms Gregory's pill

Foreign Pharmacopœias —Official in Norw, Colocynth 2, Aloes 4, Resin of Scammony 4, Oil of Cloves $\frac{3}{4}$, Suet 3, Glycerin 3, Swed, Compound Extract of Colocynth 7, Cloves 1, Resin of Jalap 2, Extract of Wormwood *q s*. Not in the others

PILULA COLOCYNTHIDIS ET HYOSCYAMI PILL OF
COLOCYNTH AND HYOSCYAMUS

Compound Pill of Colocynth, 2, Extract of Hyoscyamus, 1

B P Dose —4 to 8 grains = 0 26 to 0 52 gramme

Christison's Pill is 2 grains of *Pilula Colocynthidis et Hyoscyami* (*B P* 1867)

Hamilton's Pill —For some years past it has been the general practice to supply 4 or 5 grains of the *B P* pill mass, but some few houses in Edinburgh still supply the pills of the late Dr Hamilton, Jun, the formula for which was

Compound Extract of Colocynth, 2, Extract of Hyoscyamus, 1, mix and make into $\frac{1}{2}$ grain pills.

Foreign Pharmacopœias—Official in Jap, Colocynth 10, Aloes 20, Root of Jalap 20, Extract of Hyoscyamus 25, Potassium Sulphate 3, Oil of Cloves 1 Not in the others

Not Official

PILULÆ CATHARTICÆ COMPOSITÆ—Compound Extract of Colocynth, 16 grains, Mild Mercurous Chloride, 12 grains, Resin of Jalap, 4 grains, Gamboge, 3 grains, made into a mass with Diluted Alcohol (49 per cent) and divided into 12 pills—*U S P*

B.P.C. gives the same formula as above except that the *B.P.* Compound Extract of Colocynth is used in place of that of *U S P*, which is different

PILULÆ CATHARTICÆ VEGETABILES—Compound Extract of Colocynth, 12 grains, Extract of Hyoscyamus, 6 grains, Resin of Jalap, 4 grains, Extract of Leptandra, 3 grains, Resin of Peppermint, 2 minims, made into a mass with Diluted Alcohol (49 per cent), and divide into 12 pills—*U S P*

PILULÆ COLOCYNTHIDIS ET HYDRARGYRI *Syn* Abernethy's Pill.—Mercury Pill, 3 grains, Compound Extract of Colocynth, 2 grains, in one pill—*Pharm. Lond.*

This appears also in *B.P.C.*, but the proportions are reversed

TINCTURA COLOCYNTHIDIS—1 of Colocynth Pulp, in coarse powder, macerated with 10 of Alcohol (90 per cent) (1 in 10)

Dose—10 to 15 minims = 0.6 to 0.9 c.c. three times a day

Ph. Ger. maximum single dose, 1 gramme, maximum daily dose, 3.0 grammes

This has been incorporated in the *B.P.C.*

Foreign Pharmacopœias—Official in Hung and Mex, 1 in 5, Belg, Jap and Swiss, 1 in 10, Ger and Ital, Fruits 1, Alcohol 10, Swed, 1 in 10 with Anise Fruits $\frac{1}{10}$ Not in the others

Not Official

CONDURANGO CORTEX.

The Bark obtained from *Gonolobus condurango*

Medicinal Properties—It was introduced as a remedy for cancer, but it has not fulfilled the expectations formed of it. It relieves catarrh and hyperæsthesia of the stomach, and has been used with benefit in ulcer and cancer of the stomach, relieving the vomiting, pain and hæmatemesis, and improving the appetite—*J. M. R.* '82, 337, *L.* '95, 1004

Descriptive Notes—Formerly this bark was referred to *Gonolobus Condurango*, Truana, but in the *P.G.* it is now referred to *Marsdenia Condurango*, Reich, an Asclepiadaceous plant of Equatorial South America. It occurs in short gnarled pieces about 2 to 3 inches (50 to 75 mm) long or more, $\frac{1}{4}$ to $\frac{1}{2}$ inch (12 to 20 mm) broad and $\frac{1}{8}$ inch (3 mm) thick. Externally it is brownish grey, and the surface is uneven with slightly raised longitudinal ridges, the fracture is fibrous and exhibits numerous small glandular masses of white cells, but towards the outer surface a few projecting pores are perceptible. The distinctive features under the microscope are the large polygonal cells of the phelloderm cells, the abundance of spheraphid in the pith cells, the very variable sclerenchymatous cells, and the abundance of starch. The medullary rays consist of a single row of cells as seen in transverse section, and laticiferous vessels are present.

A cold infusion of the bark (1-2) becomes cloudy when heated, but becomes clear again when cold (*P.G.*)

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr., Ger, Jap, Mex., Norw, Russ, Span, Swed and Swiss. Not in the others.

EXTRACTUM CONDURANGO LIQUIDUM—A 1 in 1 fluid extract of Condurango bark prepared by percolation, with Alcohol (60 p c). The residue obtained after distilling the Alcohol from the latter portions of the percolate being dissolved in the reserved portion—*B P C Formulary* 1901, incorporated in the *B P C*

Dose—10 to 60 minims = 0.6 to 3.6 c c

100 of Condurango Bark is moistened with a mixture containing Alcohol (90 p c), 15, Distilled Water, 25, Glycerin, 10, and percolated with a mixture of Alcohol, 1, Distilled Water, 3, proceed as directed for fluid extracts, so as to produce 100—*Dan., Ger. and Jap.*

Austrian, Swedish, and Russian are similar, Dutch, Fluid extract, the bark is moistened with a mixture of Alcohol (90 p c) 60, Water 30, and Glycerin 10, and percolated with Alcohol (90 p c) 35 and Water 65, Belg, Fluid extract with Alcohol (30 p c), Solid extract with Alcohol (60 p c), Fr Fluid Extract with Alcohol (45 p c), Swiss, Fluid extract with a mixture of Alcohol (90 p c) 1 and Water 3, Spanish has an extract with Alcohol (70 p c)

VINUM CONDURANGO—Fluid Extract of Condurango, 1, Malaga Wine, 9—*Austr. and Swiss*

Condurango Bark, 1, Malaga, 10—*Dutch*

Condurango Bark, 1, Sherry, 10—*Ger. and Jap.*

Condurango Bark, 3, Alcohol (60 p c), 3, Carinena or Alicante Wine, *q s* to yield 100—*Span.*

All by weight

Fluid Extract of Condurango, 1, Detannated Sherry, *q s* to make 10—*B P C*

Dose—2 to 8 fl drms = 7.1 to 28.4 c c

CONIUM.

CONIUM

FR CIGUE, GER, SCHIERLING, ITAL, CICUTA, SPAN, CICUTA

The fresh Leaves and young Branches of *Conium maculatum*, L., as well as the dried unripe Fruits, are official in the *B P*, the full-grown but unripe Fruit, carefully dried and preserved, is official in the *USP*, the dried Leaves and flowering Stem Tops are official in the *PG*. The *USP* requires the Fruit to yield not less than 0.5 p c of Conium

Medicinal Properties—Sedative and antispasmodic, allays the cough in bronchitic affections, pertussis, and phthisis. Has been recommended in chorea and other spasmodic affections, also in visceral neuralgias and gastric pains. Applied externally in the form of ointment to ease pain of anal fissure or of hæmorrhoids, and cancer

Dose—Of the Succus 1 to 2 fl drms = 3.6 to 7.1 c c. Of the Tincture 30 to 60 minims = 1.8 to 3.6 c c

Ph. Ger. maximum single dose, 0.2 gramme, maximum daily dose, 0.6 gramme

Prescribing Notes—In consequence of the great variation in strength of Conium preparations, the standardised Fluid Extract or Conium Hydrobromidum should be prescribed. 1 fl drms of the Fluid Extract is about equal to 1 fl oz of Succus Conii (average strength)

Incompatibles.—Caustic Alkalis, and vegetable Astringents.

Official Preparations—Succus Conii from the Folia Unguentum Conii from the Succus Tinctura Conii from the Fructus

Not Official—Extractum Conii, Extractum Conii Liquidum, Pessus Coniinae, Pilulae Conii Compositae, Vapor Coniinae, Coniina, Coniinae Hydrobromidum, and Coniinae Hydrochloridum

Antidotes—In case of poisoning by Hemlock, stomach-tube or emetics, followed by 10 minims of Strychnine hypodermically, artificial respiration

CONII FOLIA. CONIUM LEAVES.

The fresh Leaves and younger Branches of *Conium maculatum*, collected when the fruit begins to form

Foreign Pharmacopœias—Official in Austr, Ger, Mex, Port and Span Not in Belg, Dan, Dutch, Fr, Hung, Ital, Jap, Norw, Russ, Swed, Swiss or U S

Descriptive Notes.—Conium has pinnately decompound leaves and is distinguished from other British umbelliferous plants having similar leaves by the purplish spots on the stem and petioles of the leaves, by the mouse-like odour evolved when rubbed with Liquor Potassae, and by the leaves being quite free from hairs. The extreme points of the leaf segments are white or colourless, whilst in *Aethusa Cynapium*, L., which has also hairless leaves, the tips are brown, and it has no general involucre to the umbels as in Conium, but only a partial one of three long bracts. The fresh leaves of Conium only are official and are in best condition at the end of June and beginning of July. Such of the British species of the genus *Cherophyllum* as resemble Conium in appearance, have hairy leaves and cylindrical fruits. Under the microscope it is distinguished by striated epidermal cells, by the parenchymatous cells containing minute, usually single, crystals of Calcium Oxalate, the absence of hairs, and the presence of annular as well as spiral vessels.

Tests.—Conium leaves when bruised possess a strong and peculiar odour, somewhat resembling that of mice, and when the leaves are rubbed with Potassium or Sodium Hydroxide Solution the odour is intensified.

Preparations

SUCCUS CONII. JUICE OF CONIUM

3 of Juice, obtained from the fresh Leaves and young Branches, preserved by the addition of 1 of Alcohol (90 p c)

Dose.—1 to 2 fl. drm = 3.6 to 7.1 cc

Much larger doses are also given

UNGUENTUM CONII. CONIUM OINTMENT

Evaporate 8 of the Juice of Conium on a water-bath to 1, at a temperature not exceeding 110° F (60° C), and mix with 3 of Hydrous Wool Fat

Contrary to what might have been expected, the alkaloidal strength of the juice is not affected by the evaporation, but it is better to evaporate the juice to 2 and to use Anhydrous Wool Fat, also to add 2 p c of Boric Acid

Becomes mouldy on keeping—P J '98, 165, 232

Not Official

EXTRACTUM CONII —Made from the fresh leaves and young branches of Hemlock —*B P* 1885

This has been incorporated in the *B P C*

PILULÆ CONII COMPOSITÆ —Extract of Hemlock, 5, Ipecacuanha, in powder, 1, Treacle *q s* —*B P* 1885

This has been incorporated in the *B P C*

VAPOR CONIINÆ —Juice of Hemlock, $\frac{1}{2}$ fl oz, Solution of Potash, 1 fl dr, Distilled Water, 1 fl oz —*B P* 1885

This has been incorporated in the *B P C*

CONII FRUCTUS CONIUM FRUIT

The dried, full-grown, unripe Fruits of *Conium maculatum*

Conium Fruits are not officially required to yield any definite percentage of Coniine. The *U S P* states that they shall yield not less than 0.5 p.c. of Coniine. The standard adopted by the *U S P* has been criticised as being too low, but the standard is justified (*Y B P* '05, 398)

Foreign Pharmacopœias —Official in Fr, Mex, Port, Span and U S

Descriptive Notes —Conium fruits are ovoid, greyish-green, slightly compressed laterally, and, as met with in commerce, consist of the separate mericarps. The size is given in *B P* as $\frac{1}{8}$ inch (3 mm) long, and nearly as broad, in *U S P* as 3 mm long, and about 1.5 mm in diameter. The five dorsal ridges are more or less wavy and irregularly crenate, this feature being most conspicuous before the fruits are fully ripe. The surface between the ridges is glabrous but minutely wrinkled. The flat surface shows a narrow deep depression which gives a reniform outline to a transverse section of the mericarp. The *U S P* states that Conium fruit after being kept for more than two years is unfit for use. Although vittæ are present in the very young fruit they subsequently disappear and are absent in the fruit when mature. Conium Fruits are characterised under the microscope by thin-walled nearly cubical cells, which form a layer outside the endosperm. The Coniine and an essential oil are contained in the cells of the endocarp, so that a finely powdered fruit is not necessary for its extraction.

Tests —The percentage of Coniine present in Conium Fruits may be determined by extraction with suitable solvents, and weighing the alkaloid as a Hydrochloride. A weighed quantity of 5 grammes of the finely-powdered fruit is extracted with 50 c.c. of a saturated solution of dry Hydrochloric Acid gas in Chloroform. The extraction with a further quantity of a similar mixture is continued until 6 drops of the chloroformic mixture evaporated on a watch-glass, and the residue acidified with Diluted Sulphuric Acid, gives no precipitate with Mayer's reagent. The mixed chloroformic liquids after separation from the marc are shaken with two separate quantities of 25 c.c. each of Water. The mixed aqueous shakings are in turn separated, shaken twice with 10 c.c. of Chloroform, and the Chloroform separated. The aqueous portion is made alkaline by the addition of Sodium Hydroxide Solution, and the liberated alkaloid extracted by shaking with three

successive portions each of 10 c c of Chloroform. The chloroformic liquids are separated in each case, mixed, run into 10 c c of the saturated solution of dry Hydrochloric Acid gas in Chloroform, evaporated to dryness on a water-bath, the residue dried at a temperature not exceeding 90° C (194° F), and weighed, 162.41 parts of anhydrous Coniine Hydrochloride represent 126.22 parts of Coniine.

The method of determination adopted by the *U S P* is essentially as follows.—A weighed quantity of 10 grammes of the Fruit in No. 60 powder is shaken at intervals during four hours in an Erlenmeyer flask, with 100 c c of a mixture of 98 parts of Ether, 8 parts of Alcohol (94.9 p c), and 3 parts by volume of Ammonia Water. A measured quantity of 50 c c of the clear liquid is decanted into a beaker, and mixed with sufficient Normal Volumetric Sulphuric Acid Solution to produce an acid reaction. The Ether is evaporated on a water-bath, 15 c c of Alcohol (94.9 p c) added, and the mixture set aside for two hours to permit of the Ammonium Sulphate depositing, the Tincture filtered, the residue and filter washed with a little Alcohol (94.9 p c), and the washings mixed with the filtrate. The excess of acid is neutralised by Sodium Carbonate, a slight acidity being carefully maintained. The liquid is now carefully concentrated on a water-bath to a volume of 3 c c, mixed with an equal volume of Water and 2 drops of Normal Volumetric Sulphuric Acid Solution. The liquid is washed with two successive quantities each of 15 c c of Ether, the ethereal liquids separated, the acid liquid transferred to a separator, sufficient Sodium Carbonate Test-solution added to render the liquid distinctly alkaline to red Litmus paper, and the liberated alkaloid shaken out with successive portions of 15 c c, 15 c c, and 10 c c of Ether. The ethereal solutions are in each case separated, transferred to a tared beaker, and sufficient 5 p c Hydrochloric Acid solution added to the mixed ethereal solutions to render them distinctly acid. The Ether is removed by evaporation at a gentle heat on a water-bath, and the excess of Hydrochloric Acid by adding two separate quantities of 3 c c each of Alcohol (94.9 p c), and removing them in each case by evaporation. The residue is dried at a temperature not exceeding 60° C (140° F). This weight, multiplied by 0.777 and the product by 20, gives the percentage of Coniine present in the Fruit.

Coniine may be titrated with Normal or Deci-normal Volumetric Hydrochloric Acid Solution, using Methyl Orange Solution as an indicator of neutrality, 1 c c of the Normal Acid represents 0.012622 gramme of Coniine.

Preparation.

TINCTURA CONII. TINCTURE OF CONIUM

1 of Conium Fruit, recently reduced to No. 40 powder, percolated with Alcohol (70 p c), *qs* to yield 5.
Now 1 in 5 instead of 1 in 8.

Dose.—30 to 60 minims = 1.8 to 3.6 c c

Foreign Pharmacopœias—Official in Port, Tinct Cicutæ, 1 in 5, also Fresh Herb 1, Spirit 1, Mex, Leaves, 1 in 5 Not in the others

Tests—Tincture of Conium possesses a specific gravity of from 0.895 to 0.900, contains about 1.75 p.c. of total solids and about 68 p.c. w/v of Absolute Alcohol. The *B.P.* Tincture is not a standardised preparation, and no process for the quantitative determination of the Conium is given.

Not Official.

EXTRACTUM CONII LIQUIDUM—A standardised Liquid Extract prepared by treating 100 of Conium Fruit (in No. 40 powder) with a mixture of 100 of Alcohol (60 p.c.) and $1\frac{1}{2}$ of Acetic Acid, the exhaustion is completed with Alcohol (60 p.c.), finally the liquid is adjusted to contain 1 p.c. w/v alkaloidal hydrochlorides—*B.P.C. Formulary* 1901, incorporated in the *B.P.C.*

Dose—5 to 15 minims = 0.3 to 0.9 c.c.

The *U.S.P.* has also a Fluidextractum Conii, about 1 in 1, which is standardised to contain 0.45 p.c. w/v of Conium. It is prepared by treating 100 of Conium Fruit in No. 40 powder with a mixture of 98 of Alcohol (60 p.c.) and 2 of Acetic Acid (*U.S.P.*), the exhaustion is completed with Alcohol (60 p.c.)

Tests—The *U.S.P.* mixes a measured quantity of 10 c.c. of the Fluid Extract with a little clean sand and evaporates to dryness on a water bath. After the Extract and the sand are uniformly mixed they are transferred to an Erlenmeyer flask and shaken at intervals during one hour with 100 c.c. of a mixture of 100 c.c. of Ether, 7 c.c. of Alcohol (94.9), and 3 c.c. of Ammonia Solution, the dish being washed out with the mixture, and the mixture added in portions. A measured quantity of 50 c.c. of the clear liquid is decanted into a beaker, and sufficient Normal Volumetric Sulphuric Acid Solution added to produce a distinctly acid reaction. The Ether is removed by evaporation, 15 c.c. of Absolute Alcohol added, and the Ammonium Sulphate allowed to deposit during two hours. The liquid is filtered, the residue and filter washed with a little Absolute Alcohol, the washings being added to the filtrate. The excess of acid is neutralised by the careful addition of Sodium Carbonate Test Solution, a slight acidity being maintained. The liquid is concentrated by evaporation on a water bath, to a volume of 8 c.c., mixed with an equal volume of Water and 2 drops of Normal Volumetric Sulphuric Acid Solution. The acid liquid is washed with two successive portions each of 15 c.c. of Ether, the acid liquid separated in each instance, it is transferred to a separator, sufficient Sodium Carbonate Test Solution added to render the liquid distinctly alkaline to red Litmus paper, and the liberated alkaloid removed by extraction with successive portions of 15 c.c., 10 c.c., and 10 c.c. of Ether. The ethereal solutions are separated in each case, transferred to a tared beaker, mixed, and sufficient of a 5 p.c. Hydrochloric Acid Solution added drop by drop to ensure an excess of acid. The Ether is then removed by distillation, the excess of Hydrochloric Acid by evaporating twice with successive portions of 3 c.c. of Alcohol (94.9 p.c.), the residue dried at a temperature not exceeding 60° C (140° F), till constant in weight, and weighed after cooling in a desiccator. The weight multiplied by 0.777 and the product by 20 gives the p.c. w/v of Conium present in the sample of Fluid extract.

The *B.P.C.* states, 'determine the proportion of alkaloids in the strong liquid extract, and adjust the finished product so that it shall contain alkaloids equivalent to 1.0 p.c. of alkaloidal hydrochlorides,' but does not give the details of any process by which they may be determined.

PESSUS CONIINÆ—Conium, $\frac{1}{2}$ maxim, Gelatin Basis, 20 grains—*Women*

Conium Hydrobromide, $\frac{1}{2}$ grain, Oil of Theobroma, 120 grains—*B.P.C.*

CONIINA. *Syn.* Cicutine $C_8H_{17}N$, eq. 126.22—A colourless, or pale yellow, volatile oily liquid, with a characteristic penetrating mousey odour. Obtained

from *Conium maculatum*. It unites with acids to form crystalline salts, which are much more stable than the alkaloid.

Solubility—1 in 100 of Water. It mixes in all proportions with Alcohol (90 p.c.) and with Ether.

Causes a very great increase in the blood pressure when injected (*L* '05, 1851), the effect, however, is transient, and prolonged administration causes paralysis.

Dose—It has been given in doses of $\frac{1}{12}$ grain to 1 grain = 0.0054 to 0.06 gramme, but the Foreign Pharmacopœias give much smaller doses, 1 to 4 milligrammes = $\frac{1}{24}$ to $\frac{1}{18}$ grain.

Foreign Pharmacopœias—Official in Mex. Not in the others.

Tests—Conine has a specific gravity of 0.886 (Schorm), 0.844 (Ladenburg). It boils at about 169° C (336 2° F). It is dextrogyrate, its specific rotation being +13.8° for the Sodium ray.

The aqueous solution of Conine is powerfully alkaline in reaction. When a glass tube with concentrated Hydrochloric Acid is held closely over a small quantity of Conine contained in a watch-glass, white fumes are produced, and if sufficient of the fumes be passed over the surface of the alkaloid, it is wholly converted into a crystalline Hydrochloride, Nicotine Hydrochloride is amorphous.

On the addition of a large excess of concentrated Hydrochloric Acid to Conine a pale red tint is produced, gradually deepening in colour, Sulphuric Acid gives no immediate change with pure Conine, but the mixture gradually becomes purple-red and then olive-green. It may be distinguished from Nicotine by producing with Mercuric Chloride Solution a white amorphous, instead of a crystalline precipitate, by its non-precipitation with Platonic Chloride Solution, and by its alkalinity. In Phenolphthalein Solution, an aqueous solution of Conine being coloured red immediately on the addition of 1 or 2 drops of Phenolphthalein Solution, Nicotine is neutral to Phenolphthalein Solution. When heated slowly with free access of air it is completely volatilised, leaving no weighable residue.

CONIINÆ HYDROBROMIDUM Conine Hydrobromide $C_8H_{11}N.HBr$, eq. 206.57—Transparent, colourless, rhombic crystals, or a white, crystalline powder. The usual form for prescribing Conine, of which it contains about 60 p.c.

It should be protected as far as possible from the light in well-closed glass bottles of a dark amber tint.

Solubility—1 in 2 of Water, 1 in 3 of Alcohol (90 p.c.)

Dose— $\frac{1}{2}$ to 2 grains = 0.01 to 0.13 gramme.

For hypodermic use, $\frac{1}{12}$ grain in 5 minims of Water.

Official in Fr. (1908) and Mex.

Tests—Conine Hydrobromide melts according to *Fr. Codex* (1908) at 211° C (411.8° F). The Conine obtained from the Hydrobromide answers the tests distinctive of the alkaloid given under that heading. When moistened with a few drops of Potassium or Sodium Hydroxide Solution, the peculiar mousy odour of Conine is evolved. The aqueous solution acidified with diluted Nitric Acid gives on the addition of Silver Nitrate Solution a yellowish-white curdy precipitate, practically insoluble in Ammonia Solution and in Nitric Acid. The salt should leave no weighable residue when ignited with free access of air.

CONIINÆ HYDROCHLORIDUM—Colourless crystals, readily soluble in Water and in Alcohol (90 p.c.).

Tests—The Conine obtained from Conine Hydrochloride responds to the test for the alkaloid given under that heading. When moistened with 1 or 2 drops of Potassium or Sodium Hydroxide Solution, the peculiar mousy odour of Conine is evolved. The aqueous solution acidified with Nitric Acid yields with Silver Nitrate Solution a white curdy precipitate insoluble in Nitric Acid, soluble in Ammonia Solution. The salt when incinerated with free access of air leaves no weighable residue.

Not Official

CONVALLARIA

The entire Plant of *Convallaria Mayalis*, L (Lily of the Valley), gathered when the flowers commence to open and dried

Medicinal Properties—A cardiac tonic, diuretic Not cumulative like Digitalis, but according to Mitchell Bruce it is a very uncertain remedy It has been long employed by the Russian peasantry as a remedy for dropsy The late Professor Sée considered that it may be used in all forms of heart failure, for it has none of the nauseating effects of Digitalis, nor does it exhaust the contractility of the heart and arteries

The juice of fresh plant stated (*P J* '04, 11 967) to contain 0.225 p.c. Convallamarin, and 0.12 p.c. Convallarin

Foreign Pharmacopœias—Official in Austr, Fr (Muguet), Ital (Mughetto), Mex, Span (Lirio de los Valles) and U.S. Not in the others

Convallaria contains 2 glucosides—Convallarin, a purgative, and Convallamarin, allied to Digitalin in its action on the heart, the dose of the latter is $\frac{1}{8}$ to 2 grains = 0.008 to 0.13 gramme

EXTRACTUM CONVALLARIÆ (*Fr, Ital and Span*)—An aqueous extract of the Stalks and flowers of Convallaria freshly gathered and dried Mex, from roots

Dose—2 to 5 grains = 0.13 to 0.32 gramme three times a day

Ital maximum single dose, 0.20 gramme, maximum daily dose, 1.0 gramme

FLUIDEXTRACTUM CONVALLARIÆ (*U.S.*)—1 in 1, from the rhizome and roots of Convallaria, with a mixture of Alcohol (95 p.c.) 650, and Water 350 = about Alcohol (60 p.c.)

Average Dose—8 minims = 0.5 c.c.

Russ has a Tincture from fresh Flowers

B.P.C. has 1 in 1 Fluid Extract, dose 5 to 10 minims, and a Tincture 1 in 8, dose 5 to 20 minims, both are made from the dried Flowers with Alcohol (60 p.c.)

COPAIBA.

COPAIBA

B.P.Syn—COPAIBA

FR, COPAHU, GER, COPAIVABALSAM, ITAL, BALSAMO DI COPAIBA, SPAN, OLEO RESINA DE COPAIBA

An Oleo-Resin, obtained from the trunk of *Copaifera Lansdorfii*, Desf, as well as from other species of *Copaifera*

Obtained from the northern part of South America The commercial varieties Para, Maianham, Maracabo, and Angostura are named from the various ports of shipment

Solubility—(Nearly clear) 1 in 1 (*or less*) of Alcohol (90 p.c.), but if more Alcohol be added it becomes cloudy, in all proportions of Absolute Alcohol, Ether, Benzol, and the fixed and volatile Oils, also in four times (*or less*) its bulk of Petroleum Spirit, the solution only yielding a filmy deposit on standing, also 1 in 2 (*or less*) of Glacial Acetic Acid

Medicinal Properties—Stimulant, antiseptic, and diuretic Acts more particularly upon the mucous membrane of the genito-urinary tract Used in gonorrhœa, after the acute stage has passed, and in gleet Sometimes combined with Buchu and Cubebs

Useful in chronic bronchitis and bronchiectasis, when a disinfectant expectorant is indicated. The resin is used as a diuretic in cardiac and hepatic dropsy, but not in renal, as it is liable to irritate the kidneys.

Dose.—30 to 60 minims = 1 8 to 3 6 c c

Prescribing Notes.—*Can be given in the form of pills or paste (see below), also in capsules. It may be suspended in Water by means of Mucilage of Gum Acacia (see p 3), or Liquor Potassæ, which saponifies it. Cinnamon Water, Peppermint Water, the Tinctures of Orange and Ginger have been used as flavouring agents. The Oil of Copaiba can be suspended by means of Mucilage, as can also the Resin of Copaiba.*

When Copaiba is boiled with Solution of Potassium Hydroxide the Oil is destroyed, and the Resin separates on standing. The liquid portion is consequently miscible with Water.

Official Preparation.—Oleum Copaibæ

Not Official.—Electuaire de Copahu Composé, Liquor Copaibæ Solubilis, Liquor Copaibæ, Buchu et Cubebæ, Liquor Copaibæ cum Santalo, Liquor Copaibæ et Buchu, et Cubebæ cum Santalo, Haustus Copaibæ, Mistura Copaibæ, Mistura Copaibæ Acidæ, Mistura Copaibæ Alkalina, Pasta Copaibæ, Pilula Copaibæ, Resina Copaibæ

Foreign Pharmacopœias.—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port (Terebinthina Copahiba), Russ, Span, Swed, Swiss and U S

Descriptive Notes.—The oleo-resin, incorrectly designated in commerce Balsam of Copaiba, varies considerably in consistence, according to the species of Copaifera from which it is derived. These, besides the species mentioned in the *B P*, viz, *C Lansdorffii* (the source of Maranham Copaiba), are believed to be *C officinalis*, L (Maracaibo and Cartagena Copaiba), *C Guianensis*, Desf (Surinam Copaiba and B Guiana Copaiba), *C coriacea*, Mart (Bahia Copaiba), *C confertiflora*, Benth, *C oblongifolia*, Mart, and *C rigida*, Benth, are also believed to yield some of the Copaiba of commerce. The *B P* lays no restriction upon the species from which it may be derived. The Para kind (*C multijuga*, Hayne), which is the most fluid and the palest in colour, almost resembling Olive oil in colour and consistence, yields 60 to 90 p c of volatile oil, and is therefore chiefly used for distilling the oil. The Maracaibo, which is thicker and of a brownish colour, like that of Maranham, and with a greenish fluorescence, yields only about 40 p c, and that from Bahia about 50 p c, the Maranham kind is preferred in Germany.

When a Copaiba containing much oil is desired, the Para, Surinam, and British Guiana kinds are most suitable, and when one containing much resin is required, the Maranham and Maracaibo and Cartagena are preferable. Gurgun balsam resembles the darker varieties of Copaiba in colour and consistence, but if heated to 130° C (266° F) it is transformed into a jelly.

Tests.—Copaiba has a specific gravity of from 0 985 to 0 994, *B P* gives 0 916 to 0 993, the *USP* 0 950 to 0 995 at 25° C (77° F), the *PG* 0 980 to 0 990. It should contain at least 40 p c of volatile oil, which should possess an optical rotation of from -14° to -17°, and a boiling point of 245° to 275° C.

(473° to 527° F), *B.P.*, not under 250° C (482° F) This volatile oil should not possess an odour of Turpentine, and if after its volatilisation the Balsam be heated until the volatile constituents are removed a hard readily friable residue should remain The Acid and Ester value afford a useful criterion of the quality of the Balsam, but a method for their determination is not included in the *B.P.* The *USP* and the *PG* include a determination of the Acid value, the *USP* requiring from 64.10 to 89.18, the *PG* 75.8 to 84.24 The *PG* includes a determination of the Ester value, which should be not less than 8.2, but no ester value is included in the *USP* The methods of determination given in the *PG* have been severely criticised, and are considered to be of little value, the only variety of Balsam which at all approximates the figures given being the Maranhão variety The figures for the optical rotation of Copaiba given in the *B.P.* require to be halved (*CD* '00, 1166; '03, 118; *PJ* '00, 154; '00, 1198), as they represent the rotation of the plane of a ray of polarised light in a tube of 200 mm., and not in a tube of 100 mm. as adopted in other cases It is probable that even when halved the limits may be too narrow, as some genuine samples of Copaiba yield an oil having a rotation as low as -9°, and Gildemeister and Hoffmann quote -7° to -35° as the rotation of Copaiba Oil from Pará or Maracaibo Balsam It has been suggested (*CD* '00, 1166, *PJ* '00, 1199) that the *B.P.* might with advantage include a method of determining the percentage of volatile oil in the Balsam, such as by heating a weighed quantity of the Balsam on a water-bath, and finally in a water-oven at a temperature of just below 100° C (212° F), until constant in weight Determinations of the Acid and Ester values of ten samples of the Balsam showed them, with one exception, to vary between 10.64 and 19.60 for the Ester, and 78.96 and 93.52 for the Acid value

It has also been pointed out (*CD* '01, 1436, *PJ* '01, 1326) that it would be useful to include monographs for the Resin as well as the Volatile Oil The Volatile Oil might be required to possess a specific gravity of 0.903 to 0.908, an optical rotation in a 100 mm. tube of -7° to -21°, a boiling point of 245° to 275° C (473° to 527° F), and a solubility in Absolute Alcohol of 1 in 1 The Resin should be soluble in Alcohol (90 p.c.), Ether, and Carbon Disulphide, and should possess an Acid value of at least 119.7 The specific gravity suggested for the Balsam is 0.97 to 0.995, and the Acid Value for the Balsam of at least 75.20

The Acid value of Maracaibo Copaiba Balsam should be between 76.52 and 94.90, the Ester value from 0.47 to 8.75, the Acid value of Pará Balsam should be from 65.8 to 72.0, and the Ester value from 1.9 to 2.9

The more generally occurring adulterants of Copaiba Balsam are Turpentine oil, fixed oils, *eg.*, Olive and Castor Oils, Paraffin Oils, Gurjun Balsam, Colophony, and African Copaiba Balsam Turpentine Oil may be readily detected by the odour on evaporation and the boiling point and rotation of the volatile Oil Fixed oils are indicated by the character of the Resin remaining after the

volatilisation of the ethereal Oil, and by the solubility of the Balsam in Alcohol (90 p c), and in Petroleum Ether, the *USP* includes a test with 20 drops of the Balsam and 1 c c of a 1 in 10 alcoholic Potassium Hydroxide Solution, mixing when cool with twice the volume of Ether, no gelatinisation should occur. Paraffin Oils are also readily detected by the solubility of the sample in Alcohol (90 p c), when a measured quantity of 5 c c of the Balsam is shaken with 15 c c Alcohol (94.9 p c), the mixture boiled for one minute, allowed to cool and to stand for one hour, no drops of oil should separate. Gurjun Balsam may be detected by the Nitric and Sulphuric Acid, and Acetic and Nitric Acid tests, the *BP* employs a cooled mixture of equal parts of Nitric and Sulphuric Acids, and Glacial Acetic Acid containing a small quantity of Nitric Acid, as tests for the absence of Gurjun Balsam, no transient violet coloration should be produced when 1 drop of the former mixture is added to 2 drops of the Balsam dissolved in 20 parts of Carbon Bisulphide, nor should a reddish or purple colour be yielded when 4 drops of the Balsam are carefully added to $\frac{1}{2}$ oz of Glacial Acetic Acid, to which has been added 4 drops of Nitric Acid. The *USP* uses Glacial Acetic Acid mixed with a few drops of Nitric Acid in performing this test, but gives more explicit directions for its application. No reddish zone should be produced, nor should the fluid assume a red or purple colour when 4 drops of Copaiba are carefully poured on top of a mixture of 1 drop of Nitric Acid (sp gr 1.40) and 3 c c of Glacial Acetic Acid. Colophony may be detected by shaking 1 gramme of Copaiba, in a stoppered vial, with 10 c c of Ammonia Solution, when allowed to stand 24 hours it should not gelatinise, nor should a firm mass be produced, but the liquid will become turbid. African Copaiba yields on distillation a volatile oil which is dextrogyrate, and its presence may be ascertained by its effect on the optical rotation of the distilled oil.

Volumetric Determination—1 gramme of Copaiba, dissolved in 50 c c of Alcohol, should require not less than 2.3 c c and not more than 3.2 c c (2.7 c c to 3 c c, *PG*) of the Semi-normal Volumetric Alcoholic Solution of Potassium Hydroxide for neutralisation, using 1 c c Phenolphthalein Solution (10 drops, *PG*) as indicator, *PG* and *USP*. If a further addition of 20 c c of Semi-normal Volumetric Alcoholic solution of Potassium Hydroxide be made, and the mixture warmed for 15 minutes on a water-bath, and titrated with Semi-normal Volumetric Solution of Hydrochloric Acid, it should require for the neutralisation of the excess of Potassium Hydroxide at least 19.7 c c of the Acid Solution, *PG*.

OLEUM COPAIBÆ. OIL OF COPAIBA

A yellow, or yellowish-brown, oily liquid, distilled from Copaiba. It has a distinctive Copaiba odour and a bitter, persistent taste.

It should be kept in well-closed glass bottles of a dark amber tint in a cool atmosphere, and protected as far as possible from the air and light.

Copaiba Oil contains, according to Gildemeister and Hoffmann, a sesquiterpene Caryophyllene, yielding Caryophyllene Hydrate in crystals, melting at 96° C (204.8° F) on treatment with Glacial

Acetic Acid and Sulphuric Acid A crystalline acid melting at 140°C (284°F), which has been identified as a symmetric Dimethyl-succinic Acid, has also been noted, but doubt is expressed as to whether the acid owes its origin to Caryophyllene or some other minor constituent of the oil

Solubility—1 in 20 of Alcohol (90 p c), nearly insoluble in Alcohol (60 p c), mixes in all proportions with Absolute Alcohol

Dose—5 to 20 minims = 0.3 to 1.2 c c

Foreign Pharmacopœias—Official in U S Not in the others

Tests—Copaiba Oil has a specific gravity of 0.903 to 0.908, the gravity varying considerably with the age of the oil and its exposure to the air—the official figures are 0.900 to 0.910, it is laevogyrate, the optical rotation being from -7° to -21° in a 100 mm tube. It boils between 245° and 275°C (473° and 527°F). It is neutral in reaction, and is soluble in its own volume of Absolute Alcohol. The more generally occurring adulterants are African Copaiba Oil and Gurjun Balsam Oil. The former is dextrogyrate, and may be detected by its effect on the optical rotation of the oil, the latter is recognised by its higher specific gravity and greater optical activity, which amounts generally to about -35° to -130° in a 100 mm tube, though dextrogyrate oils are also known to exist. The presence of Gurjun Balsam Oil may also be detected by the test with Acetic and Nitric Acids given under Copaiba.

Not Official

ELECTUAIRE DE COPAHU COMPOSÉ—Copaiba, 100, Cubebs in powder, 150, Catechu in powder, 50, Oil of Peppermint, 3—*Fr*

LIQUOR COPAIBÆ SOLUBILIS—Boil 20 of Copaiba with 30 of Solution of Potash for an hour, add 10 of Water, and mix thoroughly. Set aside until cold and well separated, draw off the clear liquor from the upper only portion and the sediment, and evaporate it to 38, to this add 2 of Solution of Potash—*Pharm Form* and the *Australian Pharmaceutical Formulary*

This has been incorporated in the *B P C*

LIQUOR COPAIBÆ, BUCHU ET CUBEBÆ—Liquid Extract of Buchu, 1, Liquid Extract of Cubebs, 1, Solution of Copaiba, 8—*Pharm Form*

This has been incorporated in the *B P C*

LIQUOR COPAIBÆ CUM SANTALO—Oil of Santal, 1, Alcohol (90 p c), 1, Solution of Copaiba, 8. The liquor is sometimes flavoured with Cinnamon or other essential oil, 5 to 10 minims to the ounce. Oil of Sandal Wood can also be combined with Solution of Copaiba, Buchu et Cubebs in the same manner as above—*Pharm Form*

Solution of Copaiba, 80, Oil of Sandal Wood, 10, Oil of Cassia, $\frac{1}{2}$, Alcohol (90 p c), q s to make 100—*B P C*

LIQUOR COPAIBÆ ET BUCHU ET CUBEBÆ CUM SANTALO—Solution of Copaiba, Buchu, and Cubebs, 80, Oil of Sandal Wood, 10, Oil of Cassia, $\frac{1}{2}$, Alcohol (90 p c), q s to produce 100—*B P C*

HAUSTUS COPAIBÆ—Copaiba, 15 minims, Solution of Potassium Hydroxide, 5 minims, Spirit of Nitrous Ether, 15 minims, Mucilage of Gum Acacia, 60 minims, Camphor Water, to 1 fl oz—*St Bartholomew's*.

MISTURA COPAIBÆ (Lafayette)—Copaiba, 4, Spirit of Nitrous Ether, 4, Compound Tincture of Lavender, 4, Solution of Potassium Hydroxide, 1, Syrup, 10, Mucilage of Acacia, q s to make 32. Mix the Copaiba with the

Solution of Potassium Hydroxide and the Spirit of Nitrous Ether, then add the Compound Tincture of Lavender, and lastly the Syrup and Mucilage of Acacia Well mix by shaking—*U S N F*

MISTURA COPAIBÆ (*Chapman*)—Copaiba, 8, Spirit of Nitrous Ether, 8, Compound Tincture of Lavender, 2, Tincture of Opium, 1, Mucilage of Acacia, 4, Water, *q s* to make 32—*U S N F*

MISTURA COPAIBÆ—Copaiba, 15 minims, Mucilage of Acacia, 60 minims, Magnesium Sulphate, 30 grains, Cinnamon Water, to 1 fl oz—*St Mary's*

C L U O I, 20 minims, Tincture of Quillaia, 20 minims, Spirit of Nitrous Ether, 30 minims, Camphor Water, to 1 fl oz—*Channing Cross*

Copaiba, 15 minims, Mucilage of Gum Acacia, 30 minims, Water, to 1 fl oz—*St Thomas's*

This has been incorporated in the *B P C*

MISTURA COPAIBÆ ACIDA—Copaiba, 20 minims, Dilute Sulphuric Acid, 10 minims, Mucilage of Acacia, $\frac{1}{2}$ fl oz, Water, to 1 fl oz—*King's*

MISTURA COPAIBÆ ALKALINA—Copaiba, 20 minims, Solution of Potash, 10 minims, Mucilage of Acacia, 2 fl dr, Water, to 1 fl oz—*King's*

PASTA COPAIBÆ—Copaiba, 8, Powdered Cubebs, 24, Extract of Hyoscyamus, 1, Camphor, 1, Treacle, *q s*

Dose—A piece the size of a filbert nut three or four times a day in gonorrhœa—*L. '88*, 1 1019

PILULA COPAIBÆ—Copaiba, 94, Magnesia, 6, mix intimately and set in a cold place. Should the mixture not concreate in eight or ten hours, the copaiba should be shaken with $\frac{1}{10}$ of its weight of Water, then the uncombined Water allowed to subside and the Copaiba poured off

Foreign Pharmacopœias—Official in Span (Pildoras de Copaiba)

RESINA COPAIBÆ—Prepared from the Oleo-resin by distilling off the Volatile Oil

A yellowish, or brownish-yellow, brittle resin, with an acid reaction Soluble in Alcohol

Tests—Copaiba Resin is soluble in Alcohol (90 p c), Ether, and Carbon Bisulphide It possesses an Acid value of not less than 119.77

CORIANDRI FRUCTUS.

CORIANDER FRUIT

FR., CORIANDRE, GER., KORIANDER, ITAL., CORIANDRO, SPAN., CILANTRO

The dried, ripe Fruit of *Coriandrum sativum*, L

Medicinal Properties—Stimulant, aromatic, and carminative

Dose.—20 to 60 grains = 1.3 to 4 grammes

Official Preparation—Oleum Coriandri Contained in Confectio Sennæ, Syrupus Rhei, Tinctura Rhei Composita, and Tinctura Sennæ Composita The Oil is contained in Syrupus Sennæ

Foreign Pharmacopœias—Official in Austr., Belg., Dan., Dutch, Fr., Hung., Mex (Culantro), Norw., Port (Coentro), Span and US Not in Ger., Ital., Jap., Russ., Swed or Swiss

Descriptive Notes.—The Coriander Fruit of commerce has the two mericarps united, and is globular, about $\frac{1}{4}$ inch (5 mm) in diameter, of a buff or light brown colour (brownish yellow, *B P*), glabrous, crowned with minute calycine teeth, and the conical base of the two slender divergent styles There are four prominent

secondary ridges, and five inconspicuous wavy primary ridges alternate with them on each mericarp, but there are no vittæ between them, there being only two vittæ on the concave commissural surface of each mericarp. The taste and odour of the dried fruit are agreeably aromatic and characteristic, but in the unripe fruit the odour is disagreeable. The fruits are imported from Russia, Germany, Holland, Morocco, and occasionally from Bombay, the last being oval and nearly twice as large as European Coriander, and pointed at the ends. A little is also cultivated in Essex. The English is rather pale and larger than the Dutch kind, which is small. The Russian is smaller than the other kinds. For distillation the fruits need to be previously crushed so as to expose the vittæ, which are found only on the inner surface of the mericarps. The powder of the fruits as seen under the microscope is characterised by the obliquely arranged linear cells of the endosperm, longer than those of Fennel, the sharply defined six-sided cells of the inner coat of the vittæ, and by the thick pitted walls of the large sclerenchymatous cells of the mesocarp. *J. Moeller, Leitfaden Mikr. Pharm. Übungen*, 1901, p. 182.

Tests—Coriander Fruits yield from 5 to 6 p.c. of ash. Five samples examined in the author's laboratory showed 4.69, 5.28, 5.74, 5.15 and 5.8 p.c., four samples of powdered Coriander gave 5.64, 5.7, 7.09, and 7.79. An ash limit of 6.0 p.c. for the fruits has been suggested.

Preparation

OLEUM CORIANDRI OIL OF CORIANDER

A colourless or pale yellow oily liquid, possessing a strong distinctive aromatic odour and taste.

It should be kept in well-closed glass bottles of a dark amber tint, and protected as far as possible from contact with air and light, and in a cool atmosphere.

Consists to the extent of 90 p.c. of dextrorotatory Linalool, $C_{10}H_{18}O$, sp. gr. 0.868, boiling point 194° to $198^{\circ}C$ (381° to $388^{\circ}F$).

Yield of Volatile oil from Coriandri Fructus—Moravian, Thuringian and Russian fruits yield, according to Gildemeister and Hoffmann, from 0.8 to 1.0 p.c. of oil, French, 0.4 p.c., Dutch, 0.6 p.c., Italian, 0.5 p.c., Moroccan, 0.2 to 0.3 p.c., whilst the East Indian fruit yields only 0.15 to 0.2 p.c.

Solubility—2 in 1 of Alcohol (90 p.c.), 1 in 75 of Alcohol (60 p.c.).

Used to render medicines more palatable, and prevent griping.

Dose— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 c.c.

Foreign Pharmacopœias—Official in U.S. Not in the others.

Tests—Coriander Oil has a specific gravity of from 0.870 to 0.885, is optically dextrogyrate, the rotation amounting to $+8^{\circ}$ to $+14^{\circ}$ in a 100 mm. tube. It yields a clear solution with three times its volume of Alcohol (70 p.c.).

The more generally occurring sophistications are sweet Orange Oil or Turpentine Oil, which are recognised by their influence on the specific gravity and the optical rotation, the solubility test affording additional evidence of the absence of Oil of Turpentine and added terpenes.

Not Official

COTO.

A Bark from Bolivia, origin unknown

Medicinal Properties—Aromatic stimulant and intestinal astringent Has been used in chronic diarrhoea

A precipitate may form when the Tincture or Fluid Extract is diluted with Water, but it diffuses readily, on being shaken, without the aid of Mucilage

It contains a bitter principle, **Cotoin**, sparingly soluble in Water, soluble in Alcohol, dose, $\frac{1}{2}$ to 2 grains = 0.03 to 0.13 gramme

Cotoin is recommended as checking the night sweats of phthisis —*L* '96, 1 255

Paracotoin is obtained from an allied bark, which has similar properties sparingly soluble in Water, soluble in Alcohol

Dose —2 to 3 grains = 0.13 to 0.2 gramme

Descriptive Notes—Coto bark as originally introduced into commerce is at present not obtainable, its place being taken by Paracoto bark. Both these barks come from Bolivia, the former from the banks of the Magdalena, and the latter from those of the Mapiri River, and are probably derived from trees belonging to the natural order Lauraceæ, so far as can be judged from their structure. Both are hard, heavy, reddish-brown barks occurring in quilled pieces about 6 to 8 inches (15 to 20 cm) long or more, 2 to 2½ inches (5 to 6 cm) broad, and about ½ inch (12.5 mm) thick, with a fracture granular outwardly and coarsely fibrous toward the inner surface. The chief difference between the two is that the inner surface in the true Coto bark is nearly smooth and the bark is thinner, that of Paracoto often being 15 mm or more thick and having the inner surface rough with projecting longitudinal ridges formed of sclerenchymatous fibres. Both have a pungent aromatic taste and exhibit a minute crystalline efflorescence on the broken surface. The taste of true Coto is rather more peppery than that of Paracoto. The distinctive microscopical characters are the large elongated sclerenchymatous cells, some of which contain granular matter, large parenchymatous cells containing yellow resin, and small simple starch granules. True Coto bark also contains granular reddish-brown oily bodies in some of the parenchymatous cells. The two barks may also be distinguished by the use of concentrated Nitric Acid, which turns Paracoto powder yellowish, changing gradually into a green tint, whilst that of Coto becomes deep red. This reaction is due to the Paracotoin and Cotoin.

TINCTURA COTO—1 of bruised Coto Bark macerated with Alcohol (90 p.c.) to make 10 —*B.P.C. Formulary* 1894 Incorporated in the *B.P.C.*

Dose —10 to 30 minims = 0.6 to 1.8 c.c.

Fluid extract (1 in 1), dose, 5 to 20 minims

Fortoin (Névalenc-Dicotoin) —Yellow, crystalline needles, or a light yellow powder. Insoluble in Water, soluble in Chloroform and Acetone. Decomposed by Alkali. Introduced as an intestinal antiseptic. Has been found useful in intestinal catarrh —*P.J.* '99, 11 168, '01, 1 702

Dose —1 to 5 grains = 0.06 to 0.32 gramme

CREOSOTUM.

CREOSOTE

Fr., CRÉOSÔTE OFFICINALE, GER., KREOSOT, ITAL., CREOSOTO, SPAN., CREOSOTA

A colourless or more generally a pale yellowish, highly refractive, oily liquid, possessing a strong phenolic odour and a burning, caustic taste. It is a mixture of Guaiacol, Creosol, and other Phenols obtained in the distillation of Wood Tar.

The *BP* states that Creosote is 'obtained in the distillation of Wood Tar', the *USP*, 'obtained during the distillation of Wood Tar, preferably that derived from the Birch'

It preserves animal substances from decay, from which property its name is derived. It is to the presence of this substance that the process of smoking hams owes its efficacy.

The two chief constituents of Creosote are **Guaiacol** and **Creosol**, the first of which predominates in some specimens, and the second in others. Beechwood Creosote contains most Guaiacol, formerly it was stated to contain more than 60 p c, but when the demand for Guaiacol and its salts arose, the proportion in commercial Creosote dropped to 20 p c. It can now be obtained containing 50 p c.

Guaiacol is soluble 1 in 80 of Water, and mixes with Glycerin in all proportions. Creosol is soluble 1 in 150 of Water, and will not form a clear mixture with Glycerin in any proportion.

Solubility—Beechwood Creosote is soluble about 1 in 110 of Water and mixes in all proportions with Alcohol (90 p c), Absolute Alcohol, Ether sp gr 0.735 and 0.720, Glacial Acetic Acid, Chloroform, Benzol, and Petroleum Spirit, it also mixes with Glycerin in all proportions up to nearly 3 of Glycerin to 1 of Creosote, but on the further addition of Glycerin the mixture is turbid.

'English Creosote' differs from Beechwood Creosote in that it is not nearly so soluble in Water, and does not mix readily with Glycerin. It dissolves about 1 in 350 of Water, and forms a turbid mixture with an equal volume of Glycerin.

Medicinal Properties—Disinfectant and antiseptic. It resembles Carbolic Acid in action, but it is less poisonous. Given internally in gastric fermentation, in putrefactive diarrhoea, and with considerable success in phthisis with abundant fetid sputum (*see below*), for arresting nausea in hysteria, for obstinate sea-sickness, and the vomiting of pregnancy and phthisis. A lotion (8 minims to 1 oz) and the ointment are used for eruptions of a scaly character, for venereal ulcers, and in parasitic skin diseases, it relieves the itching in eczema, toothache, when depending on caries, is relieved by its application. As an inhalation in fetid bronchitis, phthisis, and pulmonary gangrene.

Employed by internal administration with considerable success in phthisis, commencing with 5 minims in 2 fl drms of Cod liver Oil three times daily after meals and gradually increasing till at the end of three or four weeks 30 to 60 minims or even 80 minims are being taken three times daily. It is said to have no tendency to bad effects even in such large doses. Should a patient be unable to take Cod liver Oil, the Creosote may then be prescribed in spirituous solution. If the best Beechwood Creosote be used and due care exercised in increasing the dose gradually, it will be found to produce good results without unpleasantness or risk.—*B M J* '98, i 144, 299, 1388.

One drop of Creosote at bedtime every night for juvenile incontinence of urine.—*B M J* '87, i 809. In diabetes 4 drops daily increased to 10 drops.—*L* '89, i 702. Intratracheal injection of Creosoted Oil (1 in 20) to aid the expulsion of false membrane after tracheotomy.—*B M J* '98, i 1381.

Successful in cases of tuberculosis in children by pills and drops.—*T G* '93, 766.

Hypodermic injection of Creosote and Guaiacol dissolved in sterilised Almond Oil, 1 in 5 or 1 in 15.—*L* '96, ii 371, *B M J* '95, ii 1488. Small doses in gastric affections.—*L* '97, ii 404. In habitual constipation.—*L* '97, ii 932. Enemata containing 8 minims of Creosote in 4 oz of Cod liver Oil in pleuro peritoneal tuberculosis in children.—*L* '97, i 159. In malarial intermittent fever 15 minims

rubbed into the axilla and covered up with Cotton-Wool produced free perspiration and lowered the temperature—*B M J* '96, i 18, '97, i 1832, *I M G* '96, 11, *T G* '96, 325

Subcutaneous injection the best means of administering large quantities—*B M J* '01, ii 219

Creosote, Guaiacol, and their congeners are stated (*L* '04, ii 1827) to be much less used now in the treatment of pulmonary phthisis than a few years ago. An interesting item on Creosote is that each Japanese soldier is expected to carry and take Creosote pills as a prophylactic against dysentery—*B M J* '04, ii 1327

It is of distinct value in the antiseptic treatment of pulmonary tuberculosis (*Edin Med Jour* '05, 463). It often relieves gastric catarrh and stimulates the appetite. It should be given immediately after or before food in 2 or 3 minims doses, beginning with two or three times a day and gradually increasing to three times that amount, in capsules, or dissolved in Cod Liver Oil.

Twenty minims of a mixture of equal parts of a 20 p c Alcoholic solution of Creosote and Spirits of Chloroform, used for an hour or so on the sponge of an inhaler, relieves the troublesome cough of pulmonary phthisis—*Edin Med Jour* '05, 465

Dose—1 to 5 minims = 0.06 to 0.3 c c

Ph Ger maximum single dose, 0.5 gramme, maximum daily dose, 1.5 grammes

Prescribing Notes.—Given in capsules or in pills made with Soap and Liquorice Powder (see p 454). When given as a draught or mixture it is best emulsified with Mucilage of Gum Acacia and given in Milk, or dissolved in Almond Oil, see 'Guttæ Creosoti' and 'Mistura Creosoti' (Squire). For hypodermic injection, alone or dissolved in Almond Oil. When mixed with Magnesia it forms a tasteless compound insoluble in Water. Orange, Juniper, and Fluid Extract of Liquorice have been used as flavouring agents.

Incompatibles—When prescribed in pills with Silver Oxide it explodes, unless previously diluted with some inert powder.

Official Preparations—Mistura Creosoti, Unguentum Creosoti

Not Official.—Aqua Creosoti, Elixir Créosoté, Guttæ Creosoti, Mistura Pilula Creosoti, Solutio Creosoti Composita, Vapor Creosoti, creosoti, Parogenum Creosoti, Vin Créosoté, Creosoti Carbonas, Creosoti Oleas, Creosoti Phosphas, Creosoti Tannas, Creosoti Valerianas, Salocreol, Taphosote, Phosphotal, and Pneumin. The preparations of Guaiacol will be found under that name.

Foreign Preparation.—Official in Austri, Belg, Dan, Dutch, Fr, Ger, Hung, Ita, , , , Port, Russ, Span, Swed, Swiss and U S

Tests—Creosote has a specific gravity of 1.080 to 1.086, and should not be below 1.080, the *BP* states not below 1.079. The *USP* states not below 1.078 at 25°C (77°F), the *PG* not below 1.08. Its boiling point is between 200° to 220°C (392° to 428°F), between which temperature the greater portion of it distils. It is either optically inactive or but slightly dextrogyrate. It is neutral or only feebly acid towards Litmus paper. A 1 in 100 solution in Alcohol (90 p c) or a 1 in 200 aqueous solution yields with Ferric Chloride Test-solution a green coloration rapidly changing to reddish-brown. Mixed with 10 times its volume of a 1 in 5 Solution of Potassium Hydroxide in Absolute Alcohol it forms a solid crystalline mass.

The more generally occurring impurities are Phenol, Coal Tar Creosote, neutral oils, Cærolignol, and higher boilingpoint constituents of Wood Tar. The *BP* is not official for Phenol and less volatile constituents. The *Ammon* is not officially adopted.

for its distinction from Phenol, it being required to suffer no material diminution in volume when shaken with 5 times its volume of Ammonia Solution. The absence of less volatile liquids is officially ensured by the absence of a translucent stain when dropped on to filtering paper and exposed to a temperature of 100°C (212°F). The Ammonia test has been stated (*CD* '00, 11 156, *PJ* '00, 11 150) not to be of special value, inasmuch as the purest Creosote shows the greatest diminution of volume. The author has found the best differentiating test between Creosote and Phenols to be the insolubility of the former in diluted Glycerin, three measures of Glycerin (sp gr 1.260) is diluted with 1 measure of Water and 1 volume of the Creosote sample is shaken with 3 volumes of the diluted Glycerin, after complete separation, the volume of the Creosote layer is read off, the diminution roughly indicating the amount of soluble impurity. If the Glycerin layer be separated and diluted with Water, the Coal Tar acids may be extracted by agitation with Chloroform, thus permitting their further examination. The *USP* mixes equal volumes of the Creosote and 95 p.c. Glycerin Solution, stating that a clear mixture will result, from which, on the addition of one-fourth volume of Water, a layer of Creosote equal to, or greater than, the volume originally employed will separate. The *USP* and the *PG* use Sodium Hydroxide Solution as a test for the presence of neutral oils, the *USP* mixing the Creosote with not less than 5 nor more than 9 times its volume of Normal Volumetric Sodium Hydroxide Solution, the *PG* mixing it with $2\frac{1}{2}$ times the volume of Sodium Hydroxide Solution (15 p.c.), in each case a clear liquid is required to result, which remains clear on dilution with 50 c.c. of Water. Coal Tar Creosote may be detected by the solubility of the Creosote in hot Water, its subsequent behaviour on cooling, and the behaviour of the filtrate with Bromine Water, the Collodion test, and the Alcoholic Potassium Hydroxide test. The Ferric Chloride test is stated to give an indication, but its usefulness is by no means fully conceded. The behaviour of the sample with Petroleum Ether and freshly prepared Barium Hydroxide Solution forms a useful means of readily detecting the presence of Cærolignol and some other high boiling point constituents of Wood Tar. The test is described in the small type below.

Fractionation—When distilled most of it comes over between 392°F (200°C) and 428°F (220°C), *USP* and *PG*. The *BP* states that it distils between these temperatures. When cooled to -20°C (-4°F) it becomes gelatinous but does not solidify, *USP* and *PG*.

Bromine—The saturated aqueous solution of Creosote separated from the oily globules yields a reddish-brown precipitate with T.S. of Bromine, *PG* and *USP*.

Collodion—If 1 volume of Creosote be shaken with 1 volume of Collodion no gelatinous mass should be formed, *BP* and *PG*, no permanent coagulum should form when equal volumes of the liquid are stirred together, *USP*.

Potassium Hydroxide—If 1 c.c. of Creosote be mixed with 10 c.c. of a solution (1-5) of Potassium Hydroxide in Absolute Alcohol, a solid crystalline mass will form, *USP* and *PG*.

Benzin and Barium Hydroxide—If 1 c c of Creosote be shaken with 2 c c of Petroleum Benzin and 2 c c of Baryta Water, the Petroleum Benzin solution should not assume a blue colour or be muddy, and the aqueous liquid should not be coloured red, *P G*

If 1 c c of Creosote be cautiously and gently shaken with 2 c c of Petroleum Benzin and 2 c c of a freshly prepared Barium Hydroxide T S until of uniform consistence, on complete separation three distinct layers are visible, the middle one of which contains the Creosote unaltered in appearance, while the Petroleum Benzin should not be blue or muddy, and the aqueous layer should not have acquired a red tint, indicating the absence of Cærulignol and some other high boiling constituents of Wood Tar, *U S P*

Preparations

MISTURA CREOSOTI. CREOSOTE MIXTURE

Shake 16 minims of Creosote with 14 fl oz of Distilled Water, add 1 fl oz of Syrup and 16 minims of Spirit of Juniper, and Distilled Water, *q s* to yield 16 fl oz (1 in 480)

It was pointed out in the *Companion* that Glacial Acetic Acid was quite unnecessary, and it is now omitted

Dose.— $\frac{1}{2}$ to 1 fl oz = 14 2 to 28 4 c c

UNGUENTUM CREOSOTI.—CREOSOTE OINTMENT

Creosote (by weight), 1, Hard Paraffin, 4, Soft Paraffin, white, 5; add the Creosote to the melted Paraffins, and stir until cold (1 in 10)

Now made with Hard and Soft Paraffins in place of Simple Ointment

Not Official

AQUA CREOSOTI—Creosote, 10, Distilled Water, 990 Agitate the Creosote vigorously with the Distilled Water, and filter through a well-wetted filter Creosote Water should be freshly prepared when dispensed — *U S P*

This has been incorporated in the *B P C* under the title **Liquor Creosoti** with *syn* Aqua Creosoti

ELIXIR CRÉOSOTÉ—Creosote, 1, Rum, 66, mix and filter

Spiritus Creosoti—Creosote, 1, Alcohol (90 p c), 40 Dose — 1 dr m — *Martindale*

This has been incorporated in the *B P C*

GUTTÆ CREOSOTI (*Squire*)—Creosote, 16 minims, Mucilage of Gum Acacia, 60 minims, Syrup of Orange, 1 fl oz, Water, to 2 fl oz, mix the Creosote with the Mucilage and add the other ingredients One or two teaspoonfuls for a dose in an oz of Milk

MISTURA CREOSOTI (*Squire*)—Creosote, 16 minims, Almond Oil, $\frac{1}{2}$ fl oz, Syrup of Orange, 1 fl oz, Powdered Gum Acacia, $1\frac{1}{2}$ dr m, Water, to 8 fl oz Dissolve the Creosote in the Oil, mix it with the Powdered Gum Acacia in a mortar, add all at once 3 fl dr m of Water, and triturate until an emulsion is formed, then add the remainder of the Water and the Syrup of Orange

Dose.— $\frac{1}{2}$ to 1 fl oz = 14 2 to 28 4 c c

PILULA CREOSOTI—Creosote, 12 minims, Curd Soap, in powder, 6 grains, Liquorice, in powder, 30 grains, mix, and divide into 12 pills

This has been incorporated by the *B P C*

Foreign Pharmacopœias—Official in Austr, Creosote 5, Yellow Wax 2 5 Liquorice 6, Extract of Liquorice 6, Mucilage of Acacia *q s*, Belg, Creosote 10, Water 2, Liquorice Root *q s*, Ger, and Jap, Creosote 10, Liquorice 19, Glycerin 1, Swiss, Creosote 5, Liquorice 9 5, Glycerin 0 5 Fr, Creosote with

Medicinal Soap *g s* Each pill contains 10 centigrammes of Creosote, 0.1 gramme ($1\frac{1}{2}$ grains)

SOLUTIO CREOSOTI COMPOSITA—Creosote, 1, Spirit of Menthol (20 p c), 1, and Spirit of Chloroform, 1—*Brompton* Useful in an oro-nasal inhaler

VAPOR CREOSOTI (*B P* 1885)—Creosote, 12 minims, Boiling Water, 8 fl oz Mix the Creosote and Water in a suitable apparatus, for inhalation

This has been incorporated in the *B P C*

Creosote, 80 minims, French Chalk, 30 grains, Water, to 1 oz A teaspoonful in 20 oz of Water at 140° F for each inhalation—*Throat*

VASOLIMENTUM CREOSOTI—Creosote, 5, Liquid Vasoliment, 95—*Hager*

Parogenum Creosoti—Creosote, 5, Parogen, 95—*B P C*

VIN CRÉOSOTÉ—Creosote 1, Alcohol (90 p c) 9, Simple Syrup 10, Malaga Wine 80—*Fr*

CREOSOTI CARBONAS (Creosotal)—A viscid, amber coloured liquid, nearly odourless and tasteless, insoluble in Water Not only useful in chronic diseases of the lung, but in acute diseases of the respiratory organs It is stated to contain 90 p c of Creosote, and to be free from the irritating effects of that substance—*B M J E* '96, i 15, *L* '97, ii 1472

One teaspoonful doses for adults, smaller doses for children—*L* '98, i 222, this dose has been criticised, and 5 drops three times daily recommended—*L* '98, i 960

Is preferable to the Phosphate, though both are better than pure Creosote—*B M J* '01, ii 219

Teaspoonful doses morning and night, taken in a cup of hot sugared Milk in the treatment of acute broncho pulmonary affections The dosage for children is proportionately smaller Has remarkable power of reducing temperature in bronchitis and pneumonia, and is beneficial even in advanced pneumonia Administration best stopped gradually—*L* '99, ii 710, *B M J E* '02, i 4

Foreign Pharmacopœias—Official in Austr, Belg, Jap and Swiss

CREOSOTI OLEAS (Oleocreosote)—A light yellow, oily liquid, having a faint odour and taste of Creosote Insoluble in Water, soluble in Absolute Alcohol and in Ether

Dose—15 to 30 grains = 1 to 2 grammes

CREOSOTI PHOSPHAS (Phosphote)—A dense, oily substance, insoluble in Water

Dose—5 to 15 grains in capsules = 0.32 to 1 gramme

CREOSOTI TANNAS (Tannosal)—A brown, hygroscopic powder, soluble in Water, in Alcohol (90 p c) and in Glycerin

Dose—5 to 15 grains = 0.32 to 1 gramme

CREOSOTI VALERIANAS (Eosote)—A yellow, oily liquid, distilling at 240° C (464° F), insoluble in Water, soluble in Alcohol (90 p c) and in Ether Has been recommended as a substitute for Creosote on account of its freedom from corrosive and toxic properties Commencing dose 3 grains, increasing to 6 or 9 grains three times a day, given in capsules—*B M J E* '96, ii 59

SALOCREOL (Creosote Salicylic Ester)—A brown, oily, neutral liquid, insoluble in Water, readily soluble in Alcohol (90 p c), in Ether and in Chloroform It has been used in the treatment of rheumatic swelling of the joints—*B M J E* '08, ii 52

Dose—6 to 20 grammes rubbed into the skin

Taphosote, the Tannophosphoric Ester, and **Phosphotal**, the Phosphite, are combinations of Phosphoric Acid and Creosote

Pneumin, a compound of Creosote and Formaldehyde, is a yellow, tasteless, odourless powder Insoluble in Water Stated to have a beneficial effect in tuberculosis

Dose— $7\frac{1}{2}$ to 80 grains = 0.5 to 2 grammes

CRETA PRÆPARATA.

PREPARED CHALK

A purified native Calcium Carbonate, most of the impurities having been removed by elutriation

Solubility—Insoluble in Water, readily dissolved by weak acids

Medicinal Properties—It is astringent and antacid Combined with other astringents and aromatics, it is used in infantile diarrhoea and in diarrhoea accompanied with acidity One of the best antidotes for Oxalic Acid, the mineral acids, and Zinc Chloride Used as a dusting powder in burns, ulcers, and moist eczema, it is protective and desiccant

Dose—10 to 60 grains = 0.65 to 4 grammes

Prescribing Notes—Generally given in the form of *Mistura Cretæ* with astringent Tinctures and Opium

The Pulvis Cretæ Aromaticus is useful for administration to children, either in powder or in mixture with Mucilage

Incompatibles—All Acids and Sulphates

Official Preparations—*Mistura Cretæ*, *Pulvis Cretæ Aromaticus* and *Pulvis Cretæ Aromaticus cum Opio* Contained in *Hydrargyrum cum Cretâ*

Not Official—Cholera Mixture, *Pulvis Cretæ Compositus* and *Unguentum Cretæ*

Foreign Pharmacopœias—Official in Hung, Jap, Port, Span and U S Not in the others

Tests—Prepared Chalk is dissolved readily by dilute acids, effervescence occurring, with the evolution of a colourless and odourless gas, which affords a white precipitate when passed into Lime Water A solution prepared by dissolving a portion of the sample in just sufficient Hydrochloric or Nitric Acid to effect solution, boiled and cooled, answers the tests distinctive of Calcium given under Precipitated Calcium Carbonate

The more generally occurring impurities are siliceous material, Iron, Aluminium, Phosphates, Sulphates and Barium Carbonate Siliceous material may be detected by remaining insoluble in Hydrochloric Acid, preferably after the acid solution to dryness and re-solution in diluted Hydrochloric Acid, and which should be relatively minute Iron, Aluminium, Magnesium, Phosphates and Sulphates may be examined for by the tests given under *Calci Carbonas Præcipitatus*, and should be present in but slight traces Barium Carbonate, if present may be detected by dissolving a portion of the sample in Diluted Acetic Acid and adding Potassium Chromate Solution, a yellow precipitate insoluble in Acetic Acid, soluble in diluted mineral acids, indicates the presence of Barium

Preparations

MISTURA CRETÆ. CHALK MIXTURE

Prepared Chalk, $\frac{1}{2}$ oz, Tragacanth, in powder 15 grs Refined Sugar, $\frac{1}{2}$ oz, Cinnamon Water, q s to make 8 fl oz (about 1 in 32)

Tragacanth is now used in place of Gum Acacia, and Sugar in place of Syrup

Dose — $\frac{1}{2}$ to 1 fl oz = 14 2 to 28 4 c c

Foreign Pharmacopœias — Official in Port, Carbonate of Lime 3, Gum Arabic 3, Syrup of Cinnamon 10, Water 84, U S, Prepared Chalk 6, Acacia 4, Sugar 10, Cinnamon Water 40, Water, to measure 100 Not in the others

PULVIS CRETÆ AROMATICUS AROMATIC POWDER OF CHALK

Prepared Chalk, 11, Cinnamon, 4, Nutmeg, 3, Cloves, $1\frac{1}{2}$, Cardamom Seeds, 1, Refined Sugar, 25, all in powder
(about 1 Chalk in $4\frac{1}{2}$)

Saffron is now omitted

Dose — 10 to 60 grains = 0 65 to 4 grammes

PULVIS CRETÆ AROMATICUS CUM OPIO AROMATIC POWDER OF CHALK WITH OPIUM

Aromatic Powder of Chalk, 39, Opium, in powder, 1
(1 Opium in 40)

Dose — 10 to 40 grains = 0 65 to 2 6 grammes

Not Official

CHOLERA MIXTURE — Aromatic Powder (*B P* '64), 3 dr̄m, Spirit of Sal Volatile, 3 fl dr̄m, Tincture of Catechu, 10 fl dr̄m, Compound Tincture of Cardamoms, 6 fl dr̄m, Tincture of Opium, 1 fl dr̄m, Chalk Mixture, to make 20 fl oz

Dose — 1 fl oz = 28 4 c c for an adult, $\frac{1}{2}$ fl oz = 14 2 c c for a child 12 years old, $\frac{1}{4}$ fl oz = 7 1 c c for seven years old, after each liquid motion

This mixture was proposed by the Board of Health during the prevalence of cholera, and is useful in cases of diarrhœa

A mixture much like this has been introduced into the *B P C* under the title **Mistura Cretæ Composita** with the *synonym* Board of Health Cholera Mixture as follows —

Compound Aromatic Powder, 2, Aromatic Spirit of Ammonia, 1 875, Tincture of Catechu, 6 25, Compound Tincture of Cardamoms, 3 75, Tincture of Opium, 0 625, Chalk Mixture, *q s* to produce 100

PULVIS CRETÆ COMPOSITUS — Prepared Chalk, 30, Acacia, in fine powder, 20, Sugar, in fine powder, 50 — *U S P*

This has been incorporated in the *B P C*

UNGUENTUM CRETÆ — Prepared Chalk, 1, Spermaceti Ointment, 4, mix

CROCUS.

SAFFRON

FR, SAFRAN, GER, SAFRAN, ITAL, ZAFFERANO, SPAN, AZAFRAN

The dried Stigmas and tops of the Styles of *Crocus sativus*

Imported from Spain, France, and Italy

The important ingredient of Saffron is *Crocine* or *Polycrocin*, a body of a glucosidal nature stated by Hilger and Schuler to be identical with Carotin. It also contains a small percentage from 0 75 to 1 0 p c of Volatile Oil and Picrocrocin, in addition to Wax, Gum, Albumen, saline matter, Water, and Lignin

Medicinal Properties — Useful for giving colour and flavour to preparations

tum Aloes Compositum and Tinctura Cinchonæ Composita

Not Official—Glycerinum Croci and Syrupus Croci

Foreign Plasmid Official in all except US , Dutch, Stigmata
Croci, Mex, Arabian, Arab, Acafrao, Dan, Norw and Swed, Stigma
Croci

Descriptive Notes—Saffron consists of the upper part of the trifid style, and stigmas of *Crocus sativus*, L. It is of an orange-red colour and is usually about one inch or more in length, the stigmatic portion being slightly dilated, nearly tubular above, slit on the under side, and toothed at the apex. In commerce it is frequently adulterated, no drug more so. The best and purest commercial variety is that from Valencia, the Saffron of Alicante, and particularly of Barcelona, being often adulterated. The stamens of the flower are sometimes present in more than accidental amount, and are even sometimes offered separately in the drug market as 'yellow saffron'. They are linear and arrow-shaped at the base, inserted on a short filament. The florets of *Calendula officinalis*, L., are seen to be flat and pale in colour, and the roots of *Carex* thread-like. Saffron normally retains about 12½ p.c. of moisture (12 p.c., P.G.), and should therefore be kept in a tin, or loss of weight may ensue. The fresh crop is usually obtainable in commerce in November and December.

The florets of *Canthamus tinctorius*, L. (nat. ord. *Compositae*), sold in small flat cakes, are sometimes offered as 'Cake Saffron'. The florets are saffron-coloured, tubular, and contain syngenesious anthers

Under the name of Cape Saffron the flowers of *Lyperna crocea*, Eckl (nat ord *Scrophulariaceae*), are at rare intervals offered in the drug market. It is a native of the Cape of Good Hope.

Tests—Saffron yields an intensely yellow solution when treated with Water, and when rubbed on the wet finger leaves an orange-yellow stain. The *PG* states that 100,000 parts of Water shaken with 1 part of Saffron assume a pure and distinct yellow colour. When brought into contact with a drop of Sulphuric Acid it yields a deep indigo-blue coloration.

The more generally occurring adulterations of Saffron are excess of moisture, mineral matter, e.g., Barium Sulphate, Sand, etc., fixed oils, stamens artificially dyed so as to resemble stigmata, &c. Nitrates, due to the presence of artificial colouring matter derived from Nitrophenols or Nitroresols, principally the latter. The limit of moisture is fixed by the *BP* at not more than 12.5 p.c., by the *PG* at not more than 12 p.c. Mineral matter may be detected by the residue left on ignition, or by a deposit of white or coloured powder settling out when the sample is floated on the surface of some warm water. The finest Saffron yields, when ignited with free access of air, from 4.4 to 5.5 p.c. of ash. The *BP* limit is about 7.0 p.c., that of the *PG* calculated on dried sample 6.5 p.c., which is equivalent to 7.4 p.c. on the undried Saffron. The ash should be examined for Barium.

The ash is considered (C D '02, 1 118) to be of little use to the buyer of saffron unless he has experience as well to help him, a poor, thin, semi-wild

variety of Saffron may give an excellent ash, possibly not over 4 p c, whilst a fine bold quality which has been dressed to a very moderate extent will be outclassed by yielding over the *B P* maximum

Fixed oils may be detected by the greasy spot produced when the sample is pressed between folds of white bibulous paper, artificially dyed products by the Sulphuric Acid test after extraction with Petroleum Ether, which extracts the colour derived from Coal Tar products but not that of genuine Saffron Safflower yields an Infusion which is coloured greyish green by Ammonia Solution and a bright red by Nitric Acid Colouring matters derived from Nitrophenols or Nitro-cresols may be detected by deflagration occurring during incineration, or by dissolving the ash in Water and applying the Ferrous Sulphate test for Nitrates The colouring powers of different specimens of Saffron may be judged by comparison with a standardised Potassium Bichromate Solution

Preparation

TINCTURA CROCI TINCTURE OF SAFFRON

1 of Saffron, macerated with 20 of Alcohol (60 p c) (1 in 20)

Dose —5 to 15 minims = 0.3 to 0.9 c c

Foreign Pharmacopœias —Official in Spain, 1 in 5, Belg, Jap and Swiss, 1 in 10, all by weight Not in the others

Tests —Tincture of Saffron has a specific gravity of 0.920 to 0.925, contains from 2.0 to 3.0 p c w/v of total solids and from 57 to 58 p c w/v of Absolute Alcohol A few drops of the Tincture evaporated to dryness in a white porcelain dish on a water-bath leave a residue which when cooled yields an indigo-blue coloration with a drop of concentrated Sulphuric Acid

Not Official

GLYCERINUM CROCI (*Squire*) —Saffron, 1, Glycerin, 20, Alcohol (60 p c), 20, mix the Glycerin and the Alcohol, and digest in it the Saffron for an hour at a gentle heat, and filter This is introduced as a substitute for Syrupus Croci, which deposits and loses its colour

This has been incorporated in the *B P C*

SYRUPUS CROCI (*Squire*) —Glycerin of Saffron, 1, Syrup, 7

This has been incorporated in the *B P C*

CROTONIS OLEUM.

CROTON OIL

FR, HUILE DE CROTON, GER, KROTONÖL, ITAL, OLIO DI CROTONTIGLIO,
SPAN, ACEITE DE CROTON TIGLIO

A yellow, brownish yellow, or reddish-brown, somewhat viscid, slightly fluorescent, oily liquid, possessing an unpleasant odour and an acid and burning taste It is the Oil expressed from the seeds of *Croton Tiglium*, L

It consists chiefly of the Glycerides of Stearic, Palmitic, Myristic, Lauric, and Oleic Acids It also contains the Glycerin Esters of Formic, Acetic, Isobutyric,

and Isovaleric Acids, together with Tiglic Acid, Crotonoleic Acid, a toxic anisomeric Croton, and Croton-resin, the latter lactone possessing powerful vesicant properties.

A native of Hindostan, Ceylon, and the Moluccas

100 of seed yield about 50 of Oil

Solubility—Soluble in Ether, Oil of Turpentine, and Olive Oil, partially soluble in Alcohol (90 p c)

B P 1898 still retains the sentence, 'entirely soluble in Absolute Alcohol,' although it has been repeatedly pointed out that this is not strictly the case. An oil recently expressed will dissolve the Absolute Alcohol up to equal parts, but when more than one volume of Alcohol is added to one of Oil the mixture becomes turbid, and with two volumes of Alcohol the mixture separates into two layers on standing. With a sample of oil two or three years old rather more Alcohol can be added without the mixture becoming turbid, but it is only a question of degree.

The solubility of Croton Oil in Absolute Alcohol appears to depend in great measure on the age of the Oil, and the greater or less freshness of the seeds from which it is expressed, as oxidised or resmified Oil dissolves more readily.

The solubility of the Oil as a whole depends upon the proportion of free Acid, which is very soluble in Alcohol, and also carries the difficultly soluble neutral Glyceride into solution along with it.

Croton Oil can be separated by Alcohol into two parts. The non-vesicating portion insoluble in Alcohol possesses the full purgative properties of the Oil in a solid form, the alcohol-soluble or vesicating portion had no purgative same doses, but caused irritation and nausea.

Medicinal Properties—A powerful drastic cathartic, acting with great rapidity. Given in cases of obstinate constipation, in dropsy, in apoplexy, in maniacal and unconscious patients, and in eclampsia, its small dose being an advantage. Applied externally as a powerful counter-irritant in rheumatism, gout, neuralgia, and in acute laryngeal and pulmonary diseases in the form of liniment. Its external application is painful, and is often followed by an inflammatory eruption which becomes pustular, and leaves unsightly scars. It is therefore not often used externally, unless well diluted.

Croton Oil must be given with great care, and is inadmissible in feeble subjects, in organic obstruction, and in inflammatory states of the stomach and intestines.—*Mitchell Bruce*

It should never be given to children, to pregnant women, to those with hemorrhoids, nor to those suffering from peritonitis.—*Hale White*

5 minims to 1 fl oz of Olive Oil are used to promote the growth of hair

Dose— $\frac{1}{2}$ to 1 minim = 0.03 to 0.06 cc

Ph Ger maximum single dose, 0.05 gramme, maximum daily dose, 0.15 gramme

Prescribing Note—*I will with Soap and Liqueur Powder (see p 897), or in emulsion with C. Extract of Colocynth*

Official Preparation—Linimentum Crotonis

Not Official—Croton Oil Pencils and Collodium Tiglin

Antidotes—In case of an overdose an emetic should be at once administered, the stomach should be washed out with 1 oz to pint of Water, mucilaginous fluids and Opium or 1 to 2 gr of Morphia be given to check the pain and enteritis.

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fl, Ger, Hung, Ital, Jap, Mex (Aceite de Croton Tiglio) Norw, Port, Russ, Span, Swed, Swiss and US (Oleum Tiglin). Swed has also an Oleum Crotonis Extractum.

Tests—Croton Oil has a specific gravity of 0.940 to 0.960 which limits are given by both the *BP* and the *PG*, the *USP* gives 0.935 to 0.950 at 25° C (77° F). It should be slightly dextrogyrate. It possesses an Acid value of 21 to 22, a Saponification value of 203 to 215, and an Iodine absorption of not less than 105.0 p.c. A sample of the fresh oil examined in the author's laboratory had an Acid value of 24.36, an Ester value of 176.4, a Saponification value of 200.76, a sample dated 1906 had an Acid value of 20.9, an Ester value of 179.2, a Saponification value of 200.1, and an Iodine value of 106.68, a sample dated 1900 had an Acid value of 48.72, an Ester value of 149.8, and a Saponification value of 198.52. The solidifying point of the fatty acids ranges from 16.5° to 16.8° C (61.7° to 62.24° F). The *BP* refers to the specific gravity, and states that the alcoholic solution should not redden blue Litmus paper, but makes no reference to the other physical and chemical characteristics of the oil.

Croton Oil may be detected in mixtures by shaking with an Alcoholic Potassium Hydroxide solution, separating the alcoholic layer, acidifying with dilute acid and removing the spirit by distillation. The residue is shaken with Ether, the ethereal solution separated, the Ether distilled and the residue tested on the skin. A characteristic pustular eruption should be produced if Croton Oil be present.

The more generally occurring impurities are 'other non-drying oils'. These are detected by vigorously shaking a measured quantity of 2 c.c. of the oil with a mixture of 1 c.c. of fuming Nitric Acid and 1 c.c. of Water, after standing for one or two days the mixture should neither partially nor completely solidify. The test is common to the *BP*, *USP* and *PG*.

Saponification—The *USP* requires that Croton Oil should show a Saponification value of from 203 to 215 when saponified by Alcoholic T.S. of Potassium Hydroxide.

Iodine Absorption—If 0.8 gramme of Croton Oil be dissolved in 10 c.c. of Chloroform in a 250 c.c. bottle or flask, and 25 c.c. of a mixture of equal volumes of Alcoholic Iodine T.S. and Alcoholic Mercuric Chloride T.S. added, and if after standing for 4 hours protected from light 20 c.c. of Potassium Iodide T.S. be added and the mixture diluted with 50 c.c. of Water, on titrating the excess of Iodine with Tenth normal V.S. of Sodium Thiosulphate, an Iodine value of not less than 103 nor more than 109 should be obtained, *USP*.

Preparation

LINIMENTUM CROTONIS LINIMENT OF CROTON OIL

Croton Oil, 1, Oil of Cajuput, $3\frac{1}{2}$, Alcohol (90 p.c.), $3\frac{1}{2}$ (1 in 8)

Brompton and *St. Mary's* have a diluted liniment made with equal parts of the Official Preparation and Liniment of Soap.

Not Official

CROTON OIL PENCILS—Croton Oil, 2, Cacao Butter, 1, White Bees wax, 1, melt together the last two in a water-bath, add the Oil, and when nearly cold pour into moulds.

COLLODIUM TIGLII—Croton Oil, 1, Flexible Collodion, 9—*USNF*

CUBEÆ FRUCTUS.

CUBEBS

FR, CUBÈBE, GER, KUBEEN, ITAL, PEPE CUBESE, SPAN, CUBEBA.

The dried, full-grown, unripe Fruits of *Piper Cubeba*

Medicinal Properties—Stimulant and antiseptic diuretic, expectorant Acts specially on the genito-urinary mucous membrane Given in all stages of gonorrhœa, gleet, cystitis, pyelitis, and sometimes in chronic bronchitis Frequently combined with Copaiba

Dose—30 to 60 grains = 2 to 4 grammes

Prescribing Notes—The Powder is given in the above moistened wafer paper, or in smaller doses in cachets In mixture well rubbed down with Mucilage A popular form of administration is the paste, made with an equal quantity of Copaiba, which may be taken in wafer paper It is also made into a paste with Glycerin and various Syrups For throat affections, Lozenges, Compressed Tablets, and Cigarettes are made It is also given in the form of Vapour

The Oil is given in Capsules or suspended in Water with Mucilage For Inhalation the Oil may be used with or without the vapour of Water

Official Preparations—Oleum Cubebæ and Tinctura Cubebæ

Not Official—Extrait de Cubèbe, Fluidextractum Cubebæ, Oleo-resina Cubebæ, Trochiscus Cubebæ, Vapor Cubebæ and Vapor Cubebæ cum Limone

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed, Swiss and U S

Descriptive Notes—Cubebs vary much in quality, and when scarce and dear are often adulterated, or other species are substituted for them The official kind should be about $\frac{1}{8}$ inch (4 mm) in diameter and vary from nearly black to greyish-brown in colour, the pericarp being wrinkled, and furnished with a slender rounded pedicel about $1\frac{1}{2}$ times as long as the fruit and continuous with it (4 to 10 mm, P G) The pericarp contains a single seed attached to the base of the ovary The taste is warm and aromatic and slightly bitter These characters are, however, not sufficient to distinguish the genuine from the false fruits frequently offered in commerce The most reliable characters, adopted in the B P are (1) the crimson colour developed when a crushed Fruit is covered with a drop or two of Sulphuric Acid, since the spurious Cubebs hitherto met with do not contain Cubebin and Cubebic Acid, to which the reaction is due, (2) in the Powdered Fruit, the radially elongated cells of the inner surface of the pericarp Three varieties of the plant are cultivated in Java The Fruit of two of them give the crimson reaction with Sulphuric Acid, but the Fruit of one is longer than that of the other, the third kind has an odour recalling that of Nutmegs, it does not give the crimson reaction, and has caused symptoms of poisoning when administered, see P J (3), xxv, pp 314, 757, 797

When Cubebs are scarce they are adulterated with Fruits similar in form, such as *Rhamnus* species, which is a 3- to 4-celled Fruit, *Bredelia montana*, Willd, and *Litsea citrata*, Bl, which have a large exalbuminous embryo, whilst that of *Piper Coccia* is minute and embedded in the apex of a large oily and barbaous perisperm

Other species of Piper Fruits are sometimes substituted for Cubebs, *e.g.*, *Piper ribesoides*, Wall, *P. crassipes*, Korth, and *P. Lowong*, Bl, but these are either larger than Cubebs or are different in flavour, and do not give the crimson reaction with Sulphuric Acid

The quality of genuine Cubebs depends upon freedom from stalks, and from immature hollow Fruits, which are concave at the base, since the stalks or rachis contain less Oil, and the Seed contains more, than the pericarp. Usually the stalks are sold separately, and employed for the distillation of Oil of Cubebs

Tests—Cubebs when crushed and tested with Sulphuric Acid impart a crimson colour to the Acid. No limit of ash is given in the *BP*, it should not exceed 7.0 p.c.

An Oleo-resin extractable by Ether and by Alcohol (90 p.c.) is present in the Fruits, to the extent of from 17 to 25 p.c. A limit of 22.0 p.c. has been suggested (*CD '02*, 11 826) as a standard for inclusion in the official monograph, dry chemically pure Ether being suggested as a solvent. Ether was employed as a solvent in the 1890 Edition of the *USP*, but was altered to Alcohol (94.9 p.c.) in the 8th Decennial Revision. A standard of not less than 17.0 p.c. has also been suggested

Preparations

OLEUM CUBEBAE OIL OF CUBEBS

A viscid, oily liquid, possessing a characteristic odour and a warm camphoraceous taste

BP describes it as colourless, pale green, or greenish yellow, Schimmel, as light green, or bluish green, it is colourless only when the last portions of the distillation, which are blue, have not been added to the product

It is distilled from Cubebs, the yield being from 10 to 18 p.c.

It consists almost entirely of Terpenes or Sesquiterpenes. It contains a laevogyrate Terpene, Pinene, Dipentene, a laevogyrate Sesquiterpene, Cadinene, and a laevogyrate Sesquiterpene Alcohol, Cubebs-camphor, which is found only in old Oil

Solubility—1 in 18 of Alcohol (90 p.c.), in all proportions of Absolute Alcohol

Dose—5 to 20 minims = 0.3 to 1.2 c.c.

Foreign Pharmacopœias—Official in *Port*, sp. gr. 0.929, *US*, sp. gr. 0.905 to 0.925 at 25° C (77° F). Not in the others

Tests—Oil of Cubebs has a specific gravity of from 0.915 to 0.930, the *USP* gives 0.905 to 0.925 at 25° C (77° F), the *BP* 0.910 to 0.930. It has an optical rotation of -25° to -40° in a 100 mm tube. The greater portion of the Oil distils between 250° and 280° C (482° and 536° F), about 10 p.c. passing over below 250° C (482° F). The Oil is stated to be soluble in from 1 to 3 volumes of Alcohol (90 p.c.), and to afford a solution which is neutral to Litmus paper. The solubility in Alcohol (90 p.c.) varies greatly according to the age of the sample, old Oils being apparently more soluble than new Oils. The Oil is not often adulterated. Turpentine Oil if present would be detected by the behaviour of the Oil on fractionation

TINCTURA CUBEBÆ. TINCTURE OF CUBEBS

4 of Cubebs, percolated with Alcohol (90 p c), to yield 20 (1 in 5)

Dose — $\frac{1}{2}$ to 1 fl drm = 18 to 36 c c

Foreign Pharmacopœias — Official in Mex, 1 in 5, by weight Not in the others

Tests — Tincture of Cubebs has a specific gravity of about 0.840, contains about 20 p c w/v of total solids and about 86.0 p c w/v of Absolute Alcohol

Not Official

EXTRAIT DE CUBÈBE — 1 of Cubebs, in No. 22 powder, percolated first with 2 of Ether, and subsequently with 2 of Alcohol (95 p c), evaporate the two liquids separately and mix the resulting extracts — *F*

FLUIDEXTRACTUM CUBEBÆ — Cubebs, in No. 40 powder, 100 grammes, percolated with Alcohol (95 p c by vol) until the Cubebs are exhausted, reserve the first 90 c c of percolate, and evaporate the remainder to a soft extract, dissolve this in the reserved portion, and add sufficient Alcohol to make 100 c c — *U S P*

This has been incorporated in the *B P C*

Dose — 5 to 30 minims = 0.3 to 1.8 c c

OLEO-RESINA CUBEBÆ *Syn* **EXTRACTUM CUBEBÆ** — Percolate Cubebs in coarse powder with Ether, slowly, until the liquor passes colourless. Let the Ether evaporate from the liquor, at first spontaneously and then over a water-bath, or recover it by distillation, and transfer the residue to a closed vessel, letting it stand until waxy or crystalline matter ceases to be deposited. Decant the Oleo-resin and preserve it in a well stoppered bottle.

This was official in *B P* 1885, and has been incorporated in the *B P C*

Dose — 5 to 30 minims = 0.3 to 1.8 c c

Foreign Pharmacopœias — Official in Fr, Ger, Hung, Jap, Mex (*Extracto Alcohólico de Cubebas*), Swiss and U S Not in the others

TROCHISCUS CUBEBÆ — Each lozenge contains about $\frac{1}{2}$ grain of Cubebs with Fruit Paste — *Throat*

This has been incorporated in the *B P C*

Official in U S, about $\frac{1}{2}$ grain of Oleo resin in each

VAPOR CUBEBÆ — Oil of Cubebs, 40 minims, Light Magnesium Carbonate, 20 grains, Water, to 1 fl oz Mix. A teaspoonful in a pint of Water at 140° F for each inhalation — *Throat*

This has been incorporated in the *B P C*

VAPOR CUBEBÆ CUM LIMONE — Oil of Cubebs, 30 minims, Oil of Lemons, 10 minims, Light Magnesium Carbonate, 20 grains, Water, to 1 oz — *Throat*

Not Official**CUCURBITÆ SEMINA PRÆPARATA**

MELON PUMPKIN SEEDS |

The prepared fresh ripe Seed of *Cucurbita maxima*, from cultivated plants are official in the *Ind* and *Col* Add for the Mediterranean Colonies

Dose — 3 to 4 oz = 85.2 to 113.6 grammes

Not Official
CUPRI SUBACETAS

Syn—ÆRUGO VERDIGRIS

Pale green powder, or partly crystalline masses

According to Von Hager two varieties are recognised commercially the blue or French Verdigris, consisting chiefly of monobasic Copper Acetate, $\text{Cu}(\text{C}_2\text{H}_3\text{O})_2 + \text{Cu}(\text{OH})_2 + 5\text{H}_2\text{O}$, and the green, or English, German, or Swedish variety, consisting chiefly of semi basic Copper Acetate $[\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2] + \text{Cu}(\text{HO}) + 5\text{H}_2\text{O}$, as well as some bibasic Copper Acetate $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 + 2\text{Cu}(\text{HO}) + \text{H}_2\text{O}$

Solubility—When treated with Water about 50 p c dissolves as Copper Acetate, leaving an insoluble Acetate insoluble in Alcohol (90 p c), soluble in diluted mineral acids and in Acetic Acid, also soluble in Ammonia

Medicinal Properties—Used as a stimulant to foul and indolent ulcers, also as an escharotic

Foreign Pharmacopœias—Official in Belg, Mex (Acetato de Cobre bibasico), Port (Verdete), and Span (Cardenillo) Not in the others

Tests—Copper Subacetate answers the tests for Copper appearing under Copper Sulphate When warmed with Sulphuric Acid and a little Alcohol (90 p c), the distinctive odour of Ethyl Acetate is evolved, when warmed with a minute amount of Arsenious Anhydride, the characteristic and highly poisonous odour of Cacodyl Oxide is evolved It should dissolve almost completely in Ammonia Solution

The more generally occurring impurities are Arsenic, metallic Copper, Aluminium, and Chalk Arsenic may be detected by Bettendorf's test, metallic Copper and Aluminium from the residue insoluble in Ammonia Solution, and Chalk by the effervescence on the addition of Hydrochloric Acid Copper Sulphate, if present, may be detected by the addition of Barium Chloride solution

LINIMENTUM ÆRUGINIS (*Ph Lond*)—Made by dissolving Verdigris 1, in Vinegar 7, adding Honey 14, and boiling down to a proper consistence

This has been incorporated in the *B P C*

MELLITE CUIVREUX (*Onguent Ægyptiac*) (*Fr*)—Copper Acetate, 1, Water, 1, Honey, 2 Boil until it assumes a red colour, and is the consistence of honey

OXYMEL DE VERDETE (*Port*)—Verdigris, 2, Vinegar, 3, Honey, 5 Boil down to a proper consistence

TOPIQUE À L'ACÉTATE DE CUIVRE (VET)—Copper Acetate, 4, Treacle, 1, Vinegar, 1, mix—*Fr*

CUPRI ACETAS—Deep green or bluish green, prismatic crystals

Solubility—1 in 15 of Water, 1 in 300 of Alcohol (90 p c), 1 in 112 of Glycerin

Medicinal Properties—Similar to the Subacetate, but more definite when required for solution in Water

Foreign Pharmacopœias—Official in *Fr*

Tests—Copper Acetate yields a bluish-green coloured solution which changes to a deep blue on the addition of Ammonia Solution in excess It should respond to the tests for Copper given under Copper Sulphate A small portion of the salt warmed with Sulphuric Acid evolves a characteristic acetous odour When warmed with Sulphuric Acid and a little Alcohol (90 p c) the odour of Ethyl Acetate is given off

The more generally occurring impurities are Arsenic, Iron, Lead and Zinc, alkalis and alkali earths Arsenic may be detected by Bettendorf's test, Lead and Zinc by boiling an aqueous solution with an excess of Sodium Hydroxide Solution, cooling, filtering, and passing Hydrogen Sulphide into the filtrate, no cloudiness or precipitate should be produced, Iron, alkalis and alkali earths by removing the Copper as Sulphide with Hydrogen Sulphide, filtering and evaporating the filtrate to dryness, no residue should remain

CUPRI SULPHAS.

COPPER SULPHATE

B P Syn—CUPRIC SULPHATE $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, eq 247.86

FR, SULFATE DE CUIVRE, GER, KUPFERSULFAT, ITAL, SOLFATO DI RAME, SPAN, SULFATO CUPRICO

Large, translucent, blue, triclinic crystals, possessing a metallic and astringent taste. It slowly effloresces in dry air.

It may be obtained by the action of Water and Sulphuric Acid on Copper or by dissolving Copper Oxide in Sulphuric Acid.

When rendered anhydrous by heating the powder is white.

Solubility—1 in $3\frac{1}{2}$ of Water, 2 in 1 of Water (at 212°F), insoluble in Alcohol (90 p c), 1 in $2\frac{1}{2}$ of Glycerin.

Will not dissolve 1 in 275, as stated by some authorities—*P J* '02, 1 558

Medicinal Properties—Astringent, prompt emetic, eschaotie. Recommended in chronic diarrhoea, especially that of phthisis. Externally, as a styptic for bleeding surfaces and a local stimulant to ulcers, as an escharotic for warts, etc. For lotions, in proportions from 2 to 4 grains to 1 oz, also 8 grains to 1 oz for prurigo. As an astringent, **injection** to diminish excessive secretion from mucous membranes, especially in leucorrhœa and gonorrhœa. For urethral **injections**, 1 to 4 grains in an oz of Water. It is also used 1 to 2 grains to 1 oz, in granular conjunctivitis and various affections of the eyes when astringent applications are required.

An antidote in Phosphorus poisoning—3 grains every few minutes till vomiting is produced—*Mitchell Bruce*

Copper Sulphate 10 grains, Tincture of Opium 60 minims, Water 4 fl oz. This was used as a rectal injection in a bad case of dysentery—*L* '89, 11 739

Recommendation of the Departmental Committee to inquire into the use of preservatives and colouring matter in food. The use of Copper salts in the so-called greening of preserved food be prohibited—*L* '01, 11 1683, *J S C I* '01, 1228

Dose.—As $\frac{1}{4}$ to 2 grains = 0.016 to 0.13 gramme, as an emetic, 5 to 10 grains = 0.32 to 0.64 gramme

Ph Ger maximum single dose, 1.0 gramme

Prescribing Notes—*Best given in form of pill. A good pill is prepared by adding 1 part of Pulvis Tragacanthæ Compositus, and Dispensing Syrup, q s, varnish to the pill.*

Incompatibles—Alkalis and their Carbonates, Lime Water, Iodides, and most vegetable astringents.

Not Official—Guttæ Cupri Sulphatis, Cupri Oleas, Unguentum Cupri Oleatis, Lapis Divinus (Cuprum Aluminatum), Fehling's Solution, Pavy's Solution, Cupraiol, and Cupri Sulphocarbolas.

Antidotes—In case of poisoning by Copper or White of Egg is the best antidote, the stomach should be emptied, and demulcent drinks given followed by internally or Morphine hypodermically, and Linseed Meal poultices applied to the abdomen.

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital (Solfato di Rame), Jap, Mex (Sulfato de Cobre), Norw, Port, Russ, Span, Swed, Swiss and U S. Ger and Swiss have also a crude sulphate.

Tests—Copper Sulphate dissolves in Water, yielding a solution which has an acid reaction towards Litmus paper, and which with Hydrogen Sulphide produces a brownish-black precipitate insoluble in Diluted Hydrochloric Acid and in Ammonium Hydrosulphide or Potassium or Sodium Hydroxide Solution, but soluble in Nitric Acid. A similar precipitate is yielded by Ammonium Hydrosulphide Solution. Ammonia Solution added drop by drop to an aqueous solution produces at first a pale blue precipitate which dissolves in an excess of the reagent yielding an intensely blue-coloured solution, Potassium or Sodium Hydroxide Solution gives a somewhat similar precipitate, which becomes brownish-black on boiling. The light blue precipitate is soluble in a very large excess of concentrated Potassium or Sodium Hydroxide Solution, but the presence of a soluble Tartrate prevents the precipitation, a deep blue liquid being produced which readily undergoes reduction to red Cuprous Oxide on boiling with Glucose and some Sugars. Potassium Hydroxide Solution produces no precipitate, but only a deep blue coloured solution, when a fixed organic acid is present. Ammonium Carbonate Solution yields a greenish-blue precipitate soluble to a deep blue solution in an excess of Ammonia Solution. Potassium Ferrocyanide Solution yields a reddish brown precipitate insoluble in dilute mineral acids, but decomposed by Potassium or Sodium Hydroxide Solution. A strip of bright metallic Iron immersed in a solution acquires a reddish coating of metallic Copper. A solution of Copper Sulphate acidified with diluted Hydrochloric Acid yields on the addition of Barium Chloride Solution a white precipitate insoluble in Hydrochloric Acid.

The more generally occurring impurities are Arsenic, Aluminium, Iron, Lead, and Zinc. Arsenic may be detected by the Bettendorf's test, Iron, Aluminium, and Zinc by removing the Copper from an acidified solution with Hydrogen Sulphide, adding Ammonia Solution to one portion and evaporating the other to dryness, in the former case no turbidity should be produced, in the latter no residue should remain. Their presence may also be ascertained by removing the Copper as oxide by boiling with Potassium or Sodium Hydroxide Solution and examining the filtrate (after acidification with Acetic Acid) by the time-limit test for heavy metals.

Heat—When heated, Copper Sulphate loses its Water of crystallisation, two molecules are lost at 30°C (86°F) with the formation of a pale blue amorphous powder, another two are lost at 100°C (212°F), and the last molecule is given up at a temperature of 200°C (392°F), leaving an anhydrous powder weighing 68.9 p.c. of its original weight. At a still higher temperature Sulphur Dioxide and Oxygen are given off, leaving a residue of Cupric Oxide, *U S P*.

Hydrogen Sulphide—If to an aqueous solution of 0.5 gramme of Copper Sulphate an excess of Hydrogen Sulphide T.S. be added and the precipitate produced filtered off, the colourless filtrate after the addition of T.S. of Ammonia should remain colourless, and after evaporation should not leave a weighable residue, *P G*.

If Hydrogen Sulphide gas be passed through 10 c.c. of an aqueous solution (1-20) of the salt, to which 1 c.c. of diluted Hydrochloric Acid has been previously added, until precipitation of Copper Sulphide is complete, one half of the colourless filtrate should not be coloured or rendered turbid on the addition of T.S. of Ammonia, nor should the other half yield a weighable residue when evaporated and ignited, *U S P*.

Time-limit Test—An aqueous solution of the salt (1-20) when boiled with excess of TS of Sodium Hydroxide until the Copper Oxide is completely dissolved and then filtered, a colourless filtrate should be obtained which, Acetic Acid, should not respond to the time-limit test for heavy metals, *U S P*

Not Official

GUTTÆ CUPRI SULPHATIS—Copper Sulphate, 2 grains, Water, 1 fl oz —*London Ophthalmic* The strength in use at the principal hospitals

CUPRI OLEAS—Green, oleaginous solid, insoluble in Water, soluble in Ether An excellent antiseptic and antiparasitic agent When diluted it is especially useful in ringworm

UNGUENTUM CUPRI OLEATIS—Copper Oleate, 1, Lard, 4, melt together, and stir till cold Useful in ringworm, hard and horny warts, corns and bunions —*B M J '84*, 11 752

1 to 7 of Soft Paraffin (*London*), 1 to 7 of Lard (*University*), 1 to 9 of Lard (*B P C*)

LAPIS DIVINUS CUPRUM ALUMINATUM—Copper Sulphate, Potassium Nitrate, and Alum, of each equal parts, in powder, fused in a glazed earthen crucible, powdered Camphor, to the extent of $\frac{1}{4}$ th part of the whole, being added near the end of the process When cold, break in pieces and keep in a close stoppered bottle An eye-wash may be made by dissolving 2 grains in 1 oz of distilled Water

Foreign Pharmacopœias—Official in Fr (*Pierre Divine*), Ger, Hung, Jap, Russ and Swiss Not in the others

FEHLING'S SOLUTION—*See Appendix*

PAVY'S SOLUTION—Crystallised Copper Sulphate, 34.65 grammes, Rochelle Salt, 170 grammes, Potassium Hydroxide, 170 grammes, Water, to 1000 cc

When 120 cc of this Solution are mixed with 400 cc of Ammonia (sp gr 0.880) and diluted to 1000 cc, then 10 cc may be taken as equivalent to 0.005 gramme of Glucose

The method is well adapted for the examination of Diabetic Urine and Milk, also mixtures of Milk and Cane Sugars, and certainly has the advantage over the ordinary Fehling method by its definite end reaction

CUPRARGOL (Copper and Silver Albuminate)—A greyish-white powder, soluble in Water Has been used in 1 to 5 p c solution in conjunctivitis

CUPRI SULPHOCARBOLAS (Copper Aseptol)—Green rhombic prisms or light green needle-shaped crystals Soluble in Water and in Alcohol (90 p c) Hemostatic As an antiseptic, $\frac{1}{2}$ to 1 p c solution As an injection in gonorrhœa, $\frac{1}{2}$ to 1 $\frac{1}{2}$ p c solution

Not Official

CURARA—WOORARA.

A powerful poison, stated to be obtained from various species of *Strychnos* and other plants, and used by the Indians in the northern part of South America for arming the points of their arrows A brownish black, shining, brittle, resinous mass, almost wholly soluble in Water, sparingly soluble in Absolute Alcohol Different samples may vary very much in strength, and no doubt also in general composition so that the dose of every parcel has to be arrived at by experiment It is only used hypodermically, and the solution has generally been of the strength of 1 grain in 100 minims

An alkaloid Curarine has been obtained from Curara, and although commercial, is somewhat difficult to obtain

Arrow Poisons Their history, sources, and constituents —(*Stockman*) *P J '98*, 11 548, 585

Medicinal Properties—It has been used in the treatment of Strychnine poisoning, hydrophobia, chorea, and tetanus

In the convulsions of chorea, and to prevent painful spasms in moving wounded persons (*B M J* '04, 11 1642) Has an influence in diminishing the severity of the tonic and clonic tetanic spasms (*L* '05, 1 991), and should be injected hypodermically morning and evening, commencing with $\frac{1}{2}$ grain and gradually increasing the dose according to the severity of the spasms to 1 grain also 20 to 30 c c of antitetanic serum injected under the skin of the abdomen and repeated daily for a week or ten days

Dose— $\frac{1}{12}$ to $\frac{1}{2}$ grain = 0.005 to 0.032 gramme, but should be used with great care

Foreign Pharmacopœias—Official in Mex (Curaro) Not in the others

Descriptive Notes—Curare is usually imported from Venezuela in the form of a blackish extract contained in small gourds about $2\frac{1}{2}$ inches in diameter A fragment of the extract placed in a drop of Alcohol on a microscopic slide shows a brownish fluid copiously studded with quadrilateral prisms (supposed to be Curarine, which forms four sided prisms) and an abundance of minute particles of a yellowish tint which consist of Calcium Oxalate The principal ingredient in Curare is the bark of *Strychnos toxifera*, but that of other species is also used in different districts, thus in British Guiana the bark of *S. toxifera*, Schomb, *S. Schomburgkii*, Kl, and *S. cogens*, Benth, are used in the Curare of the Macusi, Oreocua and Wapishana tribes, that of *S. Gubleri*, Planch, by the Moquitari and Puaroa Indians, between the Orinoco and Rio Negro, and that of *S. Castelnociana*, Wedd, by the Ticuna, Pebia Yagua and Oregona Indians in the districts of the Upper Amazon, that of *S. Orevarum*, Planch, by the Tio and Roucouyenne Indians of French Guiana It is obvious, therefore, that Curare is an extract of uncertain composition as regards the species of *Strychnos* employed, and the more so that different ingredients are added to the extract by different tribes A preparation made in this country from the bark of *S. toxifera* imported from British Guiana would, therefore, be far more reliable Curare is said to have been used successfully in hydrophobia

INJECTIO CURARÆ HYPODERMICA.—Curare, 1^g, make it into a paste with Distilled Water recently boiled and cooled, transfer to a funnel plugged with absorbent Wool, and gradually pour upon it Distilled Water until 10 is obtained —*B P C*

B P C Formulary 1894 gave the strength as 1 grain in 12 minims

Dose—1 to 6 minims = 0.06 to 0.36 c c

CUSPARIÆ CORTEX.

CUSPARIA BARK

FR, ANGUSTURE VRAIE, GER, ANGOSTURARINDE, ITAL, CORTECCIA DE ANGUSTURA, SPAN, CORTEZA DE ANGOSTURA

The dried Bark of *Cusparia febrifuga*, DC

The alkaloids, **Cusparine**, **Cusparadine**, **Galipeine**, and **Galipidine** have been extracted from Cusparia Bark The bitter principle **Angosturin**, to which the bitterness of the bark has been assumed to be due has also been isolated, and a small quantity of a volatile Oil **Cusparine Sulphate** and **Hydrochloride** are slightly soluble in Water, the Acetate and Tartrate much more so —*P J* (3) xiv 423

Contains about 1.5 p c of ethereal oil —*J C S Abs* '98, 1 87

Medicinal Properties—An aromatic bitter tonic In South America it is given as an antiperiodic for malarial fever

Prescribing Notes—Given in the form of the Infusion or the Concentrated Infusion, generally combined with Aromatics to prevent nausea

Official Preparations—Infusum Cuspariæ and Liquor Cuspariæ Concentratus

Foreign Pharmacopœias—Official in Mex (Angostura Verdadera) and Port Not in the others

Descriptive Notes.—The bark of *Cusparia febrifuga* varies somewhat in appearance and size, the outer surface being in some pieces smooth and hard, and in others soft and spongy. The pieces are usually curved, 2 to 4 or more inches long (4 to 5, *BP*), about $1\frac{1}{2}$ inch in thickness and 1 inch or more in diameter. Its distinctive characters are the short, resinous, brown fracture, laminated inner surface, characteristic odour and flavour, in addition to its bitterness.

The character mentioned in the *BP* of numerous white points on the transverse fracture is also found in *Nux Vomica* bark, which was at one time substituted for it in commerce. The latter, however, has a paler fracture with a definite paler line. The corky portion, is not laminated, and is purely bitter without any special flavour. In powder *Cusparia* Bark may be recognised by the presence of numerous oil cells, by the acicular as well as single, oblique prismatic crystals of Calcium Oxalate, and by having very thick-walled bast fibres, which are coloured canary-yellow by Caustic Potash.

Tests.—*Cusparia* Bark yields about 8 p.c. of ash, and 10 p.c. is rarely exceeded.

Preparations.

INFUSUM CUSPARIÆ INFUSION OF CUSPARIA.

Cusparia Bark, in No. 20 powder, 1, Distilled Water, boiling, 20; infuse for fifteen minutes, strain (1 in 20)

Dose.—1 to 2 fl oz = 28.4 to 56.8 c.c.

Incompatibles—Mineral Acids, Ferric Chloride, and other metallic salts.

LIQUOR CUSPARIÆ CONCENTRATUS. CONCENTRATED SOLUTION OF CUSPARIA

10 of *Cusparia* Bark, in No. 40 powder, percolated with Alcohol (20 p.c.), to yield 20 (1 in 2)

Dose.— $\frac{1}{2}$ to 1 fl drim = 1.8 to 3.6 c.c.

Tests—Liquor *Cuspariæ* Concentratus has a specific gravity of 1.010 to 1.020, contains about 10.0 p.c. w/v of total solids and about 20.0 p.c. w/v of Absolute Alcohol.

Infusum Cuspariæ Concentratum—*Cusparia* Bark, in No. 40 powder 40, Alcohol (90 p.c.), 25, Distilled Water (1 in 1000), q.s. to make 100. Prepare by maceration. —*Farr and Wright, P J '06, 1 165 and '07, 1 621, C D '06, 1 252, Y B I', '07 219*

This appears in the *BP C*

CUSSO.

KOUSSO

FR, COUSSO, GER, KOSOBLOUTHEN, ITAL, KOUSSO, SPAN, FLOR DE COUSSO

The dried panicles of pistillate Flowers of *Brayera anthelmintica*, Kunth (of *Hagenia abyssinica* (Bruce) Gmelin, *USP*)

Obtained from Abyssinia

Medicinal Properties—Anthelmintic Especially useful for the different kinds of tapeworm Should be followed by a purgative to expel the dead worm

Dose— $\frac{1}{4}$ to $\frac{1}{2}$ oz = 7 1 to 14 2 grammes

Prescribing Notes—*The Flowers, in coarse powder, are mixed with half a pint of warm Water, allowed to stand for fifteen minutes, stirred up (not strained), and taken in 2 or 3 draughts at short intervals It should be taken in the morning on an empty stomach, the bowels having previously acted After three or four hours a brisk purgative should be administered On account of its liability to produce nausea a little Lemonade may be taken afterwards*

Foreign Pharmacopœias—Official in Austr (Koso), Belg, Fr and Port (Coussou), Ital (Koussou), Ger, Jap and Swiss (Flores Koso), Hung (Kusso), Mex (Cuso), Norw and Swed, Russ (Flores Kusso), Span (Couso), US (Cusso)

The Infusion is official in Belg 2 in 15, Fr (Apozeme de Coussou) about 1 in 8, Span (Inf de Couso), 1 in about 16 $\frac{1}{2}$, *BP C* 6 in 100

Descriptive Notes—Cusso is generally imported in rolls about 1 $\frac{1}{2}$ to 2 feet long (3 to 6 dm) and 2 $\frac{1}{4}$ to 3 inches in diameter, each consisting of the large paniced inflorescence of female flowers The flowers are shortly stalked, pubescent, and consist of the two rounded bracts, a calyx of 5 outer, rigid, purple-veined sepals, and 5 inner, smaller, incurved, shrivelled segments The 5 caducous white petals as well as the abortive stamens are usually absent in the drug, there are two carpels, and the style with two broad hairy stigmas is exerted The large stems should be rejected (*USP*), and also samples which have lost their reddish tint and become brownish, indicating age and deterioration The male flowers, which are excluded by the *BP*, *USP* and *PG*, have a greenish tint, and the outer sepals are not enlarged The powder is characterised by the thick-walled unicellular hairs, the numerous rosette crystals, as well as simple and segmented capitulate short stalked glands (*Koch*) It should not contain pollen grains, nor fragments of vessels more than 0.002 mm in diameter (*PG*), but *Koch* states that pollen grains do not occur in it

Not Official

~~CYDONIUM~~

~~QUINCE SEED~~

~~The Seeds of *Pyrus Cydonia*~~

~~Their coriaceous envelope abounds in Mucilage~~

~~**Medicinal Properties**—Demulcent The decoction is used externally for cracks in the skin A nice adjunct to eye lotions in cases of irritation and inflammation~~

Foreign Pharmacopœias—Official in Belg, Port (Maimelo), Mex (Membrillo), and Swiss Not in the others The fruit is official in Fr (Coing)

DECOCTUM CYDONII—Quince Seed, 1, Distilled Water, 80 Boil for ten minutes, and strain

This has been incorporated in the *BPC*

MUCILAGO CYDONII—1 of Quince Seed and 25 of Water, by cold maceration Was official in Austrian Ph (1889), and is the strength now incorporated in the *BPC*

Fr, 1 in 10, Port, 1 in 100

Not Official.

CYLLIN.

Jeyes' Cyllin (medical) is a non-toxic antiseptic, it contains 50 p.c. of a new series of oxidised Hydriocarbons, free from Phenol and its homologues, emulsified with neutral Tar Oil Its Carboic Acid coefficient for *Bacillus Typhosus* is 20 —*L* '07, 1 33

Preparations for internal administration are Cyllin Capsules, Cyllin Pastilles and Cyllin Syrup

The dressings, Cyllin Lint, Gauze and Wool, each contain 10 p.c. of Cyllin

Two Gelatin plates were inoculated with *Staphylococcus pyogenes aureus*, one was medicated with Cyllin inhalant, and the other was unmedicated The former showed no sign of growth, the latter a copious and normal growth —*L* '05, 1 988 A new use of the inhalant is thus indicated in combating the symbiotic action of the pus microbe in pulmonary tuberculosis

3-minim doses given (*L* '05, 1 1148), in the form of a keratin coated capsule, every second hour if necessary in the treatment of sprue, but rarely more than 8 a day are required Best time to administer it is after food

Attention has been called (*B M J* '04, 1 1119) to its value as a tubercle destroyer it being claimed to be non-toxic and about twenty times as powerful as Carbolic Acid, and hence its trial in cases of tuberculosis —*L* '05, 1 377

Not Official

CYNOGLOSSUM

The Root of *Cynoglossum officinale*, *L* It contains an amorphous alkaloid **Cynoglossine**

Medicinal Properties—Has been used as a demulcent and sedative

Foreign Pharmacopœias—Official in Dan, Fr, Mex, Norw, Port and Span Not in

Pulvis Cynoglossi Compositus is official in Dan, Fr and Norw, **Pilulas Cynoglossi** in Dan, **Pildoras de Cynoglossa** in Mex, and Span

Fr, **Pilules de Cynoglosse Opiacees**, each pill contains 0.02 gramme ($\frac{1}{50}$ grain) of Extract of Opium, and 0.02 gramme of Powdered Henbane Seeds

Not Official

CYPRIPEDIUM

The Rhizome and Roots of *Cypripedium florum* Mill, and of *C. pubescens* Salisb, are official in U.S. Pharmacopœia known as Lady's Slipper

Cypripedin is the dried extract of the above, and has been recommended in hypochondriasis, chorea and epilepsy

The eclectic remedy 'Cypripedin' which is stated to be prepared by precipitating a concentrated tincture of the root with Water, is complex in composition and stated to have no claim to the name given it

It may be used in doses of 1 to 5 grains = 0.065 to 0.32 gramme

A 1 in 1 Fluid Extract (Alcohol 48.9 p.c.) is official in the U.S., average dose 15 minims = 0.9 cc

Not Official

DAMIANA

The Leaves of one or more species of *Turnera*, from Mexico and California. Contains a bitter substance, resins, and a volatile oil.

Medicinal Properties—Tonic, diuretic, and aphrodisiac.

Prescribing Notes—Frequently given in the form of pill, the Hard Extract makes a good pill with a small quantity of Alcohol (90 p.c.), the Soft Extract is best hardened with the powdered Leaves. The Liquid Extract is given in capsules.

Foreign Pharmacopœias—Official in Mex.

Descriptive Notes—Damiana occurs in commerce in two or three different varieties. The kind which is considered the best is known as *Helmichis Damiana*, and is derived from *Turnera aphrodisiaca*, L. Ward (nat. ord. *Turneraceæ*) and is a native of California and Mexico. The leaves, of a light green colour, are wedge shaped, usually less than an inch in length (10 to 25 mm) and about $\frac{1}{2}$ inch (5 to 10 mm) in diameter in the broadest part, with about 3 to 6 coarsely crenate teeth on either side besides the terminal one. The taste recalls that of figs, but is aromatic and slightly bitter. The plant is considered by some botanists to be a variety of *T. diffusa*, Willd. It has reddish stems and thinner, smoother and less hairy, greener leaves, not greyish green as in the type. The leaves of another species, possibly *T. microphylla*, Desv., are sometimes substituted for it. They are smaller, more hairy, with hairy stems which are not reddish. The leaves of *Aplopappus discordeus*, DC., nat. ord. *Compositæ*, are occasionally offered as Damiana. They have fewer, more distant, serrate teeth, usually three on either side, and composite flowers with hairy pappus, usually mixed with the leaves.

EXTRACTUM DAMIANÆ LIQUIDUM—Damiana leaves exhausted with Alcohol (60 p.c.), 1 of fluid represents 1 of the drug.

This has been incorporated in the B.P.C.

Dose—30 to 60 minims = 1.8 to 3.6 cc.

EXTRACTUM DAMIANÆ—The above evaporated to a soft extract.

Dose—5 to 10 grains = 0.32 to 0.65 gramme.

This has been incorporated in the B.P.C.

MISTURA DAMIANÆ COMPOSITA—Sodium Hypophosphite, 5 grains, Calcium Hypophosphite, 5 grains, Liquid Extract of Damiana, $\frac{1}{2}$ fl. drm., Liquid Extract of Nux Vomica, 2 minims, Chloroform Water, to 2 drms.—*Martindale*.

This has been incorporated in the B.P.C.

PILULA DAMIANÆ COMPOSITA—Extract of Damiana, 2 grains, Phosphorus, $\frac{1}{10}$ grain, Extract of Nux Vomica, $\frac{1}{2}$ grain.—*Martindale*.

Extract of Damiana, 2 grains, Extract of Nux Vomica, $\frac{1}{10}$ grain, Phosphorated Suet (10 p.c.), $\frac{1}{10}$ grain, mix quickly these three with about $\frac{1}{2}$ minim of Chloroform and add $\frac{1}{10}$ grain of Compound Tragacanth Powder and Mucilage of Acacia q.s.—B.P.C.

DIGITALIS FOLIA.

DIGITALIS LEAVES

FR., DIGITALE, GER., FINGERHUTBLÄTTER, ITAL., DIGITALE, SPAN., HOJA DE DIGITAL.

The dried leaves of *Digitalis purpurea*, L. Collected from plants commencing to flower. The U.S.P. specifies that the leaves should be collected from plants of the second year's growth.

Medicinal Properties—Cardiac and circulatory stimulant and tonic, increases the strength and efficiency of the cardiac contractions, and reduces the pulse rate without diminishing tension. Specially useful in mitral and tricuspid lesions with loss of compensation, in cardiac insufficiency from whatever cause, with irregular and rapid action and low arterial tension, not indicated in purely aortic cases. Of great value as a cardiac stimulant in acute pneumonia, useful in pulmonary hæmorrhage due to mitral disease. Diuretic, useful in cardiac dropsy, also in renal dropsy when acute or when due to failure of a hypertrophied heart.

It is cumulative in action, and requires watchfulness. Its continued use deranges the alimentary system, therefore, after it has been taken for eight or ten days it should be left off for three or four days and then recommenced. According to Lauder Brunton, Digitalis is distinctly dangerous in advanced fatty degeneration of the heart, he also thinks it harmful in advanced Bright's disease. For a comparison with *Strophanthus* see under *Strophantha Semina*.

According to Kihani, the seeds of *Digitalis purpurea* contain Digitalinum verum, and Digitonin, the leaves contain Digitoxin, but neither of the other two. Preparation of Digitalin also described—*JCS Abs* '96, 1 58, 59, 180, '97, 1 95, *PJ* '95, 11 29, 120, '96, 11 289.

Treatment of pneumonia by Digitalis—*B M J E* '95, 11 82, '96, 11 76, '97, 1 15.

Digitoxin in doses of $\frac{1}{2}$ milligramme = $\frac{1}{288}$ grain—*B M J E* '97, 1 81.

Best administered as tincture or dried leaf in pill form, one advantage being combination of active principles whereby overaction is obviated—*L* '02, 1 673.

Untoward effects of 20 to 24 minims of the tincture taken daily for five days in a weakly overgrown boy of 10 years—*B M J E* '02, 1 1068.

The administration of Digitalis particularly deprecated in unduly high blood pressure—*B M J* '99, 1 85.

In the treatment of the rapid heart of influenza, where there is cardiac dilatation that lasts some weeks. Intermittent administration best. 10 to 20 minims of Tincture, $\frac{1}{2}$ drm of the Infusion or 1 grain Powdered Leaves, three daily for three days with intervals of three or more days during which the drug is withheld, or 2 to 4 granules of Nativelle's Digitalin containing $\frac{1}{16}$ milligramme once in twenty-four hours for two days with intervals of at least three days—*L* '99, 11 1079.

Some remarks upon Digitalis treatment in chronic disorders of the circulation, and especially upon the continuous use of Digitalis—*P* lxiv 385.

An experimental investigation into the treatment of Digitalis poisoning. Nitroglycerin, besides possessing a greater antagonistic action to Digitalis than any other known drug, is also relatively non-toxic, and for the reduction of internal tension Nitroglycerin or an ally is the best remedy, but with a low blood pressure these substances are useless—*B M J* '99, 11 1265.

Influence on the heart muscle when administered for a long time—*T G* '97, 800.

Although this is the most powerful remedy in mitral disease which we possess, in cases of pure aortic regurgitation (*B M J* '06, 1 1462), it is not only a dangerous drug but is actually a poison. It acts as a diuretic in cardiac dropsy (*B M J* '06, 1 10). The diuresis produced by the ordinary doses of the pharmacopœial preparations of the drug does not make its appearance before the third or fourth day of administration. To be useful in cardiac dropsy it must be given in full doses.

The pharmacological action of Digitalis, *Strophanthus*, and Squill is fully considered—*B M J Supplement*, '06, 11 13, *PJ* '06, 11 28.

Dose—In powder, $\frac{1}{2}$ to 2 grains = 0.032 to 0.13 gramme.

Ph Ger maximum single dose, 0.2 gramme, maximum daily dose, 1.0 gramme

Prescribing Notes—*The fresh Infusion is preferred by some to the Tincture. The powdered leaf is ordered in Pills with other ingredients. Ferrous Sulphate is not uncommonly prescribed with the fluid preparation of Digitalis, with a resulting blackening from the tannin of Digitalis where this is an objection it can be prevented by the addition of Citric Acid. 6 grains of Citric Acid are sufficient for 12 grains of Ferrous Sulphate, or the powdered drugs can be given in pills.*

Incompatibles—Ferrous Sulphate, Tincture of Ferric Chloride, preparations of Cinchona, and Lead Acetate

Official Preparations—Infusum Digitalis and Tinctura Digitalis

Not Official—Fluidextractum Digitalis, Infusum Digitalis Concentratum, Pilula Digitalis Composita, Pilula Digitalis et Hydrargyri Composita, Pilula Digitalis et Opi Composita, Succus Digitalis, Syrupus Digitalis, Vinum Digitalis Compositum, and Digitalin (various)

Antidotes—In case of an overdose, a recumbent posture is of paramount importance, and after the stomach has been emptied, 20 grains of Tannic Acid in hot Water given frequently, or hot strong Tea or Coffee, stimulants and warmth should be employed

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex, Norw, Port (Dedaloira), Russ, Span (Digital), Swed, Swiss and U.S.

The Brussels Conference agreed to use the leaf of the second year, and the powdered drug to be used entire

Tests—The ash of Digitalis varies from 7 to 10 p.c., and should not exceed the latter figure. In the present state of our knowledge of the subject a chemical method of determination is of doubtful utility, and it is generally conceded that a physiological method of standardisation leaves much to be desired.

The more or less definite principles contained in Digitalis may be arranged as follows under the names applied to them by Schmiedeberg:

- (a) **Digitonin**.—A crystallisable body resembling Saponin, constituting the larger part of the glucosidal constituents. It softens at 225° C (437° F), and melts completely at 235° C (455° F). The aqueous solution is levorotatory, and is precipitated by Tannin, Ammoniacal Lead Acetate, and Barium Hydroxide Solution. Soluble in Water, insoluble in cold Alcohol, Ether, Benzol, or Chloroform. It has none of the physiological action peculiar to Digitalis, and in other respects is directly injurious.
- (b) **Digitalein**.—An amorphous glucoside (possibly a mixture). Soluble in Water and in Alcohol, insoluble in Ether or Chloroform. Its action on the heart is non-cumulative, and it causes no irritation when subcutaneously injected.
- (c) **Digitalin**.—A white amorphous powder or soft white grains which remains unchanged when heated to 200° C (392° F), begins to aggregate at 210° C (410° F), and melts about 217° C (422° F). It is soluble in Alcohol, almost insoluble in Water, sparingly soluble in Ether or Chloroform. It dissolves in concentrated Hydrochloric or Sulphuric Acid with golden yellow colour, the colour in the latter instance changing rapidly to a blood red. On adding to the solution whilst still yellow a drop of either Nitric Acid, Ferric Chloride, or Bromine Water, a brilliant purple coloration is produced.

Possesses in a high degree the medicinal action of Digitalis

- (d) **Digitoxin**.—Pearly plates or needles melting at 240° C (464° F). *Fr Codex* (1908) gives 243° C (469° F). Easily soluble in Alcohol, slowly in Chloroform, very sparingly in Ether, quite insoluble in Water. It

does not give the colour reaction of Digitalin with strong Sulphuric Acid. It yields a yellow or greenish coloration when warmed with strong Hydrochloric Acid. The *French Codex* gives the following test. If weighed quantities of about 0.005 gramme of Ferric Sulphate be dissolved separately in 2 c.c. of Glacial Acetic Acid and in 2 c.c. of concentrated Sulphuric Acid, then if the Acetic Acid Solution of the Iron salt, previously mixed with a trace of Digitoxin, be poured gently on to the surface of the Sulphuric Acid containing the Iron salt in such a manner that the two liquids do not mix, at the point of contact of the two liquids there is developed a brown coloured zone, the colour changing to green and then to indigo-blue and after half an hour the Acetic Acid is coloured entirely blue. This characteristic reaction for Digitoxin was given in the 17th edition of the *Companion* as follows. When dissolved in Acetic Acid to which has been added 1 p.c. of a solution containing 5 p.c. of Ferric Sulphate, and Sulphuric Acid containing the same quantity of Ferric Sulphate is poured into the tube so as to form a layer beneath it, a blue colour is gradually developed in the Acetic Acid, whilst the Sulphuric Acid remains colourless, this coloration in the Acetic Acid is not produced by any other of these compounds.

The most toxic of all the constituents, but uncertain, cumulative, and dangerous in its action.

- (e) **Digitalin**—A crystalline body, physiologically inert, difficultly soluble in Water, more readily in Alcohol, insoluble in Ether or Chloroform.

It dissolves in concentrated Sulphuric Acid with brownish-yellow colour, which becomes purple-red on exposure to air, the addition of Water turning the colour to green. It is insoluble in Hydrochloric Acid, but dissolves in Nitric Acid without coloration. It does not reduce Fehling's Solution until after boiling with dilute acid.

Descriptive Notes—The Digitalis leaves of commerce are probably collected, not only from plants in flower, but from plants of the first year's growth and from shoots formed laterally from the second year's plant after flowering. The leaves accordingly differ in size and shape. The root leaves are broadly ovate, lanceolate, and crenate-serrate, and much larger and wider at the base than the stem leaves, which have shorter stalks and are gradually less ovate and more lanceolate and smaller from the base to the top of the leafy stem. The dimensions given in the *B.P.*, viz., 10 to 30 cm (4 to 12 inches) long, and 12½ to 15 cm (5 or 6 inches) broad, cover all the above forms of leaf. The leaves have a bitter taste, but no distinct odour. The features that distinguish Foxglove leaves from other similar leaves are the lower veins, which are placed at a very acute angle to the base of the mid-rib and are decurrent into the petiole, the faintly areolate ~~the~~ *B.P.* upper surface, and the paler under surface, densely pubescent with short hairs, and reticulated with prominent small veins. Other leaves occasionally found mixed with those of Foxglove differ in the venation and in the character of the hairs, which in Digitalis are of two kinds, viz., 1 to 5 celled simple hairs (usually 3 celled, *B.P.*), with occasionally a glandular head, and short 1 to 2 celled hairs, with a single or a twin gland at the apex.

The powdered leaves are distinguished by the absence of raphides and stone cells, by sinuous epidermal cells with small stomata, the 1-5-celled hairs with a more or less warty surface, and short glandular hairs.

Digitalis leaves soon lose their activity unless kept quite dry, they can be obtained in commerce with the midrib removed and packed dry in hermetically sealed bottles. The tincture would probably be more effective if prepared from the fresh leaves with rectified spirit and then heated to boiling point to prevent changes arising from the action of natural ferments in the leaves, since this takes place in the leaves in the presence of the 12 p c of moisture which they absorb after drying, if not enclosed in airtight vessels as soon as dried. The *P G* points out the triangular character of the petiole, and that the upper stem leaves may be sessile. The leaves should be obtained from wild plants. The *USP* directs leaves collected from the second year growth at the commencement of flowering, and that stone cells, star shaped hairs, and Calcium Oxalate crystals should not be present. Continental Digitalis leaves are liable to be adulterated with many other leaves—see *Apotheker Zeitung*, xxi pp 242, 252, 267, 276, where the distinctive features of the probable adulterants are given.

Preparations

INFUSUM DIGITALIS INFUSION OF DIGITALIS

Digitalis Leaves, in No 20 powder, 60 grains, boiling Distilled Water, 20 fl oz. Infuse fifteen minutes, strain.

Dose—2 to 4 fl drm = 7.1 to 14.2 c c

1 fl oz represents 3 grains of Leaves

Foreign Pharmacopœias—Official in Mex, Port and Spain, 1 in 200, Ital and Swed, 1 in 100, U S, with Cinnamon, 3 in 200. Not in the others.

Infusum Digitalis Concentratum—Digitalis Leaves, in No 20 powder, 55, Alcohol (90 p c), 20, Dilute Chloroform Water (1 in 1000), q s to make 100. Prepare by macero expression. Dose, 15 to 30 minims—*Farr and Wright, P J* '06, 1 165, and '07, 1 622, *C D* '06, 1 252, *Y B P*, 1907, 249.

This appears in the *B P C*

TINCTURA DIGITALIS TINCTURE OF DIGITALIS

2½ of Digitalis Leaves, percolated with Alcohol (60 p c) to yield 20 (1 in 8)

Dose—5 to 15 minims = 0.3 to 0.9 c c

Ph Ger maximum single dose, 1.5 grammes, maximum daily dose, 5.0 grammes, of the 1 and 10 Tincture.

Larger doses are occasionally given, but, according to some observers, the results with small doses are equally good and not nearly so dangerous.

In cases of delirium tremens, 1 fl drm every three hours. Two or even three fl drm in cases carefully watched—*P J* xxvii 373.

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Russ, Swiss and U S, 1 in 10. Ger, Ital, Jap, Norw, Spain and Swed, 1 and 10, Hung and Port, 1 in 5. Also Port and Spain, *Fresh Leaves*, 1 Spirit, Spain, with Ether, 1 dried Leaves in 5, Dan and Port, with Spirit of Ether, 1 dried Leaves in 10, Mex, Seeds 1 in 5, also *Infusum* Tincture 1 and 5. All by weight except U S.

The *Brussels Conference* agreed to a strength of 10 p c prepared by percolation with Alcohol (70 p c). Belg, Dan, Fr, Ital, Jap, Russ and Swiss adopt this.

Tests—Tincture of Digitalis possesses a specific gravity of 0.930 to 0.935, contains from 3 to 4 p c w/v of total solids and about 55.0 p c w/v of Absolute Alcohol.

A suggestion for the preparation of a fat-free Tincture (*A J P* '99, 332), by exhausting the leaves with purified Petroleum Benzin previous to the preparation of a Tincture by the official process. The resulting tincture is claimed to be less nauseating than the ordinary tincture, and to be more rapidly absorbed. Abscesses never followed its hypodermic use, whilst the official Tincture almost invariably causes pain, swelling, and abscess formation.

A fermentation test has been suggested (*C D* '02, 1 456) to prove the activity of *Digitalis* leaves. A weighed quantity of 20 grains of Amygdalin is dissolved in 1 fl oz of Water at 30° C (98° F) in a wide-mouthed bottle and set aside as a control specimen. A similar quantity of Amygdalin, together with 60 grains of powdered *Digitalis* leaves, is mixed in another bottle. At the end of eight hours the plain Amygdalin solution should show no change, but the specimen to which the *Digitalis* has been added should have developed a bitter Almond odour, and should yield a reaction for Hydrocyanic Acid when a rod moistened with Silver Nitrate solution is laid over the mouth of the bottle. The test is considered (*C D* '02, 1 509) ingenious, but inconclusive, as it does not prove the presence or absence of Digitoxin.

Not Official.

FLUIDEXTRACTUM DIGITALIS (US)—A 1 in 1 fluid extract prepared by exhausting the Leaves with Alcohol (49 p c)

Dose—1 to 2 minims = 0.06 to 0.12 c c

Foreign Pharmacopœias—Official in Dan, Mex and US. Not in the others.

Extractum Digitalis (US) is the Fluid Extract evaporated (not exceeding 50° C) to a pill consistence.

PILULA DIGITALIS COMPOSITA—*Digitalis* Leaves, in powder, 1 grain, Squill, in powder, 1 grain, Mercury Pill, 1 grain—*St Thomas's*.

This has been incorporated in the *B P C*, with the *syn* Guy's Pills, and a note that Baillie's or Gilmour's Pills contain twice as much Squill.

PILULA DIGITALIS COMPOSITA (Baillie's Pill) *Digitalis* Leaves, in powder, ½ grain, Squill, 1 grain, Mercury Pill, 2 grains, in one pill—*St George's*.

PILULA DIGITALIS ET HYDRARGYRI COMPOSITA—Mercurial Pill, 1 grain, Powdered *Digitalis*, 1 grain, Powdered Squill, 1 grain, Extract of Henbane, 2 grains—*St Bartholomew's*.

PILULA DIGITALIS ET OPII COMPOSITA (Heim's Pill)—Quinine Sulphate, 1 grain, *Digitalis*, in powder, ½ grain, Opium, in powder, ½ grain, Ipecacuanha, in powder, ½ grain, Glycerin of Tragacanth, q s—*St George's*.
Digitalis, in powder, ½ grain, Opium, in powder, ½ grain, Ipecacuanha Root, in powder, ½ grain, Quinine Sulphate, 1 grain, Syrup of Glucose, q s—*B P C*.

SUCCUS DIGITALIS—The Expressed Juice, 3, Alcohol (90 p c), 1.

This preparation may be given for a longer period than the Tincture without causing nausea.

Dose—5 to 10 minims = 0.3 to 0.6 c c

This has been incorporated in the *B P C*.

SYRUPUS DIGITALIS—Tincture of *Digitalis*, 1, Simple Syrup, 19—*Belg* and *Fr*.

VINUM DIGITALIS COMPOSITUM—Digitalis Leaves, in No 40, powder, 5, Squill, 7 5, Juniper Fruit, 75, Alcohol, 100, White Wine, 900, Potassium Acetate, 50—*Belq* and *Fr*

Alcoholic Extract 2, Water 360, Sugar 640—*Span*

DIGITALIN—Under this name four distinct varieties occur in commerce, which differ so considerably in their medicinal properties that prescribers should be careful to distinguish and specify the kind intended. All four of them are soluble in Alcohol

- 1 **Digitalin Amorphous (Homolle)**—A white or yellowish white amorphous bitter powder. Soluble in Chloroform, slightly soluble in Water. Stated to consist mainly of Digitalin with some Digitoxin. Now omitted from *Fr Codex*

Foreign Pharmacopœias—Official in Port and Span, formerly in Brit

- 2 **Digitalin Crystallised (Nativelle)**—Fine white needles, insoluble in Water, Ether or Benzene, soluble in Alcohol (90 p c) and in Chloroform. It is stated to consist almost entirely of Digitoxin, and is cumulative in its action. See Digitoxin

Foreign Pharmacopœias—Official in Fr, Mex and Span

Granules de Digitaline Cristallisée (*Fr Codex*) contains $\frac{1}{10}$ milligramme in each granule. Soluté de Digitaline Cristallisée au Millième contains one milligramme to each gramme

Digitoxin, official in *Swiss*, is a white, crystalline, odourless powder with a bitter taste, insoluble in Water, soluble in Alcohol (90 p c), and in Chloroform

- 3 **Digitalin German**—Amorphous, consists principally of Digitalin with some Digitonin and Digitalin. Readily soluble in Water, almost insoluble in Chloroform

- 4 **Digitalin Verum**—Kühn (P J (3) xxii 1061) states, with some show of reason, that the Digitalin of Schmiedeberg is the best form in which to prescribe Digitalis, and to distinguish it he applies the name Digitalin Verum. Its composition is definite, it is obtainable commercially in a sufficiently pure condition, it possesses all the medicinal activity in regard to the action of Digitalis upon the heart, it is non-cumulative in its action, the dose is $\frac{1}{4}$ milligramme ($\frac{1}{100}$ grain) every 2 or 3 hours, it is soluble about 1 in 1000 of Water, about 1 in 100 of Alcohol (50 p c). The aqueous solution froths upon being shaken, and is remarkably prone to become mouldy

Not Official

DUBOISIA MYOPOROIDES

A plant indigenous to N S Wales and Queensland, it has been classed in the order *Solanaceæ*

Ringer's experiments show that the physiological action of the extract is apparently identical with that of Atropine. Tweedy has used it as an application to the eye in all cases in which Atropine is indicated

Foreign Pharmacopœias—Official in Span

The name Duboisine represents a variable product obtained from this plant. Pseudo hyoscyamine from *Duboisia myoporoides*, R Br, isomeric with Atropine and Hyoscyamine, has been described by Merck

Foreign Pharmacopœias—Official in Mex

Duboisine Sulphate is an amorphous hygroscopic powder, soluble in Water, consisting of an indefinite mixture of Hyoscyamine and Hyoscyne Sulphates, and the Sulphates of other bases

Not Official
DUGONG OIL

An Oil obtained in Australia from *Halicore Dugong*, Daub, by boiling the superficial fat. A substitute for Cod-Liver Oil, recommended at one time (*P J* (3) in 3, 100) as not being disagreeable in taste, but it does not possess this character now.

Not Official
DULCAMARA

The dried young Branches of *Solanum Dulcamara* (Bittersweet), from indigenous plants which have shed their leaves.

Fresh ones have been found (*C D* '02, in 313, *Y B P* '02, 491) to contain two alkaloids, Solanidine and Solanidine, a glucoside (Solanein), and a bitter principle (Dulcamarin) of a glucosidal nature yielding on hydrolysis Dulcamaretin and Glucose.

Medicinal Properties—Alterative and sedative. Used in cutaneous eruptions, chiefly of a scaly nature, as psoriasis and pityriasis, a decoction being applied externally, at the same time that it is used internally.

An alkaloid *Solanine* obtained from *Solanum nigrum*, *S. Dulcamara* and *S. tuberosum* (Potato plant), has been recommended as an analgesic.—*L M R* '86, 496, '88, 242, *T G* '87, 56, '88, 630, *L* '87, in 1097.

Foreign Pharmacopœias—Official in Austr, Fr (*Douce-amère*), Mex, Port (*Doce-amarga*), and Span. Not in the others.

EXTRACTUM DULCAMARÆ FLUIDUM—1 fl oz equals 1 oz Dulcamara. Prepared with diluted Alcohol.—*U S P* 1890.

Dose—30 to 60 minims = 1.8 to 3.6 cc.

Foreign Pharmacopœias—Official in Mex.

A solid *Extractum Dulcamara* is official in Austr, Fl and Mex.

INFUSUM DULCAMARÆ—Dulcamara, 1, boiling Water, 10, infuse 1 hour.

Dose—1 to 2 fl oz = 28.4 to 56.8 cc.

This has been incorporated in the *B P C*.

Foreign Pharmacopœias—Official in Fl (1 in 50). Not in the others.

ELATERIUM.

ELATERIUM

Fr, ELATERION, GER, ELATERIUM, ITAL, ELATERIO, SPAN, ELATERIO

A sediment from the juice of the Fruit of *Ecballium Elaterium*.

It contains from 20 to 40 p.c. of Elaterin, to which principle the activity of the drug is due. It contains in addition a second crystallisable bitter principle, Prophetin, and the amorphous substances Ecballin or Elateric Acid, Hydroelaterin and Elateride, of which but little is at present known.

'Extractum Elaterii' was the official synonym in *B P* '85 for Elaterium.

Medicinal Properties—The most powerful hydragogue cathartic, only used in special cases. Employed in cardiac or renal dropsy and in constipation. Its administration in a debilitated state of the system or in gastro-intestinal inflammation requires very great caution on account of the depression which it produces.

Dose — $\frac{1}{10}$ to $\frac{1}{2}$ grain = 0.006 to 0.032 gramme

Prescribing Notes — *On account of the similarity in name to the active principle, care must be exercised to avoid confusion. The Pulvis Elaterii Compositus is often preferred, it is frequently given in the form of Pill with Compound Extract of Colocynthis and Henbane. To prevent it causing persistent diarrhoea, it may be given with Henbane, especially in renal diseases, in cardiac cases it should be guarded by a stimulant to prevent too much depression.*

Official Preparations — Elaterinum, Elaterin is contained in Pulvis Elaterii Compositus

Not Official — Pilula Elaterii Composita

Antidotes — The same as for Croton Oil (*q.v.* p. 460)

Foreign Pharmacopœias — Official in Mex., Elaterio, Port., Extracto de Pepinos de S. Gregorio. Not in the others.

Descriptive Notes — Two forms of Elaterium are met with in commerce, viz., English and Maltese.

The English form is very brittle, and consequently is usually met with in thin flakes or fragments $\frac{3}{4}$ inch to $\frac{1}{2}$ inch in width, the colour when fresh is green, soon becoming greyish, and when kept long or not kept dry it turns yellowish-grey. It should contain no Starch (*B.P.*), it yields up to 33 p.c. of Elaterin. The Maltese occurs in square cakes or tablets about 1 in. in diameter and rather more than $\frac{1}{2}$ in. in thickness, of a greenish grey colour, it sometimes contains Starch and Calcium Carbonate, and yields about 27 p.c. of Elaterin.

The English drug is official.

Tests — Elaterium should yield no marked effervescence on the addition of Hydrochloric Acid, indicating the absence of more than traces of Carbonates. When boiled with Water, cooled, and tested with Iodine Solution no decided blue coloration should be produced, indicating the absence of more than a trace of Starch. It is officially required to yield 50 p.c. of its weight to boiling Alcohol (90 p.c.), and when exhausted successively with Chloroform and Ether and the process repeated, it is required to yield 25 p.c. or not less than 20 p.c. of Elaterin. Good specimens of Elaterium yield from 30 to 40 p.c. of Elaterin.

Preparations

ELATERINUM ELATERIN ($C_{20}H_{28}O_5$), eq. 344.89, occurs in small hexagonal scales or tables.

It is the active principle of Elaterium.

Solubility — Insoluble in Water, sparingly in Alcohol (90 p.c.), 1 in 12 of Chloroform.

A recent figure obtained for Alcohol (90 p.c.) was 1 in 1100.

Dose — $\frac{1}{40}$ to $\frac{1}{10}$ grain = 0.0016 to 0.0065 gramme.

Foreign Pharmacopœias — Official in U.S. Not in the others.

Tests — Elaterin when heated to $190^{\circ}C$ ($374^{\circ}F$) turns yellow, and melts at $216^{\circ}C$ ($420.8^{\circ}F$). Its melting point is, however, given in the *B.P.* It should be neutral in reaction towards Litmus. A crimson colour rapidly changing to scarlet is produced on the addition of Sulphuric Acid to a solution of Elaterin in melted Phenol.

Sulphuric Acid colours it yellow, the colour gradually changing to scarlet. A crystal evaporated to dryness with a little Hydrochloric Acid leaves a residue which when washed with hot Water and subsequently treated with Sulphuric Acid produces a brownish-red colour. Mineral matter and alkaloids are the more commonly occurring impurities. The former may be detected by the residue left on the ignition of the sample with free access of air, the latter by the production of a precipitate when Tannic Acid Solution, Mercuric Chloride Test Solution, or Platonic Chloride Solution is added to a solution of the principle in Alcohol (90 p c)

PULVIS ELATERINI COMPOSITUS. COMPOUND POWDER OF ELATERIN

Elaterin, 1, Milk Sugar, 39

Dose —1 to 4 grains = 0.06 to 0.24 gramme

Foreign Pharmacopœias —Official in U.S. (Tituratio Elaterini), Elaterin, 1, Milk Sugar, 9. Not in the others

Not Official

PILULA ELATERII COMPOSITA —Elaterium, $\frac{1}{2}$ grain, Compound Extract of Colocynthis, 2 grains, Calomel, $1\frac{1}{2}$ grains, Capsicum, $\frac{1}{2}$ grain, Syrup of Glucose q s —*St. Bartholomew's*

Dose —1 or 2 pills.

Not Official

ELEMI.

A concrete, resinous exudation, the botanical source of which is undetermined, but is sometimes referred to *Canarium commune*, L. It has lately been attributed to *Canarium Luzonicum*, Miq.

It is imported from Manila.

When of good quality it is pale yellow of the consistence of stiff Honey and has a Terrene odour.

Brazilian and Yucatan Elemis are official in some of the Foreign Pharmacopœias, but are derived from other species of the same natural order *Burseraceæ*. They are usually more discoloured and harder, but have a similar odour.

Solubility —The greater part is soluble in Alcohol (90 p c), wholly soluble in Ether.

Medicinal Properties —The ointment is stimulant to indolent ulcers.

Foreign Pharmacopœias —Official in Austr., Belg., Dutch, Fr., Mex. (Goma de Liriodendron), Port., Span. and Swiss. Not in the others.

UNGUENTUM ELEMII —Elemi, 1, Spermaceti Ointment, 4, melt, strain, and stir till cold —*B.P.C.* 1885 (1 in 5)

This has been incorporated in the *B.P.C.*, using Unguentum Simplex.

Foreign Pharmacopœias —Official in Mex., Span. and Swiss, 1 of Elemi and 1 of Turpentine in 4 of Ointment, Dutch, 3 of Elemi, 2 of Turpentine in 10 of Ointment, Port., 2 of Elemi and 1 of Turpentine in 10. Not in the others.

Not Official

EMBELIA

The Fruit (including the dried Fruit and the Seeds) of *Embelia Ribes*, Burm. f., and of *Embelia robusta*, Roxb., are official in the Ind. and Col. Add. for India and the Eastern Colonies.

The powdered Seeds are used in India for tapeworm — *L* '87, n 199

Dose — 60 to 240 grains = 4 to 16 grammes

ACIDUM EMBELICUM — Obtained from the Seeds Insoluble in Water
It forms salts with Ammonium, Potassium, and Sodium

AMMONII EMBELAS — A tasteless crystalline salt, in red needles

Dose — 3 to 6 grains = 0.2 to 0.4 gramme, in Honey or Simple Syrup

Not Official

EMBLICA

The fruit of *Phyllanthus Emblica* L., (Emblie Myrobalan) has been used in Hindu medicine for a long time, as a diuretic and laxative. The fresh fruits preserved in Syrup are imported into this country

Not Official

EPHEDRINE HYDROCHLORIDE

The Hydrochloride of an alkaloid obtained from *Ephedra vulgaris*, L., or *E. Helvetica*, C. A. Mey

Has been recommended as a mydriatic in the form of a 5 p c solution —
B M J E '98, n 92

The addition to it of 1 p c of Homatropine Hydrochloride enhances its action, and the mixture, which is supplied under the name 'Mydrine' is a white powder readily soluble in Water, a 10 p c aqueous solution dilates the pupil moderately within a few minutes, without affecting the accommodation, and its effects pass away in two to four hours. It is useful in diagnostic examinations —
L '98, n 24, *T G* '98, 757

ERGOTA.

ERGOT

FR, ERGOT DE SEIGLE, GER, MUTTERKORN, ITAL, SEGALA CORNUTA,
SPAN, CORNEZUELO DE CENTENO

The sclerotium of *Claviceps purpurea*, Tulasne, in the ovary of *Secale cereale*, L.*

The drug should be stored whole, should be well dried, and kept in airtight vessels and perfectly dry. The *USP* says that after being kept for one year it is unfit for use.

The two principal varieties of Ergot are Spanish and Russian. They contain respectively about 0.2 and 0.25 p c of Ergotinine, and although the former contains somewhat less Ergotinine than the latter, it is usually considered the best. Ergot yields its virtues to Water and to Alcohol.

Ergot contains, in addition to the crystalline alkaloid Ergotinine discovered by Tanret, a second alkaloid Ergotoxine discovered by Barger and Carr of the Wellcome Physiological Research Laboratories, and described by them at the British Association meeting at

* Ergot is common on grasses, and if it grows in the pastures where cattle feed, it is said to occasion dry gangrene, causing them to lose their hoofs and horns.

York in 1906 (*C N* '06, 89, *B M J* '06, n 1792) The latter alkaloid, although itself amorphous, forms a number of crystalline salts. It is claimed to be the most important if not the one essential active principle, whilst the pure crystalline Ergotinine is almost if not quite physiologically inactive. Tanret (*J Pharm Chemie*, '06 [vi], 24, 397-403) *JCS Abs*, '06, i 979, *YBP* '07, 62) takes exception to the application of the name Ergotoxine to the amorphous body accompanying crystalline Ergotinine, which he discovered and named amorphous Ergotinine, and also strongly controverts the statement that crystalline Ergotinine is almost physiologically inactive, alleging in support the constant therapeutic employment of the base. Barger and Corn point out (*JCS Trans* '07, 340) that Tanret himself attributed the variation in the specific rotation of amorphous Ergotinine to varying amounts of crystallised Ergotinine contained in it, and that he therefore had not prepared the pure alkaloid. As to the physiological activity, they refer the reader to the experiments of H. H. Dale, published in the *Ann Physiol* '06, 34, 163. According to Barger and Corn (*JCS Trans*, '07, 339), Acetic Anhydride converts the crystalline into the amorphous alkaloid, the change being brought about by the removal of a molecule of Water and not by the introduction of an Acetyl group, and support the suggestion of Kraft's that the amorphous is the Hydrate of the crystalline alkaloid, and this theory is regarded as definitely established by their analysis. Hydroergotinine, discovered independently by Kraft (*JCS Abs* '06, i 979), is considered (*JCS Trans* '07, 341) to be undoubtedly identical with Ergotoxine. Cornutine does not occur as such in Ergot, but is an artificial decomposition product of Ergotinine. The Picrosclerotine of Dragendorff and the Socalme of Jacobi are regarded as other names for Tanret's alkaloid.

Ergot also contains Ergotinic Acid (the Sclerotic Acid of Dragendorff and the Ergotic Acid of Wenzell), Sphacelmic Acid or Sphacelotoxin, Ergosterol, Trehalose, and Mannite. Colouring matters, *eg*, Sclererythrin, Scleroidin, Sclerovanthin and its anhydride Sclerocrystallin, Picrosclerotine and Fusco-sclerotic Acid, are present, and about 33 per cent. fixed oil, which can be extracted with Ether, Petroleum Ether, and to a great extent by hydraulic pressure.

Medicinal Properties.—Ergotic, used in obstetric practice to contract the uterus, assist expulsion of placenta, and prevent or stop post-partum hæmorrhage. Employed in uterine hæmorrhage from other causes, such as fibroid tumour, and in subinvolution of the uterus, also, but with doubtful success, in hæmoptysis, hæmatemesis, hæmaturia, and epistaxis. Efficacious in flatulent dilatation of stomach, acute myelitis and in hæmorrhages of hæmorrhagic origin, in night sweats of phthisis. In hæmorrhage of the rectum gives most relief. In action in critical cases. Injections into sphincter are valuable in prolapsus ani. After elaborate investigation Robert recommends finely-powdered Ergot for certainty of

of this value have been increased by its employment in preventing abdominal surgery. 30 minims of a

specialty-prepared Ergot, in which from $\frac{1}{80}$ th to $\frac{1}{30}$ th grain of Strychnine or $\frac{1}{30}$ th grain Sparteine is dissolved, are injected three times daily, for two or three days before operation. In chorea 1 to $\frac{1}{2}$ drm of the liquid extract with 2 minims of Liquor Strychninae have been given thrice daily (*B M J* '05, i 354), or 1 drachm liquid extract and 3 minims of Liquor Arsenicalis — *B M J* '05, i 354.

It is this drug which has given the best results (*L* '05, i 851), and which seems to solve the difficulty of the treatment of surgical shock. 2 grammes of a specially prepared Ergot diluted with 20 c c of normal saline solution, 5 to 10 c c injected at a time. Its great advantage over Adrenalin is that its action is more prolonged, one dose being sufficient to keep up the blood pressure for some time.

The best remedy for intestinal hæmorrhage — *T G* '07, 324.

In hiccough (*L* '85, ii 276), in periodic neuralgia (*T G* '94, 343), in diabetes insipidus, 30 minim doses of the Liquid Extract every three hours — *L M R* '80, 231, 446, '81, 12.

In chorea 1 dram doses of the Liquid Extract given every four hours — *B M J* '03, ii 133.

Ammoniated Tincture stated to be an active preparation, and to have proved useful in obstinate cases of uterine hæmorrhage when other Ergot preparations have failed — *C D* '01, i 324, 663.

Dose — 20 to 60 grains = 1.3 to 4 grammes.

Prescribing Notes — *The unpleasant taste of the preparations of Ergot is improved by Tincture of Orange and Chloroform Water, or better by Tincture of Orange and Cinnamon Water. The Infusion and Hypodermic Injection should be made fresh as required. When the extract is ordered in pills, Powdered Liquorice Root added q s makes a good pill.*

The prescriber has three fluid extracts to choose from: (1) B P which is exhausted by cold Water, (2) U S P by diluted Alcohol mixed with Acetic Acid, (3) Liquor Ergotæ Ammoniatæ (not official) by Ammoniated diluted Alcohol. The official Tinctura Ergotæ Ammoniatæ is similar to the last, but much weaker.

It is often desired to give Iron with Ergot, which produces an unsightly ink-like mixture and a precipitate. This can be avoided by adding 6 grains of Citric Acid to 1 fl. drm of Tincture of Perchloride of Iron.

Incompatibles — Astringents, metallic salts.

Official Preparations — Extractum Ergotæ, Extractum Ergotæ Liquidum, Infusum Ergotæ, Tinctura Ergotæ Ammoniatæ. Injectio Ergotæ Hypodermica is made with Extractum Ergotæ.

Not Official — Discs of Ergotin, Extractum Ergotæ, Extractum Fungi Secalis Fluidum, Extractum Secalis Cornuti, Extractum Secalis Cornuti-Cornutino, Sphacelinicum, Fluidextractum Ergotæ, Liquor Ergotæ Ammoniatæ, Mistura Ergotæ, Mistura Ergotæ Ammoniatæ, Mistura Ergotæ et Ferri, Pilula Ergotini, Tinctura Ergotæ, Vinum Ergotæ, Acidum Scleroticum, Cornutine Citrate, Ergotin (various), Ergotinine, Ergot Aseptic, Ergotoxine, Ergotoxine Hydrochloride, Ergotoxine Phosphate.

Foreign Pharmacopœias — Official in Austr, Belg, Dan, Dutch, Ger, Hung, Jap, Norw, Russ, Swed and Swiss (Secale Cornutum), Fr (Ergot de Seigle), Ital (Segala Cornuta), Mex (Guernecillo de Centeno), Port (Cravagem de Centeno), Span (Cornezuelo de Centeno), U S (Ergota).

The Brussels Conference agreed that Ergot should be not more than one year old, and kept whole.

Descriptive Notes — Ergot is the compact horny mycelium or spawn of the small fungus, *Claviceps purpurea*, Tulasne, and is developed on, and takes the place of, the growing ovary of the rye plant. The fungus itself resembles a minute mushroom in shape, without gills, but with cavities containing ascospores, in its cap or head. It cannot be developed from the Ergot of commerce, the vitality of which is destroyed by drying, but can readily be grown on damp sand in

spring from the mature but undried Ergot. As met with in commerce Ergot may vary in size according to the variety, but averages about $\frac{1}{2}$ to $\frac{3}{4}$ of an inch (12 to 19 mm) and 1 to 2 lines in diameter. The official description limits it to $\frac{1}{3}$ to $1\frac{1}{2}$ inch (1 to 4 cm) in length, but does not give the diameter, which varies from $\frac{1}{2}$ to 4 lines. There are three principal varieties in commerce, viz., Spanish, German or Austrian, and Russian, and occasionally a variety from the Canary Islands. The Spanish is the largest and most highly priced, the German comes next in size, and then the Russian, the Canary kind containing a larger number of small specimens than the Russian. English Ergot is not known in retail commerce, it is probably mixed with the foreign drug in this country, being separated from the cereal by millers. The activity of Ergot appears to depend more upon the method of preservation than upon the particular variety employed.

It should be hard and dry. It is longitudinally furrowed on each side, violet-black externally, and pinkish-white within, with a short fracture often irregularly cracked. Specimens that are flexible have a mouldy odour, and are much cracked, usually due to exposure to damp before drying, or are infested with powder-like mites, should be rejected. If dried over lime or in a current of warm air, and kept in stoppered bottles from which air is excluded by Vaseline around the stoppers, it will keep good for some months, but should only be powdered when required for use. It should not be kept longer than a year (*P G* and *U S P*), and should not give off an ammoniacal or rancid odour when 10 parts of boiling Water are poured over it (*P G*).

Tests.—Ergot possesses a peculiar and disagreeable odour, and if it be reduced to powder and the powder is moistened with Potassium Hydroxide Solution, this odour is intensified. Good Ergot contains 3 to 5 p.c. of ash when ignited with free access of air. Specimens examined in the author's laboratory left from 2.15 to 2.96 p.c., with an average of 2.75 of ash on incineration. The cold Water extract varied from 11.04 to 13.4 p.c., with an average of 12.3 p.c.

Preparations.

EXTRACTUM ERGOTÆ.—EXTRACT OF ERGOT *B P Syn*—**ERGOTIN**

100 of Ergot exhausted by percolating with Alcohol (60 p.c.) Evaporate percolate to 25 and mix it with an equal quantity of Distilled Water, filter, add 4.7 of diluted Hydrochloric Acid, and after 24 hours filter, wash the residue in the filter until free from acid, add 2 of Sodium Carbonate to the filtrate mixed with the washings and evaporate the whole to soft extract.

Dose—2 to 8 grams *U S P* to 0.52 gramme

The corresponding preparation as to *U S P* '85 was prepared from Liquid Extract of Ergot and Rectified Spirit.

Extractum Ergotæ (U S P) is practically the same as *B P*, except that Citric Acid is added towards the end of the process. It is an alcoholic extract of Ergot treated with diluted Hydrochloric Acid to precipitate Sclerotin, the characteristic colouring matter of Ergot, neutralised with Monohydrated

Sodium Carbonate and evaporated as directed in *U S P*. One would gather from the note in the *B P C* that *U S P* employed less than half the *B P* quantity of Sodium Carbonate, but this is not so, Sodium Carbonate should read Mono hydrated Sodium Carbonate, then the quantities are nearly the same

Extractum Secalis Cornuti (*Ger*)—2 of Ergot macerated in 4 of Water, twice, the liquors mixed and evaporated to 1, mixed with 1 of Alcohol (90 p c), filtered after 3 days, and evaporated to a thick extract

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Mex (*Ergotina de Bongean*), Norw, Port, Russ, Span, Swed, Swiss and U S

The *Brussels Conference* agreed to prepare a watery extract and make up with Alcohol (60 p c)

EXTRACTUM ERGOTÆ LIQUIDUM LIQUID EXTRACT OF ERGOT *N O Syn*—**EXTRACTUM SECALIS CORNUTI FLUIDUM**

Macerate 20 of crushed Ergot in 100 of Distilled Water for 12 hours, strain, repeat the maceration with a further 50 of Distilled Water and strain, press the marc, strain the fluid, mix it with the other fluid portions and evaporate to 14, when cold add $7\frac{1}{2}$ of Alcohol (90 p c) and after one hour filter (In practice it is better to allow it to stand for several hours) (1 in 1)

Dose—10 to 30 minims = 0.6 to 1.8 c c

60 minims = 3.6 c c, is not infrequently prescribed

Tests—Liquid Extract of Ergot has a specific gravity of 1.015 to 1.025, contains from 13 to 16 p c w/v of total solids and about 32 p c w/v of Absolute Alcohol

Fluidextractum Ergotæ (*U S P*)—Percolate 100 of Ergot (in No. 60 powder) with 2 of Acetic Acid (*U S P*) mixed with 98 of Alcohol (49 p c), continue the percolation with Alcohol (49 p c) until exhausted, reserve the first 85, evaporate the remainder to a soft extract, dissolve this in the reserved portion and make up to 100 with Alcohol (49 p c)

Foreign Pharmacopœias—Austr (*Extractum Fungi Secalis Fluidum*) The fat is extracted from 100 of Ergot with Petroleum Ether, and after drying the marc, it is percolated with a mixture of Glycerin 5, Alcohol 20, Water 20, to produce 100, Belg, Dan, Ger, Norw, Swed and Russ, Extract with **Hydrochloric Acid** and dilute Alcohol, Fr, exhausted with Water, and Tartaric Acid, Mex (*Extracto Fluido de Curnecillo de Centeno*), with **Acetic Acid** and dilute Alcohol, Swiss and U S percolated with dilute Alcohol acidified with **Acetic Acid**, Dutch, with dilute Alcohol and Tartaric Acid, Jap, with a mixture of Alcohol 2, Water 8. Not in the others

The *Brussels Conference* agreed that the strength should be 100 p c

INFUSUM ERGOTÆ INFUSION OF ERGOT

Infuse 1 of freshly crushed Ergot wth 20 of boiling Distilled Water for 15 minutes and strain

Dose—1 to 2 fl oz = 28.4 to 56.8 c c

Used also as an injection for gleet

INJECTIO ERGOTÆ HYPODERMICA. HYPODERMIC INJECTION OF ERGOT *B P Syn*—HYPODERMIC INJECTION OF ERGOTIN

Extract of Ergot, 100 grains, Phenol, 3 grains, Distilled Water, 220 minims, or a sufficient quantity. Mix the Phenol with the Distilled Water, boil for a few minutes, cool, add the Extract of

Ergot, and, if necessary, sufficient recently boiled and cooled Distilled Water to produce 330 minims of the Injection (1 in 3)

The above is the official wording, but it is not clear why the Water should be boiled *after* the addition of the Phenol. It would be better to dissolve both the Ergot and the Phenol in the previously Sterilised Water.

Dose, by *subcutaneous injection*—3 to 10 minims = 0.18 to 0.6 c.c.

This injection should be recently prepared. 33 minims = 1 grain of Extract of Ergot.

Foreign Pharmacopœias—Official in Port (Solutio de Ergotino cum Glycerino), Ergotin 1, Glycerin 4, Water 5, all by weight, Span (Inyección Hipodérmica de Ergotina), Ergotin 1 gramme, Glycerin 2 grammes, Water *q s* to 10 c.c. Mex and Span have Injection Ergotinine.

TINCTURA ERGOTÆ AMMONIATA AMMONIATED TINCTURE OF ERGOT

Ergot, in No. 20 powder, 5, Solution of Ammonia, 2, Alcohol (60 p.c.), *q s* to yield 20 (1 in 4)

Dose—30 to 60 minims = 1.8 to 3.6 c.c.

Foreign Pharmacopœias—A simple tincture is official in Dutch, Mex and Port, 1 in 5, all by weight. Not in the others, U.S. (Vinum Ergotæ), 1 in 5.

Tests—Ammoniated Tincture of Ergot has a specific gravity of 0.930 to 0.938, contains from 3 to 5 p.c. of total solids and about 52 p.c. w/v of Absolute Alcohol.

Not Official.

DISCS OF ERGOTIN $\frac{1}{2}$ grain = 0.02 gramme, and $\frac{1}{4}$ grain = 0.016 gramme are prepared for hypodermic use.

PILULA ERGOTINI—Ergotin 2 grains, Liquorice Powder 3 grains.

LIQUOR ERGOTÆ AMMONIATUS—A liquid Extract of Ergot (1 in 1), prepared with ammoniated diluted Alcohol.

Dose—10 to 60 minims = 0.6 to 3.6 c.c.

B.P.C. gives the following formula, under the title **Extractum Ergotæ Ammoniatum Liquidum**, but adds that although four times the strength of the official tincture, it is not very active—100 of Ergot in No. 20 powder is percolated with a mixture of Solution of Ammonia 10, and Alcohol (60 p.c.) 70, continue the percolation with Alcohol (60 p.c.) until exhausted, reserve the first 85, evaporate the remainder to 15 and mix.

MISTURA ERGOTÆ—Liquid Extract of Ergot, 30 minims, Diluted Sulphuric Acid 10 minims, Chloroform Water, to 1 fl. oz.—*St. Thomas's*.

This has been incorporated in the *B.P.C.*

Liquid Extract of Ergot, 80 minims, Syrup of Ginger, 30 minims, Infusion of Orange Peel, to $\frac{1}{2}$ fl. oz.—*London*.

MISTURA ERGOTÆ AMMONIATA—Liquid Extract of Ergot, 20 minims, Ammonium Carbonate, 3 grains, Emulsion of Chloroform, 15 minims; Camphor Water, to 1 fl. oz.—*University*.

Liquid Extract of Ergot, $\frac{1}{2}$, Ammonium Carbonate, $\frac{1}{2}$, Emulsion of Chloroform $\frac{1}{2}$, Camphor Water, *q s* to produce 100—*B.P.C. Supplement*.

MISTURA ERGOTÆ ET FERRI—Liquid Extract of Ergot, 30 minims, Solution of Ferric Chloride, 15 minims; Citric Acid, 5 grains, Chloroform Water, to 1 fl. oz.—*Guy's*.

TINCTURA ERGOTÆ—Ergot, 5, Proof Spirit, 20—*B.P. 1885*.

This has been incorporated in the *B.P.C.*

VINUM ERGOTÆ—Fluid Extract of Ergot, 20, Alcohol (95 p c), 5, White Wine, 75 —*U S P*

This has been incorporated in the *B P C*, using Detannated Sherry

ACIDUM SCLEROTICUM—A weak acid principle obtained from Ergot by Dragendorff. It is used hypodermically $\frac{1}{4}$ to $\frac{1}{2}$ grain = 0.021 to 0.05 gramme, dissolved in Distilled Water or Thymol Water

CORNUTINE CITRATE—A soluble salt of an alkaloid which is stated by Kobert to be the active principle of Ergot. A brown powder, which is used in obstetric practice

Dose— $\frac{1}{4}$ to $\frac{1}{2}$ grain = 0.0054 to 0.01 gramme, or subcutaneously $\frac{1}{32}$ to $\frac{1}{8}$ grain = 0.002 to 0.008 gramme

Given in $\frac{1}{100}$ grain hypodermically to contract uterus in a case of eclampsia
—*L* '99, 1 1430

A soluble Cornutine Hydrochloride has also been prepared

ERGOTININE—An alkaloid obtained from Ergot. Long white crystals which have a tendency to darken on exposure to light and air

Solubility—According to Barger and Carr 1 part by weight of Ergotinine dissolves in 312 parts by weight of Absolute Ethyl Alcohol at 10° C (50° F) and in 292 parts by weight at 18° C (64.4° F). It is soluble 1 in 1020 parts by weight of Absolute Ether, 1 in 91 parts by weight of Ethyl Acetate, 1 in 26 parts by weight of Acetone, 1 in 77 parts by weight of boiling Benzene, 1 in 52 parts by weight of boiling Ethyl Alcohol, and 1 in 56 parts by weight of boiling Methyl Alcohol. It is stated by these authors to be extremely soluble in cold Chloroform, moderately so in Amyl Alcohol or Xylene, and insoluble in Petroleum Ether

These figures also appear in the *B P C*, but the abstractor has failed to note that all the fluids are by weight, and not by measure, and '1 in 91 parts by weight of Ethyl Alcohol' has been incorrectly copied as '1 in 91 by volume of Ethyl Acetate'

Foreign Pharmacopœias—Official in Fr (Ergotinine Cristallisée), Span and Mex

Tests—Ergotinine melts according to Barger and Carr at 229° C (444.2° F). Its solution in Ethyl Alcohol is strongly dextrogyrate, the rotation of a saturated solution in this solvent at 10° C (50° F) being + 338°, but the rotation is effected by prolonged boiling

Ergotinine is precipitated by the usual alkaloidal reagents such as Potassio-mercuric Iodide Solution, Iodo potassum Iodide Solution, Gold Chloride Solution, Platinum Chloride Solution, Bromine Water, Tannic Acid Solution and Picric Acid Solution. The addition of concentrated Sulphuric Acid to a solution of Ergotinine in Ether or in Ethyl Acetate produces a transitory orange coloration changing to blue. When the alkaloid is dissolved in concentrated Sulphuric Acid and a little anhydrous Ferric Chloride is added, a pale yellow coloration passing through orange, crimson and green to a permanent dark blue is produced

A soluble Ergotinine Citrate has also been prepared

ERGOTOXINE—This alkaloid was discovered by Barger and Carr, and is described by them as a light white powder

Solubility—It is more soluble in organic solvents than Ergotinine, notably in cold Alcohol. It is also soluble in Sodium Hydroxide solution. It is but slightly soluble in Ether

Tests—Ergotoxine, according to the above-named authors, begins to soften about 155° C (311° F) and gradually melts at 162° to 164° C (323.6° to 327.2° F). The rotation of an alcoholic solution varies with the method of preparation. Ergotoxine is precipitated by the usual alkaloidal reagents, *e.g.*, Potassio-mercuric Iodide Solution, Iodo potassum Iodide Solution, Auric Chloride Solution, Platinum Chloride Solution, Picric Acid Solution, Phosphomolybdic Acid, Bromine Water and Tannic Acid Solution. The addition of Concentrated Sulphuric Acid to a solution of Ergotoxine in Ethyl Acetate or Ether gives rise to a transitory orange coloration, changing to blue. The addition of anhydrous

Ferrie Chloride to a trace of the alkaloid dissolved in concentrated Sulphuric Acid gives a pale yellow coloration changing through orange, crimson and green to a permanent dark blue

ERGOTOXINE HYDROCHLORIDE—This salt was prepared by Barger and Carr, and is described by them as forming minute diamond shaped plates, and very thin and very long square ended needles. It melts at 205°C (401°F). It is considered very unstable and therefore very difficult to purify.

ERGOTOXINE PHOSPHATE—This salt is described as the most easily purified of the Ergotoxine salts, it is stated to crystallise in groups of needles, and when pure in isolated needles.

Solubility—Barger and Carr state that 1 part of Ergotoxine Phosphate dissolves in 313 parts by weight of cold, and in 14 parts by weight of boiling Alcohol (90 p c).

Tests—Ergotoxine Phosphate melts according to the above-named authors at 186° to 187°C (366.8° to 368.6°F). A 1 p c solution of the salt in cold Distilled Water forms a typical colloidal solution. If an equal volume of Normal Volumetric Hydrochloric, Oxalic or Acetic Acid Solutions are added to the solution, the degree of contraction in the order named, the Hydrochloric Acid forms a thick jelly, so that the tube can be inverted without the contents escaping, whilst in the case of the Acetic Acid, the solution remains fluid.

A normal and an acid Ergotoxine Oxalate have been prepared by Barger and Carr, the former described by them as elongated, a melting point of 179°C (354.2°F), the latter as minute prisms possessing a similar melting point.

ERGOTIN—This is a synonym for *B.P.* Extract of Ergot, there are also the following commercial varieties—

Ergotinum Bonjean—An aqueous reddish-brown Extract, purified by Alcohol. 1 part Extract = 5 to 6 parts Ergot.

Dose— $\frac{1}{2}$ to $4\frac{1}{2}$ grains = 0.1 to 0.8 gramme.

Ergotinum Bonjean Depuratum pro Injectione—A purified liquid for injection, $\frac{1}{2}$ parts = 1 part Ergotin Bonjean.

Dose— $\frac{1}{2}$ to $4\frac{1}{2}$ grains = 0.1 to 0.8 gramme.

Ergotin Bombelon Fluidum (Cornutinae Ergotae)—A brownish-black liquid.

Dose—80 minims = 1.8 c.c. per os, $8\frac{1}{2}$ to 8 minims = 0.2 to 0.5 c.c. subcutaneously.

Ergotin Bombelon Spissum—Soft Extract. Administered internally in Pul. form or in Solution. Ergot Bombelon Spissum, 10 grammes (or 154 grains), Aqua Laurocerasi, 7.5 grammes (or 2 fl. drms), Alcohol (90 p c), 2.5 grammes (or 42 minims), 4 to 15 drops.

Ergotinum Denzel Fluidum—A purified Extract.

Dose—3 to 10 grains = 0.2 to 0.65 gramme.

Ergotinum Kohlmann Fluidum—Brownish black fluid, miscible with Water.

Daily Dose—60 to 75 grains = 4 to 5 grammes.

Ergotinum Purum Dialysatum Wernich Spissum—A dialysed aqueous Extract of Ergot, purified by treatment with Ether and Alcohol Soluble in Water.

Dose—10 to 30 grains = 0.65 to 2 grammes.

Ergotinum Purum Dialysatum Wernich Fluidum—2 parts = 1 part of the above preparation.

Dose—10 to 60 grains = 0.65 to 4 grammes.

Ergotinum Purum Dialysatum Wernich Siccum.

Dose —22 grains = 1.4 grammes

Ergotinum Purum Siccum Wiggers—A reddish brown powder, soluble in Water

Dose — $\frac{1}{2}$ to $1\frac{1}{2}$ grain = 0.02 to 0.1 grammes

Ergotin Yvon—A brownish black fluid, prepared from fat free Ergot by exhaustion with dilute Tartaric Acid solution

Dose —10 to 20 drops internally per os, 1 c c = 16 minims hypodermically

EXTRACTUM SECALIS CORNUTI CORNUTINO-SPHACELINICUM (KOBERT)—An Extract which combines the action of Cornutine and Sphacelinic Acid, an alkaloid and a resinous body, obtained by Kobert from Ergot. It is prepared by exhausting Ergot with strong Alcohol, and evaporating the liquid to an Extract, the fatty Oil being removed by Ether

ERGOT ASEPTIC—A sterilised concentrated preparation prepared from physiologically standardised Ergot, put up in bulbs containing 1 c c representing 2 grammes or 30 grains Ergot

Not Official

ERIGERONTIS CANADENSIS OLEUM

OIL OF CANADIAN FLEABANE

A colourless, or pale yellow, mobile liquid, distilled from the fresh flowering Herb *Erigeron Canadense*, L., which grows abundantly in American Mint fields

It has a tendency to darken in colour and to become viscid on exposure to air, and rapidly becomes resinified. It should be kept in well stoppered glass bottles of a dark amber tint, in a cool atmosphere and protected as far as possible from the light

It consists almost entirely of Dextro limonene

Medicinal Properties—Diuretic, tonic, and astringent. Chiefly employed for arresting internal hemorrhage

Dose —5 to 10 minims = 0.3 to 0.6 c c every two or three hours

Foreign Pharmacopœias—Official in U.S. Not in the others

Tests—Erigeron Oil has a specific gravity of 0.850 to 0.870, an optical rotation of not below +45°, and the greater part of the oil distils about 175° C (347° F). It should be soluble in an equal volume of Alcohol (94.9 p c)

Not Official

ERYTHROL TETRANITRATE

TETRANITRIN

A colourless, crystalline solid melting at 61° C (141.8° F) prepared from Erythrol (a tetratomic Alcohol). When kept in a dark and moderately cool place it is fairly stable, but if exposed to warmth, and especially sunlight, it rapidly undergoes decomposition. It is liable to explode on percussion, and should be handled with great care

It is but slightly soluble in Water, but dissolves readily in Alcohol (90 p c) and in Ether

It is a vaso dilator and belongs to the group of which Glycerol Trinitrate (Nitroglycerin) may be regarded as the typical representative. Blood pressure experiments show that it has a less marked but more prolonged action than that substance.—*B M J* '95, ii 1213, '97, i 907, '98, i 18, 37, 248, ii 936

A list of cases treated with Erythrol Tetranitrate.—*B M J* '99, ii 1259
Dangers.—*M P* '99, 838

Dose — $\frac{1}{2}$ to 1 grain, in alcoholic solution or in the form of tablets
Tablets are made containing $\frac{1}{2}$, $\frac{1}{4}$, and 1 grain

Not Official.

ERYTHROPHLÆUM

CASCA BARK SASSY BARK

The Bark of the *Erythrophlæum guineense*, Don Introduced as a cardiac tonic in 1877

An Ordeal Bark used in West Africa It yields an alkaloid **Erythrophlæine**, the Hydrochloride of which is soluble in Water

B.P.C. Formulary 1894 had a Tincture (1 in 10), dose 5 to 10 minims = 0.3 to 0.6 c.c., but it was omitted from the 1901 edition, it is now re-introduced in *B.P.C.* 1907

ETHYL NITRITIS LIQUOR.

See under SPIRITUS ÆTHERIS NITROSI

EUCAINE. See COCAINE, p. 413**EUCALYPTI GUMMI.**

EUCALYPTUS GUM

A ruby-coloured exudation, or so-called Red Gum, from the bark of *Eucalyptus rostrata* and some other species of *Eucalyptus* Imported from Australia

Under the name of Gummi Rubrum, this has been 'Not Official' in the *Companion* since 1871

Medicinal Properties.—Astringent, principally used in diarrhoea, dysentery, and relaxed throat

This Gum adheres with great pertinacity to the mucous surfaces, and it is probably on this account that its astringency is more effective than that of Catechu Kino, etc. although it contains less astringent matter

The **Fluid Extract** is an excellent styptic, injected into the nostril, at once stops bleeding of the nose, a tablespoonful in a pint of Water forms an astringent injection for the vagina or rectum, it also forms an astringent lotion for the eyes

Dose—2 to 5 grains = 0.13 to 0.32 gramme

Prescribing Notes—Given in the form of cachets or pills
in the form of Syringes The Tincture mixes with Water and

Official Preparation—Trochiscus Eucalypti Gummi

Not Official—Extractum Gummi Rubri Liquidum, Extractum Eucalypti
 Suppositoria Gummi R Rubri, Syrupus
 Syrupus Eucalyptus Gummi Rubri,
 Gummi, Trochiscus Eucalypti Compositus, Trochiscus
 Gummi Rubri (*Squire*)

Descriptive Notes—Although one variety of *Eucalyptus* Kino is known as Red gum in commerce it is incorrectly called gum in the *B.P.* and indeed it is often called in retail commerce by the more appropriate name of *Eucalyptus* Kino The *B.P.* states that it is obtained from the bark of *Eucalyptus rostrata*, *Scaplect*, and some

other species The one named in the *B P* is unfortunately a species which does not yield the best kind According to Mr H G Smith (*P J* (4), 23, p 101) *Eucalyptus calophylla*, R. Br., yields the best obtainable in commercial quantities, the kino of *E. rostrata* being not so astringent, and its Tincture gelatinises Eucalyptus kinos contain two tannins, one giving a green colour with Ferric Chloride, and not gelatinising, and the other giving a purple colour and gelatinising when kept (See *Proc Roy Soc N S Wales, June and Aug, 1904*) The fragments or grains are described in the *B P* as transparent and ruby red, somewhat tough, adhering to the teeth and tinging the saliva red It should be soluble to the extent of 80 to 90 p c in cold Water and almost entirely in 90 p c Alcohol The Eucalyptus kino of commerce is often blackish and opaque and consists of the natural product of the trees, but there is a preparation obtainable which is made in Australia by boiling down the fresh juice collected from incisions made in the bark of the tree This is usually distinguished under the name of 'red gum' in commerce and the *B P* characters apply to it The tincture does not gelatinise It is used especially in 'red gum' lozenges on account of its purity and ready solubility Eucalyptus Gum or Kino that is allowed to dry on the tree or is picked out of the wood is often largely insoluble in Water, owing apparently to the action of an oxydase which is only destroyed by boiling

Preparation

TROCHISCUS EUCALYPTI GUMMI—EUCALYPTUS GUM LOZENGE

1 grain of Eucalyptus Gum, in each, with Fruit basis

Not Official

EXTRACTUM GUMMI RUBRI LIQUIDUM—Red Gum, 7, Water 21 dissolve, strain, and add Alcohol (90 p c), 1

Dose—30 to 60 minims = 1 8 to 3 6 c c, in a wineglassful of Water

EXTRACTUM EUCALYPTI GUMMI LIQUIDUM—Dissolve 5 of Red Gum in 18 of Distilled Water, strain, and add 2 of Alcohol (90 p c) and sufficient Distilled Water to produce 20

This has been incorporated in the *B P C* from the *B P C Formulary* 1901

SUPPOSITORIA GUMMI RUBRI—Powdered Red Gum, 5 grains, Extract Nux Vomica, 1 grain, Cocoa nut Stearin, *q s* to make one suppository

SYRUPUS GUMMI RUBRI—Liquid Extract, 20, Sugar, 12, dissolve

Dose—30 to 60 minims = 1 8 to 3 6 c c

This has been incorporated in the *B P C* under the title **Syrupus Eucalypti Gummi**

SYRUPUS EUCALYPTI ROSTRATÆ—Red Gum of *Eucalyptus rostrata*, 800 grains, Boiling Distilled Water, 9½ oz, Refined Sugar, 16 oz, Oil of Eucalyptus, 80 minims, Mucilage of Acacia, 4 fl drms—*Pharmacy Board of Victoria (C D '06, 1 110)*

Dose—30 to 60 minims = 1 8 to 3 6 c c

This has been incorporated in the *B P C* with slight alteration of the quantities as follows—

Syrupus Eucalypti Compositus.—Eucalyptus Gum from *Eucalyptus*

Rostrata, $\frac{7}{8}$, Oil of Eucalyptus, $\frac{1}{2}$, Refined Sugar, 60, Mucilage of Gum Acacia, 2, Distilled Water, *q s* to produce 100—*B P C*

TINCTURA GUMMI RUBRI—Gum, 1, Alcohol (90 p c), 4, digest and strain Mixes with Water without becoming turbid

Dose—20 to 40 minims = 1 2 to 2 4 c c

1 part of this with 6 or 8 of Water for a gargle

Tinctura Eucalypti Gummi (*B P C*)—Eucalyptus Gum, 25, Alcohol (45 p c), *q s* to make 100

TROCHISCUS EUCALYPTI COMPOSITUS—2 grains of Potassium Chlorate, $\frac{1}{2}$ grain of Powdered Cubebs and 1 grain of Red Gum in each—*Throat*

TROCHISCUS GUMMI RUBRI (*Squre*)—Made with Rose Paste This lozenge, which has been in use for about forty years, differs in appearance and flavour from that now introduced into the *B P*

Useful for relaxed throat They have also been recommended as a preventive of sea-sickness

EUCALYPTI OLEUM.

OIL OF EUCALYPTUS

A colourless, or pale yellow, oily, limpid liquid, having a characteristic aromatic odour It should contain at least 50 p c of Eucalyptol, and but very little Phellandrene It is the volatile Oil distilled from the fresh Leaves of *Eucalyptus globulus*, and other species of *Eucalyptus*

For many years the Oil from *E amygdalina* was the most esteemed variety, and was included in *B P* '85, but it is now excluded by the tests given in *B P*, '98,

The chief constituent of the Oil is Eucalyptol (Cineol), which in good Oils amounts to from 50 to 70 p c It also contains the Terpene, Dextro-pinene, in the crude Oil various Aldehydes, principally Valeric, Butyric, and Capronic Aldehydes, and in the higher boiling point fraction a laevogyrate Ester, yielding on saponification a laevogyrate Alcohol

Solubility.—3 in 1 (or less) of Alcohol (90 p c), in all proportions of Absolute Alcohol, 1 in 38 of Alcohol (60 p c), Oil, 1 in 175)

These figures have been incorporated in the *B P C*

Medicinal Properties—It is a powerful antiseptic and deodoriser, antipyretic It is used as an inhalation in cases of pulmonary gangrene, phthisis, influenza, and coryza, and internally or by inhalation to relieve the cough in chronic bronchitis, phthisis, and asthma Mixed with Iodoform as an application to hard and soft chancres, and as urethral suppository in gonorrhœa Given internally for chronic inflammation of the bladder

The following prescription of Sir R Douglas Powell (*Edm Med Jour* 05, 465) is of great service in relieving the troublesome cough of phthisis, Eucalyptol, or Pine Oil, 3 drms, Oil of Bitter Almonds, 1 drms, Spirits of Chloroform (double strength), 1 oz Ten to 15 drops to be inhaled after the first morning coughing, in the middle of the day, and in the evening

Alarming symptoms (*L* '05, 1, 903) following the internal administration of a teaspoonful of the oil, taken plain to relieve an ordinary cold Recovery

A case of recovery by Recovery—*B M J* '06, 1 1085

With Chloroform in the treatment of actylostomiasis, also in killing tape- and thread-worms—*L* '06, 1 285.

Inhalation in whooping cough—*B M J* '86, i 430 As a disinfectant, as a throat and nose spray, and as anunction in scarlet fever—*L* '95, i 861

An infusion (60 grains in 6 oz of the leaves) twice daily in the treatment of diabetes—*B M J* '02, i 1295, ii 1884, *P J* '02, ii 118

Dose— $\frac{1}{2}$ to 3 minims = 0.03 to 0.18 c c

Prescribing Notes—*Given in the form of emulsion with Mucilage of Acacia and Water, or taken on Sugar Used as an inhalation or spray May be mixed with equal parts of Olive Oil for a liniment, 1 to 3 or 4 of Olive Oil as an antiseptic ununction in scarlet fever*

Official Preparation—Unguentum Eucalypti

Not Official—Fluidextractum Eucalypti, Tinctura Eucalypti, Eucalyptus Gauze, Eucalyptus Wool and Lint, Pastille of Eucalyptus, Pastille of Eucalyptol, Nebula Eucalypti, Nebula Eucalypti et Pini, Nebula Eucalypti et Menthol et Cocainæ, Parogenum Eucalyptolis, Pessus Eucalypti, Vapor Eucalypti, Vasolimentum Eucalyptoli, Eugol, Eucalypteol, Eucalyptol, Phellandrene, Oleum Eucalypti Maculatæ var Citriodora, Eudesmol

Foreign Pharmacopœias—Official in Fr (Essence d' Eucalyptus), sp gr 0.910 to 0.930, Hung, sp gr 0.914, Jap, sp gr not given, Mex (Ácete Volátil de Eucalipto), sp gr 0.905, Norw, sp gr 0.915 to 0.925, U.S., sp gr 0.905 to 0.925 at 25° C (77° F) Not in the others The Leaves are official in Belg, Dutch, Fr, Hung, Ital, Jap, Mex, Port, Span, Swiss and U.S.

Descriptive Notes—The Eucalyptus Oil of commerce is derived chiefly from *E. globulus*, Labill in Tasmania and California, etc, and from *E. amygdalina*, Labill, *E. cneorifolia*, DC, *E. dumosa*, A. Cunn, and *E. oleosa*, F v M, in South Australia

The oil of *E. amygdalina* was that originally used in medicine in Australia. It has not the Cummin flavour and odour due to Aromadendral which characterises the last three. The oil of *E. globulus* unless rectified has an unpleasant odour. Most of the oils of commerce have been rectified to free them from irritating Alcohols and Aldehydes and colouring matter, but will, nevertheless, if kept with access of air in bottles half full, in course of time resinify and thicken. Oil of *E. globulus*, adulterated with Castor Oil, has been met with in commerce.

Tests—Eucalyptus Oil has a specific gravity, according to Baker and Smith, from 0.900 to 0.925, the official figures are 0.910 to 0.930, the *USP* gives 0.905 to 0.925 at 25° C (77° F). The Report of the Committee of Reference in Pharmacy suggests that the specific gravity should be raised to 0.910. It is difficult to gauge what this means, as the minimum specific gravity is already given as 0.910. The optical rotation in a tube of 100 mm. is officially required to be from +10° to -10°. The *BP* does not include a process for the quantitative determination of the Eucalyptol (Cineol), but contents itself with the statement that it should become semi-solid on being stirred, when cold, with a third or half its volume of Phosphoric Acid (sp gr 1.75). It must be conceded that the methods available for the quantitative determination of Eucalyptol in Eucalyptus Oils are not strictly accurate. The Phosphoric Acid method for all practical purposes is sufficiently accurate to enable the comparative values of the oils to be judged. The method has been

found most useful in arranging the several members of the genus into groups.

The Phosphoric Acid method for the determination of Eucalyptol in Eucalyptus Oils was originally discovered by Mr L R Scammell, of Adelaide, South Australia, in 1892, and was the outcome of an investigation on various samples of cheap oils then being placed on the market. For about two years the process was used by Messrs Faulding and Co for the manufacture of Eucalyptol which they shipped to England. In 1894 the process was patented by Mr Scammell as Faulding's Process in England, France, Germany, and America, as well as in the Australian Colonies. With this method available, it was possible to introduce a standardised oil containing a guaranteed quantity of Eucalyptol.

The method adopted was to prepare the Eucalyptol Phosphate in a perfectly dry powdery condition by repeatedly pressing it between fresh absorbent paper, well breaking up the cake between each pressing, until finally no moisture could be detected. The Eucalyptol Phosphate thus prepared was weighed in the tared vessel in which it was to be decomposed, and from which evaporation of the Eucalyptol was not possible. Cold Water was then added, and sufficient time allowed for the Phosphate to be perfectly decomposed without heating, usually over night. The whole was then transferred to a narrow burette, graduated in $\frac{1}{10}$ of a c.c. The aqueous portion was then separated, and this, together with the warm Water used in washing the Eucalyptol, transferred to a 100 c.c. flask. When the Eucalyptol had cooled down to the room temperature, it was measured, the remaining Water run into the flask, the Eucalyptol passed through a dry filter, and the specific gravity taken, from which the weight of the Eucalyptol was calculated. The dilute acid in the flask was then made up to the mark, and 10 c.c. titrated with Semi-normal Sodium Hydroxide Solution, using Phenolphthalein Solution as indicator, and checking the results by a Lead determination.

To obtain good results with the Phosphoric Acid method, it was found necessary to keep the temperature of the bath as low as possible, using iced Water if necessary, and to add the acid slowly by drops well incorporating it with the oil. As the compound became solid it was well broken up with the rod, and ample time given for complete crystallisation to take place. Excess of Phosphoric Acid was used over that required theoretically, assuming the richest oil to contain about 73 p.c. of Eucalyptol, the determinations were made upon 10 grammes of oil.

The Phosphoric Acid method of determination is adopted by the *U.S.P.*, and a description of the process will be found under Oil of Cajuput, p. 279. An alternative method of determination is by means of Hydrobromic Acid. Absolutely anhydrous gaseous Hydrobromic Acid is passed through a measured quantity of 10 c.c. of the oil dissolved in 40 c.c. of Petroleum Ether, maintained at a freezing temperature, until a precipitate is no longer formed. The white precipitate of Cineol Hydrobromide is transferred to a pressure filter and washed with cold Petroleum Ether. The filtrate and washings

are further treated with Hydrobromic Acid, any precipitate being separately collected and added to the bulk precipitate. The Petroleum Ether is removed from the Cineol Hydrobromide by allowing it to remain for a quarter of an hour in a vacuum. It should then be rinsed with a little Alcohol into a Cassia flask and decomposed with Water. The Cineol is brought into the graduated neck of the flask and the volume read off. The figure so obtained multiplied by 10 yields the percentage by volume present in the oil. Schimmel & Co consider the Phosphoric Acid method unreliable and useless, and give a caution against its adoption. They are also of opinion that the Hydrobromic Acid cannot lay claim to reliability either, and suggest Resorcin as suitable substance for making the determination. A measured quantity of 10 c.c. of the oil is mixed in a Cassia flask with sufficient 50 p.c. Resorcin Solution to about four-fifths fill the flask. After being thoroughly shaken for 5 minutes, the uncombined oily portions are brought into the neck of the flask by adding a further quantity of the Resorcin Solution, and the volume read off. The figure multiplied by 10 yields the percentage by volume of oily constituents other than Eucalyptol (Cineol), the latter being determined by difference. Oils very rich in Cineol require to be diluted beforehand with an equal volume of Turpentine Oil in order to prevent crystallisation of the Cineol Resorcin.

It is pointed out (*CD* '08, 1 55) that within certain limits the Phosphoric Acid method proposed by Scammell gives very fair results. It is that usually adopted for the determination of Cineol. The Resorcin process is dealt with in the same reference, the opinion expressed being that it gives very disappointing results, an oil showing a Cineol content of 65 p.c. w/v by the Phosphoric Acid method indicating 82 p.c. w/v by the Resorcin method, whilst samples of Cajeput oils showing 48 to 52 p.c. w/v by the Phosphoric Acid, indicated 80 to 84 p.c. w/v by the Resorcin method. Until further important information is forthcoming, the new process cannot be accepted as giving even approximate results.

The objections to the Resorcin process recorded *CD* '08, 1 55, have been acknowledged (*CD* '08, 1 265) by Wiegand and Lehmann of Schimmel's laboratory, who state that the error is due to the influence of the terpenes and other bodies in the oil which do not distil between 170° and 190° C (338° and 374° F.). The process originally recommended has been modified so as to permit of its use for the estimation of Cineol. 100 c.c. of the oil are distilled from a Ladenburg 3-bulb flask, in such a manner that approximately 1 drop passes over every second. The Cineol content of the principal fraction boiling between 170° and 190° C (338° and 374° F.), is then determined in the manner described above in detail. The Cineol content ascertained in the fraction is then re-calculated for the original oil, and the total content in p.c. by volume is thus obtained.

The *U.S.P.* requires the oil to contain not less than 50 p.c. w/v of Cineol. The inclusion in the *B.P.* of an assay process indicating not less than 55 p.c. of Eucalyptol has been recommended. Phellandrene, if present in the oil, may be detected by mixing the sample with

twice its volume of Glacial Acetic Acid and a saturated solution of Sodium Nitrite. If Phellandrene be present, a crystalline mass will be formed.

Preparation

UNGUENTUM EUCALYPTI. EUCALYPTUS OINTMENT

Oil of Eucalyptus (by weight), 1, Hard Paraffin, 4, Soft Paraffin,
White, 5

Now 1 in 10 instead of 1 in 5

The Leaves and Oil of *E. amygdalina* are recommended by Bosisto for making the ointment

Not Official

FLUIDEXTRACTUM EUCALYPTI (US) — Eucalyptus in No 40 powder, 100, percolate with a mixture of Alcohol (95 p c), 75, and Water, 25; reserve the first 90 and evaporate the remainder to a soft extract, dissolve this in the reserved portion, and add enough menstruum to produce 100

TINCTURA EUCALYPTI—Eucalyptus Leaves, in No 20 powder, 1, Alcohol (60 p c), to percolate 5, *B P C* The *B P C Formulary* of 1901 employed Alcohol 90 p c, the foreign Pharmacopœias use an intermediate strength *U S P* fluid extract about 70 p c Alcohol

Dose — 15 to 120 minims = 0.9 to 7.1 c c

Foreign Pharmacopœias—Official in Belg, Dutch, Fr, Hung, Ital, Mex, Port, Span and Swiss, 1 in 5, Dutch, Hung and Swiss with Alcohol (70 p c), Belg, Ital and Mex with Alcohol (80 p c) Not in the others

Eucalyptus Gauze contains about 6 p.c. of the Oil, **Eucalyptus Wool** and **Lint** 5 p.c. and 10 p.c., **Pastille of Eucalyptus** containing 1 minim of Oil is made, also **Pastille of Eucalyptol** containing $\frac{1}{2}$ minim of Eucalyptol, and both of these with Cocaine $\frac{1}{20}$ grain of the Hydrochloride, also the above with $\frac{1}{2}$ grain of Menthol in each.

NEBULA EUCALYPTI—Oil of Eucalyptus, 20 minims, Liquid Paraffin, to 1 fl. oz.—*Throat*

Oil of Eucalyptus, 1, Liquid Paraffin, *q s* to produce 20 — *B P C*

Nebula Eucalypti et Pini—Oil of Eucalyptus, 5, Oil of Pine, 7 5,
Liquid Paraffin, *q s* to produce 100—*B P C*

Nebula Eucalypti et Mentholi et Cocainæ—See p 405

PESSUS EUCALYPTI—Oil of Eucalyptus, 15 minims, Oil of Theobroma,
to 2 fl drms

VAPOR EUCALYPTI.—Oil of Eucalyptus, 20 minims, Light Magnesium Carbonate, 10 grains, Water, to 1 fl oz Mix a teaspoonful in a pint of Water at 140° F for each inhalation.—*Throat*

This has been incorporated in the *B P C*

VASOLIMENTUM EUCALYPTOLI—Eucalyptol, 20, Liquid Vasoliment, 80—*Hager*

Parogenum Eucalyptolis (Eucalyptol \overline{n} 1, 20,
Parogen, 80 — BPC

Eugol is a liquid containing Beta-naphthol, Boric Acid, Menthol, Thymol, Eucalyptol, Gaultheria, and *Hamamelis* — *B.M.J.* '98, 1 702, *L.* '98, 1 37

Eucalypteol (C₁₅H₂₆O) (chloride) —A crystalline substance, almost insoluble in Water, m.p. 170°C (320°F) and boiling at 115°C (239°F)

Dose—5 grains = 0.32 gramme, as an internal antiseptic. 80 grains in Olive Oil may be given as an enema in diarrhoea.

EUCALYPTOL (Crystallisable)—A definite chemical body ($C_{15}H_{26}O$ eq 152.98), obtained from Eucalyptus Oil by a freezing process, or by separation as

Eucalyptol Phosphate and subsequent decomposition of this salt by hot Water It is liquid at ordinary temperatures, but crystallises about 0°C (32°F) It should be kept in well closed glass bottles of a dark amber tint and protected as far as possible from the light It is identical with an oxidised compound obtained from Oil of Cajuput and a number of other essential oils, consequently the names **Cineol** and **Cajuputol** have also been applied to it

Dose —1 to 3 minims = 0.06 to 0.18 c c

Official in Fr, Belg, Ital, Port, Span, Swed, Swiss and U S

Tests —Eucalyptol has a specific gravity of 0.928 to 0.930, *U S P* 0.925 at 25°C (77°F), *Fr Codex* (1908) 0.940 at 0°C (32°F) It boils at 176° to 177°C (348.8 to 350.6°F), *Fr Codex* 176°C (348.8°F) It is optically almost inactive It is liquid at ordinary temperatures, but crystallises about 0°C (32°F) When placed in a freezing mixture and gradually mixed with an equal volume of Phosphoric Acid (1.75 sp gr) it sets to a solid white crystalline mass No diminution in volume should occur when the sample is shaken with an equal volume of Sodium Hydroxide Solution It dissolves readily in Alcohol (90 p c), forming a solution which should be neutral in reaction to Litmus paper, and which should yield no brownish or violet colour on the addition of a drop of Ferric Chloride T S

The percentage of Cineol (Eucalyptol) may be determined by the Phosphoric Acid process given under Oil of Eucalyptus

PHELLANDRENE —A levogyrate terpene, occurring in the Oil from *E amygdalina* Its presence can readily be detected by the formation of a crystalline nitrosite when the Oil is treated with Nitrous Acid

OLEUM EUCALYPTI MACULATÆ VAR CITRIODORA —A pale yellow oily liquid with a pleasant citronella like odour Sp gr 0.870 to 0.905 It contains from 84 to 90 p c Citronellal, $\text{C}_{10}\text{H}_{18}\text{O}$

EUDESMOL —A crystalline Camphor from Eucalyptus Oil

EUONYMI CORTEX.

EUONYMUS BARK

FR, FUSAIN NOIR POURPRÉ, GER, SPINDLEBAUM, ITAL, EVONIMUS, SPAN, BOMETTRO

The dried Root-bark of *Euonymus atropurpureus* Jacq

Medicinal Properties —Tonic, cathartic, and diuretic The dry extract is a powerful cholagogue and purgative, useful in chronic constipation and torpid liver

Prescribing Notes —Dried Extract in one form or another has been known for many years as **Euonymin**, usually given in the form of pills with Extract of Henbane, if prescribed alone, a little Soap, $\frac{1}{2}$ grain in a 2 or 3 grain pill, and Alcohol (90 p c) q s makes a good mass Also prescribed with Iridin, the dose of which is the same

Official Preparation —Extractum Euonymi Siccum

Not Official —Elixir Euonymini Comp, Extract Euonymi, Fluidextractum Euonymini, Liquor Euonymini, Liquor Euosmici et Pepsini, Liquor Euonymi Bismuth Pepsin cum Iridino, Pilula Euonymini et Cascara, Tinctura Euonymi

Foreign Pharmacopœias —Official in Fr and U S Not in the others

Descriptive Notes —It is probable that a part of the bark of commerce is derived from *E americanus* L, which has warty fruits and almost sessile, thick leaves The root-bark usually occurs in small curved or slightly quilled pieces $1\frac{1}{2}$ to 2 inches (37 to 50 mm)

long and $\frac{1}{2}$ to $\frac{3}{8}$ of an inch (2 to 4 mm) thick and 12 to 15 mm in width, of an ashy or brownish-grey colour externally, with scattered patches of soft cork, and occasional small transverse scars and darker lines or patches. The inner surface is pale, of a light brown colour, and the fracture is short and yellowish, with projecting silky threads, more evident when the fractured edges are gently separated. The taste is bitter, somewhat acrid, and mucilaginous. Although only the root-bark is official, both in the *BP* and the *USP*, that of the stem is also sold either separately or mixed with it. It can be distinguished by occurring in longer, thin quills, with a greenish cortical portion, a fibrous bast, and more fibrous fracture.

The bark of *Alstonia scholaris*, R. Br., has been offered for *Euonymus*, but it is twice as thick, and its transverse fracture does not show cottony threads but small granular masses of stone cells.

Preparation

EXTRACTUM EUONYMI SICCUM. DRY EXTRACT OF EUONYMUS

Exhaust *Euonymus* Bark by percolation with Alcohol (45 p c), evaporate the percolate to dryness, and to each 4 of product add 1 of Calcium Phosphate. As it is hygroscopic, it should be kept in stoppered bottles.

Dose — 1 to 2 grains = 0.06 to 0.13 gramme

Fr., a powder, U.S., an extract

Not Official

EXTRACTUM EUONYMI (U.S.) — 100 of fluid extract is evaporated to dryness, and when powdered mixed with sufficient powdered Lignum to make 25 by weight.

FLUIDEXTRACTUM EUONYMINI (U.S.) — 100 of *Euonymus* in No. 40 powder is exhausted by a mixture of Alcohol (95 p c), 80, and Water, 20, reserve the first 80 of percolate, evaporate the remainder to a soft extract, which dissolve in the reserved portion, and make up to 100.

LIQUOR EUONYMINI — *Euonymin*, 32 grains, Oil of Coriander, 2 minims, Alcohol (45 p c), 1 fl. oz. — *Bourne's Formulary*

Dose — 15 to 30 minims = 0.9 to 1.8 c c

Dry Extract of *Euonymus*, 6, Oil of Coriander, 0.75, Alcohol (45 p c), q s to produce 100 — *B.P.C.*

LIQUOR EUONYMIN ET PEPSINI — Soluble Scale Pepsin, 32 grains, Dilute Hydrochloric Acid, 80 minims, Solution of *Euonymin*, 4 fl. drms, Alcohol (45 p c), 4 fl. drms, Chloroform Water, q s to make 2 fl. oz. — *Bourne's Formulary*

LIQUOR EUONYMINI CUM PEPSINO — Tincture of *Euonymus*, 2½ fl. oz., Pepsin, in scales, 24 grains, Diluted Hydrochloric Acid, 3 fl. drms, Glycerine, 3 fl. oz., Distilled Water, to 20 fl. oz. — *A.P.H.*

This has been incorporated in the *B.P.C.* under the title **Elixir Euonymi et Pepsinæ**, the figures being 12.5, 2.0, 15, 100 respectively.

LIQUOR PEPSINI BISMUTHI ET EUONYMI CUM IRIDINO — Glycerole Pepsin (*Armour's*), 24 fl. oz., Ammonio Citrate of Bismuth, 320 grains, Tincture of *Euonymus* (*B.P.C.*), 400 minims, Iridin, 16 grains, Tincture of Cochineal q s, Simple Elixir, q s to make 20 fl. oz. — *Armour's Form.*, also *P.J.F.*

Elixir Euonymi Compositum—Tincture of Euonymus, 4, Iridin, $\frac{1}{2}$, Stronger Glycerine of Pepsine, $12\frac{1}{2}$, Bismuth and Ammonium Citrate, $8\frac{1}{2}$, Solution of Cochineal $q\ s$, Simple Elixir, $q\ s$ to produce 100—*B P C*

PILULÆ EUONYMINI ET CASCARÆ—Euonymin, 12 grains, Extract of Cascara, 36 grains, Green Extract of Hyoscyamus, 12 grains, Iridin, 12 grains, Extract of Nux Vomica, $1\frac{1}{2}$ grains Divide in 24 pills—*Pharm Form*

Pilulæ Cascaræ et Euonymini—Extract of Cascara Sagrada, $\frac{1}{2}$ grain, Euonymin, $\frac{1}{2}$ grain, Green Extract of Hyoscyamus, $\frac{1}{2}$ grain for 1 pill—*B P C*

TINCTURA EUONYMI—Euonymus Bark, in No 20 powder, 4, Alcohol (90 p c), sufficient to percolate 20—*B P C Formulary* 1901

Dose—10 to 40 minims = 0 6 to 2 4 c c

This has been incorporated in the *B P C*

Not Official

EUPATORIUM

THOROUGHWORT BONESET

The dried leaves and flowering tops of *Eupatorium perfoliatum* L. A perennial plant indigenous to the United States, and is official in *U S P*

Medicinal Properties—A bitter tonic and diaphoretic. In large doses, emetic and aperient. Has been used in bronchial catarrh, influenza, and muscular rheumatism.

FLUIDEXTRACTUM EUPATORII (U S)—A 1 in 1 fluid extract of the above prepared by percolation with Alcohol (49 p c)

Dose—20 to 60 minims = 1 2 to 3 6 c c

Not Official

EUPHORBIIUM

The concrete resinous Juice of *Euphorbia resinifera*, Beng (a native of Morocco), and other species. Official in Austr, Belg, Dan, Fr, Ger, Hung, Ital, Mex, Norw, Port, Span, Swed and Swiss. It was formerly official in London, Edinburgh and Dublin Pharmacopœias. It contains an acrid Resin. It is a powerful irritant and vesicant, and is used principally in veterinary medicine. It is noticed here because it is official in most of the Foreign Pharmacopœias. A Tincture, 1 in 5, is official in Port.

It must not be confounded with the following—

EUPHORBIA PILULIFERA—A plant growing in Queensland and tropical America. The herb is collected when in flower and carefully dried. It yields its virtues to Alcohol and to Ether.

Given in spasmodic asthma and bronchial affections, in coryza and hay fever, and in spasmodic dyspnoea of whatever origin. *L* '85, 11 '86, *T G* '85, 92, *M A* '93, 260, '94, 20, *Y B T* '94, 32.

EXTRACTUM EUPHORBIAE PILULIFERÆ—Obtained by the evaporation of the following Tincture.

Dose— $\frac{1}{2}$ to 1 grain = 0 032 to 0 065 grainme

TINCTURA EUPHORBIAE PILULIFERÆ—Euphorbia in No 20 Powder, 1, Alcohol (60 p c), to percolate, 5. *B P C Formulary* 1901, incorporated in the *B P C* under the title *Tinctura Euphorbiæ*.

Dose—10 to 80 minims = 0 6 to 8 c c, well diluted with Water.

Foreign Pharmacopœias—Not in any.

Not Official

EXALGIN

METHYLACETANILIDE

eq 148 01

Long, colourless prismatic needles, or in tabular crystals

It may be prepared by the action of Acetyl Chloride on Monomethylaniline

Solubility —1 in 50 of Water, 1 in 2 of Alcohol (90 p c), 1 in 4 of Alcohol (60 p c), 1 in 2 of Chloroform, 1 in 10 of Ether

In hot Water Exalgin is very apt to form supersaturated solutions, which when cold will not separate even when stirred or scratched, but set solid at once on the addition of a fragment of a crystal

Medicinal Properties —In small doses it acts as an analgesic without effects, giving the best results in neuralgia and toothache. It is antipyretic —*B M J* '90, 1 844, 558, '90, 1 735, *P J* (3) xix 781, 861, *T G* '89, 339, 534, 746, 797, *L* '89, 1 658, '90, 1 845, '92, 1 1174, 1175, '93, 1 785. In large doses it possesses toxic properties

Severe toxic symptoms in an asthmatic woman after taking one dose of 5 grains —*L* '95, 1 1807

Caution —by large dose (150 grains), recovery. Treatment consisted of 30 grains of Acid by nasal tube, and of injection of $\frac{1}{10}$ grain Atropine, followed by two injections of $\frac{1}{10}$ grain — 890

Dose — $\frac{1}{2}$ to 1 grain = 0.032 to 0.065 gramme, was found sufficient by Fraser, but larger doses, 4 to 8 grains = 0.26 to 0.52 gramme, have been given in France

Prescribing Notes —May be given in Mixtures, previously dissolving it in a little of the Tincture before adding the Water. A nice pill mass is made by adding Grains 15 or $\frac{1}{2}$ grain Compound Tragacanth Powder to each 3 grains of Exalgin. Syrup q s. It may also be conveniently given in cachets Compr. also prepared

Foreign Pharmacopœias —Official in Fr (Methylacetanilide), Mex and Span. Not in the others

Tests —Exalgin possesses a melting point of 101° C (213° F) and a boiling point of about 245° C (473° F). When boiled with Sodium Hydroxide solution it is decomposed with difficulty, but is completely decomposed by concentrated Hydrochloric Acid with formation of Acetic Acid and Methylaniline. When a small quantity is boiled with Hydrochloric Acid, and the cooled mixture is treated with an excess of Ammonia Solution, no violet coloration should be produced on the addition of Chlorinated Lime Solution. When boiled with a few drops of Chloroform and some Alcoholic Potassium Hydroxide Solution, no odour of Phenylisocyanide is evolved. Exalgin dissolves readily in Chloroform, and this fact enables it to be distinguished from Acetanilide and Phenacetin. When 1 gramme of the sample is treated with 2 cc of Chloroform, the Exalgin is dissolved. A chloroformic solution of Exalgin remains clear when diluted with 10 times its volume of Petroleum Ether, whereas solutions of Acetanilide and Phenacetin become turbid. 0.5 gramme should leave no weighable residue when heated with free access of air.

MISTURA METHYLACETANILIDI —Methylacetanilide, 3 grains, Syrup of Orange, 1 fl drim, Chloroform Water (*B P* '85) to 1 fl oz

FEL BOVINUM PURIFICATUM.

PURIFIED OX BILE

Evaporate 20 fl oz of fresh Ox Bile to 5 fl oz, and mix it with 10 fl oz of Alcohol (90 p c), separate the precipitate, and reduce the clear fluid to a thick extract

Solubility—Soluble in Water and in Alcohol (90 p c) In soluble in Ether

Medicinal Properties—Intestinal antiseptic and cholagogue, purgative Used where there is a deficiency of bile, it assists the emulsification of fats

Dose—5 to 15 grains = 0.32 to 1 gramme

As it is desirable that it should pass into the small intestine unchanged, the pills should be coated with Keratin solution, p 710, which protects them from the action of the gastric juice

Foreign Pharmacopœias—Official in Dutch and Jap (Fel Tauri Inspissatum), Mex (Hiel de toro) Port (Extracto de Fel de Boi), Gall 1, Alcohol 1, Animal Charcoal $\frac{1}{10}$, U S (Fel Bovis Purificatum), Ox Gall 3, concentrated to 1, Alcohol 1 Not in the others

Tests—Purified Ox Bile is soluble in Water and in Alcohol (90 p c), when dissolved in from twenty to thirty times its weight of the former liquid, and mixed with a drop of a fresh syrup prepared by dissolving one part of refined Sugar in four of Water, it yields on the addition of Sulphuric Acid cautiously added so that the precipitate at first formed is redissolved, a cherry-red colour changing through carmine and purple to violet The reaction is known as Pettenkofer's test, and is the characteristic reaction of Cholalic Acid It may also be equally well observed by treating a drop of an aqueous solution of the bile on a porcelain surface with a drop of a solution of Cane Sugar, and adding a drop of strong Sulphuric Acid Owing to a chance of the reaction being obscured by the charring of the Sugar, it has been proposed to employ Furfural or Glucose in the place of Cane Sugar Unpurified Ox Bile, if present, is revealed on the addition of Alcohol (90 p c) to an aqueous solution, if absent, no precipitate should be produced The *BP* does not state the strength of the aqueous solution to be employed nor the quantity of Alcohol (90 p c) to be added, the *USP* states that an aqueous solution of the purified Ox Gall (presumably 1 in 100) should be clear and should remain transparent upon the addition of an equal volume of Alcohol (94.9 p c)

FERRUM.

IRON

Fe, eq 55.60

FR, FER, GER, GEPULVERTES EISER, ITAL, FERRO, SPAN, HIERRO

Annealed Iron wire, having a diameter about 0.005 inch = 0.1 mm (about No 35 wire gauge), or wrought iron nails, free from Oxide

The use of Iron in medicine is of great antiquity, it is said to have been the first mineral used internally, more than 3000 years ago

Iron salts naturally divide into two groups the Ferrous or Protosalts, based upon the Oxide FeO , and the Ferric or Sesquisalts (Persalts), based upon the Oxide Fe_2O_3 Ferrous salts have a strong tendency to pass into the Ferric condition by absorption of atmospheric Oxygen, a change which takes place very rapidly in presence of oxidising agents, as Chlorine, Nitric Acid, etc

Medicinal Properties.—The Iron salts in general are hæmâtine and tonic, the Perchloride and Sulphate are also very astringent and hæmostatic, and are antiseptic. All the Iron salts are stated to be converted into Chloride by the acid of the stomach. The Astringent salts are the most powerful tonics, but as they frequently produce gastric irritation, the Neutral salts are far more generally prescribed. Of these Ferrous Carbonate in its various forms, and the Iron and Ammonium Citrate, are in the greatest demand. The Phosphate preparations are excellent hæmâtinics, and are very popular with children. Iron preparations are given after food.

The Iron and Quinine Citrate, Arsenate, and Iodide are given in special cases calling for these combinations.

Iron is useful in most forms of anæmia, and in dyspepsia, debility, chronic cachectic conditions, neuralgia, amenorrhœa and other conditions which so often depend on anæmia, also in convalescence. It is contra-indicated in apoplectic persons and generally in fevers, but has been given with benefit in erysipelas.

When constipation is a symptom, the Iron is combined with some aperient, such as Aloes and Nux Vomica or Cascara, or a mixture containing Magnesium or Sodium Sulphate may be taken separately as required.

Official Preparations.—Of metallic Iron, Ferri Sulphas, Liquor Ferri Pernitrat, Liquor Ferri Perchloridi Fortis, of Iron Wire, Syrupus Ferri, Syrupus Ferri Phosphatis, Syrupus Ferri Phosphatis cum Quinina et Vinum Ferri, of Ferrous Sulphate, Ferri Arsenas, Ferri Carbonas Saccharatus, Ferri Phosphas, Ferri Sulphas Exsiccatus, Liquor Ferri Persulphatis, Mistura Ferri Composita, of Strong Solution of Ferric Chloride, Liquor Ferri Perchloridi, Tinctura Ferri Perchloridi, of Solution of Ferric Sulphate, Ferri et Ammonia Citras, Ferri et Quinina Citras, Ferrum Tartaratum, Liquor Ferri Acetatis, of Exsiccated Ferrous Sulphate, Pilula Ferri, Pilula Aloes et Ferri, of Reduced Iron, Trochiscus Ferri Redacti, of Iron and Ammonium Citrate, Vinum Ferri Citratis.

Not Official.—Mistura Ferri Aromatica, Extractum Ferri Pomati, Iron Malate Wine, Syrupus Ferri Pomati Compositus, Tinctura Ferri Pomati.

Foreign Preparations.—in Austr, Dan, Dutch, Ger, Hung, Ital, Pruss, Russ, Siam, Spain, Sweden, Switzerland, and U.S. (see also Vinum Pulveratum), Belg (Ferri Pulvis), Fr. (Fer), Ital (Limatura de Ferro), also (Ferro Polfirizzato), Port (Ferro), Mex (Fierro), Span (Hierro), and U.S. (Ferrum).

Tests.—Iron when present in solution in the Ferric condition answers the following distinctive tests.—The addition of Ammonia Solution produces a reddish-brown flocculent precipitate, insoluble in excess of the reagent, soluble in Citric or Tartaric Acid, Potassium or Sodium Hydroxide Solution produces a similar precipitate also soluble in Citric or Tartaric Acid, Potassium Ferrocyanide Solution produces a fine blue precipitate insoluble in dilute Hydrochloric Acid, soluble in Oxalic Acid, decomposed by Potassium or Sodium Hydroxide Solution, Potassium Ferrocyanide Solution produces a brown or reddish-brown coloration but no precipitate, Ammonium Hydrosulphide Solution produces a black precipitate mixed with Sulphur, on the addition of Hydrochloric Acid the black precipitate dissolves, evolving Hydrogen Sulphide gas and leaving a white insoluble precipitate of Sulphur, Ammonium or Potassium

Thiocyanate Solution yields a blood red coloration readily destroyed by Mercuric Chloride Test-solution, also destroyed by Phosphoric Acid, Tannic Acid Solution produces a black or bluish-black coloration in dilute solutions, a black or bluish black precipitate in stronger solutions, a solution of the Ferric salt acidified with Hydrochloric Acid liberates Iodine when added to a solution of Potassium Iodide, this reaction has been utilised in the *USP* as a general method for the determination of Iron in the Ferric condition

When present in the Ferrous condition its solution yields the following reactions —Ammonia Solution produces a white flocculent precipitate, rapidly turning to a dirty green colour and ultimately to reddish brown, it is soluble in diluted mineral acid and in Citric or Tartaric Acid, rapidly becoming brown on exposure to air, Potassium or Sodium Hydroxide Solution yields a similar precipitate which behaves similarly with the reagents mentioned, Potassium Ferrocyanide Solution produces a bluish-white precipitate insoluble in dilute Hydrochloric Acid, the precipitate rapidly changes to dark blue on exposure to air, Potassium Ferricyanide Solution produces a dark blue precipitate, insoluble in dilute Hydrochloric Acid and decomposed by Potassium or Sodium Hydroxide Solution, Ammonium Hydrosulphide Solution yields a black precipitate soluble in cold diluted Hydrochloric Acid with the evolution of Hydrogen Sulphide gas, but no precipitate of Sulphur remains, Hydrogen Sulphide Solution yields no precipitate in an acid solution of a Ferrous salt, Ammonium or Potassium Thiocyanate Solution produces no reaction in solutions containing pure Ferrous salt

Preparation

VINUM FERRI IRON WINE

Iron, in wire, 1, Sherry 20 Set aside for thirty days in a closed vessel, the Iron wire being almost, but not quite, immersed in the Sherry, the vessel being frequently shaken, and the stopper occasionally removed, filter

The quantity of Iron dissolved seems to depend almost wholly upon the acidity of the Wine We found that a good dinner Sherry, containing acids equal to 0.896 p.c. of Acetic Acid, dissolved 0.14 p.c. of Iron, and had its acidity reduced to 0.09 p.c. It was treated as directed in the *BP*, and the bottle was about half full

Of such a Vinum Ferri, 3 fl. drms would represent the Iron contained in 5 minims of Tinctura Ferri Perchloridi

Commercial samples seem to lie between 0.2 and 0.3 p.c. of Iron, although occasionally samples are found much weaker

According to *PJ* (8) xxi 641, the Iron strength increases for three weeks and then diminishes Our experience does not agree with this A gallon quantity was put on and examined after the first week, and afterwards every month for four months, with the following results 0.084, 0.114, 0.157, 0.185, 0.204 p.c. of metallic Iron

N.B. —The old Vinum Ferri, made with Malaga, is much sweeter than that of the *BP*, and is sometimes ordered on that account

Dose —1 to 4 fl. drms = 3.6 to 14.2 c.c.

Prescribed for young children and delicate females with irritable stomach

Not Official

MISTURA FERRI AROMATICA—Fine Iron Wire, 2, Red Cinchona Bark, in powder, 4, Calumba, in coarse powder, 2, Cloves, bruised, 1, Compound Tincture of Cardamoms, 12, Tincture of Orange Peel, 2, Peppermint Water, 48. Macerate the first four ingredients in the last one for three days in a closed vessel, agitating occasionally, filter, and make up with Peppermint Water to 50, to this add the Tinctures, and preserve in a well-stoppered bottle—*B P* 1885

Dose—1 to 2 fl oz = 28 4 to 56 8 cc

Much valued, especially in Dublin, as a stomachic tonic and hæmatinic

This has been incorporated in the *B P C*, slightly modifying the quantities in the transposition to the decimal system

EXTRACTUM FERRI POMATI—Sour Apples, 50, convert them into a pulp and express, to the expressed liquid add Iron Wire, 1, heat the mixture on a water-bath until the evolution of gas ceases. Dilute the liquid with Water to make 50 parts, and set it aside for several days, then filter and evaporate to a thick extract. The extract should be a greenish-black, and should form a clear solution with Water

Dose—3 to 10 grains = 0 20 to 0 65 grammes

Foreign Pharmacopœias—Official in Hung (*Ext Malatis Ferri*), Austr, Dan, Norw and Swed (*Ext Pomi Ferratum*), Belg and Ger (*Ext Ferri Pomati*), Jap, Russ and Swiss (*Ext Ferri Pomatum*). Swiss is prepared by dissolving freshly precipitated Peroxide of Iron in Apple Juice, all the others are with metallic Iron and Apple Juice

SIRUPUS FERRI POMATI COMPOSITUS—Ferrated Extract of Apples, 1, Cinnamon Water, 4, Syrup of Orange Peel, 20, Simple Syrup, 24, Syrup of Rhubarb, 50, Tincture of Cinnamon, 1—*Swiss*

TINCTURA FERRI POMATI—Ferrated Extract of Apples, 1, Alcohol (90 p c), 1, Cinnamon Water, to make 10

Dose—30 to 90 minims = 1 8 to 5 4 cc

Foreign Pharmacopœias—Official in Austr, Dan, Hung, Norw and Swed, 1 and 5, Belg, Ger, Jap, Russ and Swiss, 1 and 9, Dutch (*Solutio Ferri Pomata*), and Ital (*Tinctura di Malato di Ferro*). Not in the others

IRON MALATE WINE—In Devonshi . . . Iron Wire or Nails
is digested in a bottle of Cider for a week, a . . . times a day is the
dose

FERRI ACETATIS LIQUOR.

SOLUTION OF FERRIC ACETATE

A dark brownish-red liquid possessing an odour of Acetic Acid and an acid pungent taste.

Medicinal Properties—Has a diuretic in addition to a hæmaturic and astringent action, and being compatible with Potassium Acetate, is used in some cases of Bright's disease

In the treatment of either broncho or lobar-pneumonia (*B M J* '05, 1 812), the following prescription has yielded surprisingly good results. *Liquor Ferri Perchlor*, 15 minims, *Liquor Ammon Acet*, 2 drms, *Aqua Chloroformi*, to $\frac{1}{2}$ oz, every four hours when taken alone, or every six hours when alternated with the following Strychnine mixture—*Liquor Strychninæ*, 5 minims, *Chloroform Water*, to $\frac{1}{2}$ oz

Dose—5 to 15 minims = 0 3 to 0 9 cc

Not Official—*Tinctura Ferri Acetici Ætherea*

Incompatibles—The same as given under *Tinctura Ferri Perchloridi*

Foreign Pharmacopœias—Official in Russ and Swiss, sp gr 1 087 to 1 091 Not in the others

Solubility—Miscible in all proportions with Water and Alcohol (90 p c)

Tests—Solution of Ferric Acetate has a specific gravity of 1 031 to 1 035 It is officially required to answer the tests distinctive of Ferric salts, given under strong Ferric Chloride Solution, but it should be noted that this solution will not react with Potassium Sulphocyanide Solution except in the presence of a free mineral acid (not Phosphoric), neither will it liberate Iodine from Potassium Iodide Tannic Acid Solution yields a bluish-black coloration or precipitate Ammonium, Potassium or Sodium Hydroxide Solution produces a reddish-brown precipitate, soluble in Citric or Tartaric Acid Solution When heated with Sulphuric Acid and a little Alcohol (90 p c) the characteristic odour of Ethyl-Acetate is evolved When warmed with Sulphuric Acid alone it evolves a strong acetous odour

The more generally occurring impurities are Ammonium, Arsenic, Calcium, Copper, Lead, Sodium, Potassium, Zinc, Nitrates, Sulphates, and Ferrous salts Arsenic may be detected by the modified Gutzeit's test, Copper, Lead and Zinc by Hydrogen Sulphide in either acid or alkaline solution, Ammonium by the evolution of an odour of Ammonia when the liquor is warmed with Potassium or Sodium Hydroxide Solution, Calcium by the precipitate or cloudiness produced by Ammonium Oxalate Solution, Nitrates and Sulphates after the removal of the Iron, the former by the Ferrous Sulphate ring test, the latter by Barium Chloride Solution

Not Official

TINCTURA FERRI ACETICI ÆTHEREA (*Swiss*)—Solution of Iron Acetate (sp gr 1 087 to 1 091), 8, Alcohol, 1, Acetic Ether, 1 All by weight

Dose—10 to 20 minims = 0 6 to 1 2 c c

Official in Russ, the proportions being 9, 2, and 1 respectively

Not Official

FERRI ALBUMINAS

A liquor is official in the Dutch Pharmacopœia containing 0 25 p c of Ferric Oxide, and several other formulas have been proposed, but it is more convenient to use the commercial scale preparation, which is fairly soluble in Water, and contains 5 p c of Ferric Oxide

Medicinal Properties—Hæmatinic tonic Given with success in anæmia, and specially recommended in gastric ulcer—*T G* '86, 399, *L* '94, n 1113, '95, 1 1065, *B M J E* '94, 1 28, 96, *P*, l m 87

Dose—3 to 10 grains = 0 2 to 0 65 gramme

Foreign Pharmacopœias—Official in Dan, Dutch, Ger., Jap, Russ and Swiss (*Liquor Ferri Albuminati*), Swed (*Liquor Oxydi Ferrici Albuminati*) All containing 0 4 p c of Iron

LIQUOR FERRI ALBUMINATI—Dry Egg Albumen, 4, Solution of Ferric Oxychloride, 13, Alcohol (90 p c), 12, Aromatic Elixir (*U S P*), 40,

Solution of Sodium Hydroxide (*U S P*) and Distilled Water, *q s* of each to produce 100 — *U S N F*

This has been incorporated in the *B P C*, employing 12.5 of Alcohol (90 p c) in place of 12 of Alcohol (95 p c)

FERRATIN — A brown, tasteless powder, containing 7 p c of Iron, prepared from egg Albumen and Tatarated Iron in alkaline solution. Daily dose for children, 5 to 15 grains, and for adults, 20 to 30 grains — *P*, 11 427, *A J P* '94, 500, *B M J* '95, 1 985, *B M J E* '95, 11 16, '96, 1 8, *T G* '96, 40, *L* '96, 11 1820, *B M J E* '02, 11 11

Official in Russ

Alboferin (Iron Albuminate) — An almost odourless, brown powder, soluble in Water — *B M J E* '02, 1 68

Carniferrin — A compound of Iron with Phospho-carnic Acid. A brown powder containing about 30 p c of Iron

Fersan (Iron Paranucleo-proteid) — An Iron compound, obtained from red blood corpuscles, soluble in Water — *B M J E* '00, 11 20

Dose — 10 to 30 grains = 0.65 to 2 grammes

Ferri Alginas (Alginoid Iron) — A tasteless, brown powder, containing about 10 p c of Iron. Insoluble in Water, soluble in Ammonia. Recommended in anæmia — *P J* '98, 11 199, *B M J* '02, 1 723

Claimed (*M P* '05, 11 9) that this drug has two advantages over other compounds of Iron: (1) it does not derange digestion, (2) it does not cause constipation. Alginic Acid is a nitrogenous acid obtained from seaweed. It is best given in powder or cachets.

Dose — 2 to 15 grains = 0.13 to 1 gramme

Particularly useful in chlorosis with vomiting and pain in the stomach

FERRI PEPTONAS — A brown or reddish-brown powder, having a meaty and somewhat disagreeable odour. Readily soluble in Water

Dose — 5 to 10 grains = 0.32 to 0.65 gramme

LIQUOR FERRI PEPTONATI — Peptone, dry, 4, Solution of Ferric Oxychloride, 20, Alcohol, 12, Aromatic Elixir (*U S P*), 40, Solution of Sodium Hydroxide (*U S P*) *q s*, Distilled Water, *q s* to produce 100 — *U S N F*

This has been incorporated in the *B P C*

LIQUOR FERRI PEPTONATI CUM MANGANO — Ferric Peptonate, 4.5, Soluble Manganese Citrate, 0.8, Ammonia Water (*U S P*), 1.3, Aromatic Elixir, 5.0, Alcohol (95 p c), 15.00, Distilled Water, *q s* to produce 100 — *U S N F*

Manganese Chloride, 0.35, Solution of Iron Peptonate, *q s* to produce 100 — *B P C*

FERRI ARSENAS.

IRON ARSENATE

ARSENATE OF IRON — *B P* '85

Fr., ARSFNIATE DE FER, GER., ARSENSAURES EISENOXYDUL,
SPAN., ARSENIATO DE HIERRO

A tasteless, olive-green, amorphous powder, consisting of Ferric Arsenate, $\text{Fe}_3(\text{AsO}_4)_2 \cdot 6\text{H}_2\text{O}$, eq. 550.12, Ferric Arsenate and some Iron Oxide, and ' ' ' ' not less than 12½ p c of hydrous, equivalent to 10 p c of anhydrous Ferrous Arsenate

Medicinal Properties — Similar to those of Arsenous Acid, the quantity of Iron in the dose is extremely small

Dose — $\frac{1}{8}$ to $\frac{1}{4}$ grain = 0.004 to 0.016 gramme

Prescribing Note — *Best given in pill well triturated with Milk Sugar, and massed with a little Glucose*

Antidotes — *See Acidum Arseniosum*

Not Official — *Mistura Ferri Arsenicalis, Pilula Ferri Arsenicalis, Ferri Aisenio Citras Ammoniata, Injectio Ferri Aisenatis Solubilis*

Foreign Pharmacopœias — Official in Fr, Mex (*Aiseniato de Fierro*) and Span Not in the others

Tests — Iron Arsenate dissolves in Hydrochloric Acid, and the solution answers the tests distinctive of both Ferrous and Ferric salts given under Ferrum After separation of the Iron, the neutralised filtrate should yield a reddish-brown precipitate with Silver Ammonio-nitrate Solution, and a white crystalline precipitate with Magnesium Ammonio-sulphate It is officially required to indicate 10 p c of anhydrous or nearly 12½ p c of hydrous Ferrous Arsenate as determined by titration with Volumetric Potassium Bichromate Solution, using Potassium Ferricyanide Solution as an indicator, 1 gramme requiring at least 6.7 c c The solution in Hydrochloric Acid should yield no decided turbidity with Barium Chloride Solution, indicating the absence of more than a trace of Sulphates

Not Official

MISTURA FERRI ARSENICALIS — Arsenical Solution, 2 minims, Iron and Ammonium Citrate, 5 grains, Tincture of Calumba, 10 minims, Water, to 1 fl oz — *St Thomas's*

This has been incorporated in the *B P C*

Citrate of Iron and Ammonium, 8 grains, Arsenical Solution, 5 minims, Tincture of Calumba, 30 minims, Water, to 1 fl oz — *University*

Arsenical Solution, 5 minims, Iron and Ammonium Citrate, 6 grains, Infusion of Quassia, to 1 fl oz — *Guy's*

PILULA FERRI ARSENICALIS — Arsenious Anhydride, $\frac{3}{16}$ grain, Excised Ferrous Sulphate, 3 grains, Excipient, *q s* for one pill — *University*
Arsenious Acid, $\frac{1}{10}$ grain, Excised Ferrous Sulphate, 3 grains, Milk Sugar and Syrup of Glucose, *q s* for one pill — *B P C*

FERRI ARSENIO-CITRAS AMMONIATA — Green or yellowish green deliquescent scales, containing 1.4 p c Arsenious Acid and 15 to 18 p c of Iron Readily soluble in Water A valuable antiperiodic Best administered by subcutaneous injection

INJECTIO FERRI ARSENATIS — A neutral, sterilised solution, containing 2.5 p c of the above salt, specially prepared for hypodermic administration The dose, which is 1 c c, contains 0.0035 gramme Arsenious Acid and from 0.00375 to 0.0045 gramme of Iron

FERRI CACODYLAS — *See under Sodii Cacodylas*

Not Official

FERRI BROMIDUM

The commercial salt is in greyish white crystalline masses, coated with red insoluble Oxybromide, which amounts to about 0.5 p c

It generally contains about 18 p c of Water, corresponding nearly with the formula $\text{FeBr}_2 \cdot 3\text{H}_2\text{O}$, eq 347.29 When this is not allowed for, a Syrup or Liquor made from the solid Bromide, and calculated as if anhydrous, will be proportionately weaker than when made from Iron Wire

Foreign Pharmacopœias —Not in any

LIQUOR FERRI BROMIDI FORTIS —A clear green liquid Sp gr 1.554

Each fl dr̄m contains 36 grains of Iron Bromide FeBr_2 214.9)

This solution keeps well in a corked bottle, with Wire immersed in it, and on filtration gives a clear green liquid

With the addition of a small quantity of Hypophosphorous Acid, the Liquor will keep very well

Foreign Pharmacopœias —Official in Mex (Bromuro Ferroso) and Port (Brometo Ferroso), both solid, no solution Not in the others

SYRUPUS FERRI BROMIDI —Strong Solution of Iron Bromide (filtered), 1, Simple Syrup, 7, mix

Contains $4\frac{1}{2}$ grains of Iron Bromide in each fl dr̄m

Medicinal Properties —A tonic in anæmia and amenorrhœa

Syrupus Ferri Bromidi —Iron Wire free from oxide, 2.5, Bromine, 6, Refined Sugar, 70, Distilled Water, q s to yield 100 —B P C

It is not stated in the B P C whether the Bromine is by weight or measure, but as it is taken from the *Conference* formula, it is most probably by weight, and rather less Bromine is used in the B P C It was subsequently stated to be by weight

Each fl dr̄m contains about $4\frac{1}{2}$ grains of Ferrous Bromide

Dose —30 to 60 minims = 1.8 to 3.6 cc

SYRUPUS FERRI BROMIDI CUM QUININA —Acid Quinine Hydrobromide, $\frac{1}{2}$ oz, Diluted Hydrobromic Acid, 2 fl dr̄m, Distilled Water, 1 fl oz, dissolve the Quinine salt in the Acid and Water mixed, then add Syrup of Ferrous Bromide, q s to yield 12 $\frac{1}{2}$ fl oz —B P C

Dose —30 to 60 minims = 1.8 to 3.6 cc

1 fl dr̄m contains about $1\frac{1}{10}$ grains of Acid Quinine Hydrobromide, and about 4 grains Ferrous Bromide

It is rather stronger in Quinine than the *Conference* formula

SYRUPUS FERRI BROMIDI CUM STRYCHNINA —Strychnine 1 grain, Diluted Hydrobromic Acid, 70 minims, Syrup Ferrous Bromide, to 8 fl oz

60 minims contains $\frac{1}{10}$ grain of Strychnine

SYRUPUS FERRI BROMIDI CUM QUININA ET STRYCHNINA —Dissolve 1 grain of Strychnine, in powder, in 8 fl oz of the Syrup of Ferrous Bromide with Quinine given above —B P C

1 fl dr̄m contains about $\frac{1}{10}$ grain Strychnine, about $1\frac{1}{10}$ grains Quinine Acid Hydrobromide and about 4 grains Ferrous Bromide

Dose —30 to 60 minims = 1.8 to 3.6 cc

FERRI CARBONAS SACCHARATUS.

SACCHARATED IRON CARBONATE

FR, SACCHARURE DE CARBONATE FERREUX, GER, ZUCKERHALTIGES FERRO CARBONAT

Dull, greyish-brown, amorphous, odourless at first a sweet and subsequently a ferruginous taste stated to consist of Ferrous Oxy carbonate, $x\text{FeCO}_3, y\text{Fe(OH)}_2$, in a greater or less degree of oxidation, mixed with Sugar, the Ferrous salt, if reckoned as Ferrous Carbonate, FeCO_3 , eq 115.15, 33 $\frac{1}{3}$ p c of the mixture

A new method of preparing Saccharated Carbonate of Iron is recommended by Mr J H Franklin, he proposes the use of liquid Glucose instead of Sugar, the percentage of ferrous carbonate obtained is about double that obtained by the official process, and keeps perfectly in a well-closed bottle. It is useful in the preparation of pills, tablets and capsules—*P J '07*, n 114, 155

Medicinal Properties—An excellent chalybeate, readily taken and well borne. Not astringent. Useful in anæmia, and in anæmic forms of amenorrhœa, neuralgia and sciatica. Ferrous Carbonate, in the form of 'Blaud's Pills,' is a very popular medicine.

Dose—10 to 30 grains = 0.65 to 2 grammes

The above dose is equivalent to $3\frac{1}{2}$ to 10 grains = 0.216 to 0.65 gramme of Ferrous Carbonate

Prescribing Notes—*Given in cachets, lozenges, or pills. Sometimes ordered in the form of Powders to be taken on bread and butter. A good pill can be made by adding Dispensing Syrup q s. It can also be taken as an effervescent granule.*

Incompatibles—Acids and Acidulous salts, all Vegetable astringents

Official Preparations—*Mistura Ferri Composita and Pilula Ferri.* Although not actually prepared from the Saccharated Iron Carbonate, they are here grouped for comparison.

Not Official—*Massa Ferri Carbonatis, Pilulæ Ferri Carbonatis, Trochisci Ferri Carbonatis Saccharati, Ferri Oxidum Saccharatum*

Foreign Pharmacopœias—Official in Austr and Swiss (*Ferrum Carbonicum Saccharatum*), contains about 20 p.c. of Carbonate, Belg (*Carbonas Ferri Saccharatus*), 20 p.c., U.S. contains 15 p.c., Ger, Jap and Russ, 9.5 to 10 p.c. of Iron equal to about 20 p.c. of Carbonate, Norw (*Hydratocarbonas Ferrosus Saccharatus*). No Sugar Jap (*Ferrum Subcarbonicum*), and Mex (*Carbonato de Hierro*). Not in the others.

Tests—Saccharated Iron Carbonate dissolves with effervescence in diluted Hydrochloric Acid, and the solution yields with Potassium Ferrocyanide or Potassium Ferricyanide Solution a blue precipitate. It is officially required to contain about $33\frac{1}{2}$ p.c. of the Ferrous Salt if reckoned as Ferrous Carbonate, the *U.S.P.* preparation is required to contain not less than 15 p.c. of Ferrous Carbonate, and the *P.G.* from 9.5 to 10 p.c. of Iron, corresponding to 19.7 to 20.7 p.c. of Ferrous Carbonate. The *B.P.* employs Volumetric Potassium Bichromate Solution for the determination, and Potassium Ferricyanide Solution as an indicator, dissolving the Carbonate in warm concentrated Phosphoric Acid, notwithstanding it having been shown that warming on a water-bath even for 10 minutes introduced an error of 25 p.c. The *U.S.P.* dissolves the Carbonate in Diluted Sulphuric Acid and performs the titration with Tenth-normal Volumetric Potassium Dichromate Solution. The *P.G.* converts the whole of Ferrous salt into the Ferric condition, and determines the total Ferric Iron with Potassium Iodide Solution, titrating the liberated Iodine with Tenth-normal Volumetric Sodium Thiosulphate Solution.

A 2 p.c. solution of the Carbonate in sufficient Hydrochloric Acid to effect solution and ensure a slight excess of acid should yield no pronounced turbidity with Barium Chloride Test Solution.

Barium Nitrate (or Chloride)—A solution of Saccharated Iron Carbonate prepared as above should not give more than a slight cloudiness with T S of Barium Chloride, *U S P*. The *P G* requires that a solution of the Saccharated Iron Carbonate in Water (1-50) obtained by means of the least possible quantity of Hydrochloric should only be rendered slightly turbid by T S of Barium Nitrate, *P G*.

Volumetric Determination—The solution of 1 gramme of Saccharated Iron Carbonate in excess of warm concentrated Phosphoric Acid diluted with Water should require at least 29 c c of the Volumetric of Potassium Dichromate Solution, using Potassium Ferricyanide Solution as an indicator, *B P*, the solution obtained by dissolving 1.15 gramme in 10 c c of dilute Sulphuric Acid, diluted to about 100 c c with Water should require not less than 15 c c of Tenth-normal Volumetric Solution of Potassium Dichromate for complete titration, using Potassium Ferricyanide Solution as an indicator, *U S P*, the *P G* requires that 1 gramme be dissolved in 10 c c of dilute Sulphuric Acid without heat. To this is added solution of Potassium Permanganate (5-1000) until the faint transitory reddening just becomes permanent, then 2 grammes Potassium Iodide. The mixture is allowed to stand for one hour in a closed vessel at ordinary temperatures, and then titrated with Tenth-normal Volumetric Solution of Sodium Thiosulphate, for combination with the free Iodine 17 to 17.8 c c of Tenth-normal Volumetric Solution of Sodium Thiosulphate should be necessary.

Preparations

MISTURA FERRI COMPOSITA. COMPOUND MIXTURE OF IRON. *N O Syn*—GRIFFITH'S MIXTURE

Reduce 60 grains of Myrrh to powder, and mix it with 30 grains of Potassium Carbonate and 60 grains of Refined Sugar, form this into a smooth thin paste, by rubbing with a small quantity of Rose Water. Gradually add more Rose Water and 50 minims of Spirit of Nutmeg until the product measures 7 fl oz. Dissolve 25 grains of Ferrous Sulphate in 3 fl oz of Rose Water, and mix with the above.

It is convenient to keep the first part of the mixture ready made, and to add the Ferrous Sulphate solution when required for use.

Dose— $\frac{1}{2}$ to 1 fl oz = 14.2 to 28.4 c c

The following modification has been suggested by Mr J H Franklin—Saccharated Carbonate of Iron (with Glucose), 16 grains, Syrup of Glucose, 3 fl drms, Gum Acacia (in powder), 20 grains, Tincture of Myrrh, 4 fl drms, Spirit of Nutmeg, 50 minims, Rose Water to produce 10 fl oz. Reduce the Saccharated Carbonate of Iron to a fine powder, triturate with the Syrup of Glucose and continue the trituration with a few drops of Rose Water to form a smooth thin paste, gradually add more of the Rose Water, and add the Acacia diffused in the Tincture of Myrrh and Spirit of Nutmeg, finally making the product measure 10 fl oz with Rose Water.—*P J '07*, n 155, *C D '07*, n 180.

This has been incorporated in the *B P C* under the title **Mistura Ferri Carbonatis Composita**.

Foreign Pharmacopœias—Official in Dan, similar to Brit, but with three times as much Sugar, and without Nutmeg, Norw, without Nutmeg, with Peppermint Water, Swed, Emulsio Myrrhæ Ferratæ, with Peppermint Water and Tincture of Lavender in the place of Rose Water and Nutmeg, *U S* similar to Brit, but with Spirit of Lavender in the place of Nutmeg. Not in the others.

PILULA FERRI. IRON PILL

Mix 150 grains of Syrup, 10 grains of Glycerin and 20 grains of Distilled Water, with this incorporate 150 grains of Exsiccated Ferrous Sulphate, add 95 grains of Exsiccated Sodium Carbonate,

and mix quickly Allow 15 minutes for the salts to react, and make into a pill mass by the addition of 50 grains of powdered Gum Acacia and 15 grains of powdered Tragacanth

If divided into 5 grain pills, each pill will contain about 1 grain of Ferrous Carbonate

Dose—5 to 15 grains = 0.32 to 1 gramme

Pilula Ferri Carbonatis (*B P '85*)—Made with Saccharated Iron Carbonate, 4, Confection of Roses, 1, contains rather more Ferrous Carbonate than *Pilula Ferri* (*B P '98*)

The following modification has been suggested by Mr J H Franklin—Saccharated Carbonate of Iron (with Glucose), 648 grains, Liquorice Root (in powder), 162 grains, Liquid Glucose, 216 grains, Water, 54 grains Make a mass, and divide into pills weighing $2\frac{1}{2}$, 5 and $7\frac{1}{2}$ grains each—*P J '07*, 11 115

This has been incorporated in the *B P C*

Vallet's mass is made by precipitating and washing the Iron Carbonate, and mixing it with Honey and Milk Sugar to form a mass See below

Blaud's Pills are made by mixing (in the pill mass) dried Ferrous Sulphate and dried Potassium or Sodium Carbonate See below

Foreign Pharmacopœias—Official in Belg and Dutch (*Pilulæ Bland*), Dan and Norw (*Pilulæ Blandii*) also (*Pilulæ Ferri Compositæ*), Fr (*Pilules de Carbonate Ferreux*, formule de Vallet, and *Pilules de Carbonate de Fer composées*, *Pilule de Bland*, Ger and Jap (*Pilulæ Ferri Carbonici Blandii*), Austri (*Pilulæ Ferri Carbonici*), Ital (*Pillule di Carbonato Ferroso*) (*Pillule di Bland*) also (*Pillule di Vallet*) Mex (*Pildoras de Bland* and *Pildoras de Vallet*), Port (*Pilulas de Carbonato Ferroso*), Span (*Pildoras de Bland*), Swed (*Pilulæ Ferratæ Blandii* and *Pilulæ Myrihæ Ferratæ*), Swiss (*Pilulæ Ferratæ Blandii* and *Pilulæ Ferri Carbonici*) (*Pil Valletii*), US (*Pilulæ Ferri Carbonatis*) (*Blaud's Pills*), also (*Massa Ferri Carbonatis*) (*Vallet's Mass*) Not in the others

Not Official

MASSA FERRI CARBONATIS (*Vallet's Mass*)—Dissolve 100 of Ferrous Sulphate and 46 of Monohydrated Sodium Carbonate, each separately, in 200 of boiling Distilled Water, and, having added 20 of Syrup to the solution of the Iron salt, filter both solutions and allow them to become cold, gradually add the Iron solution to the Sodium solution in a 500 bottle, rotating it until Carbonic Acid gas no longer escapes Add Distilled Water, *q s* to fill the bottle, then cork it and set aside so that the Ferrous Carbonate may subside Pour off the supernatant liquid, and wash the precipitate with a mixture of Syrup 1, Water 19, by decantation until the washings no longer have a saline taste Drain and press, mix the precipitate at once with 38 of Clarified Honey and 25 of Sugar, and evaporate the mixture in a tared dish on a water-bath, with constant stirring, until it is reduced to 100—*U S*

PILULÆ FERRI CARBONATIS (*Blaud's Pills*)—Rub 8 grammes of Potassium Carbonate in a mortar with about 10 drops each of Glycerin and Water, then add 16 grammes of Ferrous Sulphate and 4 grammes of Sugar, previously triturated together to a uniform powder, and rub the mass thoroughly until it assumes a greenish colour When the reaction has terminated incorporate 1 gramme of Tragacanth and 1 gramme of Althæa, and, if necessary, a little more Water, so as to obtain a mass of pillular consistence Divide this into 100 pills—*U S*

TROCHISCI FERRI CARBONATIS SACCHARATI—Containing 3 grains of Saccharated Carbonate in each

Dose—1 to 3 lozenges

FERRUM OXIDUM SACCHARATUM (*Ger and Austri*)—A reddish-brown powder, with a sweet, slightly ferruginous taste, a mixture of Hydrated Ferric Oxide and Sugar, containing the equivalent of 2.8 p.c of Iron

Dose—5 to 15 grains = 0.32 to 1 gramme

FERRI ET AMMONII CITRAS.

IRON AND AMMONIUM CITRATE

Thin, translucent, deep ruby-red, odourless, deliquescent scales, with a ferruginous and somewhat astringent taste

Solubility—10 in 5 of Water, and measures $10\frac{1}{2}$, 2 dissolved in 3 of Water measure 4, almost insoluble in Alcohol (90 p c)

Medicinal Properties.—As a hæmatinic, it is a very effectual salt, and it possesses scarcely any astringency or tendency to cause gastric irritation or constipation, it may often be given when the stomach will not bear the more astringent preparations of Iron. It becomes moist if kept in paper.

A useful prescription for combating the anæmia which is often a marked feature of neurasthenia is Ferric Ammonium Citrate, 7 grains, Liquor Arsenicalis, 5 minims, Potassium Bromide, 10 grains, Liquor Ammon Acet, 1 drim, Chloroform Water, to 1 oz.—*B M J '06*, 1 494

Dose.—5 to 10 grains = 0.32 to 0.65 gramme

Prescribing Note—*Generally prescribed in solution with Tincture of Orange, which covers the taste well*

An Aqueous Solution, 2 fl oz representing 480 grains of the scale preparation, is convenient for dispensing, and keeps well

Incompatibles—Mineral Acids, Vegetable astringents, and fixed Alkalis

Official Preparation—Vinum Ferri Citratis

Not Official—Mistura Ferri cum Ammonia

Foreign Pharmacopœias—Official in U.S., Jap and Swiss (Ferrum Citricum Ammoniatum), Belg (Ferrum Citricum), Fr (Citrato de Fer Ammoniacal), Ital (Citrato di Ferro Ammoniacale), Mex (Citrato de Fierro Amoniacal), Norw (Citrato Ferrico-Ammonicus), Port (Citrato de Ferro Ammoniacal), Swed. (Citrato Ferricus), Swiss (Ferrum Citricum Ammoniatum), Span (Citrato Ferrico-Amónico) Not in the others. Ger has Ferrum Citricum Oxidatum

Tests.—Iron and Ammonium Citrate has a faintly acid reaction towards blue Litmus paper. When incinerated with free access of air it leaves a residue of 31 or 32 p c of Ferric Oxide. An aqueous solution when heated with an excess of Potassium Hydroxide Solution evolves the distinctive odour of Ammonia, and yields a brownish-red precipitate, and, if this precipitate be filtered off, the filtrate, when neutralised with Acetic Acid, yields on boiling with a little Calcium Chloride Solution a white precipitate.

Over and above the statement that when incinerated with free access of air it leaves 31 or 32 p c of Ferric Oxide, the *BP* gives no method for the detection of the Iron. The *USP* employs the Potassium Iodide process mentioned below, titrating the liberated Iodine with Tenth-normal Volumetric Sodium Thiosulphate Solution, using Starch Solution as an indicator. As thus determined, the percentage of metallic Iron should amount to not less than 16 p c, equivalent to not less than 22.8 p c of Ferric Oxide.

The more generally occurring impurities are fixed alkalis, Tartrates and Sulphates. Fixed Alkalis may be detected by the reaction

of the ash towards Litmus paper, it should not show an alkaline reaction towards red Litmus paper Tartrates are indicated by the appearance of a crystalline precipitate on the addition of an excess of Acetic Acid to the filtrate after removal of the Iron by boiling with Potassium Hydroxide Solution An aqueous solution should yield no pronounced turbidity with Barium Chloride Solution

Volumetric Determination—The *U S P* directs that 0.555 gramme of the salt be dissolved in 15 c.c. of Water and 2 c.c. of Hydrochloric Acid in a glass stoppered flask having a capacity of about 100 c.c., and 1 gramme of Potassium Iodide added The flask is then securely closed and the mixture kept at a temperature of 40° C (104° F) for half an hour and then cooled When titrated with Tenth-normal Volumetric Solution of Sodium Thiosulphate, using Starch T S as indicator, the mixture should require not less than 16 c.c. of the Volumetric Solution to discharge the colour of the liquid

Preparation

VINUM FERRI CITRATIS —WINE OF IRON CITRATE

Iron and Ammonium Citrate, 160 grains, Orange Wine, *q s* to yield 20 fl oz (1 grain in each fl dm)

Dose—1 to 4 fl drm = 3.6 to 14.2 c.c.

Official in Jap (*Vinum Ferri*), 1 in 50, **Mex** (*Vino de Fieiro*), 1 in 150, **Span** (*Vino Calibeado*), 1 and 200 of Malaga

Vinum Ferri (U S)—Iron and Ammonium Citrate, 4, Tincture of Sweet Orange Peel, 6, Syrup, 10, White Wine, *q s* to produce 100

Vinum Ferri Amarum, see p 517

Not Official

MISTURA FERRI CUM AMMONIA—Iron and Ammonium Citrate, 10 grains, Aromatic Spirit of Ammonia, 30 minims, Infusion of Quassia, to 1 fl oz—*King's*

Iron and Ammonium Citrate, 5 grains, Aromatic Spirit of Ammonia, 10 minims, Spirit of Chloroform, 5 minims, Infusion of Quassia, to 1 fl oz—*Royal Free*

FERRI ET QUININÆ CITRAS

IRON AND QUININE CITRATE

Thin, transparent, pale yellowish green, deliquescent scales possessing a bitter and ferruginous taste

It should be kept in well-closed vessels and protected as far as possible from the light

Solubility—2 in 1 of Water

Medicinal Properties—Bitter stomachic and tonic, combining the properties of both Iron and Quinine

63 grains contain 1 grain of Quinine

Dose—5 to 10 grains = 0.32 to 0.65 gramme

Prescribing Notes—Generally given in Mixture with Tincture of Orange and Spirit of Chloroform, or Syrup of Orange, or in Pills made with Alcohol (90 p.c.) *q s* It is sometimes prescribed with Potassium Citrate or Lithium Citrate, both of which have a tendency to throw out Quinine Citrate It can be given in the form of Effervescent Granules, dose one teaspoonful

For dispensing purposes, it is convenient to keep an aqueous solution, 2 fl oz = 480 g. ains of the salt

Incompatibles—Alkalis, then Carbonates and Citrates, Lithium Citrate, Tannic Acid, and vegetable astringents.

Not Official—Vinum Ferri Amatum, Vinum Ferri et Quininae, Ferri Quininae et Strychninae Citras, Ferri et Strychninae Citras

Foreign Pharmacopœias—Official in Austr (Ferrum Citricum Chinatum), Ger, Jap and Russ (Chininum Ferro-Citricum), Dan (Citras Ferricus cum Chinina), Noiw (Citras Ferricus cum Chinino) Port (Citrate de Ferro e de Quinina), Swed (Citras Ferrico Chinicus), Swiss (Chinino-Ferium Citricum), U S Not in the others U S has also Ferri et Quininae Citras Solubilis

Tests—Iron and Quinine Citrate dissolves readily in Water, yielding a solution which is very faintly acid in reaction towards blue Litmus paper. The aqueous solution yields with Potassium Hydroxide Solution a reddish-brown precipitate, and when heated evolves Ammonia (which fact is not noticed in *BP*), with Ammonia Solution it yields a white curdy precipitate, with Potassium Ferrocyanide and with Potassium Ferricyanide blue precipitates, with Tannic Acid a bluish black precipitate.

It is officially required to contain 15 p c of Ether-soluble alkaloid, which when neutralised by Sulphuric Acid should answer to the tests for Quinine Sulphate. No standard for the percentage of Iron is given. The *USP* requires the salt to contain not less than 11.5 p c of dried Quinine, and Ferric Citrate corresponding in amount to not less than 13.5 p c of metallic Iron. The *PG* preparation contains from 9 to 10 p c of Quinine, and is required to leave not less than 30 p c of Iron Oxide on ignition. An outline of the method adopted by the *BP* for the determination of the Quinine is given below. The extracted alkaloid is required to be almost entirely soluble in a little purified Ether, to leave but a minute residue on ignition, and, when neutralised by Sulphuric Acid, to answer the tests distinctive of Quinine Sulphate. The *USP* employs Chloroform as a solvent for the Quinine, and requires that the dried residue should conform to the reactions and tests for Quinine. The Iodometric method is adopted for the determination of the Iron, the determination being conducted on the liquid remaining after the removal of the Quinine. The *PG* employs Ether as a solvent in the Quinine determination. Allon has pointed out that in shaking out with Chloroform or Ether a considerable excess of Ammonia should be present, and the volume of the solvent should equal that of the ammoniacal liquid. The alkaloidal residue should be dried at 110° to 120° C (230° to 248° F) a constant weight being difficult to obtain at a water-bath temperature.

The more generally occurring impurities are fixed alkalis, which may be detected by the alkaline reaction of the residue left on ignition, and Tartrates, which yield a crystalline precipitate, when Acetic Acid is added in slight excess to the filtrate after removal of the Iron by precipitation with boiling Potassium Hydroxide Solution.

Gravimetric Determination—Dissolve a weighed quantity of 5 grammes of the salt in 45 c c of Water, add Ammonia Solution in slight excess, extract

the liberated alkaloid by repeated shakings with Ether. Separate the ethereal solutions, mix, evaporate to dryness, and when completely dried at 120° C (248° F), cool and weigh. The residue should amount to 0.75 gramme, *B P*, a weighed quantity of 1.11 gramme of the salt is dissolved in 20 c c of Water, transferred to a separator, rendered alkaline with 5 c c of Ammonia Solution, and the mixture shaken out for 1 minute with 10 c c of Chloroform. The chloroformic layer is separated and the agitation twice repeated with successive quantities each of 10 c c of Chloroform. The Chloroform solutions are mixed, transferred to a tared dish, the Chloroform evaporated spontaneously, the residue dried at 100° C (212° F) till constant in weight. It should weigh not less than 0.1276 gramme, which is equivalent to at least 11.5 p c of Quinine. The aqueous liquid from the above determination is freed from Chloroform by heating on a water bath until all ammoniacal and chloroformic odours have disappeared, cooled, and diluted with Water to 50 c c. A measured quantity of 25 c c is transferred to a glass stoppered flask capable of holding about 100 c c, 3 c c of Hydrochloric Acid and 1 gramme of Potassium Iodide added, the flask securely stoppered, and the mixture allowed to stand half an hour at 40° C (104° F). When cool not more than 13.5 c c of Tenth normal Volumetric Sodium Thiosulphate shall be required to discharge the colour of the liquid, Starch Solution being employed as an indicator. 1 c c of Tenth normal Volumetric Sodium Thiosulphate Solution indicating 1 p c of metallic Iron, *U S P*, a weighed quantity of 1 gramme of the salt is dissolved in 4 c c of Water, and sufficient Sodium Hydroxide Solution (15 p c) added to ensure a strongly alkaline reaction. The mixture is then shaken out three times in succession with 7 c c of Ether. The separated ethereal layers are mixed, evaporated to dryness, and the residue dried at 100° C (212° F). It should weigh at least 0.09 gramme, *P G*.

Not Official

VINUM FERRI AMARUM—Soluble Iron and Quinine Citrate, 5, Tincture of Sweet Orange Peel, 6, Syrup, 30, White Wine, *q s* to produce 100—*U S P*

VINUM FERRI ET QUININÆ—Iron and Quinine Citrate, 2, Detanated Sherry, *q s* to produce 100—*B P C*

Ferri, Quininæ et Strychninæ Citras, resembling the above but containing in addition 1 p c of Strychnine, and **Ferri et Strychninæ Citras** (*U S*), similar to the above but without Quinine, are both scale preparations, the doses of which are 2 to 5 grains = 0.13 to 0.82 gramme

Not Official

FERRI HYPOPHOSPHIS

There are two Iron Hypophosphites, the Ferrous and the Ferric. The latter is used in most of the American and other proprietary Syrups of the Hypophosphites. The Ferric salt has now replaced the Ferrous salt in the *B P C* preparations.

FERROUS HYPOPHOSPHITE, when freshly prepared, is a greenish crystalline powder, soluble about 1 in 10 of Water, but the commercial salts are so insoluble as to be practically useless for pharmaceutical purposes.

FERRIC HYPOPHOSPHITE—This compound is obtained as a white precipitate on adding a solution of a soluble Hypophosphite to one of Ferric Chloride containing as little free acid as possible.

It is fairly insoluble in Water, but with the addition of Potassium Citrate it dissolves readily to a green solution, which forms with Sugar a pale yellow *neutral* Syrup, permanent and unalterable by exposure to air, which may be combined with other soluble Hypophosphites, Quinine Hydrochloride, and Strychnine without the addition of acid, and is free from all the pharmaceutical objections attaching to Hypophosphite Syrups containing Iron in the ferrous condition.

Official in U.S.

It is usually sold as **Compound Syrup of Hypophosphites**, and is also made without Quinine to which it is added, who are peculiarly susceptible to that drug, it is then prescribed 'sine Quinina'.

LIQUOR FERRI HYPOPHOSPHITIS FORTIS — Solution of Ferric Sulphate, 14 2, Solution of Ammonia, 28, Citric Acid, 7 6, Sodium Hypophosphite, 9 6, Sodium Citrate, 6 6, Distilled Water *q s* and Chloroform Water (1 in 200) *q s* to produce 100 — *B P C*

This formula was devised (*Y B P* '07, 265) as an improvement on the old *B P C* method

The solution of Ferric Sulphate is diluted with an equal volume of Water and added to the solution of Ammonia also diluted with an equal volume of Water. After the precipitated Ferric Hydroxide has subsided sufficiently, wash it by decantation with Distilled Water until free from Sulphates, collect the precipitate and drain it, dissolve it in the Citric Acid previously dissolved in 20 c of Distilled Water by the aid of a water-bath. When the solution is clear add the Sodium Hypophosphite and continue the heat until a clear greenish solution is produced, then add Sodium Citrate, filter and pass sufficient Chloroform Water through the filter to make up 100 of product.

The *B P C Supplement* replaces the 14 2 of solution of Ferric Sulphate by 12 9 of Ferric Citrate.

LIQUOR HYPOPHOSPHITUM — Calcium Hypophosphite, 3 5, Sodium Hypophosphite, 2, Potassium Hypophosphite, 1 75, Citric Acid, 1 6, Water, *q s* to produce 100, dissolve and filter — *U S N F* 1896

This has been incorporated in the *B P C*

In *U S N F* 1906 the 1 6 of Citric Acid is replaced by 0 6 of Hypophosphorous Acid, *U S P*

Dose — 10 to 30 minims = 0 6 to 1 8 c c

LIQUOR HYPOPHOSPHITUM COMPOSITUS *Syn.* Liquor Hypophosphitis Compositus — Dissolve 320 grains of Calcium Hypophosphite, 320 grains of Sodium Hypophosphite, and 160 grains of Magnesium Hypophosphite in 12 fl oz of Distilled Water, add 6 fl oz of Strong Solution of Ferric Hypophosphite, filter, and add Distilled Water to make the product 20 fl oz — *B P C Formulary* 1901

Each fl drim = 2 grains each of Sodium and Calcium Hypophosphites, 1 grain Magnesium Hypophosphite, and 1½ grains of Ferric Hypophosphite

Dose — ½ to 2 fl drim = 1 8 to 7 1 c c

This has been incorporated in the *B P C* as follows — Calcium Hypophosphite, 8 5, Magnesium Hypophosphite, 1 75, Sodium Hypophosphite, 3 5, Strong Solution of Ferric Hypophosphite, 30, Distilled Water, sufficient to produce 100

SYRUPUS FERRI HYPOPHOSPHITIS — Strong Solution of Ferric Hypophosphite, 1, Syrup, 4 — *B P C Formulary* 1901, incorporated in the *B P C*

Each fl drim = about 1 grain of Ferric Hypophosphite

Dose — ½ to 2 fl drim = 1 8 to 7 1 c c

SYRUPUS HYPOPHOSPHITUM — Calcium Hypophosphite 4 5, Potassium Hypophosphite, 1 5, Sodium Hypophosphite 1 5, Distilled Hypophosphorous Acid, 0 20, Tincture of Fresh Lemon Peel, 0 5, Sugar, 65, Water, *q s* to make 100 — *U S P*

Dissolve the Hypophosphites in 45 of the Water, add the Tincture and the Acid, filter, and in the filtrate dissolve the Sugar without heat, make up to 100 with Water

This has been incorporated in the *B P C*

SYRUPUS HYPOPHOSPHITUM COMPOSITUS — Calcium Hypophosphite, 80 grains, Magnesium Hypophosphite, 40 grains, Potassium Hypophosphite, 40 grains, Citric Acid, 20 grains, Distilled Water, 8 fl oz of Chloroform Water, and 1 gr of Strychnine dissolved in 1 fl drim of Hypophosphorous Acid, and then 1 fl oz of Strong Solution of Ferric Hypophosphite, add 14 oz of Refined Sugar and dissolve without heat, add sufficient Chloroform Water to make 20 fl. oz. and strain through flannel. — *B. P. C.*

Each fl dr̄m contains $\frac{1}{150}$ grain Strychnine, and $\frac{1}{2}$ grain of Quinine Hypo phosphite

Dose — $\frac{1}{2}$ to 2 fl dr̄m = 18 to 71 cc

The employment of Potassium Citrate (1.033 gramme) in the place of Ammonium Citrate for dissolving the precipitated Ferric Hypophosphite, as originally recommended in the *Companion*, is also advocated — *P J '02*, 11 532

Syrupus Hypophosphitum Compositus — Rub 2.25 of Ferric Hypo phosphite and 2.25 of Manganese Hypophosphite with 3.75 of Sodium Citrate, add 30 cc of Water and warm the mixture for a few minutes, until a clear greenish solution is obtained. Dissolve 35 of Calcium Hypophosphite, 17.5 of Potassium Hypophosphite in a mixture of 450 cc of Water, and 5 cc of Diluted Hypophosphorous Acid, then dissolve 1.10 of Quinine and 0.115 of Strychnine in a mixture of 30 cc of Water and 10 cc of Diluted Hypophosphorous Acid, mix the solutions and finally dissolve in them 775 of sugar. Strain the Syrup, if necessary, and add Water *q s*, through the strainer, to produce 1000 cc — *U S*

Not Official FERRI IODIDUM

IRON IODIDE

FeI_2 , eq 307.40

In reddish brown, deliquescent dense masses, easily soluble in Water, leaving only a slight residue, and forming a reddish yellow solution owing to partial oxidation. The solution may be made green by either hot or cold digestion over bright Iron Wire.

Medicinal Properties — It combines the properties both of Iodine and Iron, and is a most valuable tonic and alterative in the treatment of scrofulous and syphilitic diseases.

Prescribing Notes — *Best given in the form of the official Syrup of Ferrous Iodide, it is also given in the form of pills massed with powdered Gum Acacia and Dispensing Syrup, q s. In some cases Liquorice Powder must be used instead of Dispensing Syrup.*

Official Preparation — Syrupus Ferri Iodidi

Foreign Pharmacopœias — Official in Mex (Yoduro Ferroso) and Port. Not in the others. Jap has Ferrum Iodati Saccharatum.

LIQUOR FERRI IODIDI FORTIS — A clear, greenish liquid.

Each fl dr̄m contains 44 grains of Ferrous Iodide ($\text{FeI}_2 = 307.40$). It can be diluted 1 to 7 with Syrup to prepare a Syrup of Iron Iodide, or with Water to make Liquor Ferri Iodidi the same strength as the Syrup.

With the addition of a small quantity of Hypophosphorous Acid, the solution will keep well for a long time, but in this case, when diluting with Syrup, it must be remembered that the official Syrup does not contain Hypophosphorous Acid.

The *B P C* gives a formula for the strong Liquor containing 7.5 pc of Diluted Hypophosphorous Acid (*U S P*).

Foreign Pharmacopœias — Official in Belg, Ger (Liquor Ferri Iodati), Russ and Swiss (Ferrum Iodatum Solutum), all contain 50 pc of Ferrous Iodide, Mex (Solucion oficial de Yoduro ferroso) 20 pc.

Incompatibles — Acids, Acid salts, Alkalis and their Carbonates, Lime Water, vegetable astringents.

PILULÆ FERRI IODIDI (U S) — Reduced Iron, 4 grammes, Iodine, 5 grammes, Glycyrrhiza, in No. 60 powder, 4 grammes, Sugar, in fine powder, 4 grammes, Extract of Glycyrrhiza, in fine powder, 1 gramme, Acacia, in fine powder, 1 gramme, Water, a sufficient quantity. To the Reduced Iron, contained in a small mortar, add 6 cc of Water, and then gradually the Iodine, constantly

tritulating, until the mixture ceases to have a reddish tint. Then add the remaining powders previously well mixed together, and mix the whole thoroughly. Transfer the mass to a porcelain capsule, and evaporate the excess of moisture, on a water-bath, with constant stirring, until the mass has acquired a pilular consistence. Coat with Balsam of Tolu dissolved in Ether. To make 100 pills.

Pilula Ferri Iodidi was official in *B P* '85, but omitted in 1898. It has been incorporated in the *B P C*.

Foreign Pharmacopœias—Official in Belg., Dan., Dutch, Fr., Ital., Mex., Norw., Port., Span., Swed. and Swiss, each pill contains about $\frac{3}{4}$ grain Iodide of Iron. Hung., about 1 grain, and all coated with Balsam of Tolu dissolved in Ether, except Dutch, which uses Tolu in Chloroform, and Swiss, not coated. Not in the others.

Official Preparation

SYRUPUS FERRI IODIDI. SYRUP OF FERROUS IODIDE

Iron Wire, $\frac{1}{2}$ oz., Iodine, 726 grains, Refined Sugar, $16\frac{1}{2}$ oz., Distilled Water, *qs* to produce 20 fl. oz. of a pale green Syrup containing 3 grains of Ferrous Iodide in 33 minims.

Dose—30 to 60 minims = 1 S to 3 C c.

This Syrup is very liable to become discoloured. It may be due to one or other of two causes: (1) Oxidation of Iron, which may be prevented by careful manipulation, or removed by Hypophosphorous Acid. (2) Slight caramelisation of the sugar by overheating, this cannot be removed by reducing agents.

Foreign Pharmacopœias—Official in Brit., 9.83 to 10 p.c. of Iron Iodide, Austr., Belg., Dan., Dutch, Ger., Jap., Russ., Span., Swiss and U.S., 5 p.c., Fr. and Port., 0.5 p.c., Hung., 12.2 p.c., Ital., 0.6 p.c., Mex., 1 p.c., Norw. and Swed., 10 p.c. All by weight.

The Brussels Conference agreed to a strength of 5 p.c. anhydrous Ferrous Iodide.

Tests.—Syrup of Ferrous Iodide has a specific gravity of 1.380 to 1.387, the *U.S.P.* syrup a specific gravity of about 1.349 at 25° C (77° F). When diluted with Water it affords with Potassium Ferricyanide Solution a dark blue precipitate. The diluted syrup mixed with Starch Solution yields on the addition of a little Chlorine Water a deep blue coloration. It is officially required to contain not less than 9.83 p.c. w/v, equivalent to 7.1 p.c. w/w, nor more than 10.14 p.c. w/v, equivalent to 7.31 p.c. w/w, of anhydrous Ferrous Iodide, as determined by decomposition of the Ferrous Iodide with Sodium Carbonate and titration of the exactly neutralised solution of Sodium Iodide with Volumetric Silver Nitrate Solution, using Potassium Chromate Solution as an indicator. The *U.S.P.* syrup is required to contain about 5 p.c. w/w, equivalent to 6.74 p.c. w/v of Ferrous Iodide. The Ferrous Iodide is estimated by indirect titration with Tenth-normal Volumetric Silver Nitrate Solution, the excess of Silver being titrated with Tenth-normal Volumetric Potassium Sulphocyanate Solution, Ferric Ammonium Sulphate Solution being used as an indicator. The standard of 5 p.c. w/w of anhydrous Ferrous Iodide is that suggested by the Brussels Conference for the unification of the pharmacopœial formulas for potent drugs. Several processes claiming to be improvements on the official method of determination have been suggested but do not appear to have been adopted.

The *BPC* in an explanatory footnote to the preparation stated that it contained 1 p c of Ferrous Iodide. This was obviously incorrect, and has since been rectified.

Volumetric Determination—A measured quantity of 10 c c (equivalent to 18.87 grammes) of the Syrup is introduced into a flask of 100 c c capacity containing 1 gramme of dried Sodium Carbonate dissolved in 10 c c of Water. The mixture is shaken until complete interaction has taken place, sufficient Water is added to bring the volume of the liquid to 100 c c, the whole mixed and filtered. A measured quantity of 25 c c of the filtrate is exactly neutralised with diluted Nitric Acid and titrated with Volumetric Silver Nitrate Solution, using Potassium Chromate Solution as an indicator. Not less than 16.0 nor more than 16.5 c c should be required. *BP* a weighed quantity of 10 grammes should be diluted with Water to 100 c c and 15.4 c c of the solution be mixed with 15 c c of Water, 6 c c of Tenth normal Volumetric Silver Nitrate Solution and 2 c c each of diluted Nitric Acid and Ferric Ammonium Sulphate Solution are added and the mixture thoroughly shaken. On titration with Tenth normal Potassium Sulphocyanate Solution not more than 1 c c should be required to produce a permanent reddish brown tint, 1 c c of Tenth normal Volumetric Silver Nitrate Solution corresponds to 1 p c of Ferrous Iodide, *USP*.

FERRIC CHLORIDE

NO Syn—CHLORETUM FERRICUM

The commercial solid, or crystalline, Ferric Perchloride approximates to the formula $\text{Fe}_2\text{Cl}_6 \cdot 12\text{H}_2\text{O}$, eq. 586.90, it occurs in yellow, or yellowish-brown, crystalline masses, deliquescent in air. It is soluble in Water, Alcohol (90 p c), Ether and Glycerin.

Medicinal Properties—A powerful local styptic. 3 grains to an oz of Water for a **spray**, 60 to 120 grains to an oz of Water or Diluted Glycerin (Glycerin 1 and Water 1) for a **paint**.

2½ oz dissolved in 1 oz of Water makes a solution about the same strength as Liquor Ferri Perchlor. Fort.

For **Incompatibles**, see Tinctura Ferri Perchloridi.

The Anhydrous Ferric Chloride (Fe_2Cl_6 , eq. 322.84), prepared by sublimation, is in black metallic looking plates. It deliquesces rapidly on exposure to the air, and then solidifies again to a Hydrate ($\text{Fe}_2\text{Cl}_6 \cdot 12\text{H}_2\text{O}$), containing almost 40 p c of Water. Another Hydrate ($\text{Fe}_2\text{Cl}_6 \cdot 5\text{H}_2\text{O}$), containing 21.7 p c of Water (official in the Portuguese Pharmacopœia), can be obtained by evaporating an acid solution until syrupy, and then cooling it.

Foreign Pharmacopœias—Official in Austri. and Hung. (Ferrum Sesquichloratum Crystallisatum), Dan., Dutch, Norw. and Swed. (Chloretum Ferricum), Mex. (Cloruro Ferrico), Port. (Chloreto Ferrico Anhydrido), also Crystallizado, Ger., Jap. and Russ. (Ferrum Sesquichloratum), Span. (Cloruro Ferrico) (Anhydrous and the Hydrate), Swiss (Ferrum Sesquichloratum), U.S. (Ferri Chloridum).

FERRI PERCHLORIDI LIQUOR FORTIS.

STRONG SOLUTION OF FERRIC CHLORIDE

A dark reddish-brown liquid, possessing a powerfully styptic taste, readily miscible with Water, and Alcohol (90 p c)

Medicinal Properties—A powerful local styptic and astringent, escharotic. The more dilute forms are used internally to arrest hæmorrhage in the gastro-intestinal or urinary tracts. See also 'Tinctura Ferri Perchloridi,' p 524

The liquor (not fortis) in $\frac{1}{2}$ drm doses thrice daily for hæmorrhagic gastric oozing—*L* '06, ii 1189

Official Preparations—Liquor Ferri Perchloridi and Tinctura Ferri Perchloridi

Not Official—Glycerinum Ferri Perchloridi, Liquor Ferri Chloroxydi, Liquor Ferri Dialysatus, Liquor Ferri Oxychlorati, Mistura Ferri Amara, Mistura Ferri Aromatica, Mistura Chalybeata, Mistura Ferri cum Magnesi Sulphate, Mistura Ferri Subchloridi, Tinctura Ferri Chlorati Ætherea, and Tinctura Ferri Muratis

Foreign Pharmacopœias—Official in Austr, sp gr 1 280 to 1 290 (10 p c of Iron), Belg, sp gr 1 28 (29 p c Iron Chloride), Dan and Swed, sp gr 1 298 to 1 302 (10 p c of Iron), Dutch, sp gr 1 470 to 1 482 (75 p c of Iron Chloride), Fr, Port and Span, sp gr 1 260 (about 9 p c of Iron), Jap and Norw, sp gr 1 280 to 1 282 (10 p c of iron), Mex, sp gr 1 260 (26 p c of anhydrous Iron Chloride), Swiss, sp gr 1 280 to 1 290 (about 10 p c of Iron), Ger, Hung and Russ sp gr 1 280 to 1 282 (10 p c of Iron), Ital, sp gr 1 29 (10 p c of Iron, 29 p c Iron Chloride), U S, sp gr 1 315 at 25° C (10 p c of Iron, 29 p c Iron Chloride)

Tests—Strong Solution of Ferric Chloride has, *BP*, a specific gravity of about 1 42, but there is a difference between the Pharmacopœia figure for Oxide and this. The *USP* Liquor has a specific gravity of 1 280 to 1 290 at 25° C (77° F), the *PG* Liquor 1 280 to 1 282. The diluted solution answers the tests distinctive of Ferric salts given under Ferrum. Silver Nitrate Solution produces in the diluted solution, acidified with Nitric Acid, a white curdy precipitate, insoluble in Nitric Acid, but readily soluble in Ammonia Solution. It is officially required to indicate 32 0 p c w/v of Iron Oxide, which is equivalent to 39 8 p c of anhydrous Ferric Chloride. The *USP* preparation is required to contain not less than 29 p c of Ferric Chloride, corresponding to 10 p c of metallic Iron. The method of determination adopted by the *BP* is a gravimetric one. The Iron is precipitated as Hydroxide, ignited and weighed as Oxide, the precipitate obtained by adding an excess of Ammonia Solution to a measured quantity of 5 c c diluted with 80 c c of Water, when well washed and dried should leave a residue weighing 1 6 grammes. The *USP* process is volumetric, and is described below. The amount of Oxide yielded by the *BP* process has been shown (*CD* '99, ii 220, '00, ii 163, *YBP*, '99, 361, *PJ*, '99, ii 44, 63, 133, '00, ii 106) to be at variance with the specific gravity. A sample made strictly in accordance with the *BP* gave 1 604 grammes of Iron Oxide per 5 c c, but possessed a specific gravity of 1 480 instead of 1 42.

The more generally occurring impurities are Ammonium, Arsenic, Calcium, Copper, Lead, Potassium, Sodium and Zinc, Nitrates and Ferrous salts. Of these the more important are Arsenic, Copper, Lead and Zinc. Arsenic may be detected by Bettendorf's test with Stannous Chloride Solution, Copper and Zinc by Hydrogen Sulphide, using the filtrate after removal of the Iron by Ammonia Solution, or by Potassium Ferrocyanide Solution after removal of the Iron with excess of Ammonia Solution, Lead by precipitation as Sulphate.

Nitrates are examined for by the Ferrous Sulphate test, and Ferrous salts with Potassium Ferrocyanide Solution.

A test for Oxychloride with Tenth-normal Volumetric Sodium Thiosulphate Solution is given in the *PG* and *USP*. Each of these tests is given in small type below.

Zinc Iodide Starch Solution—Strips of paper soaked with Zinc Iodide Starch Solution should not be coloured blue when brought near to Liquid Ferric Sesquichloride, *PG*.

Potassium Ferrocyanide—Diluted Solution of Ferric Chloride yields a dark blue precipitate with T.S. of Potassium Ferrocyanide, *PG* and *USP*. If 5 c.c. of Ferric Chloride Solution diluted with 20 c.c. of Water be mixed with excess of T.S. of Ammonia and the mixture filtered a colourless filtrate should be obtained, which when supersaturated with Acetic Acid should not be affected by T.S. of Potassium Ferrocyanide, *PG*.

Potassium Ferricyanide—Solution of Ferric Chloride diluted with 10 parts of Water and acidulated with Hydrochloric Acid should not produce a blue coloration with T.S. of Potassium Ferricyanide, *PG*. The *USP* directs that a few drops of freshly prepared T.S. of Potassium Ferricyanide be added to a diluted portion of Solution of Ferric Chloride (1-20), a pure brown colour should be produced which should not turn green or greenish blue at once—*USP*.

Sodium Thiosulphate—Three drops of Ferric Chloride Solution heated slowly to boiling with 10 c.c. of Tenth normal Volumetric Solution of Sodium Thiosulphate should not give a precipitate of Ferric Hydroxide, *USP* and *PG*.

Residue—If to Ferric Chloride Solution (5 c.c. diluted with 20 c.c. of Water, *PG*) there be added excess of T.S. of Ammonia, and the mixture filtered, a colourless filtrate should be obtained which should not yield a weighable residue on evaporation and gentle ignition, *USP* and *PG*.

Hydrogen Sulphide—A portion of the filtrate obtained as described in the Residue test above should not yield a precipitate with T.S. of Hydrogen Sulphide, *USP*.

Barium Nitrate—Another portion of this filtrate should not be affected by T.S. of Barium Nitrate, *PG*.

Ferrous Sulphate—A third portion of 2 c.c. of this filtrate, mixed with 2 c.c. of Sulphuric Acid and 1 c.c. of T.S. of Ferrous Sulphate carefully poured over this as a layer, should not give a brown ring, *PG*. The *USP* directs that a clear crystal of Ferrous Sulphate be added to a cooled mixture of equal volumes of Sulphuric Acid and a diluted portion of Solution of Ferric Chloride Solution (1-10), the crystal should not become coloured brown, nor should a brownish-black colour develop around it.

Stannous Chloride—A mixture of 1 c.c. of Ferric Chloride Solution and 3 c.c. of T.S. of Stannous Chloride should not assume a dark colour in the course of an hour, *PG*.

Volumetric Determination—The *USP* gives the following instructions: 10 grammes of the Solution are diluted to measure 100 c.c. and 11.1 c.c. of this mixture are introduced into a glass stoppered bottle of 100 c.c. capacity, together with 10 c.c. of Water and 2 c.c. of Hydrochloric Acid. 1 gramme of

Potassium Iodide is then added and the mixture kept at a temperature of 40°C (104°F) for half an hour, then cooled and mixed with a few drops of T S of Starch. The mixture when titrated with Tenth-normal Volumetric Solution of Sodium Thiosulphate should require not less than 20 c c of the Volumetric Solution to discharge the blue or greenish colour, 1 c c of the V S is equivalent to 0.5 p c of metallic Iodine.

Preparations

LIQUOR FERRI PERCHLORIDI. SOLUTION OF FERRIC CHLORIDE

Dilute 1 of Strong Solution of Ferric Chloride with Distilled Water to make 4 of a liquid, sp gr 1.110 (1 in 4)

Dose—5 to 15 minims = 0.32 to 1.0 gramme

This solution and the 'Tincture of Ferric Chloride' contain identical proportions of Ferric Chloride, for 'Prescribing Notes' see below

TINCTURA FERRI PERCHLORIDI.—TINCTURE OF FERRIC CHLORIDE *NO Syn*—STEEL DROPS TINCTURE OF STEEL

Mix 1 of Strong Solution of Ferric Chloride with 1 of Alcohol (90 p c), and add Distilled Water to make 4 (1 in 4)

Medicinal Properties.—Astringent, tonic, hæmostatic. Given in passive hæmorrhage and to arrest hæmorrhage in typhoid. As a general tonic during convalescence, highly useful in anæmia, valuable in large doses for faecal and for erysipelatous inflammations. A rectal injection of 60 minims of the Tincture in half a pint of Water kills thread-worms.

Recommended (*L* '04, 11 1178, 1248, 1415), not only in puerperal septicæmia, but also in local and general septic infection occurring in gynecological practice. 15 to 25 minims every two hours strongly recommended in blood poisoning.—*L* '04, 11 1318.

If Potassium Iodide be added to an aqueous solution of Potassium Citrate, and Tincture of Ferric Chloride added, a yellowish-green solution is obtained, containing no free Iodine, and remaining permanent for months at least. This is suggested (*CD* '05, 11 971, *PJ* '05, 11 861) as a means of overcoming the incompatibility of Potassium Iodide and Ferric Chloride solutions.

Dose—5 to 15 minims = 0.3 to 0.9 c c

Prescribing Notes.—Preparations of Iodine can be given in Infusion of Quassia, or Calumba, but they tinge Infusion of Chiretta and Hops, and change to brown or black those of Cusparia, Gentian, Orange, Cascarella, Cinchona, Cloves, Digitalis, and all astringent infusions.

Glycerin is better than an equal quantity of Syrup for masking the unpleasant astringent taste of Ferric Chloride Solutions. Chloroform Water is also useful.

Equal volumes of Liquor Ferri Perchloridi and Glycerin forms a good paint in faecal inflammation.

Styptic Wool, containing Ferric Chloride, is useful for local application.

Incompatibles.—Alkalies and their Carbonates, Lime Water, Calcium Carbonate, Magnesia, Salicylates, Mucilage of Acacia.

Foreign Pharmacopœias.—Official in Dan, Norw and Swed (Solutio Chloreti Ferrici Spirituosa), Dan and Swed, also (Solutio Chloreti Ferrici Spirituoso-Ætherea), Ger and Russ (Tinct Ferri Chlorati Ætherea), US (Tinctura Ferri Chloridi), Port, from the salt, with Alcohol and Ether, Ital (Soluzione Alcolico-Ætherea di Cloruro Ferrico), and in the Soluor with Alcohol and Ether, Swiss (Spiritus Æthereus Ferri). None in the others. See also 'Tinctura Ferri Chlorati Ætherea'.

Tests—Tincture of Ferric Chloride has a specific gravity of 1.085 to 1.089, contains about 12 p c w/v of total solids and about 22 p c w/v of Absolute Alcohol. It yields with Ammonia Solution a reddish brown voluminous precipitate, with Potassium Ferrocyanide Solution a blue precipitate, and with Silver Nitrate Solution a white curdy precipitate, insoluble in Nitric Acid. The *USP* Tincture has a specific gravity of about 1.005 at 25° C (77° F), and contains not less than 13.28 p c of anhydrous Ferric Chloride, corresponding to 4.6 p c of metallic Iron.

Tinctura Ferri Sesquichloridi PL—Tinctura Ferri Murialis P.E.—There is an idea, which periodically finds its way into print, that a Tincture made according to the formula of the London and Edinburgh Pharmacopœias is more efficacious than the *BP*, and can be given in cases where the other is not tolerated. From a chemical point of view the only difference is that *PL* is three-fourths the strength of *BP*, and when freshly made contains one-fifteenth of the Iron in the Ferrous condition. Alcohol has no reducing action on Ferric Chloride, even after years of contact.

Liquor Ferri Chloroxydi and **Liquor Ferri Dialysatus** have been much used as palatable, non-astringent, and non-irritant hæmatics, given in cases where the astringent salts would derange the stomach.

Not Official

LIQUOR FERRI CHLOROXYDI—A solution in Water of a basic Ferric Chloride, containing 0.8 p c of Chlorine for 5 p c of Ferric Oxide, approximating to the formula $\text{Fe}_2\text{Cl}_6 \cdot 7\text{Fe}_2\text{O}_3$. This is the ratio of the Solution made by us many years previous to the use of 'Dialysed Iron'. It was and is still made to contain 7.1 p c of Ferric Oxide to correspond with the official Tincture.

Dose—10 to 30 minims = 0.6 to 1.2 c c

LIQUOR FERRI DIALYSATUS (Dialysed Iron)—This was formerly official in *BP*, but is now omitted. It contains 5 p c of Ferric Oxide, and was dialysed until nearly tasteless. It is better to work to a definite percentage of Chlorine, it may be reduced to 0.3 p c without interfering with the stability of the solution. It is very doubtful, however, whether there is any advantage in reducing the Chlorine ratio below that of **Liquor Ferri Chloroxydi** as described above.

Another method is to add a certain proportion of diluted Ammonia Solution to a solution of Ferric Chloride, so that the precipitate which first forms just redissolves. The Ammonia becomes Ammonium Chloride and the Iron a very basic Oxychloride, from which the Ammonium salt is readily dialysed. Where a saving of expense is an object, as in some large institutions, it would probably be equally efficacious without dialysis.

Dose—10 to 30 minims = 0.6 to 1.8 c c

Foreign Pharmacopœias—Official in Austr (*Ferrum Hydroxydatum Dialysatum Liquidum*); Ger, Hung, Russ and Swed, when **Liquor Ferri Oxidati Dialysati** is prescribed, **Liquor Ferri Oxychlorati** (sp gr 1.050) may be dispensed, Belg and Swiss (*Ferrum Oxychloratum Solution*), sp gr 1.05, Mex (*Oxido de Hierro Dialysado*), sp gr 1.046. Not in the others.

Liquor Ferri Oxychlorati—Dilute Ferric Chloride Solution 85, with 160 of Distilled Water, and pour into a mixture of Ammonia Water 85 and Distilled Water 920, wash, press, and dissolve the precipitate in 8 of Hydrochloric Acid, finally warming it to about 40° C and dilute the solution with Distilled Water until it has a sp gr 1.05. *Ger* *Jap* has the same formula, but employs 2.5 of Hydrochloric acid (80 p c) in place of the *PG* (25 p c).

Liquor Ferri Oxychloridi—Solution of Ferric Chloride (*USP*), 85, by weight, Ammonia Water (*USP*), 85, by weight, Hydrochloric Acid (*USP*), 2.85, by weight, Water, *qs* to produce 100 by weight—*USNF*.

Strong Solution of Ferric Chloride (*B P*), by weight, 22 50, Solution of Ammonia (*B P*), by weight, 35 00, Hydrochloric Acid (*B P*), by weight, 2 35, Distilled Water, *q s* to produce by weight 100—*B P C*

Both of the above are stated to correspond in strength with **Liquor Ferri Oxychlorati**—*P G*

GLYCERINUM FERRI PERCHLORIDI—Solution of Ferric Chloride, 1 fl oz, Glycerin, 1 fl oz—*Middlesex and University*
Ferric Chloride, 1, Glycerin, 4—*Guy's*

MISTURA FERRI AROMATICA—Solution of Ferric Chloride, 10 minims, Aromatic Spirit of Ammonia, 20 minims, Syrup, 40 minims, Water, to 1 fl oz—*St Thomas's*

Dose—1 fl oz Mix with the Syrup the Iron Solution, and add the Aromatic Spirit previously diluted with the Water

This has been incorporated in the *B P C* under the title **Mistura Ferri Ammoniata**

MISTURA CHALYBEATA—Solution of Ferric Chloride, 15 minims, Syrup, 80 minims, Infusion of Quassia, to 1 fl oz—*St Thomas's*

Dose—1 fl oz

This has been incorporated in the *B P C* under the title **Mistura Ferri Amara** with the *syn* **Mistura Chalybeata**

Mistura Ferri Amara—Solution of Perchloride of Iron, 20 minims, Spirit of Chloroform, 5 minims, Infusion of Quassia, to 1 fl oz—*Loch*

MISTURA FERRI CUM MAGNESII SULPHATE—Solution of Ferric Chloride, 15 minims, Magnesium Sulphate, 20 grains, Glycerin, 40 minims, Infusion of Quassia, to 1 fl oz—*St Thomas's*

Dose—1 fl oz

This has been incorporated in the *B P C*

MISTURA FERRI SALINA—Potassium Citrate, 22 grains, Solution of Ferric Chloride, 24 minims, Chloroform Water, to 1 fl oz—*University*

Dose— $\frac{1}{2}$ to 1 fl oz

SYRUPUS FERRI SUBCHLORIDI—Iron Wire, 300 grains, Hydrochloric Acid, 2 fl oz, Citric Acid, 10 grains, Distilled Water, 10 fl drms, Syrup, *q s* to produce 20 fl oz—*B P '85*

Dose— $\frac{1}{2}$ to 1 fl drms = 1 8 to 3 6 cc

This has been incorporated in the *B P C*

TINCTURA FERRI CHLORATI ÆTHEREA—Iron Chloride Solution, 1, Ether, 2, Alcohol (90 p c), 7 All by weight—*Ger, Ital and Jap*

FERRI PERNITRATIS LIQUOR.

SOLUTION OF FERRIC NITRATE

A reddish-brown liquid, readily miscible with Water It contains Ferric Nitrate, $\text{Fe}_2\text{6NO}_3$, eq 480 68, in solution

Medicinal Properties.—Tonic, astringent and escharotic Like the Ferric Chloride it is useful in hæmatemesis and in 'pyrosis' from the bowel, either by the mouth or as an injection with starch mucilage

Dose.—5 to 15 minims = 0 3 to 0 9 cc

110 minims contain $3\frac{1}{2}$ grains of Iron, 100 cc. contain 3 3 grammes

Foreign Pharmacopœias —Not in any

Tests —Ferric Nitrate Solution has a specific gravity of 1.107 to 1.109. It should answer the tests distinctive of Ferric salts given under Ferrum. The diluted solution, when mixed with an equal volume of Sulphuric Acid, keeping the liquid cool meanwhile, yields a dark-brown ring when a solution of Ferrous Sulphate is gently floated on to the surface of the liquids. It is officially required to yield 4.6 p.c. w/v of Iron Oxide, when a measured quantity of 5 c.c. is precipitated with Ammonia Solution in excess, and the precipitate is washed, dried, ignited, and weighed, the residue amounting to 0.23 gramme. It should be free from the impurities mentioned under Liquor Ferri Perchloridi Fortis, Nitrates excepted.

FERRI PHOSPHAS.

IRON PHOSPHATE

A dull, greyish-blue, amorphous, odourless powder, which is officially required to contain not less than 47 p.c. of Hydrrous Ferrous Phosphate, $\text{Fe}_2(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$, eq. 498.48 together with Ferric Phosphate and Iron Oxide.

Solubility —Insoluble in Water, but soluble in Hydrochloric Acid.

Medicinal Properties —A valuable hæmatinic tonic. Given in anæmia, in amenorrhœa, some forms of dyspepsia, rachitis and tubercular bone diseases, in nervous depression and exhaustion with tendency to phosphaturia, and during convalescence.

Dose —5 to 10 grains = 0.32 to 0.65 gramme.

Prescribing Notes —*Given in cachets, pills, or powders. A good pill can be made by adding one third of its weight of 'Diluted Glucose'.*

Official Preparations —Syrupus Ferri Phosphatis, Syrupus Ferri Phosphatis cum Quinina et Strychnina.

Not Official. —Syrupus Triplex, Syrupus Tres, Elixir Ferri Quinina et Strychnina Phosphatum, Glyceritum Ferri Quinina et Strychnina Phosphatum, Pilula Ferri Quinina et Strychnina Phosphatum, Liquor Ferri Phosphatis Fortis, Pilula Trium Phosphatum, Syrupus Ferri Phosphatis Compositus, Squire's Chemical Food, Syrupus Ferri Phosphatis c. Manganeseo Ferri Phosphas Solubilis, Ferri Pyrophosphas Solubilis.

Foreign Pharmacopœias —Official in Spain (Fosfato de Hierro), U.S. (Soluble Ferric Phosphate), Mex. (Fosfato Ferrico - Ferrico). Not in the others.

Tests —Iron Phosphate dissolves in Hydrochloric Acid, yielding a solution which gives with Potassium Ferrocyanide and with Potassium Ferricyanide Solutions the tests distinctive of Ferric and Ferrous salts given under Ferrum. On the addition of Tartaric Acid and an excess of Ammonia Solution it yields on the subsequent addition of Magnesium Ammonio-sulphate Solution a white granular precipitate. It is officially required to contain not less than 47 p.c. of hydrrous Ferrous Phosphate, as determined by the titration of a solution of 1

gramme in Hydrochloric Acid, with Volumetric Potassium Bichromate Solution, using Potassium Ferricyanide Solution as an indicator, at least 28.2 cc of the Volumetric Solution should be necessary. Arsenic may be present as an impurity, and may be tested for by the Bettendorff's test.

Preparations

SYRUPUS FERRI PHOSPHATIS. SYRUP OF FERROUS PHOSPHATE

Iron, in Wire, 75 grains, Concentrated Phosphoric Acid, 1½ fl oz, Syrup, 14 fl oz, Distilled Water, q s to make 20 fl oz of a pale green syrupy liquid, containing 1 grain of anhydrous Ferrous Phosphate in 60 minims.

Dose —½ to 1 fl dm = 18 to 36 cc

This Syrup can be conveniently made by adding 1 volume of Liquor Ferri Phosphatis Fortis to 5½ vols of Simple Syrup and 1½ vols of Distilled Water.

Ferrous Phosphate absorbs Oxygen with great rapidity on exposure to air, and requires such a large excess of Acid to keep it in solution that in framing a formula for Syrupus Ferri Phosphatis a compromise must be made between liability to deposit on the one hand and acidity on the other. We think it is better to use a comparatively small excess, and keep the Syrup in small bottles lying down.

SYRUPUS FERRI PHOSPHATIS CUM QUININA ET STRYCHNINA. SYRUP OF PHOSPHATE OF IRON WITH QUININE AND STRYCHNINE

Iron, in Wire, 75 grains, Concentrated Phosphoric Acid, 1½ fl oz, Quinine Sulphate, 130 grains, Syrup, 14 fl oz, Distilled Water, q s to make 20 fl oz of a pale yellowish-green syrupy liquid, possessing a very bitter taste, and having a strong fluorescence, it contains 1 grain of anhydrous Ferrous Phosphate, ½ grain of Quinine Sulphate, and ⅓ grain of Strychnine in 60 minims.

Dose —½ to 1 fl dm = 18 to 36 cc

It resembles the compound known as Easton's Syrup.

It can be made extemporaneously by dissolving 2 grains of Strychnine and 51 grains of Quinine Sulphate in 24 minims of Concentrated Phosphoric Acid and Distilled Water to 1½ fl oz, Liquor Ferri Phosphatis Fortis, 1 fl oz, Syrup, to make 8 fl oz.

This formula has been incorporated in the *BPC* under the title *Liquor Quininæ et Strychninæ*.

Foreign Pharmacopœias —Official in U.S. Not in the others.

A mixture of Easton's, Fellows' and Parrish's Syrups is sold as 'Triple Syrup'.

Syrupus Triplex —Syrupus Ferri Phosphatis Compositus, 2 fl oz, Syrupus Ferri T. 1 fl oz, Syrupus Eastoni, 1 fl oz —*Pharm. Form.* The Syrupi Tres of the *Edinburgh Royal Infirmary* is the same.

Martindale (1904) and *BPC* (1907) give the proportions as an equal volume of each.

Not Official.

ELIXIR FERRI QUININÆ ET STRYCHNINÆ PHOSPHATUM. —Soluble Ferric Phosphate, 1.75, Strychnine, 0.0275, Phosphoric Acid, 0.20, Ammonium Carbonate, 0.90, Alcohol (95 p.c.), 6.00; Acetic Acid,

2 865, Ammonia Water, *q s*, Distilled Water, *q s*, Aromatic Elixir, *q s* of each to produce 100—*U S P*

Average Dose—1 fl dr̄m = 3 6 c c

This has been incorporated in the *B P C* with slight modification

Soluble Iron Phosphate, 1 75, Quinine, 0 875, Strychnine, 0 0285, Concentrated Phosphoric Acid, 0 25, Ammonium Carbonate, 0 90, Alcohol, 6 25, Acetic Acid, 2 75 Solution of Ammonia, Distilled Water and Aromatic Elixir, *q s* of each to produce 100—*B P C*

In the *B P C Supplement* the 1 75 of Soluble Iron Phosphate is replaced by 1 35 of Ferric Citrate, and sufficient Sodium Phosphate to give the solution a distinctly green coloration

GLYCERITUM FERRI QUININÆ ET STRYCHNINÆ PHOSPHATUM (*U S*)—Soluble Ferric Phosphate, 8, Quinine, 10 4, Strychnine, 0 08, Phosphoric Acid, 20, Glycerin, 50, Water, *q s* to make 100—*U S P*

The **Average Dose**, 15 minims, contains about 1½ grains of Ferric Phosphate, 1½ grains of Quinine, ⅛ grain of Strychnine

This has been incorporated in the *B P C*

It is used for preparing Syrupus Ferri Quininae et Strychninae Phosphatum, *U S P*, by mixing Glycerite 1 with Syrup 3, but the Syrup so produced is very different from the corresponding preparation in the *B P* It contains in each fl dr̄m about 1½ grains of Ferric Phosphate, 1½ grains of Quinine, ⅛ grain of Strychnine

LIQUOR FERRI PHOSPHATIS FORTIS—Containing 8 grains per fl dr̄m of the Anhydrous Phosphate, is made by dissolving 360 grains of Iron Wire in 6 fl oz of Concentrated Phosphoric Acid, with sufficient Water to make 12 fl oz

PILULA FERRI QUININÆ ET STRYCHNINÆ PHOSPHATUM—Ferrous Phosphate, 1 grain, Quinine Sulphate, 1 grain, Strychnine, ⅛ grain, Milk Sugar, 1½ grains, Concentrated Phosphoric Acid, *q s* for one pill—*Martindale*

It is also made half this strength, and either may be combined with Arsenious Acid ⅛ grain—*Martindale*

Pilulae Ferri Phosphatis cum Quinina et Strychnina. *Syn.* **EASTON'S PILLS**—In 100 parts, Ferrous Phosphate, 20, Quinine Sulphate, 20, Strychnine, 0 62, Milk Sugar, a sufficient quantity, Concentrated Phosphoric Acid, *q s* to form a mass Divide into pills containing 2 grains each—*B P C*

Note—Easton's Pills are sometimes made twice the size specified above, and they may be ordered with the addition of ⅛ grain of Arsenious Acid—*B P C*

Although the *B P C* form resembles that of *Martindale*, it is not nearly so definite in strength

Pilula Trium Phosphatum **EASTON'S PILL**—Iron Phosphate, 1 grain, Quinine Sulphate, 1 grain, Strychnine, ⅛ grain, Concentrated Phosphoric Acid, 1½ minims, Liquorice Powder, to 4 grains—*Guy's*

SYRUPUS FERRI PHOSPHATIS COMPOSITUS—Iron Wire, free from Oxide, 87½ grains, Concentrated Phosphoric Acid (sp gr 1 5), 1 fl oz, Distilled Water, 5 fl dr̄m, dissolve by a gentle heat in a flask plugged with Cotton-Wool, the Iron being completely covered by the liquid

Precipitated Calcium Carbonate, 120 grains, Concentrated Phosphoric Acid, 4 fl dr̄m, Distilled Water, 2 fl oz, mix, and add Potassium Bicarbonate, 9 grains, Sodium Phosphate, 9 grains, filter, and set aside

Cochineal, 30 grains, Distilled Water, 7½ fl oz, boil for 15 minutes, and when cooled filter, pouring over the filter a sufficient quantity of Distilled Water to produce 7 fl oz of filtrate to this add Refined Sugar, 14 oz, heat till dissolved, and strain When cold, add the Iron and Calcium Solutions and sufficient Distilled Water to produce 20 fl oz—*B P C Formulary* 1901

This has been incorporated in the *B P C*, employing 288 minims of Orange Flower Water in place of that quantity of Distilled Water in the quantities given above, but the *B P C Supplement* has since altered the quantity to 480 minims

Each fl drm = $\frac{1}{2}$ grain Ferrous Phosphate and $\frac{1}{4}$ grain Calcium Phosphate with small quantities of Potassium and Sodium Phosphates. It should be kept in bottles quite full.

Dose — $\frac{1}{2}$ to 2 fl drm = 18 to 71 cc

SYRUPUS FERRI PHOSPHATIS COMPOSITUS, SQUIRE (Squire's Chemical Food) — The preparation, made for many years by Squire, was imported and subsequently purchased by Squire.

It contains Ferrous Phosphate, Calcium Phosphate, Sodium Phosphate and Potassium Phosphate.

Dose — $\frac{1}{2}$ to 1 teaspoonful, in Water, with meals.

A formula was published many years ago, but how far this has been a success is shown by comparing the Syrups commercially sold, all of them more or less empirically stated to be made according to the published formula.

In nine samples analysed, the Iron Phosphate ranged from 0.19 to 0.66, the Calcium Phosphate from 0.5 to 1.6, the total Phosphoric Acid from 1.5 to 4.7, these results are expressed in grains per fl drm.

Medicinal Properties — A tonic in debility, of whatever origin, and during convalescence from acute diseases. Specially indicated in tuberculosis and rickets, and during pregnancy.

SYRUPUS FERRI PHOSPHATIS C MANGANESIO — Dissolve 100 grains Manganese Phosphate in $1\frac{1}{2}$ fl oz of Liquor Ferri Phosphatis Fortis and 80 minims of Phosphoric Acid, then dilute to 20 fl oz with Simple Syrup.

This Syrup will contain in each fl drm $\frac{1}{2}$ grain each of anhydrous Ferrous Phosphate and anhydrous Manganese Phosphate.

Dose — 1 fl drm = 86 cc

This can sometimes be taken when Syrup of Ferrous Phosphate disagrees.

FERRI PHOSPHAS SOLUBILIS Soluble Ferric Phosphate (*U S*) — Prepared by dissolving Ferric Citrate and Sodium Phosphate in Distilled Water, evaporation and scaling on plates of glass. The scales are transparent and of a bright green colour, freely soluble in Water, they, however, become dark and discoloured on exposure to air. It is used in the preparation of Elixir Ferri Quininae et Strychninae Phosphatum (*U S*), Glyceritum Ferri Quininae et Strychninae Phosphatum (*U S*), and Syrupus Ferri Quininae et Strychninae Phosphatum (*U S*) (from Glycerite).

FERRI PYROPHOSPHAS SOLUBILIS Soluble Ferric Pyrophosphate (*U S*) — Prepared by dissolving Ferric Citrate and Sodium Pyrophosphate in Distilled Water, evaporation and scaling on plates of glass. The scales are transparent and of an apple green colour, freely soluble in Water.

FERRI SULPHAS.

FERROUS SULPHATE

FER, SULFATE DE PROTOXIDE DE FER OFFICINAL, GER, FERROSULFAT, ITAL, SOLFATO FERROSO, SPAN, SULFATO FERROSO

$\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$, eq 276.10

Large, translucent, pale green, octonuclear monoclinic prisms, having a saline, styptic, ferruginous taste.

Ferrum Sulphuricum Præcipitatum (*Austri*), resembles the Ferri Sulphas Granulata of *BP '85*, omitted in 1898. It is obtained by pouring an aqueous solution of Ferrous Sulphate into Alcohol (90 p c).

Solubility. — 1 in $1\frac{1}{2}$ of Water, the solution rapidly oxidises on exposure, insoluble in Absolute Alcohol or Alcohol (60 p c), hence it cannot be dissolved in Tinctures.

Medicinal Properties —A powerful astringent and a hæmâtinic tonic, but is apt to irritate the stomach. Internally it is given in anæmia, amenorrhœa, and general debility, along with Quinine it promotes the appetite, given with cathartics, such as Magnes Sulph and Aloes, to increase their action, but at the same time reduce their dose, externally it is used as a lotion for ulceration and erysipelatous surfaces, 3 to 5 grains in an oz of Water, also as an injection for urethral and vaginal inflammations and prolapse of rectum.

Dose —1 to 5 grains = 0.06 to 0.32 gramme

Prescribing Notes —*Given in solution or more generally pill form, to avoid gastric irritation. The Dried Sulphate is best in pills, 8 grains, which are equal to 5 of the crystallised salt, make a nice pill with 'Diluted Glucose'.*

Liquor Ferri Persulphatis is an excellent styptic. 2 grains of Ferrous Sulphate, 30 grains of Magnesium Sulphate, 5 minims of Diluted Sulphuric Acid, Chloroform Water or Peppermint Water to 1 oz, occurs in Hospital formulas as Mistura Ferri Aperiens.

Official Preparations —Ferri Sulphas Exsiccatus and Liquor Ferri Persulphatis. See also 'Ferrum'.

Not Official —Liquor Ferri Subsulphatis (Monsel's Solution), Mistura Ferri et Magnesi Sulphatis, Mistura Ferri Aperiens, Monsel's Salt, Gossypium Ferratum, and Ferri et Ammonii Sulphas.

Foreign Pharmacopœias —Official in Belg, Dan, Dutch, Fr, Ger, Hung, Ital, Jap, Norw, Port, Russ, Span, Swed, Swiss and U.S., Mex (Sulfato Ferroso), Fr, Ger, Jap, Russ and Swiss have a Crude Sulphate, Austr has a Precipitated Sulphate, U.S. a Granulated Sulphate.

Tests —Ferrous Sulphate should dissolve to form a clear solution in less than 2 parts of cold Water. The aqueous solution answers the tests distinctive of Ferrous salts given under the heading of Ferrum. Acidified with Hydrochloric Acid its solution yields with Barium Chloride Solution a white precipitate insoluble in Hydrochloric Acid.

It is officially required to contain 99.4 p.c. of crystallised Ferrous Sulphate as determined by titration with Volumetric Potassium Bichromate Solution, using Potassium Ferricyanide Solution as an indicator. The *U.S.P.* salt is required to contain not less than 99.5 p.c. pure Ferrous Sulphate. The processes of determination are compared in the small type below under the heading of Volumetric Determination.

The more generally occurring impurities are Ammonium, Copper, Potassium, Sodium and Zinc, and Ferric salts. They are best detected by oxidising the aqueous solution with Nitric Acid and precipitating the Iron as Ferric Hydroxide with Ammonia Solution. The filtrate should not be blue in colour nor yield a precipitate on the addition of Hydrogen Sulphide, indicating the absence of Copper and Zinc, another portion of the filtrate evaporated to dryness and ignited should not leave a weighable residue, indicating the absence of Potassium and Sodium salts. The *B.P.* uses Hydrogen Sulphide as a test for Ferric salts. It should dissolve 1 in 1½ of Water as stated above, and the solubility of the sample in less than 2 parts of cold Water is officially included as a test for the absence of Oxysulphate.

Hydrogen Sulphide—If 2 grammes of the salt in aqueous solution be added to 10 c.c. of Bromine Water, and excess of T S of Ammonia be added to the mixture, the filtrate from this mixture should be colourless and should not be affected by T S of Hydrogen Sulphide, *P G*. This test is also given in the *USP*. 1 gramme of the salt dissolved in 25 c.c. of Water containing 1 c.c. diluted Sulphuric Acid is heated to boiling and oxidised with Nitric Acid. A slight excess of T S of Ammonia is then added and the mixture filtered. A colourless filtrate is obtained which should not respond to the time-limit test for heavy metals. The colourless filtrate obtained as in the preceding test should not on evaporation and ignition leave a weighable residue, *P G* and *USP*.

Volumetric Determination—An aqueous solution of 1 gramme of Iron Sulphate acidified with Sulphuric Acid requires at least 36 c.c. of Volumetric Solution of Potassium Bichromate, *BP*, the *USP* directs that 1.38 grammes of the salt in uneffloresced crystals be dissolved in 25 c.c. of dilute Sulphuric Acid and the solution titrated with Tenth-normal Volumetric Solution of Potassium Permanganate, not less than 49.75 c.c. of the Volumetric Solution should be necessary to impart a permanent pink colour to the liquid.

Preparations

FERRI SULPHAS EXSICCATUS. EXSICCATED FERROUS SULPHATE. DRIED SULPHATE OF IRON—*BP '85*

Ferrous Sulphate, submitted to a temperature of 100° C (212° F), until it ceases to lose aqueous vapour, reduce to a fine powder and keep in dry, well-stoppered bottles. It should be slowly but completely soluble in Water.

Dose— $\frac{1}{2}$ to 3 grains = 0.032 to 0.20 gramme

3 grains are equal to 5 grains of Ferrous Sulphate

Foreign Pharmacopœias—Official in Dan and Swed, dried at 104° to 122° F (40° to 50° C), Ger, Swiss and U.S., dried at 212° F (100° C), Dutch, Fr; Russ and Span, no temperature given. Not in the others.

Tests—Dried Ferrous Sulphate dissolves slowly but completely in Water, the solution answers the tests distinctive of Ferrous salts given under Ferrum. The 1 in 20 aqueous solution acidified with Hydrochloric Acid yields with Barium Chloride Solution a white precipitate insoluble in Hydrochloric Acid. It is officially required to contain at least 92.5 p.c. of dried Ferrous Sulphate of the official formula, as determined by titration with Volumetric Potassium Bichromate Solution, using Potassium Ferricyanide Solution as an indicator. The processes of the *BP* and *P G* are compared below under the heading of Volumetric Determination. It should, of course, be free from the impurities mentioned under Ferrous Sulphate, but *BP* does not say so. A standard suggested for Arsenic (*CD '08*, 1796) is 2 parts per million.

Volumetric Determination—A solution of 1 gramme of the salt in water acidified with Sulphuric Acid requires at least 54.6 c.c. of the Volumetric Solution of the Potassium Bichromate. This corresponds to at least 92.5 p.c. of Exsiccated Ferrous Sulphate $\text{FeSO}_4 \cdot \text{H}_2\text{O}$, *BP*, the *P G* gives the following directions—Let 0.2 gramme of the salt be dissolved in 10 c.c. of diluted Sulphuric Acid and the solution mixed with Solution of Potassium Permanganate (5-1000) until a faint reddening occurs. After the colour is destroyed, which may be effected if necessary by a few drops of Alcohol, 2 grammes of Potassium Iodide are added and the mixture is allowed to stand for 1 hour at ordinary temperature in a closed vessel. It is then titrated with Tenth-normal

Volumetric Solution of Sodium Thiosulphate, of which at least 10 c c should be necessary for the combination of the free Iodine, *P G*

LIQUOR FERRI PERSULPHATIS. SOLUTION OF FERRIC SULPHATE

Ferrous Sulphate, 16, Sulphuric Acid, $1\frac{1}{2}$, Nitric Acid, $1\frac{1}{2}$, Distilled Water, *q s* to make 22 of a reddish-brown liquid, sp gr 1.441, miscible with Water and Alcohol (90 p c)

Introduced for making several preparations of Iron which are enumerated under 'Ferrum,' p 504

Foreign Pharmacopœias—Official in Ital, Jap and Swiss, sp gr 1.428 to 1.430, Russ, sp gr 1.426 to 1.430, U S, sp gr 1.430 to 1.450 at 25° C (77° F) Not in the others

Tests—Ferric Sulphate Solution is officially required to possess a specific gravity of 1.441. Its diluted aqueous solution should answer the tests for Ferric salts given under Ferrum. It should yield when diluted with 10 times its volume of Water a brown but no pronounced blue coloration with Potassium Ferricyanide Solution, indicating the absence of more than a trace of Ferrous salt. It should not decolorise Potassium Permanganate Solution. It is officially required to yield 1.04 grammes of Iron Oxide, as gravimetrically determined by precipitation as Hydroxide with Ammonia Solution, washing, drying and incinerating. The *U S P* Liquor is required to contain 36 p c of Normal Ferric Sulphate [$\text{Fe}_2(\text{SO}_4)_3$ eq 397.05], corresponding to not less than 10 p c of metallic Iron. The *U S P* employs a volumetric Iodometric method for the determination of Iron. The respective processes are compared in small type below under the headings Gravimetric and Volumetric Determinations.

The liquor should be free from the impurities mentioned under Ferrous Sulphate.

Potassium Ferricyanide.—A small portion of the solution diluted with about 10 volumes of Water should yield with a few drops of freshly-prepared T S of Potassium Ferricyanide a pure brown colour without a tinge of green or greenish-blue, *U S P*.

Sulphuric Acid.—If 2 volumes of the solution be slowly mixed with 1 volume of concentrated Sulphuric Acid in a beaker, no solid white mass should separate, *U S P*.

Ferrous Sulphate and Sulphuric Acid.—If a crystal of Ferrous Sulphate be added to a diluted portion of the solution (about 1-10), mixed with an equal volume of concentrated Sulphuric Acid and cooled, the crystal should not become brown nor should a brownish-black colour develop around it, *U S P*.

Gravimetric Determination—The reddish brown precipitate produced when a measured quantity of 5 c c of the Liquor diluted with 80 c c of Water is treated with Ammonia Solution in excess, should, when washed, dried, ignited, cooled and weighed amount to 1.04 grammes, *B P*.

Volumetric Determination—A weighed quantity of 1.11 gramme is introduced into a glass stoppered bottle of about 100 c c capacity together with 15 c c of Water and 2 c c of Hydrochloric Acid. 1 gramme of Potassium Iodide is added and the mixture kept at a temperature of 40° C (104° F) for half an hour, then cooled and titrated with Tenth normal Volumetric Sodium Thiosulphate Solution using Starch Solution as an indicator, not less than 20 c c shall be required to discharge the blue or greenish colour of the liquid. 1 c c of Tenth normal Thiosulphate = 0.5 p c w/w metallic Iron, *U S P*.

Not Official.

MISTURA FERRI ET MAGNESII SULPHATIS—Sulphate of Iron, 8 grains, Magnesium Sulphate, 30 grains, Dilute Sulphuric Acid, 5 minims, Distilled Water, to 1 fl oz—*Royal Free*

Ferrous Sulphate, 2 grains, Magnesium Sulphate, 20 grains, Diluted Sulphuric Acid, 10 minims, Water, to 1 fl oz—*King's*

Mistura Ferri Aperiens—Ferrous Sulphate, 2 grains, Magnesium Sulphate, 30 grains, Diluted Sulphuric Acid, 2 minims, Peppermint Water, to 1 fl oz—*University*

LIQUOR FERRI SUBSULPHATIS (U S)—An aqueous solution of basic Ferric Sulphate, corresponding to not less than 13.57 p c of Iron. It is known as **Monsel's Solution**

Monsel's Salt is produced by evaporating and scaling the solution

GOSSYPIUM FERRATUM—Moisten Cotton-Wool with Glycerin, then steep the damp Wool in a solution of Ferrous Sulphate, 1 part to 2 parts of Water, squeeze out as much as possible of the liquid, and, without drying, pack the prepared wool into a bottle furnished with a glass stopper

FERRI ET AMMONII SULPHAS Ammonio Ferric Alum—Iron Alum is an Alum in which Iron takes the place of Aluminium. Pale violet octahedral crystals, which are efflorescent. It should contain 99.5 p c of pure uneffloresced Ferric Ammonium Sulphate

Solubility—Soluble 1 in 3 of Water, insoluble in Alcohol (90 p c)

It is used in bleeding from the kidneys, it arrests the hæmorrhage and the anæmia that accompanies it, it is considered more astringent than Alum

The aqueous solution will, even after filtration, deposit unless slightly acidified with Diluted Sulphuric Acid

Dose—5 to 10 grains = 0.32 to 0.65 gramme

Foreign Pharmacopœias—Official in U S

Tests—Ferric Ammonium Sulphate dissolved in Water yields a blue precipitate with Potassium Ferrocyanide Solution and a brownish-red precipitate with Potassium Hydroxide Solution, followed by the evolution of Ammonia gas on warming. The aqueous solution gives with Barium Chloride Solution a white precipitate insoluble in Hydrochloric Acid. A weighed quantity of 0.555 gramme of the uneffloresced crystals is dissolved in 15 c c of Water and 2 c c of Hydrochloric Acid, in a 100 c c glass stoppered flask, 1 gramme of Potassium Iodide is added, the flask securely fastened, the mixture kept for half an hour at 40° C (104° F), and then cooled, not less than 11.5 c c of Tenth-normal Volumetric Sodium Thiosulphate Solution should be required to discharge the colour. 1 c c of Tenth-normal Thiosulphate = 1 p c of metallic Iron

FERRUM REDACTUM.**REDUCED IRON**

FR, FER REDUIT PAR L'HYDROGÈNE, GER, REDUZIRTES EISEN, ITAL, FERRO RIDOTTO DALL' IDROGENA, SPAN, HIERRO REDUCIDO POR EL HIDROGENO

A fine, tasteless powder, possessing a dull iron-grey metallic appearance, and strongly attracted by a magnet. It is officially required to contain at least 75 p c of metallic Iron, with a variable amount of Iron Oxide. It is prepared by the reduction of Ferric Hydroxide, at a dull red heat, by dry Hydrogen

With reference to the keep of Reduced Iron, it may be noted that, under ordinary atmospheric conditions, a sample containing 91.5 p c of Iron, loosely covered with paper to keep out dust, lost only 1 p c of metallic Iron in a month

Medicinal Properties—Hæmatinic Given in chlorosis and amenorrhœa

As Hydrogen is evolved by its contact with the acid gastric secretion, flatulence may be set up

Dose—1 to 5 grains = 0.065 to 0.32 gramme

Prescribing Notes—*Given in powder, pill, or in lozenges. Pills containing Reduced Iron have a tendency to crack. An excellent pill can be made by mixing Reduced Iron 24 grains, Liquorice Powder 6 grains, Glycerin of Tragacanth 6 grains, and dividing into 12 or more pills as desired.*

Official Preparation—Trochiscus Ferri Redacti

Foreign Pharmacopœias—Official in Austri, Belg., Dan., Dutch, Fr., Ger., Hung., Ital., Jap., Mex., Norw., Port., Russ., Span., Swed., Swiss and U.S.

Tests—Reduced Iron dissolves in Hydrochloric Acid, and Hydrogen gas is at the same time evolved. The solution thus yielded gives the tests distinctive of Ferrous salts given under Ferrium, and on oxidation with Nitric Acid the tests distinctive of Ferric salts also given under Ferrium.

It is officially required to contain at least 75.48 p.c. of metallic Iron as determined by the titration with Volumetric Potassium Bichromate Solution of the Ferrous Sulphate produced when an excess of Copper Sulphate in solution is decomposed by a weighed quantity of Reduced Iron, Potassium Ferricyanide Solution being used as an indicator. The equivalent amount of Copper is precipitated from a hot solution of 1 gramme of Copper Sulphate in 15 c.c. of Water by the addition of a weighed quantity of 0.25 of a gramme of the Reduced Iron, 10 minutes is allowed for the completion of the reaction. The resulting solution of Ferrous Sulphate is filtered with as little exposure to the air as possible and acidified with Sulphuric Acid, it should require at least 33.7 c.c. of Deci-normal Volumetric Bichromate Solution. Both *USP* and *PG* employ Iodometric methods, which are described below in small type under the heading Volumetric Determination. The *BP* 1898 raised the percentage of metallic Iron from 50 to at least 75.5 p.c., but there is no difficulty in obtaining Reduced Iron containing over 90 p.c. of metal. It has been pointed out (*CD* '99, ii 214, *PJ* '99, ii 109) that the Copper Sulphate method is not satisfactory, and that either one of the other two methods tried is to be preferred (these were the Iodometric process and the 'Mercuric Chloride' process official in the *US* '90, which have now been abandoned in favour of the Iodine method).

The *BP* does not include specific tests for impurities, with the exception of Sulphur, which is officially stated to be recognised by an odour of Hydrogen Sulphide during solution, both *USP* and *PG* employ Lead Acetate paper. The more generally occurring impurities, other than the above, are Arsenic, Copper, Silica, Carbon, and alkali Carbonates. Arsenic may be detected by the modified Gutzzeit's test, after the preliminary precipitation indicated below, or by the Bettendorf's test. It has been suggested that a limit of Arsenic should be included in the *BP*. The *USP* adopts a limit of 1 in 100,000. A limit of 0.05 p.c. has been suggested (*CD* '01, ii 242), and this standard is upheld (*YBP* '03, 242). It is stated (*CD* '08, i 796)

that a standard of 0.02 p.c. appears to be a sufficiently stringent limit for Arsenic in Reduced Iron. Copper may be detected by Hydrogen Sulphide in a solution rendered faintly acid with Hydrochloric Acid, or it may be detected by oxidising the Ferrous salt to the Ferric condition, precipitating the Iron as Ferric Hydroxide with Ammonia Solution and examining the filtrate. The limit might be fixed at 1 in 5,000. Silica and Carbon may be detected by the residue insoluble in Hydrochloric Acid, which should not amount to more than 1 p.c. Alkali salts may be detected by the reaction towards red Litmus paper of the water with which the sample has been shaken, and by the residue left on evaporation of the same after filtration.

Stannous Chloride—Let 0.2 gramme of Reduced Iron and 0.2 gramme of Potassium Chlorate be mixed with 2 c.c. of Hydrochloric Acid in a large test glass, and after the reaction ceases the mixture be warmed until free Chlorine is expelled. The solution is then filtered. 1 c.c. of the filtrate so obtained, with the addition of 3 c.c. of T.S. of Stannous Chloride, should not assume a dark colour in the course of an hour, *P. G.*

Modified Gutzet's Test—The *U.S.P.* gives the following instructions for treating Reduced Iron before proceeding to test for Arsenic.—To 0.5 gramme of Reduced Iron contained in a small covered beaker, add 20 c.c. of diluted Sulphuric Acid. After the reaction has somewhat subsided, warm the liquid on a water-bath until the reaction ceases, then collect any minute undissolved residue of impure Iron Arsenide upon a very small filter, rinse the beaker with Water, add the rinsings to the filter, and wash the residue with Water until free from acid reaction. Transfer the residue to the beaker by rinsing it back, and after adding about 0.25 gramme of Potassium Chlorate and 5 c.c. of Hydrochloric Acid evaporate the solution slowly to dryness on a water-bath. Dissolve the residue in sufficient Water to measure 50 c.c., then add 5 c.c. of this solution to 5 c.c. of a saturated Solution of Sulphurous Acid and heat the liquid on a water-bath for fifteen minutes, until all traces of Sulphurous Acid have been removed. The resulting solution should not respond to the modified Gutzet's test for Arsenic.

Volumetric Determination—A weighed quantity of 0.555 gramme of Reduced Iron is introduced into a 100 c.c. flask containing about 2.6 grammes of Iodine, the weight of which is subsequently accurately recorded, 6 c.c. of Water and 2 grammes of Potassium Iodide are added, the flask is securely stoppered and set aside for one hour, sufficient Distilled Water is added to measure exactly 100 c.c., mixed well, and 25 c.c. of this solution removed, and after the addition of a few drops of Starch Test-solution it is titrated with Tenth-normal Volumetric Sodium Thiosulphate Solution. The weight of Iodine taken is divided by 0.02518, the quotient subtracted from twice the number of c.c. of Tenth-normal Volumetric Sodium Thiosulphate Solution used, and the remainder represents the percentage of Iron in the sample. Instead of employing the official Iodine for the test the percentage of purity of the Iodine may be ascertained by a separate experiment, and the equivalent quantity of pure (100 p.c.) Iodine may be used instead of the 2.6 grammes referred to above, *U.S.P.*

A weighed quantity of 0.3 gramme of finely-powdered Reduced Iron is mixed with 10 c.c. of T.S. of Potassium Iodide, and into this mixture is gradually introduced 1.5 grammes of powdered Iodine, cooling and shaking. As soon as the Iron and Iodine are completely dissolved, the liquid is diluted with Water to 100 c.c., allowed to stand and deposit. A measured quantity of 50 c.c. of the clear Solution is filtrated with Tenth-normal Volumetric Solution of Sodium Thiosulphate, of which not more than 10.3 c.c. should be necessary for combination with the free Iodine, *P. G.*

Preparation

TROCHISCUS FERRI REDACTI. REDUCED IRON LOZENGES

1 grain of Reduced Iron in each, on a Simple Basis

Dose.—1 to 6 lozenges

FERRUM TARTARATUM.**TARTARATED IRON**

FR, FERRITARTRATE DE POTASSIUM, GER., KALIUMFERRITARTRAT, ITAL, TARTRATO FERRICO POTASSICO, SPAN, TARTRATO FERRICO POTASSICO

Thin, deep ruby red, translucent, slightly deliquescent scales, having a sweetish, ferruginous and astringent taste

It should be kept in well closed vessels, of a dark amber tint, and protected as far as possible from air and light

Solubility—1 in 1 of Water (slowly), very sparingly in Alcohol (90 p c)

Medicinal Properties—Chalybeate tonic, and slightly diuretic, suitable in the anæmia of convalescence

Dose—5 to 10 grains = 0.32 to 0.65 gramme

Foreign Pharmacopœias—Official in Belg (Tartras Ferrico-Potassicus), Fr (Ferritartiate de Potassium), Ital (Tartriato Ferrico Potassico), Mex (Tartriato de Potasio y Fierro), Port (Tartriato de Potassa e de Feiro), Russ (Feiro Kalium Tartaricum), Span (Tartrato Ferrico Potassico), US (Ferri et Potassii Tartras) Not in the others

Ferri et Ammonii Tartras is also official in US

Tests—Tartarated Iron dissolves slowly in Water. The solution answers the tests distinctive of Ferric salts given under Ferrum. It is stated to yield no dark blue coloration, but only a greenish turbidity with Potassium Ferricyanide Solution, but it always contains Ferric salt, which precipitates with the Potassium Ferricyanide reagent

If the precipitate produced by Potassium Hydroxide Solution be removed by filtration and the filtrate be slightly acidulated with Acetic Acid, it yields, as it cools, a crystalline deposit, more particularly if the filtrate is first mixed with a little Alcohol (90 p c). It is officially required to yield 30.0 p c of Ferric Oxide, as determined by incinerating a weighed quantity at a red heat, cooling, and washing the residue till free from Potassium Carbonate, which operation is not always an easy matter to complete. The *USP* preparation is required to contain Iron and Potassium Tartrate corresponding in amount to not less than 15 p c of metallic Iron. The *USP* method of determination is an Iodometric one, and is described below. If the Iron be removed from a 1 in 10 aqueous solution by boiling with an excess of Potassium Hydroxide Test-solution, the filtrate, when slightly acidified with Acetic Acid, will gradually deposit a white crystalline precipitate, *USP*

With Potassium Ferrocyanide Test solution, the solution should not afford a blue colour or precipitate, unless it be acidulated with Hydrochloric Acid, *USP*

Ammonia—The aqueous solution of the salt should not yield any precipitate with T.S. of Ammonia, but is rendered darker, *USP*

Volumetric Determination—The *USP* gives the following instructions—If 0.555 gramme of the dry salt be dissolved in 15 c c of Water and 2 c c of Hydrochloric Acid, in a glass stoppered flask having a capacity of about 100 c c, and if after the addition of 1 gramme of Potassium Iodide, and securely

closing the flask, the mixture be kept for half an hour at 40° C (104° F) and then cooled, it should require not less than 15 c c of Tenth-normal Volumetric Solution of Sodium Thiosulphate to discharge the colour of the liquid, Starch T S being used as indicator (each c c of Tenth-normal Volumetric Solution of Sodium Thiosulphate indicating 1 p c of metallic Iron)

FICUS.

FIGS

FR, FIGUL, GER, FEIGEN, ITAL, FICHI, SPAN, HIGOS

The dried fleshy receptacles of *Ficus Carica*, L

Medicinal Properties—Nutritious, laxative, and demulcent
Chiefly used medicinally in constipation Cut open and heated, it forms a convenient cataplasm

Official Preparation—Contained in Confectio Sennæ

Foreign Pharmacopœias—Official in Port (Figs Passados), U S Not in the others

Descriptive Notes.—Dried Figs are usually imported in two forms, natural and pulled figs Natural figs are fruits that have not been made supple by kneading and squeezing, pulled figs are those so treated, and are generally imported in small boxes, in which they have been packed by careful pressure They are flattened, translucent, and have the characteristic taste of the fig In dry weather they are covered with a saccharine efflorescence Greek figs are inferior in quality, containing less pulp, and are smaller

The fruit is sometimes called a syconus, it is a pyriform receptacle filled with female flowers, each of which contains a minute ovary which, when ripe, forms an achene, often erroneously called a seed The male flowers are developed amongst bracts surrounding the minute tubular orifice at the apex

Compound Syrup of Figs—Under this title several preparations are made containing the soluble laxative constituents of Figs and Senna

FILIX MAS.

MALE FERN

The Rhizome of *Aspidium Filix-mas*, Sw, carefully dried

Medicinal Properties.—The powder of the rhizome is slightly tonic and astringent, chiefly used in the form of Liquid Extract as an anthelmintic for tapeworm

Prescribing Notes.—The Liquid Extract, which is an Ointment can be given in Milk, or made into an emulsion with 1 to 2 fl drms of very rich Mucilage of Gum Acacia, or $\frac{1}{2}$ to 1 drms of powdered Acacia, and with Peppermint Water or Milk to form a 2 oz draught, or in capsules Best given in the early morning fasting after a purge on the 11th day, as the worm is so protected by food It is more effective if the dose of 1 drms be continued for 3 or 4 days

and given at intervals of half an hour. It should be followed 12 hours afterwards by a brisk purgative (not Castor Oil) to clear away the dead worm.

Under the headings *Haustus*, and *Mistura*, *Filicis Maris*, several formulas are given in the Pharmacopœias of the London Hospitals.

10 minims of Tincture of Senega recommended for each fl dr̄m of liquid extract, as an emulsifying agent.—*P J '02*, ii 869.

Official Preparation—*Extractum Filicis Liquidum*

Not Official—*Mistura Filicis*

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Jap, Fr (*Fougere*), Ger, Hung, Norw, Ital (*Felce Maschio*) Port (*Feto Macho*), Russ, Mex, Span (*Helecho Macho*), Swed, Swiss, US (*Aspidium*)

Descriptive Notes—The rhizome, as met with in English commerce, is sometimes entire and sometimes cut in half longitudinally for facility in drying, and has the scaly bases of the leaf stalks or stipes attached to it, these being angular and about 1 inch long and about $\frac{1}{2}$ inch in diameter. The official description limits the size from 3 to 6 inches (7.5 to 15 cm) in length, $\frac{3}{4}$ to 1 inch (2 to 2.5 cm) in diameter. The rhizome should be green internally. It should not be kept more than one year. The *BP*, as well as the *PG* and *USP*, requires that the rhizome should not be kept more than a year, as the medicinal activity is decreased on keeping. An indication of its freshness when purchased is the yellowish green tint of the rhizome and stipes when cut transversely. The *BP* requires that it should be collected late in the autumn, and divested of its roots, leaves and dead portions. The *USP* states that the chaff (*ie*, scales), together with the dead portions of the rhizome and stipes, should be removed, and only such portions used as have retained their internal green colour. The distinguishing feature of the rhizome is the presence in the transverse section of 10 large vascular bundles forming a circle, beyond which a number of small ones are scattered, the leaf stalks showing eight only in an irregular circle. In the intercellular spaces near the apex, of the rhizome globular stalked glands are found, which do not occur in most of the allied ferns likely to be mistaken for it in this country, such as *A. Oreopteris*, Sw, and *Athyrium Filix-fœmina*, Roth. The scales of *A. Filix-mas*, Sw, have two glands, at the base, but that of *A. spinulosum*, Sw, which has been found frequently in Germany mixed with the true rhizome, has them also on the margins of the scales. In S Africa the root of *Aspidium athamanticum*, Kunze, is used as a tænicide under the name of 'Unkomokomo,' and in Continental commerce as 'Pannum.'

Tests—The ash of Male Fern varies from 1.5 to 3.0 p c, the insoluble portion of the ash from 0.1 to 0.5 p c. A standard of not less than 5 p c has been suggested.

Preparation

EXTRACTUM FILICIS LIQIDUM LIQUID EXTRACT OF
MALE FERN

Male Fern exhausted by percolation with Ether, and subsequent evaporation of the Ether

It is referred to in the *U S P* as *Oleoresina Aspidii*, and is prepared from *Aspidium* by percolation with Acetone

Dose—45 to 90 minims = 2 7 to 5 4 c c

For larger doses than 90 minims, see *L* '88, 11 1037, *B M J* '89, 1 319, and " as to mode of administration, *L* '94, 11 255

U S states that the granular crystalline substance, which deposits on standing, should be thoroughly mixed with the liquid portion before use

The activity of the Extract is supposed to be due to **Filicic Acid**—*P J* (3) xxii 84, and this varies in different samples from 0 71 to 9 59 p c, reaching in one sample 13 07 p c—*P J* '97, 11 85

Foreign Pharmacopœias—Official in Austri and Russ (Ext *Filicis Maris*), Belg, Dan, Dutch, Ger, Jap, Norw, Swed and Swiss (Ext *Filicis*), *Fr* (Extrait de Fougère Male), Hung (Extract *Filicis Maris Æthereum*), Ital (Estratto di Felce Maschio Etereo), Port (Extracto de Feto Macho Etereo), Span (Aceite de Helecho Macho), *U S* (*Oleoresina Aspidii*) All made with Ether

Test.—Fluid Extract of Male Fern has a specific gravity of 1 008 to 1 010

Not Official

MISTURA FILICIS—Liquid Extract of Male Fern, 1, Powdered Acacia, 1, Chloroform Water, to 8—*University*

FENICULI FRUCTUS.

FENNEL FRUIT

FR, FENOUIL DOUX, *GER*, FENCHEL, *ITAL*, FINOCCHIO,
SPAN, HINOJO

The dried ripe Fruit of *Foeniculum capillaceum*, Gilib, from cultivated plants

Medicinal Properties—Stimulant, aromatic, and carminative
In action similar to Anise Antispasmodic in intestinal colic of children

In infants an infusion (1 to 60) is employed as an enemæ for the expulsion of flatus

Official Preparation—*Aqua Fœniculi* Used in the preparation of *Pulvis Glycyrrhizæ Compositus*

Not Official—*Oleum Fœniculi*

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, *Fr* (Fœnoul Doux), Ger, Hung, Jap, Norw, Ital (Finocchio), Port (Funcho), Russ, Mex and Span (Hinojo), Swed, Swiss and *U S*

Descriptive Notes—A number of different varieties of Fennel fruits are met with in commerce, varying from 3 to 4 mm (*Japaresc*), to 8 to 10 mm (*Saxon*) in length, and from 1 5 mm (*Russian*) to 3 mm (*French and Saxon*) in diameter The larger fruits are usually slightly curved, and greenish or greenish-brown in colour, according to age and ripeness when collected The mericarps are usually united, and taper at the apex, and the longitudinal ridges are prominent with six large vittæ in each mericarp, two being on the flat, and four on the convex side The different kinds vary in the percentage of Oil and in the relative percentage of Anethol and Fenchone that they

contain The Indian fruit, which yields the smallest percentage of oil, is referred to, *F. panmorium*, D C, which, however, is regarded by some botanists as only a variety of *F. capillaceum*

Fennel fruits, after distillation, are used in cattle foods, and to adulterate powdered Fennel fruits The directions given in the *B P* limit the Fennel fruits to those 5 to 10 mm long and 3 mm in diameter, these include the Saxon and the cultivated French varieties, unless the Persian, Indian and Galician, which come within the limits of length, but are rather less in diameter than the official measurement, could be considered to be not excluded by the term 'about' prefixed to the official measurement So far as flavour is concerned the Saxon, French, Macedonian, Persian, and Japanese are the best Under the microscope the powder is characterised by the spiral and reticulated thin-walled colourless parenchymatous cells of the mesocarp, and the obliquely arranged thin walled linear oblong cells, about 3 to 5 times as long as broad, of the inner epidermis, and the absence of striation on the cells of the outer epidermis

Tests—The ash of Fennel Fruit should amount to not more than 10 p c The ash of four samples determined in the author's laboratory amounted to 8.47, 8.93, 9.75 and 7.70 p c The ash of six samples of the Pulvis to 10.85, 12.8, 9.90, 8.91, 13.0 and 9.89 p c Good Fennel fruits yield from 3 to 5 p c of volatile oil

Preparation

AQUA FENICULI FENNEL WATER

Fennel Fruit, 1, Water, 20 Distil 10 (1 in 10)

Dose—1 to 2 fl oz = 28.4 to 56.8 c c

Foreign Pharmacopœias—Official in Austri, 1 in 20, Ital, Mex and Port, 1 in 4, Ger, Jap and Russ, 1 in 30, Hung and Swed, 1 in 10, Dutch and Swiss, 1 in 25, Belg, Oil 1, Alcohol 99, Water 3800, Dan, with Oil, 1 in 2000, and U S, with Oil, 1 in 500 Not in Fin or Norw

Not Official

OLEUM FENICULI—A colourless or slightly yellow liquid, possessing a peculiar characteristic odour and taste It is distilled from Fennel Fruit, the yield of Oil varying from 4 p c to 6 p c

The important constituent of this Oil is Anethol It also contains the ketone, Fenchone, which is isomeric and closely related to Camphor

The commoner oils contain the Terpenes, Dextro pinene and Dipentene, together with Phellandrene and Limonene A good oil contains about 60 p c Anethol

The Oil from Japanese Fennel resembles closely that from the other varieties—*P J* '96, 11 91, *C D* '96, 11 191

Commercial varieties of Fennel and their essential oils—*P J* '97, 1 225

Dose—5 to 15 minims = 0.3 to 0.9 c c

Foreign Pharmacopœias—Official in Austri, Belg, Dan, Dutch, Ger, Hung, Jap, Norw, Port, Russ, Swed, Swiss and U S Not in Fr, Ital or Mex

Tests—Fennel Oil has a specific gravity of 0.965 to 0.980 It is soluble in an equal volume of Alcohol (90 p c) and in 10 of Alcohol (80 p c) It is dextrogyrate, the rotation being from -5° to $+20^{\circ}$ in a 100 mm tube. The solidifying point should be between 5° and 10° C (41° and 50° F)

The more generally occurring adulterations of Fennel Oil are oils from which the Stearoptene has been removed, Alcohol, Volatile Oils containing Phenols, and Oil of Turpentine. The addition of oils from which the Anethol has been abstracted is rendered evident by the lowering of the solidifying point, Alcohol by the lowering of the specific gravity, whilst Turpentine is also detected by the reduction in the specific gravity, the Alcohol-solubility and Rotation.

Ferric Chloride T.S. is employed to detect volatile oils containing Phenol, the addition of a drop of the solution to an alcoholic solution of the Oil should produce no coloration.

Not Official

FORMIC ALDEHYDE

METHANAL METHYL ALDEHYDE

Produced by the limited oxidation of Methyl Alcohol. A gas condensable by cold to a clear mobile liquid. The commercial article 'Formol' or 'Formalin' is stated to be a 40 p.c. solution.

The Formaldehyde Solution official in the *U.S.P.* is required to contain not less than 37 p.c. w/w, that of the *P.G.* about 35 p.c. w/w, and that of *Fr. Codex*, 35 p.c. w/w of absolute Formaldehyde.

FORMALDEHYDUM SOLUTUM—A clear colourless fluid, with an irritating odour, containing from 35 to 40 p.c. of Formaldehyde.

Medicinal Properties—The strong solution (35 to 40 p.c.) is a powerful antiseptic, disinfectant and deodorant, it is also a powerful caustic, and should be handled with care. The vapour is irritating to the eyes and nose, probably due to traces of Formic Acid. Even in very dilute solution, 1 of Formic Aldehyde in 20,000, or 1 of Formalin in 8000, it preserves liquids otherwise liable to decay. Mixed with 50 to 100 of Water, may be used as a general antiseptic in the sick room for washing the hands, spray, etc., and with 400 to 500 of Water as an antiseptic mouth-wash or gargle.

Case of poisoning by drinking 4 oz. of a 4 p.c. solution—*P.J.* '99, ii 295.

Formalin (40 p.c.) in 2000 to 3000 of Water used freely to hypopyon ulcers, and septic abrasions of the cornea—*B.M.J.* '96, i 144.

2 p.c. solution in ringworm—*B.M.J.E.* '94, ii 108, *Y.B.T.* '95, 894.

40 p.c. solution applied to ringworm—*B.M.J.* '96, ii 650.

40 p.c. solution sometimes causes suppuration, and is not so useful for ringworm as Carbolic Acid—*B.M.J.* '97, i 972.

Stated to be best administered with Sugar of Milk, without a single bad result (*M.P.* '04, ii 523) in many hundred cases, including scarlet fever, diphtheria, croup, and cystitis.

Formic Aldehyde has received considerable attention as a therapeutic agent in pulmonary tuberculosis and has been employed both intravenously and as an inhalation. Maguire in his Harveian lectures recommends a solution of 1 part Formic Aldehyde Gas in 2000 parts of a sterilised solution of Sodium Chloride—*Trans. of Brit. Cong. on Tuberculosis*, vol. iii p. 438, *L.* '00, ii 1549, 1633, 1709, '01, i 629, 707, '01, ii 310, '03, i 98, '03, ii 463, *B.M.J.* '00, ii 1566, 1637, 1695.

Intravascular injections have shown that at present there is no evidence which would warrant the use of a septicæmia in animals can be favourably influenced by the intravenous injection of an antiseptic—*L.* '03, i 98.

A single intravenous injection of Formaldehyde in physiological solution effected a cure (*L.* '05, i 1341) in a case of marked oral sepsis, and the cure by intravenous injection in a case of tuberculous abscess of the lung in a patient with acute pulmonary tuberculosis was absolute and rapid. Tubercle bacilli, sputum and cough all disappeared.

Poisons such as Strychnine, Veratrine, Morphine, Atropine and Phosphorus will remain in the organs preserved with a 10 p.c. aqueous solution of Formalin for a very long time—*L.* '05, i 1093.

Formaldehyde has been somewhat extensively used by intravenous injection in the treatment of pulmonary phthisis, and a solution of 1 in 2000 is a suitable strength for injection.

As an inhalation, it has been used with good results in tuberculosis, pertussis and diphtheria. 2½ to 6 p.c. solutions of Formalin in pure Water or in 10 to 20 p.c. Glycerin solution are convenient, and should there be more than usual sensitiveness in the air passages, a little Aromatic Spirit of Ammonia may be added.

A solution of Formalin 1, Chloroform 1, Alcohol (90 p.c.) 2, has also been used, or it may be used as a fine spray at a strength of 6 to 10 p.c. solution mixed with Glycerin—*B M J* '99, 1 202, 772, 1440, '00, 1 189, '00, 1 1624, '02, 1 1692, *L* '01, 1 468, '01, 1 310, '02, 1 562, 772, *Trans of the Brit Cong on Tuberculosis*, vol III p 486.

Severe inflammation of the ends of all the finger nails caused by the prolonged use of a 1 in 500 solution of Formalin as a disinfectant for the hands—*B M J* '02, 1 54.

Recurrent papillomata of the larynx treated locally by Formalin as a 1 in 1000 increasing up to 1 in 100 spray—*L* '01, 1 487.

A solution of equal parts of Formalin and Glycerin as a paint in lupus—*B M J* '01, 1 1078, *B M J E* '01, 1 48.

10 to 50 p.c. ointment in chilblains if skin be not delicate—*P* '08, 1 251.

Cases of poisoning from swallowing commercial Formalin—*B M J E* '01, 1 9, 72.

A few drops of Liquor Ammonia Fort well diluted with Water, or still better Liquor Ammonii Acetatis, given at frequent intervals as an antidote in cases of Formalin poisoning—*B M J E* '01, 1 7.

Formic Aldehyde as a preservative of foods—It is generally condemned as a preservative of foods on account of its action on the flesh forming constituents, rendering them insoluble. The proteids of Milk containing Formalin fail to yield to the digestive action of Pepsin—*L* 99, 1 1507, '99, 1 1282, 1427, 1577, '00, 1 228, *J C S Abs* 01, 1 517, *B M J E* '02, 1 16.

Recommendation of the Departmental Committee appointed to inquire into the use of preservatives in food, that Formaldehyde or any of its preparations be absolutely prohibited in food or drinks—*L* '01, 1 1683, *B M J* '01, 1 1758, *P J* '01, 1 620, *C D* '01, 1 880, *Analyst*, '01, 383.

Formic Aldehyde as a disinfectant—There is no conflict of evidence as to Formaldehyde being a reliable disinfectant when used in solution, or used in the gaseous state for room disinfection when all objects are freely exposed, but it seems to be the general opinion that for the disinfection of heavy materials and furniture, or where there are many cracks or fissures, or the surfaces are not freely exposed, on account of its non-penetrative properties it is not so suitable as Sulphurous Acid Gas. It has the advantage, however, of being non-injurious to delicate fabrics such as furs, silks, etc.—*L* '99, 1 1436, '02, 1 759, '03, 1 37, *B M J* '99, 1 1280, '00, 1 1575, '00, 1 1600, '02, 1 792, *B M J E* '00, 1 55, *T G* '99, 600.

Report of the practical experiments on disinfectants undertaken by the London County Council both Formic Aldehyde and Sulphur Dioxide failed in the case of wood and cloth charged with spores, in the case of tuberculous sputum dried on linen and paper, Formaldehyde showed to greater advantage than Sulphur Dioxide—*L* '02, 1 759, *B M J* '02, 1 792.

Formaldehyde in the state of vapour is able to destroy the bacilli in 'dried' sputum, but solutions of 4 to 10 p.c. did not affect 'ordinary' sputum—*L* '03, 1 37.

A paper by Kanthack on the use of Formalin lamps for the disinfection of rooms—*L* '98, 1 1049.

The Aldehyde vapours are non-poisonous, but very irritating to the eyes and throat, they possess marked deodorant and disinfectant properties, and are well suited to the purposes of room disinfection, for they do not affect colours. The use of the reagent in a gaseous form appears to possess the advantages over disinfection by Sulphurous Acid, that it injures nothing except Iron, it diffuses better, and it possesses greater disinfectant power—*B M J* '98, 1 1542.

Muller's Fluid, containing 10 p.c. of Formal, has been recommended for hardening pathological specimens, but it deposits in 5 days and must be changed, 60 p.c. Alcohol, to which 1 p.c. Formal has been added, is a good preservative fluid after hardening in above—*B M J E* '96, 1 88.

The 35 p c solution is diluted with 10 to 50 of Water, for fixing and hardening histological and pathological specimens, and for preserving them.

In room disinfection, best results obtained when 50 grammes of Potassium Permanganate are added to 100 c c Formaldehyde, or multiples of these quantities. The space to be disinfected—*T G '07, 460*
value and selection of disinfectants—*P G '07, 269*

Foreign Trials. Official in Austr., Belg., Dan., Dutch, Fl., Ger., Ital., Jap., and U.S.

Tests.—Formic Aldehyde Solution has a specific gravity of 1.079 to 1.081. The *U S P* has a specific gravity of 1.075 to 1.081 at 25° C (77° F), the *P G* solution 1.079 to 1.081. It should be neutral or only faintly acid to Litmus paper.

On evaporating 5 c c to dryness on a water-bath a white amorphous mass is left, which should leave no weighable residue on ignition.

If the solution be made strongly alkaline with Ammonia Solution and evaporated to dryness on a water-bath, a white crystalline residue readily soluble in Water remains. Formaldehyde Solution readily reduces Silver Ammonio-nitrate Solution, and Potassio cupric Tartrate Solution, the former yielding a greyish-black deposit of metallic Silver, the latter a deposit of red Cuprous Oxide. 2 c c of the Solution mixed with an equal volume of Potassium Hydroxide Solution and about 0.5 gramme of Resorcin gradually yields, when the mixture is heated to boiling, a bright red coloration. 2 drops added to 5 c c of Sulphuric Acid containing a little dissolved Salicylic Acid yields, on permanent amount of brilliant blue colour, varying in amount of present, is produced when about 0.05 gramme of Phenylhydrazine Hydrochloride is added to 1 c c of the solution diluted to 5 c c with Distilled Water, followed by the addition of 8 drops of a freshly-prepared 5 p c Sodium Nitro-prusside Solution, thorough agitation of the liquid, then Sodium Hydroxide Solution drop by drop until an excess has been added. Numerous methods have been proposed for the quantitative determination of Formic Aldehyde. That perhaps most generally used, on account of the ease of manipulation is the Ammonia process, and depends upon its conversion into Hexamethylenetetramine and determination of the amount of Ammonia absorbed. A weighed quantity of 2 grammes of pure neutral Ammonium Chloride is dissolved in 25 c c of Water and introduced into a flask provided with a well-fitting stopper. A weighed quantity of 2.5 grammes of the sample is carefully neutralised with Normal Volumetric Potassium Hydroxide Solution and added to the Ammonium Chloride Solution. A measured quantity of 25 c c of Normal Volumetric Potassium Hydroxide Solution is then added, the flask securely stoppered and set aside for one hour. A few drops of Rosolic Acid Solution are added, and the excess of Ammonia is titrated with Normal Volumetric Sulphuric Acid Solution, each c c of Normal Volumetric Potassium Hydroxide Solution absorbed corresponding to 2 p c w/w of Formaldehyde.

The *P G* process consists in treating 5 c c of the Formic Aldehyde Solution with 20 c c of Water and 10 c c of Ammonia Solution, allowing the mixture to react for one hour in a well-stoppered flask. A measured quantity of 20 c c of Normal Volumetric Hydrochloric Acid Solution is added, a few drops of Rosolic Acid Solution and the excess of acid titrated with Normal Volumetric Potassium Hydroxide Solution. At least 4 c c should be necessary to produce a red coloration. The *U S P* process depends upon the oxidation of the Formic Aldehyde to Formic Acid and titration with standard alkali. A measured quantity of 3 c c of Formic Aldehyde Solution is placed in a well-stoppered flask and accurately weighed. A measured quantity of 50 c c of Normal Volumetric Sodium Hydroxide Solution is added, followed immediately by 50 c c of Hydrogen Dioxide Solution added slowly through a small funnel, a drop or two of Litmus Solution having been previously added, and the solution previously neutralised with Normal Volumetric Sodium Hydroxide Solution. When the reaction is completed the funnel and sides of the vessel are rinsed with Water. The whole allowed to stand 30 minutes, and titrated back with Normal Volumetric Sulphuric Acid Solution, using Litmus solution as an indicator. The number of c c of Normal Volumetric Sulphuric Acid consumed are subtracted from 50, the remainder is multiplied by 2.979 and the product divided by the weight of

Solution taken, the quotient indicates the percentage w/w of absolute Formic Aldehyde. Both methods have been tried in the author's laboratory. The Hydrogen Peroxide method is the more accurate of the two and yields higher results, but the ease of manipulation of the Ammonia process and the fact that the results yielded are sufficiently accurate for most practical purposes ensures its more general application. An Iodometric method has been proposed by G. Romijn (*Analyst* '97, 221). A weighed quantity of 2.075 grammes of Formaldehyde Solution is diluted with Water to 500 c.c. A measured quantity of 10 c.c. of this Solution is mixed with 25 c.c. of Deci-normal Volumetric Iodine Solution and sufficient Sodium Hydroxide Solution (15 p.c.) added drop by drop to colour the liquid clear yellow. Allow to stand 10 minutes and add sufficient dilute Hydrochloric Acid to liberate the uncombined Iodine which is titrated with Deci-normal Volumetric Sodium Thiosulphate Solution. 1 c.c. of the Volumetric Iodine Solution is equivalent to 0.001489 gramme of absolute Formic Aldehyde. A method based on the production of a Bisulphite compound by interaction between Formaldehyde, Sodium Bisulphite and Normal Volumetric Sulphuric Acid Solution, using Phenolphthalein Solution as an indicator, has also been suggested. The end reaction is, however, somewhat indefinite, and it is therefore difficult to judge when the reaction is complete. The method adopted by the *Fr. Codes* is similar to that of the *U.S.P.*, and depends upon the oxidation of the Formaldehyde to Formic Acid, by means of Hydrogen Peroxide, and determination of the Formic Acid volumetrically.

The more generally occurring impurities are Methyl Alcohol, excess of acid, e.g., Formic Acid, fixed impurities, Iron, Lead, Copper, and Calcium, Chlorides and Sulphates. The presence of Methyl Alcohol or Acetone may be shown by the Iodoform test, no precipitate of Iodoform should be produced when 1 c.c. of the Solution is mixed with 10 c.c. of Iodine Solution, the excess of Iodine decolourised with Sodium or Potassium Hydroxide Solution, and the mixture warmed, excess of acid may be determined by titration with Normal Volumetric Sodium or Potassium Hydroxide Solution, using Phenolphthalein Solution as an indicator of neutrality, the *U.S.P.* and the *P.G.* permit 0.23 w/v of anhydrous Formic Acid, fixed impurities are detected by the residue left on evaporation and ignition, Iron by the Potassium Ferrocyanide test in the diluted solution, Lead, Copper, Calcium, Chlorides and Sulphates by diluting the solution 1 to 3 or 1 to 4 and applying Hydrogen Sulphide Solution, Ammonium Oxalate Solution, Silver Nitrate Solution or Barium Chloride or Nitrate Solution respectively.

PARAFORMIC ALDEHYDE (Paraform Tri-oxymethylene)—A white micro-crystalline or amorphous powder, insoluble in Water. It is a polymer of Formic Aldehyde, it volatilises at 100° C (212° F), and is readily convertible into that substance when heated to the above temperature in the presence of Water. It is used for disinfecting rooms. It is official in *Fr. Codes*.

Sterilisol—An aqueous solution of Paraform, the solution being effected at 40° to 45° C (104° to 113° F) *in vacuo*—*L.* '05, 1 1075

HEXAMETHYLENETETRAMINE—Colourless and odourless lustrous crystals, or as a white crystalline powder, possessing an alkaline reaction.

It is a condensation product, obtained by the action of Ammonia gas on Formic Aldehyde. It should be preserved in well stoppered bottles.

Commercial varieties of this substance are known under the names of **Aminoform**, **Cystamine**, **Formin** and **Urotropine**.

It has been implied, if not actually stated, that all these products are exactly the same and practically interchangeable. This is not borne out by clinical experience, for the different preparations do not always produce the same results in the same patient. This is precisely what we should expect from a body of which the stereographic formula presents so many different possibilities.

Solubility—Soluble 5 in 6 of Water, 1 in 8 of Alcohol (90 p.c.), sparingly in Ether.

Urinary antiseptic, given in cystitis and phosphaturia.

Dose.—5 to 15 grains = 0.32 to 1 gramme, dissolved in Water or in aerated Water.

Marvellous effects in doses of 10 grains thrice daily in typhoid bacilluria and cystitis, for which conditions it appears to be an almost specific remedy—*L* '00, 1 707, 1059, 1876, '01, 1 174, '02, 1 687, *B M J E* '02, 1 95 5-grain doses three times a day in cystitis with ammoniacal urine—*L* '00, 1 1658

As an intestinal disinfectant — *B M J E* '01, 11 60

In daily doses of 20 to 60 grains in diabetic coma.—*B M J E* '02, 1 72

Two cases of hæmaturia following the use of from 5 to 10 grains of the salt three times daily—*B M J* '01, 1473, 1617, 1659, *T G* '01, 617

In the pyuria of *tuberculosis* 3 grains daily — *L* '03, 11 1019

In vesical catarrh accompanying typhoid fever 10-grain doses have been given three times daily with advantage—*B. M. J.* '04, n. 70, p. 1705 (S). It is liable to produce irritation of the stomach, a measles-like rash, renal irritation, albuminuria and hematuria unless well diluted, and the powder of Water

In enteric fever, doubtful if it had any influence on the course of the illness itself — B M J 05, 1 414

In acute but not in tubercular cystitis, in 3-gramme doses — *T G '07*, 311

A mixture of Urotropine and Iridin has a pronounced effect in causing dissolution of calculi in the treatment of artificially-produced cholelithiasis.—*B M J* '05, ii 272

Of value as a prophylactic against the nephritis of scarlatina all cases of scarlatina be treated from the beginning with 5 to 10 grains daily, well diluted with Water, to be continued to the 28th day of the disease—*Edin Med Jour* '07, 1: 113

Foreign Pharmacopoeias - Official in Dan, Jap, Swiss and U S

Tests — **Phenol** : Dissolves in water at a temperature of 263° C (505.4° F). With concentrated Sulphuric Acid and heated with Sulphuric Acid, it develops a carmine-red coloration. If heated with diluted Sulphuric Acid the characteristic irritating odour of Formaldehyde is evolved, and if a piece of filter paper, moistened with Silver Ammonio-nitrate Solution, be held over the tube, it is immediately darkened. If this Sulphuric Acid Solution be cooled and supersaturated with Sodium Hydroxide Solution, the characteristic odour of Ammonia is evolved, recognised also by its turning a piece of moistened red Litmus paper blue. A 10 pc aqueous solution affords a precipitate with Tannic Acid Solution, with Mercuric Chloride Solution, on standing, white precipitates are produced, with Iodo-potassium Iodide Solution it yields a white precipitate.

The more generally occurring impurities are mineral matter, Copper, Iron or Lead, Chlorides or Sulphates, Ammonia salts, and Para formaldehyde. Mineral matter may be detected by the residue left on ignition. Copper and Lead may be detected by Hydrogen Sulphide Solution, Iron by Potassium Tartrate Solution, Chlorides by Silver Nitrate Solution after acidification with dilute Nitric Acid, Sulphates by Barium Chloride Solution after acidification with diluted Hydrochloric Acid. Ammonium salts and Parafomaldehyde may be detected by Potassium-mercuric Iodide (Nessler's) Solution, the former causing brownish-red colour or precipitate, the latter readily causing a separation of metallic Mercury.

AMYLOFORM—A white, amorphous, odourless powder, which is a compound of Formaldehyde with Starch Insoluble in Water, but when brought in contact with moist surfaces it is slowly decomposed, giving off Formaldehyde. Recommended as a dressing or as a dusting powder—*L* '97, 11 40, '00, 1, 470; *T G* '00, 816

Dextroform is a white powder, freely soluble in Water, slightly soluble in cold Glycerin, but dissolves in 10 when warmed. It is a compound of Formaldehyde with Dextrine. It has been used internally, and has been given in the form of a 5, 10, or even 20 per cent solution in gonorrhoea.

Glutol is a yellowish-white powder, insoluble in Water and Glycerin; it is a compound of Formaldehyde with Gelatin, used as an antiseptic dressing.

FORMICIN—A syrupy liquid, sp gr 1.240 to 1.260. Miscible with Water, Alcohol and Chloroform in all proportions. It is produced by the action of Acetamide on Formaldehyde, and has been introduced (*B M J E* '05, ii. 99, *P J* '05, ii. 885) as a powerful antiseptic. Applied in the form of a 2 p.c. tepid solution it has been used as a surgical disinfectant.

HELMITOL (Hexamethylenetetramine Anhydromethylene Citrate)—Colourless crystals, or as a white crystalline powder, soluble 1 in 5 of Water, sparingly soluble in Alcohol (90 p.c.), insoluble in Ether. Has been recommended in chronic posterior urethritis, cystitis and prostatitis.

In acute cystitis the subjective results were good (*B M J E* '05, ii. 20), but the cystitis reappeared if the drug were discontinued. It is more useful in bacteriuria, the results being permanent.

Dose—10 to 15 grains = 0.65 to 1 gramme, three times daily.

HETRALIN (Dioxybenzolhexamethylenetetramine)—One of the many derivatives of Hexamethylenetetramine, it forms snow-white crystals, soluble (according to our experiments, *P J* [4], xx. 784, *C D* '05, i. 788) 1 in 9 of Water, 1 in 17½ of Alcohol (90 p.c.), 1 in 180 of Ether, sp gr 0.785, insoluble in Chloroform. It has been introduced as a urinary antiseptic (*B M J* '04, ii. 1468), but (*B M J E* '04, ii. 64) failed to produce any good effect in seven cases of tuberculous disease of kidneys and bladder.

In doses of 1 grain, given every 3 hours, has been found of value in acute cystitis in an infant—*B M J* '07, i. 1181.

In cases of cystitis it has proved beneficial in doses of 15 grains twice a day in a tumblerful of cold Water—*General Practitioner*, Feb. 18, 1907.

INDOFORM—A white powder, m.p. 108° to 109° C (226.4° to 228.2° F.), produced by action of Formaldehyde on Acetyl-salicylic Acid. Sparingly soluble in cold Water, and has an acid, astringent taste. Antirheumatic and anti-neuralgic.

Dose—7½ grains = 0.5 gramme.

SODIUM ANHYDROMETHYLENECITRATE (Citarin)—A white granular, amorphous powder, soluble 1 in 1½ Water, insoluble in Alcohol (90 p.c.), and in Ether. Given in rheumatism and gout, and as a solvent for Uric Acid calculi.

Dose—15 to 30 grains = 1 to 2 grammes.

URESIN (Hexamethylenetetramine Di-lithium Citrate)—A white, crystalline powder, readily soluble in Water, has been given in gout, and as a solvent for certain urinary deposits.

Dose—5 grains = 0.32 gramme.

Chinotropine (Quinotropine) is a white powder, readily soluble in Water. It is a combination of Quinic Acid and Hexamethylenetetramine. Is said to lessen formation of Uric Acid—*B M J E* '01, ii. 95, *P J* '01, i. 666.

Dose—10 to 15 grains = 0.65 to 1 gramme.

Under the name of Igazol a combination of Formic Aldehyde with Chloral, Terpene and Iodoform has been introduced for the treatment of pulmonary consumption, and is used as an inhalation—*Trans of Brit Cong on Tuberculosis*, iii. 416, *B M J* '00, ii. 662.

Lysoform is a clear, colourless or pale yellowish, soapy liquid. Miscible with Water. Introduced as an antiseptic. A solution 1 to 2 tablespoonfuls to the pint is used to disinfect the hands—*B M J E* '01, ii. 88, *L* '03, ii. 1807.

In the sterilisation of the hands, a 2 p.c. solution in Alcohol gave much superior results to the hot Water-Alcohol method (*B M J* '05, i. 727), but still better results were obtained with Bacillol and Sublimin. Bacillol is a Cresol preparation, non-toxic and non-injurious to the hands. Experiments with a 1 p.c. alcoholic solution gave complete sterility through all tests in a minimum of 60 p.c.

Carbol Lysoform is stated to be a mixture of crude Carbohc Acid and Lysoform, and to be a more active bactericide than either of its components—*B M J E* '02, ii. 92, *P J* '03, i. 840.

Not Official.

FUCUS VESICULOSUS

Bladder-wrack collected from rocks by the seaside and dried

Medicinal Properties—Given to reduce obesity
Smelling fresh seaweed is said to relieve hay asthma

Foreign Pharmacopœias—Official in Mex (Encina de Mai), Port (Bodelha) Not in the others

Descriptive Notes—This seaweed is of a blackish colour, flat, forked, about half an inch broad and a foot or more long. It is distinguished by having a mid-rib, and oval air bladders in the frond, usually in pairs, one on each side of the mid-rib. When dried it has the essence of Mannite on the surface. It is said to be used in pills.

Tests—Bladder-wrack leaves about 15 p.c. of ash. Two specimens examined in the author's process of air. The ash is blackish and contains 15.6 p.c. of ash.

EXTRACTUM FUCI VESICULOSI—Prepared from the dried seaweed. Alcohol (45 p.c.), and evaporation to a stiff extract, incorporated in the B.P.C. under the title *Extractum Fuci Vesiculosi*. Since 1867, and was used in pills.

Dose—3 to 10 grains = 0.2 to 0.65 gramme.

Test—It leaves about 18 p.c. of ash on ignition. The ash has a specific gravity of 1.044.

EXTRACTUM FUCI VESICULOSI LIQUIDUM—Extract of Fucus Vesiculosus in Alcohol (45 p.c.) to saturation, incorporated in the B.P.C. under the title *Extractum Fuci Vesiculosi Liquidum*. The fluid extract has been given in *Companion* and *Formulary* '01.

Dose—1 to 2 fl. drms = 3.6 to 7.1 c.c.

Tests—Liquid Extract of Fucus Vesiculosus in Absolute Alcohol (45 p.c.) to saturation, contains about 8 p.c. w/v of solid matter. The solid matter is held in suspension by a piece of gelatin.

GALBANUM

GALBANUM

FR, GALBANUM, GER, GALBANUM, ITAL, G

A Gum-resin obtained from *Ferula galbanifolia* and probably from other species.

Gambanum contains about 9.5 p.c. of impurities and Buhse, Gum-resin soluble in Alcohol, and 27 p.c. of impurities. The pure Gum-resin contains Umbelliferone Galbanol, about 50 p.c., and similar Ester, 20 p.c., Umbelliferone, 0.5 to 3.0 p.c. of ash.

Medicinal Properties—Internally, less energetic, externally as a plaster, in chronic inflammatory swellings.

Dose—5 to 15 grains = 0.32 to 1.0 gramme

Official Preparation—Pilula Galbani Composita

Not Official—Emplastrum Galbani and Unguentum Galbani Compositum

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Ital, Jap, Mex, Norw, Port, Russ, Span, Swed and Swiss. Not in Hung or U.S.

Descriptive Notes—Galbanum is much scarcer in commerce than formerly. Two principal varieties of the drug are recognised in commerce, which are called respectively Levant and Persian, although both are the products of Persia. The Levant Galbanum, which comes by way of Egypt and Turkey, occurs in two forms (1) small yellowish-brown tears, yellowish-white and opaque internally, and possessing a musky odour and bitter and somewhat acrid taste, and probably obtained from the stem, (2) a tough, pasty mass, consisting of slices of root with bluish green, almost translucent, pieces, mixed with yellowish-brown pieces, and also possessing a musky odour, and evidently obtained from the root. Both of these probably come from near Shiraz, *via* the Persian Gulf. The Persian Galbanum occurs also in two forms (1) a turpentine, sticky mass, having a turpentine rather than a musky odour, and containing fruit stalks, but no slices of roots, (2) a treacly liquid, of a reddish colour, often containing fruits of the plant. These apparently come from the Demawend mountains in the north of Persia, by way of Astiakhian and Orenburg, and are apparently the produce not of *F. galbaniflua* but another species. African Ammoniacum, the only Gum-resin that at all resembles Galbanum, does not yield Umbelliferone. Persian Galbanum gives a yellowish-red colour with Hydrochloric Acid, whilst the Levant gives different shades of violet. As the former possesses a musky odour, and the latter a turpentine one, they are probably derived from different species. The *P. G.* directs Galbanum to be dried over quicklime and submitted to a low temperature in order to powder it.

Tests—Galbanum yields about 50 p.c. of substances soluble in Alcohol (90 p.c.). If a portion is heated to redness in a dry test-tube, the residue, when cooled and boiled with Water, yields a solution which, largely diluted, produces a strong blue fluorescence when rendered alkaline with Ammonia Solution. This test is known as the Umbelliferone test, and remarks upon its application will be found under Ammoniacum. The ash should not exceed 10 p.c. The volatile Acid value is 73.5 to 114.0, the Acid value, 21.2 to 63.5, the total Saponification value, 116.2 to 135.8.

Ammonia.—If finely powdered Galbanum be boiled with fuming Hydrochloric Acid for a quarter of an hour, filtered through a previously moistened filter, and the filtrate carefully saturated with Ammonia Solution, the mixture shows a blue fluorescence in reflected light.—*P. G.*

Residue from Alcohol (90 p.c.).—After completely exhausting 100 parts of Galbanum with boiling Alcohol (90 p.c.), a residue is obtained which, after drying, should amount to at most 50 p.c. of the original mass.—*P. G.*

Ash.—100 parts of Galbanum should yield on incineration not more than 10 parts of ash.—*P. G.*

Preparation

PILULA GALBANI COMPOSITA — COMPOUND PILL OF GALBANUM *B. P. Syn* — COMPOUND PILL OF ASAFETIDA

Asafetida, 1, Galbanum, 1, Myrrh, 1, Syrup of Glucose, *as* Mix together on a water-bath

Dose—4 to 8 grains = 0.26 to 0.52 gramme

The following modification will be found convenient for dispensing powder the Myrrh, mix it with the Asafetida and Galbanum melted on a water-bath, allow the mixture to cool, and after crush it by attrition in a mortar to powder with one-sixth of its weight of Light Magnesium Oxide. The powder will keep well, and can be made into pills as required with the aid of Alcohol (60 p.c.)

Foreign Pharmacopœias—Official in Port, similar to Brit Not in the others

Not Official

EMPLASTRUM GALBANI—Galbanum, 1, Ammoniacum, 1, melt together and strain, then add them to Yellow Beeswax 1, Lead Plaster 8, previously melted together Mix (1 in 11)

Was official in L.P. 1835, but omitted in B.P. 1898, it has been incorporated in the B.P.C. using 7 of Lead Plaster instead of 8 so as to make the total 10

A plaster more or less resembling this is Official in the Foreign Pharmacopœias except Hung and U.S. Fr has 1 plaster of dissection for the Mex Emplastro de Galbano Azafranado Dutch Emplastrum Galbani Compositum

UNGUENTUM GALBANI COMPOSITUM—Galbanum Plaster, 4 oz, Lead Plaster, 4 oz, White Beeswax, 4 oz, soft Extract of Opium, 1 dram, Olive Oil, 20 fl oz Melt together

It is used for boils and carbuncles, and for sore nipples and inflamed breasts

GALLA.

GALLS

FR, GALLE D'ALEP, GER, GALLAPPEL, ITAL, NOCI DI GALLA, SPAN, AGALLA DE ALEPO

Excrecences on *Quercus* Oliv, resulting from punctures and deposited eggs of *Galleria mellonella*, Oliv

This description occurs in B.P. and U.S.P. Fr Codex gives it as a pathological product due to the puncture of *Cynips* Oliv, or the young shoots of the oak of the dyers, *Quercus tinctoria*, Lamk. var *infectoria*, Oliv

Chiefly from Turkey, Persia and Greece

Galls contain 60 to 70 p.c of Gallo-tannic Acid, and 3 to 5 p.c of Gallic Acid, to which their therapeutic qualities may be attributed

Solubility—All the soluble matter of Galls is taken up by forty times their weight of boiling Water, and the residue is tasteless

Medicinal Properties—Astringent Chiefly used locally in form of lotion or injection to suppress hæmorrhage from the gums, nose, etc., to lessen the discharge from mucous membranes, as in gleet, leucorrhœa etc., both Ointments are useful in painful hæmorrhoids

Dose—10 to 20 grains = 0.65 to 1.3 gramme

Incompatibles—The mineral Acids, Iron and Lead salts, Copper Sulphate, Silver Nitrate, Potassium and Sodium Carbonates and Alkalies, Lime Water, Tartar Emetic, Ipecacuanha and Opium, Infusions of Cinchona, Calumba and Cuscuta

Official Preparations—Unguentum Galla and Unguentum Galla cum Opio Used in the preparation of Acidum Gallicum and Acidum Picricum

Not Official—Decoctum Galla, Suppositoria Galla, and Suppositoria Galla cum Opio

Foreign Pharmacopœias—Official in Austr, Dan, Dutch, Fr (Galle d'Alep), Ger, Hung, Ital (Noci di Galla), Jap, Mex (Agallas de Levante), Norw, Port (Galha), Russ, Span (Agalla de Alepo), Swiss and U S

Descriptive Notes—The galls of *Quercus infectoria* are known in commerce as Aleppo galls, and are met with in three varieties, blue, green, and white. The blue green are considered the best, the dark green second, and the white galls are of very inferior quality. The last named, besides the pale yellowish-brown colour, are noticeable for the fact that each shows a perforation whence the gall insect has escaped. They are also lighter in weight, and are excluded from use by the official description, according to which Aleppo galls are spherical, averaging $\frac{1}{2}$ to $\frac{3}{4}$ in (12 to 18 mm) in diameter, and have a smooth surface, are dark green or olive green externally, are furnished in the upper half with small pointed tubercles, and ridges widely separated, the lower half, being usually smooth, are yellowish or brownish white internally, with a small central cavity. They have an astringent and slightly acid taste, followed by a slight sweetness. The characteristic features of powdered galls are the raphides, angular fragments of Tannin, the parenchymatous cells, with intercellular spaces, the sclerenchymatous cells with stratified walls, and starch grains with a stellate hilum. English oak galls, from *Quercus pedunculata*, Willd, resemble Aleppo galls in size, but have no prominences, and contain less than a third of the amount of Gallic tannic acid (15 to 20 p c) contained in the Aleppo galls (70 p c). Other oak galls, under the name of Morea galls, are occasionally imported from Greece. These are about $\frac{1}{2}$ in in diameter, and have a crown of small tubercles. The Japanese and Chinese galls, from Hiogo and Canton, which are largely imported, are irregularly fig shaped, hollow, and downy externally, from 1 to 2 in long, $\frac{1}{2}$ to 1 in broad, the shell being only $\frac{1}{16}$ to $\frac{1}{12}$ in in thickness. They are formed on *Rhus semialata*, Murr, and other species by *Aphis chinensis*, Bell, the skeletons of which are usually found within the galls. They yield up to 78 p c of Gallic tannic Acid, and are therefore of considerable technical value. The plum-shaped Chinese galls are formed on *Distylium racemosum*, S et Z, Tamarisk galls, formed on *Tamarix orientalis*, L, and other species, are from the size of a pea up to $\frac{1}{2}$ in in diameter, and are occasionally imported, they contain about 40 p c of Tannin.

ACIDUM GALLICUM—See ACIDUM GALLICUM

ACIDUM TANNICUM—See ACIDUM TANNICUM

Preparations

UNGUENTUM GALLÆ—GALL OINTMENT

Galls, 1, Benzoated Lard, 4 (1 in 5)

Foreign Pharmacopœias—Official in U S, 1 in 5 Not in the others

UNGUENTUM GALLÆ CUM OPIO. GALL AND OPIUM OINTMENT

Opium, $7\frac{1}{2}$ grains, Gall Ointment, 92 $\frac{1}{2}$ grains (about 1 in 13)

The ointment might be made direct by mixing 15 grains of Opium and 37 grains of Galls with 118 grains of Benzoated Lard

Not Official

DECOCTUM GALLÆ.—Bruised Galls, 2½, Distilled Water, 40; boil to 20, and strain (1 in 8)

B.P.C. Decoction is 1 in 16

SUPPOSITORIA GALLÆ.—5 grains powdered Galls and 1 grain Opium in each, with a basis of Coconut Stearin

TINCTURA GALLÆ.—1 of Galls percolated with Alcohol (60 p.c.) to yield 8, (1 in 8)

Dose —½ to 2 fl drms = 18 to 71 c.c.

B.P.C. Tincture is 1 in 10, also with " " " " " "

Foreign Pharmacopœias—Official in Austr., Dan., Dutch, Ger., Hung., Jap., Mex., Norw., Russ., Swiss and U.S., 1 in 5. All by weight, except U.S. Not in the others.

Not Official.

GARCINIA PURPUREA, Roxb.

KOKUM BUTTER TREE

Grows in the forests of Malabar, the Concars, and other parts of the Madras Peninsula

The Oil of the seeds (*Kokum Butter*) is obtained by first exposing the seeds for some days to the action of the sun to dry, they are then bruised and boiled in Water, the Oil collects on the surface, and on cooling contracts into a solid cake. It melts at 98° F. (36.6° C.). The seeds yield about 10 p.c. of Oil.

It is used in India in the preparation of ointments, suppositories, etc.

Not Official

GAULTHERIÆ OLEUM.

OIL OF WINTERGREEN.

Three nearly allied substances are sold as Oil of Wintergreen, and they are all official in U.S.

Oil of Gaultheria (Wintergreen)—A volatile Oil distilled from the leaves of *Gaultheria procumbens*, L., consisting almost entirely of Methyl Salicylate, and nearly identical with Volatile Oil of Betula. A colourless or yellow liquid, with a strong characteristic odour, and a pungent taste.

Official in the *Ind.* and *Col. Add.* for the North American Colonies.

It should be kept in well-closed bottles of a dark amber tint, in a cool atmosphere, and protected as far as possible from the light.

It contains, according to Power and Kleber, about 99 p.c. of Methyl Salicylate, with a small amount of a paraffin, probably triacontane, an aldehyde or ketone, an apparently secondary Alcohol and an Ester.

Tests—Oil of Gaultheria has a sp. gr. of 1.175 to 1.185. It is slightly laevogyrate, the optical rotation being not below -0.25° nor more than -1° in a 100 mm tube. It boils at 218° to 221° C. (424.4° to 429.8° F.). It should form a perfectly clear solution at about 20° C. (68° F.) with 5 parts of Alcohol (70 p.c.). It should yield the tests and be free from the impurities mentioned under Methyl Salicylate. It may be distinguished from Oil of Betula by its optical rotation, the latter being optically inactive. Foreign oils of Gaultheria, if present, may be determined by the sp. gr.,

Volatile Oil of Betula (Sweet Birch) —A volatile Oil obtained by distillation from the bark of *Betula lenta*, L. It is identical with Methyl Salicylate, and nearly identical with Oil of Gaultheria

It should be kept in well closed bottles of a dark amber tint, in a cool atmosphere, and protected as far as possible from the light

It is produced by the action of the ferment Betulase on the glucoside Gaultherin

According to Power and Kleber, the Oil consists, to the extent of about 99.8 p.c., of Methyl Salicylate, and in its unrectified state of a paraffin, probably Triacotane and an Ester, but does not contain the secondary Alcohol found in Gaultheria Oil

Tests —Oil of Sweet Birch has a sp. gr. of 1.180 to 1.187. It is optically inactive. It boils between 218° and 221° C (424.4° and 429.8° F). It should form a perfectly clear solution at about 20° C (68° F) with 5 parts of Alcohol (70 p.c.)

Foreign Oils or Petroleum, if present, may be detected by a lowering of the sp. gr. In other respects it resembles Oleum Gaultheriae, and conforms to the tests and should be free from the impurities mentioned under that Oil

Methyl Salicylas ($\text{CH}_3\text{C}_6\text{H}_4\text{O}_2$, eq. 150.92) is produced synthetically. A colourless or slightly yellowish liquid, with a characteristic odour and taste. A large proportion of the Oil in commerce is synthetic Methyl Salicylate, or Artificial Oil of Wintergreen

It should be kept in well closed bottles of a dark amber tint, protected as far as possible from the light and in a cool atmosphere

Solubility —Readily soluble in Alcohol (90 p.c.), Ether, Chloroform, and Glacial Acetic Acid, only slightly soluble in Water

Medicinal Properties —A valuable remedy in acute rheumatism, internally, also externally, applied directly over joints and limbs and covered with oiled silk or gutta percha tissue, to prevent evaporation, thus applied is specially useful in acute muscular rheumatism, also mixed with equal parts of Olive Oil. Used largely as a flavouring agent in America, more particularly in dentifrices. It is a good antiseptic

Methyl Salicylate is better for external application than the Oil of Wintergreen as it does not produce an eruption. In all cases it was applied according to the process, become classic, of 50 to 100 drops poured upon a double fold of aseptic gauze, and covered by an impermeable material, applied for some hours, either to the forearm or to the leg, and renewed twice every twenty-four hours. The part treated with natural essence of Wintergreen, was more or less red, painful, and covered sometimes with a rubeoliform eruption, pure Methyl Salicylate produced no such reaction —*L* '98, i 52, *B M J E* '00, i 56

As a dressing in the treatment of chorea, 6 to 10 grammes of the Oil either pure or mixed with Vaseline and covered with oiled silk to prevent evaporation —*T G* '99, 240, *B M J E* '99, i 8

In subacute and chronic rheumatism it is stated to be of great advantage, employed either alone or in conjunction with Sodium Salicylate —*T G* '99, 612, *B M J E* '99, i 63

Dose —5 to 15 minims = 0.3 to 0.9 c.c. every 4 hours when given as a substitute for Sodium Salicylate, but the taste is rather pungent

Prescribing Notes —When required to be added into an emulsion or pills, the same general rules would apply as for other Essential Oils, see 'Mucilage Acaciae' and 'Pilulae'; or it may be given in Coffin's rules, containing 5 or 10 minims in each

Foreign Pharmacopœias —Official in Fr. and U.S. Not in the others

Tests —Methyl Salicylate has a sp. gr. of 1.185 to 1.190. It is optically inactive. It has a boiling point of 219° to 221° C (426.2° to 429.8° F). It is readily soluble in Alcohol (90 p.c.), the solution being neutral or only slightly acid to Litmus paper. *Fr. Codex* gives the sp. gr. as 1.1819 at 18° C (60.8° F), and the boiling point as 224° C (435.2° F)

The saturated aqueous solution yields with Ferric Chloride T.S. a deep violet coloration. It should form a perfectly clear solution at about 20° C (68° F) with 5 parts of Alcohol (50 p.c.). If the Oil be saponified with Sodium Hydroxide Solution and the alkaline liquid be filtered with about 10 c.c. of its volume of Water, and acidified with diluted Sulphuric Acid, a white crystalline precipitate is formed, which, collected on a filter, washed with a little Water, and recrystallised from hot Water, should possess a melting point of 150° to 157° C (312° to 314.6° F) and should otherwise answer the tests of identity of Methyl Salicylate from the impurities mentioned under Acidum Salicylicum. It may be determined volumetrically with Normal Volumetric Potassium Hydroxide Solution, using Phenolphthalein Solution as an indicator. A weighed quantity of 5 grammes of the Oil is dissolved in 25 c.c. of the Normal Volumetric Solution and the mixture is boiled for five minutes to effect saponification. It is cooled, and the excess of alkali is titrated with Normal Volumetric Sulphuric Acid Solution 1 c.c. of Normal Volumetric Potassium Hydroxide Solution corresponds to 0.15092 gramme of Methyl Salicylate. The number of c.c. of Normal Solution absorbed multiplied by 0.15092 and the product multiplied by 20, yields the percentage w/w of absolute Methyl Salicylate present in the sample. The percentage of Methyl Salicylate may also be determined by saponification with Normal Volumetric Potassium Hydroxide Solution or, adding sufficient Normal Volumetric Hydrochloric Acid Solution to produce a faintly acid reaction, removing the liberated Salicylic Acid by Ether, washing till free from mineral acid and titrating the ethereal solution of Salicylic Acid with Normal Volumetric Potassium Hydroxide Solution using Phenolphthalein Solution as an indicator. 1 c.c. of Normal Volumetric Potassium Hydroxide Solution corresponds to 0.15092 gramme of absolute Methyl Salicylate. A good specimen contains not less than 99 p.c. w/w of Methyl Salicylate.

The more generally occurring impurities are Alcohol or Chloroform, other volatile oils or Petroleum and Methyl Benzoate. Alcohol or Chloroform may be detected by placing 1 c.c. in a flask provided with a suitable condenser and heating on a water bath. The distillate should not have the characteristic odour of Alcohol or Chloroform. The presence of volatile oils or Petroleum is indicated by the separation of oily drops either on the surface or at the bottom of the liquid, when 1 c.c. of Methyl Salicylate contained in a capacious test-tube is agitated with 5 c.c. of Potassium Hydroxide Solution. Methyl Benzoate is indicated by the m.p. of the acid, obtained after saponification and the decoloration of the Salicylic Acid as described above.

SPIRITUS GAULTHERIÆ—Oil of Gaultheria, 5, Alcohol (95 p.c.), 95, both by measure—L.S.P.

Average Dose—30 minims. This has been incorporated in the B.P.C. using Alcohol B.P. in place of Alcohol L.S.P.

SANOFORM (Di-iodomethyl salicylate)—A white crystalline powder, almost odourless and tasteless. It contains 62.7 p.c. of Iodine.

The m.p. of the powder is 110.5° C (230.9° F), and it therefore may be sterilised at 100° C (212° F) without decomposition. It may be employed (B.M.J.E. '05, 1, 80) in all cases where Iodoform is used, chiefly as a dressing in minor surgical operations, in cases of senile and diabetic gangrene and in gynaecology.

Solubility—Insoluble in Water and Glycerin, slightly soluble in cold Alcohol (90 p.c.), and readily in Ether.

MESOTAN (Salicylic Acid Methoxymethylester)—A yellow, oily liquid, possessing a slight aromatic odour. Insoluble in Water, readily soluble in Alcohol (90 p.c.), Ether and Chloroform. It is stated to be readily absorbed by the skin, and to be useful as a local application in all forms of rheumatic and gouty affections. It may be used as a 50 p.c. solution in Olive Oil, or by itself—B.M.J.E. '03, 1, 44.

Applied externally as an antirheumatic, it is stated (L. '04, 1, 100) B.M.J.E. '05, 1, 20) to have afforded distinct relief. It is stated to afford relief in the after-treatment of acute rheumatism, but is not so during the fever. Not the slightest effect followed its use in chronic rheumatism, and in one case well-marked local effect.

There can be little doubt (*B M J* '05, i 715) of the value of Mesotan in the treatment of rheumatism, but its use requires caution and careful supervision. An embrocation consisting of equal parts of Mesotan and oil very gently applied to the feet and ankles caused a rash in about 10 or 12 days, not only on the parts to which the embrocation had been applied, but also on the arms. It should be painted on where the skin is specially delicate (*M P* '05, i 452), and the skin should be previously dried and not covered with any impervious material afterwards.

Methyl-acetyl-salicylate is a crystalline powder, insoluble in Water, soluble in Alcohol (90 p c) and in Chloroform. Has been recommended in rheumatic affections—*C D* '03, ii 90.

Amyl Salicylas—A colourless or slightly yellowish liquid, with a characteristic odour and taste. It is not nearly so pungent as Oil of Gaultheria, and therefore has been suggested as a substitute for the latter.

GELATINUM.

GELATIN

The purified air-dried product of the hydrolysis of certain animal tissues as skin, ligaments and bones by the action of boiling Water.

Commercial Gelatin varies considerably in its gelatinising power, and it is advisable to keep to the same brand to avoid alteration in formulas.

Medicinal Properties—Hæmostatic. Used for increasing the coagulability of the blood in aneurisms.

A sterilised 1 to 2 p c solution in normal saline has been used with considerable success in the treatment of aortic aneurism—*L* '02, ii 169, 558, '03, i 591, 1810, *B M J* '03, i 1493. *B M J E* '02, i 16, 91, *P* lxii 577, *P J* '99, ii 213, *C D* '01, ii 442.

A method of preparing the sterilised solution in flasks, and a description of a suitable apparatus for its use—*B M J* '01, 1415.

Each flask contains the requisite quantity of sterile Gelatin solution ready for use without further dilution and consequent risk of contamination. 100 c c of a 2 p c solution are introduced (*L* '05, i 1169) into the subcutaneous tissue over an interval of from ten to twelve minutes in order to avoid discomfort and over-distension of the skin. The inner aspect of the thigh is found to be the most convenient place for the injection. Potassium Iodide in 10 grain doses three times a day is given concurrently with the Gelatin injection.

Rectal injection of 250 c c of a 5 p c sterilised aqueous solution of Gelatin in the treatment of hæmoptysis—*L* '03, i 578.

Six samples of Gelatin examined, and tetanus spores found in four of them—*L* '03, i 579.

Cases of tetanus terminating fatally following the subcutaneous injection of Gelatin solution—*B M J* '01, ii 638, 741, *L*, '03, ii 33, *C D* '01, ii 382.

In melæna hæmatorum—*B M J* '02, i 43.

Contra-indicated in nephritis—*B M J E* '00, ii 1.

In hæmoptysis as a rectal injection, $\frac{1}{2}$ pint (*B M J* '05, i 68) three times daily.

Following frequent references to the use in aneurism of a 2 p c solution in normal saline injected into the gluteal region the further note appears. A popliteal aneurism was cured by seven injections, into the gluteal region, of a serum containing 2 p c of Gelatin. Each dose was 200 grammes, and the injections extended over seven months—*L* '05, i 1169.

Preferable to begin with 50 c c of 2 p c solution and gradually to increase the quantity to 100 c c and the strength to 4 p c. Treatment to continue over three to six months—*B M J E* '06, ii 76.

Official Preparations—Used in the preparation of the various Lamellæ, and Suppositoria Glycerini, p 569

Not Official—Gelatin Basis for Pessaries and Suppositories, Glyco-gelatin, Gelato-glycerin and Gelatinum Glycerinatum

Foreign Pharmacopœias—Official in Austri, Belg, Dan, Dutch, Fr, Ger, Hung., Jap, Mex, Port, Russ, Span, Swed, Swiss and U S Not in the others. Fr has Gelatine, and Gelatine officinale Swed includes a white and an ordinary Gelatin

Tests.—Gelatin, when immersed in cold Water, swells up and softens, taking up from 5 to 10 times its weight of Water, without undergoing solution to any great extent. It dissolves readily in hot Water. It is official in 1 in 50 parts of the latter liquid, a solution which is inodorous and which solidifies to a jelly on cooling. The *USP* states that a solution 1 in 50 of boiling Water should solidify on cooling and form a firm jelly; the *PG* states that a 1 in 100 solution will form a jelly on cooling. A useful test for comparing the gelauminising power of commercial Gelatins is to place 5 grains in a test-tube ($\frac{1}{2}$ in in diameter) with 250 grains of Water for half an hour, warm gently until the water is then place the test-tube in Water at 15°C (60°F), and leave undisturbed for 30 minutes, by which time a jelly should be formed of such consistence that it will remain in position if the test-tube be inverted. The aqueous solution affords a whitish precipitate with Tannic Acid Solution, *USP* specifies the strength of Solution as 1 in 5000, the *PG* says 'very dilute solutions'. Mercuric Chloride also affords a precipitate in an aqueous solution, neither Ferric Chloride TS, Lead Acetate Solution nor Alum Solution produces a precipitate. Potassium Bichromate Solution added to a Solution of Gelatin in hot Water, forms, on cooling, a jelly which becomes insoluble in warm Water after exposure to light. This latter reaction is made use of in photo-lithography. The *USP* and *PG* require that when incinerated it shall not leave more than 2 p.c. of ash.

Not Official

GELATIN BASIS FOR PESSARIES AND SUPPOSITORIES—Soften 1 oz. of Gelatin by allowing it to soak in 1 fl. oz. of Water until it is absorbed, then dissolve in $3\frac{1}{2}$ fl. oz. of Glycerin by the heat of a water-bath and allow it to cool and solidify. It can be medicated by mixing it over a water-bath and suspending or dissolving in it substances in fine powder, and then pouring the mixture into moulds.

See also Glycerin

GLYCO-GELATIN—Refined Gelatin 1 oz., Glycerin (by weight), $2\frac{1}{2}$ oz.; Ammoniacal Solution of Carmine a sufficiency, Orange-flower Water, $2\frac{1}{2}$ fl. oz.—Throat

Soak the Gelatin in the Water for 2 hours, then heat in a water-bath till dissolved, add the Glycerin and stir well together. Let the mixture cool, and when nearly cold add the Carmine solution, mix all uniformly coloured, and set aside to solidify.

This mass is used for making the various medicinal pills. The various substances are rubbed with an equal quantity of hyssop leaves when melted over a water-bath.

Glyco-gelatinum.—Gelatin, 12, Glycerin, 20, Sugar, 5, Citric Acid, 2, Carmine, a sufficient quantity.—*B P C*

This mass is stated to be of an unsatisfactory consistence, the following is an improvement (*P J '07*, n 804, 813) —

Gelatin, 20, Glycerin, 80, Distilled Water, 56, Orange-flower Water (undiluted), 7, Citric Acid, 2 50, Absolute Alcohol, 1, Oil of Lemon, 0 20, Solution of Carmine, 1

GELATO-GLYCERIN — Refined Gelatin (by weight), 5 oz, Glycerin (by weight), 6 oz, Water (by weight), 6 oz Soak the Gelatin in the Water for 12 hours, with occasional stirring, add the Glycerin, dissolve in a water-bath, and evaporate to produce 15 oz by weight of the Gelato glycerin — *Throat*.

(For preparing Nasal Bougies)

This has been incorporated in the *B P C*

GELATINUM GLYCERINATUM — Gelatin, 1, Glycerin, 1, Water, quantity sufficient to make 2 (all by weight) — *U S P*

Cover the Gelatin with boiled and Distilled Water, and after one hour drain the excess of Water away, transfer to a tared dish, add the Glycerin, and heat on a water-bath until solution is effected, strain whilst hot, and evaporate to 2

GELSEMII RADIX.

GELSEMIUM ROOT

FR, GELSEMIUM, GER, GELSEMIUMWURZEL, ITAL, GELSEMIO,
SPAN, GELSEMIO

The dried Rhizome and Roots of *Gelsemium nitidum*, Michaux

The plant, Carolina Jasmine, grows in the Southern States of North America

The root contains two alkaloids Gelsemine and Gelseminine It also contains B methylasculetin, which is identical with Gelsemic Acid

Excellent papers on the alkaloidal content of Gelsemium Root and Rhizome appear in *Proc Amer Pharm Assoc*, lvi 282, liv 383

Medicinal Properties.—Antispasmodic and analgesic Has been used in dental neuralgia, migraine, and especially in tic-douloureux (neuralgia of fifth nerve), also in uterine and ovarian pain, spasmodic and asthmatic cough, and in chorea

This drug should be used with care, and in the event of toxic symptoms presenting themselves, artificial respiration should be carried on — *Pr* 15 50

Official Preparation — Tinctura Gelsemii

Not Official — Extractum Gelsemi Alcoholicum, Fluidextractum Gelsemi

Antidotes — Emetic of Mustard and Water, Atropine, Aromatic Spirit of Ammonia, Brandy, Nitroglycerin, and Digitalis Artificial respiration should be kept up very steadily for at least three hours

Foreign Pharmacopœias — Official in Jap, Mex, Swiss and U S Not in the others

Descriptive Notes — Gelsemium Root consists mostly of the underground stem or rhizome, with occasional pieces of the root The rhizome is easily distinguished by the presence of a small, usually dark, pith, it has a purplish-brown longitudinally-fissured bark, which is thin (about 1 mm *U S P*) and shows when fractured a few silky fibres The root is yellowish-brown and tortuous, but has no pith, both root and stem have a radiate woody structure with numerous medullary rays, the bark has a bitter taste and a faint, slightly aromatic, odour The pieces vary in diameter from $\frac{1}{4}$ to $\frac{3}{4}$ of an inch (6 to 18 mm), and about 6 to 8 inches (20 or even 30 cm

U S P) in length According to Sayre, the root contains less of the active principle than the rhizome, but it resides almost entirely in the bark, and the tincture is therefore likely to vary in strength according to the proportion of bark present, it also varies in different samples, and a tincture made from the fresh rhizome is more active as a heart depressant. Under the microscope the structure of the root is remarkable for the thick medullary rays, which are about 6 to 8 cells in thickness, the cell walls being thick and pitted, but as they approach the cortical zone, the cells become larger, thinner walled, and many of the cells contain octahedral prisms of Calcium Oxalate. The cortical parenchyma has no stone cells nor laticiferous vessels, the liber has no lignified fibres, and the numerous vessels in the wood are isolated, not in groups.

Tests—Although numerous processes have been published from time to time for the assay of the preparations of Gelsemium, very few give accurate or uniform results, and those which yield uniform results are too complicated for ordinary usage. A process which gives very satisfactory and accurate results, and which, when tried in the author's laboratory, was found to justify the claims made for it, is recorded, *Proc Amer Pharm Assoc* lv. (1907), 357. As carried out on the fluid extract, the details are as follows—A measured quantity of 15 cc is evaporated at 60° C (140° F) to a soft extract, or sufficiently to dissipate the Alcohol. A measured quantity of 5 cc of Normal Volumetric Sulphuric Acid Solution, which has been previously diluted with an equal volume of Water, is added and the resulting mass allowed to disintegrate, when this is accomplished it is transferred to a 15 cc graduated cylinder and diluted to 15 cc, it is thoroughly mixed, the precipitate allowed to settle and a measured quantity of 10 cc is filtered or decanted off into a separate bottle the acid solution is washed with Chloroform, using three separate portions each of 10 cc, 5 cc and 5 cc. The chloroformic washings are in each instance separated, mixed and in turn washed with about 5 cc of slightly acidulated Water, the acid aqueous washings being mixed with the main acid solution. The mixture is rendered alkaline with Ammonia Solution and the liberated alkaloids are shaken out with three successive quantities each of 15 cc, 10 cc and 5 cc of Chloroform. A further quantity of 10 cc of Chloroform may occasionally be necessary to extract the whole of the alkaloids, their complete extraction may be determined by allowing a few drops of the chloroformic solution to evaporate, acidifying with dilute Sulphuric Acid and testing with a drop or two of Potassio-mercuric Iodide (Mayer's) Solution. The chloroformic liquids are in each instance separated, mixed, transferred to a tared flask, the Chloroform is evaporated and the residue dried until constant in weight, the weight of alkaloids multiplied by 20 and the product divided by 3 yields the percentage w/v of Chloroform-soluble Gelsemium alkaloids present in the specimen operated upon. The alkaloidal residues remaining from the above process were of a bright yellow colour, and were pure products. A sample of fluid extract

the author's laboratory in 1885 by the then official process of the *USP*, when recently examined gave the following figures specific gravity, 0.865, total solids, 8.74 p c w/v, Absolute Alcohol, 81.11 p c w/v, and when assayed according to the process described above yielded 0.37 p c w/v of Chloroform-soluble Gelsemium alkaloids.

The following constituents of Gelsemium have been described

Gelsemin — A name given to a resinoid and eclectic remedy, resembling the alcoholic extract

Dose — $\frac{1}{2}$ to 2 grains = 0.032 to 0.13 gramme

Gelsemine, Gelsemine — The crystallisable alkaloid forming crystalline salts, described by Gerrard (*PJ* (3) xiii 641) as having the formula $C_{22}H_{26}N_2O_4$, eq 405.24 and the melting point $45^\circ C$ ($113^\circ F$). Spigel says that experiments intended to establish the formula for Gelsemine (known in Germany as **Gelseminine**) as between $C_{22}H_{26}N_2O_4$ (Gerrard) and $C_{22}H_{26}N_2O_5$ have not led to a decisive conclusion, yet the results of analyses agree more closely with the latter formula.

A brittle transparent solid, crystallising with difficulty from Alcohol. It is only sparingly soluble in Water, more readily in Alcohol (90 p c), and readily in Ether and Chloroform. It dissolves in strong Nitric Acid with little or no colour. When the liquid is allowed to evaporate spontaneously in porcelain, a permanent bluish green colour is obtained. The pure alkaloid dissolves without change of colour in concentrated Sulphuric Acid, even on warming, but if not perfectly pure, a reddish or brownish colour is obtained, which gradually becomes pinkish, and on heating becomes chocolate or purple. When treated with strong Sulphuric Acid and an oxidising agent, e.g., Potassium Bichromate, a fine reddish purple or cherry red coloration is produced, rapidly changing to a bluish green or blue tint.

Dose — $\frac{1}{120}$ to $\frac{1}{2}$ grain = 0.0005 to 0.002 gramme

Care must be taken to ascertain the intention of the prescriber when any doubt exists as to whether the alkaloid or resinoid is required.

When quite free from Gelseminine, with which all early specimens were probably mixed, Gelsemine is stated (*P* 11 38) to be without action on mammals, even when injected intravenously up to $\frac{1}{2}$ gramme = $7\frac{1}{2}$ grains. Gelseminine, on the other hand, is intensely poisonous, causing a descending paralysis of the central nervous system, $\frac{1}{2}$ grain = 0.032 gramme being the calculated lethal dose for an adult. Applied locally it produces dilatation of the pupil, and it is to the action of this alkaloid, modified by the various acid resins, that the action of Gelsemium Tincture is mainly due.

Gelseminæ Hydrochloridum — Colourless crystals, soluble in Water. Known in Germany as **Gelsemininum Hydrochloricum Cryst**.

Dose — $\frac{1}{120}$ to $\frac{1}{32}$ grain = 0.0005 to 0.002 gramme

Gelseminine — A white amorphous powder, which softens at $105^\circ C$ ($221^\circ F$), and melts at $120^\circ C$ ($248^\circ F$) with partial decomposition. Insoluble in Water, soluble in Alcohol (90 p c), Ether and in Chloroform. With dilute Nitric Acid it yields a brown coloration, with concentrated Nitric Acid a green coloration, and with Sulphuric Acid a yellow coloration, changing on the addition of an oxidising agent, e.g., Potassium Bichromate, to violet and, finally, green. It is intensely bitter and poisonous.

Gelsemic Acid is not known to have any medicinal properties, but affords reactions, which to some extent serve as a test for Gelsemium preparations, particularly the blue fluorescence which it produces in alkaline solutions.

Colourless, odourless and nearly tasteless groups or tufts of prisms, or in minute scales and plates. It is not distinctly acid to Litmus paper. It is soluble in hot Water, readily soluble in Alcohol (90 p c), and in Ether and Chloroform. It dissolves in solutions of the fixed alkalis and in Ammonia.

solution, forming a solution having an intensely yellow colour by transmitted light, but which by reflected light exhibits a strong green fluorescence, which is readily destroyed by free acids. It dissolves in Nitric Acid with the production of a yellow or orange colour changing, on the addition of an excess of Ammonia solution, to a blood red coloration.

Preparation

TINCTURA GELSEMI. TINCTURE OF GELSEMIUM

1 of Gelsemium Root, in No 40 powder, percolated with Alcohol (60 p c) to yield 10 (1 in 10)

Dose.—5 to 15 minims = 0.3 to 0.9 c c

Swiss, maximum single dose, 1 gramme, maximum daily dose, 5 grammes

Foreign Pharmacopœias.—Official in Mex, 1 in 5, Swiss and US, 1 in 10, Jap, 1 in 8. All by weight except US. Not in the others.

A girl 9 years old was killed in two hours by 2 fl drim = 7.1 c c of the Tincture.

Tests.—Tincture of Gelsemium has a sp gr of 0.920 to 0.925, it contains about 1.5 p c w/v of total solids and about 58 p c w/v of Absolute Alcohol. When assayed according to the process described under Gelsemium Radix the B P Tincture yielded 0.043 p c w/v of Chloroform-soluble Gelsemium alkaloids. A specimen of the US P Tincture prepared and examined in the author's laboratory had a specific gravity of 0.913, it contained 1.8 p c w/v of total solids. When assayed according to the process recommended under Gelsemium Radix it yielded 0.048 p c w/v of Chloroform-soluble Gelsemium alkaloids.

A standard of 0.025 p c w/v of Gelsemine has been suggested for the Tincture, but a standard of total alkaloids is suggested as a safer basis.—Y P B '04, 279.

The Rhizome contains from 0.38 to 0.7 p c of total alkaloids, so that 0.5 p c might be regarded as a suitable standard, equal to 0.05 p c of total alkaloids for the Tincture.

The percentage of alkaloids in the Tincture may vary between 0.002 and 0.076 p c w/v, but standardisation, according to total alkaloids without the ratio of the two alkaloids, may be of doubtful value.

Not Official

EXTRACTUM GELSEMI ALCOHOLICUM.—Gelsemium in No 60 powder percolated with Rectified Spirit and evaporated to an extract.—B P '85.

Dose.— $\frac{1}{2}$ to 2 grains = 0.032 to 0.13 gramme.

This has been incorporated in the B P C.

FLUIDEXTRACTUM GELSEMI.—Percolate 100 of Gelsemium in No 60 powder with Alcohol (95 p c) until exhausted, reserve the first 90 of percolate and evaporate the remainder to a soft extract, which mix with the reserved portion and make up to 100.—US P.

Average dose.—One minim = 0.06 c c.

This has been incorporated in the B P C.

GENTIANÆ RADIX.

GENTIAN ROOT

FR, RACINE DE GENTIANE, GER, ENZIANWURZEL, ITAL, GENZIANA,
SPAN, GENCIANA

The dried Rhizome and Roots of *Gentiana lutea*, L

Collected in the mountainous districts of central and southern Europe

The active principle *Gentiopicroin* is a neutral crystalline body, soluble in Water and diluted Alcohol, insoluble in Ether

Medicinal Properties—Bitter tonic, used in cases of atonic dyspepsia, the infusion is recommended in the vomiting of pregnancy, along with a mineral acid, or when a general tonic is required, as in convalescence from acute diseases or in nervous debility

For the ordinary phthisical patient nothing is better in the way of drugs to promote appetite and aid digestion than the time honoured *Mistura Gentianæ Alkalina* of the Brompton Hospital Pharmacopœia—*L* '04, 11 1827

The extract has been largely used as an excipient to form powders into pills

Official Preparations—*Extractum Gentianæ*, *Infusum Gentianæ Compositum*, and *Tinctura Gentianæ Composita*

Not Official—*Extractum Gentianæ*, *Fluidextractum Gentianæ*, *Infusum Gentianæ Compositum Concentratum*, *Aromatic Infusion of Gentian*, *Mistura Gentianæ*, *Mistura Gentianæ Alkalina*, *Mistura Gentianæ cum Soda*, *Mistura Gentianæ Acida*, *Tinctura Gentianæ*

Incompatibles—Ferrous Sulphate, Silver Nitrate, and Lead salts

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, Fr, Ger, Hung, Ital (*Genziana*), Jap, Mex (*Genciana*), Norw, Port, Russ Span, Swed, Swiss and U S

Descriptive Notes—The official Gentian Root is that of *Gentiana lutea*. As met with in commerce, Gentian Root consists of more or less rootstock continuous with the root, the rootstock being marked with crowded rings of leaf scars, but the root is longitudinally wrinkled. It varies much in length and thickness, seldom exceeding an inch ($2\frac{1}{2}$ cm) in diameter, *BP*, 5 to 35 mm ($\frac{1}{4}$ to $1\frac{1}{2}$ inch), *USP*, Gentian Root is usually somewhat flexible and tough, with a soft fracture showing no woody tissue or medullary rays, but when recently dried is harder and brittle. Externally it is of a yellowish-brown colour, but internally more of an orange tint or reddish-yellow. The reddish colour, which causes it to be distinguished on the Continent as Red Gentian Root, is partly the result of fermentation before the root is dried, by which the characteristic odour is also more developed. The taste is sweet at first, but soon afterwards bitter. There is occasionally met with in English commerce a root with a paler fracture, known as White Gentian, which is disagreeably bitter, and should therefore not be substituted for the Official kind. It is imported from Bordeaux, and is probably derived from *Gentiana Burseri*, Lapeyr, and is not fermented before drying. Under the microscope the tissue is seen to be devoid of sclerenchymatous cells, contains minute Calcium Oxalate crystals, and rarely a few simple starch grains. The wood possesses sieve-tubes besides reticulated

solution, forming a solution turning brown on exposure to light, but which is reflected light colorless. It is readily destroyed by free acid. It dissolves in Nitric Acid with the production of an orange colour, changing, on the addition of an excess of Ammonia to a blood red coloration.

Preparation

TINCTURA GELSEMII TINCTURE OF GELSEMIUM

1 of Gelsemium Root, in No 40 powder, percolated with Alcohol (60 p.c.) to yield 10 (1 in 10)

Dose.—5 to 15 minims = 0.3 to 0.9 c.c.

Swiss, maximum single dose, 1 gramme, maximum daily dose, 5 grammes

Foreign Pharmacopœias—Official in Mex., 1 in 5, Swiss and U.S., 1 in 10, Jap., 1 in 5. Not in the others.

A girl 9 years old was killed in two hours by 2 fl. dr. = 71 c.c. of the Tincture.

Tests.—Tincture of Gelsemium has a sp. gr. of 0.920 to 0.925, it contains about 1.5 p.c. w/v of total solids and about 58 p.c. w/v of Absolute Alcohol. When assayed by the process described under Gelsemium Radix the B.P. Tincture yielded 0.043 p.c. w/v of Chloroform-soluble Gelsemium alkaloids. A specimen of the U.S.P. Tincture prepared and examined in the author's laboratory had a specific gravity of 0.913, it contained 1.8 p.c. w/v of total solids. When assayed according to the process recommended under Gelsemium Radix it yielded 0.048 p.c. w/v of Chloroform-soluble Gelsemium alkaloids.

A standard of 0.025 p.c. w/v of Gelsemine has been proposed for the Tincture, but a standard of total alkaloids is not yet established. A later paper—J. P. B. '04, 279.

The Rhizome contains from 0.38 to 0.7 p.c. of total alkaloids, so that 0.5 p.c. might be regarded as a suitable standard, equal to 0.05 p.c. of total alkaloids for the Tincture.

The percentage of alkaloids in the Tincture may vary between 0.02 and 0.076 p.c. w/v, but standardisation, based on total alkaloids without the ratio of the two alkaloids, may be of doubtful value.

Not Official.

EXTRACTUM GELSEMII ALCOHOLICUM—Gelsemium in No 60 powder percolated with Rectified Spirit and evaporated to an extract—B.P. '85

Dose— $\frac{1}{2}$ to 2 grains = 0.032 to 0.13 gramme

This has been incorporated in the B.P.C.

FLUIDEXTRACTUM GELSEMII—Percolate 100 of Gelsemium in No 60 powder with Alcohol (95 p.c.) until exhausted, reserve the first 90 of percolate and evaporate the remainder to a soft extract, which mix with the reserved portion and make up to 100—U.S.P.

Average dose—One minim = 0.06 c.c.

This has been incorporated in the B.P.C.

GENTIANÆ RADIX.

GENTIAN ROOT

FR, RACINE DE GENTIANE, GER, ENZIANWURZEL, ITAL, GENZIANA,
SPAN, GENCIANA

The dried Rhizome and Roots of *Gentiana lutea*, L

Collected in the mountainous districts of central and southern Europe

The active principle **Gentiopicroin** is a neutral crystalline body, soluble in Water and diluted Alcohol, insoluble in Ether

Medicinal Properties.—Bitter tonic, used in cases of atonic dyspepsia, the infusion is recommended in the vomiting of pregnancy, along with a mineral acid, or when a general tonic is required, as in convalescence from acute diseases or in nervous debility

For the ordinary phthisical patient nothing is better in the way of drugs to promote appetite and aid digestion than the time-honoured Mistura Gentianæ Alkalina of the Brompton Hospital Pharmacopœia —L '04, 11 1827

The extract has been largely used as an excipient to form powders into pills

Official Preparations—Extractum Gentianæ, Infusum Gentianæ Compositum, and Tinctura Gentianæ Composita

Not Official—Extractum Gentianæ, Fluidextractum Gentianæ, Infusum Gentianæ Compositum Concentratum, Aromatic Infusion of Gentian, Mistura Gentianæ, Mistura Gentianæ Alkalina, Mistura Gentianæ cum Soda, Mistura Gentianæ Acida, Tinctura Gentianæ

Incompatibles—Ferrous Sulphate, Silver Nitrate, and Lead salts

Foreign Pharmacopœias—Official in Austr, Belg, Dan, Dutch, F₁, Ger, Hung, Ital (Genziana), Jap, Mex (Genciana), Norw, Port, Russ, Span, Swed, Swiss and U S

Descriptive Notes—The official Gentian Root is that of *Gentiana lutea*. As met with in commerce, Gentian Root consists of more or less rootstock continuous with the root, the rootstock being marked with crowded rings of leaf scars, but the root is longitudinally wrinkled. It varies much in length and thickness, seldom exceeding an inch ($2\frac{1}{2}$ cm) in diameter, B P, 5 to 35 mm ($\frac{1}{4}$ to $1\frac{1}{2}$ inch), U S P, Gentian Root is usually somewhat flexible and tough, with a soft fracture showing no woody tissue or medullary rays, but when recently dried is harder and brittle. Externally it is of a yellowish-brown colour, but internally more of an orange tint or reddish-yellow. The reddish colour, which causes it to be distinguished on the Continent as Red Gentian Root, is partly the result of fermentation before the root is dried, by which the characteristic odour is also more developed. The taste is sweet at first, but soon afterwards bitter. There is occasionally met with in English commerce a root with a paler fracture, known as White Gentian, which is disagreeably bitter, and should therefore not be substituted for the Official kind. It is imported from Bordeaux, and is probably derived from *Gentiana Burseri*, Lapeyr, and is not fermented before drying. Under the microscope the tissue is seen to be devoid of sclerenchymatous cells, contains minute Calcium Oxalate crystals, and rarely a few simple starch grains. The wood possesses sieve-tubes besides reticulated

vessels, *P G* and *Jap*. The *B P* requires that it should not yield any definite reactions with the tests for Starch. It has been found to be adulterated with 20 p c of ground olive stones, and a conviction obtained, *P J* (4) Nov 339. The *P G* permits the use of other species besides *G. lutea*, L., including *G. Pannonica*, Scop., *G. purpurea*, L., and *G. punctata*, L. The root of *Gentiana purpurea* has a branched appearance at the apex, due to several stems arising from the crown of one root, but is even more bitter than that of *G. lutea*. The roots of *G. punctata* have a similar appearance, but are a brighter reddish-brown internally. That of *G. Pannonica* is more slender, rarely exceeding 10 mm in diameter, and has more slender branches. It is likely to occur in root imported from Austria, since it occurs abundantly in the Austrian Alps, where *G. lutea* does not occur.

Tests—Gentian Root yields about 4 p c of ash. Samples examined in the author's laboratory gave from 2.2 to 5.6 p c, with an average of 3.5 p c.

Preparations

EXTRACTUM GENTIANÆ. EXTRACT OF GENTIAN

An aqueous Extract of Gentian Root, made by maceration with cold Water for 2 hours, boiling for 15 minutes, and evaporation of the strained liquid.

Dose.—2 to 8 grams = 0.13 to 0.52 gramme

Foreign Pharmacopœias—Official in Austr., Belg., Dan., Dutch, Fr., Ital., Jap., Mex., Port., Russ. Span., Swed. and U.S., with cold Water, Hung., with hot Water, Ger., Norw. and Swiss, with cold Water, and purified with Alcohol, Dan. and U.S., also **Fluid Extract**, 1 in 1.

INFUSUM GENTIANÆ COMPOSITUM. COMPOUND INFUSION OF GENTIAN

Gentian Root, $\frac{1}{4}$, Dried Bitter-Orange Peel, $\frac{1}{4}$, Fresh Lemon Peel, $\frac{1}{2}$, boiling Distilled Water, 20. Infuse 15 minutes. (1 in 80)

Dose.— $\frac{1}{2}$ to 1 fl. oz. = 14.2 to 28.4 cc

Foreign Pharmacopœias—Official in Fr. (Tisane), Gentian Root 1, cold Water 200, Swed., similar to Brit. Not in the others.

TINCTURA GENTIANÆ COMPOSITA. COMPOUND TINCTURE OF GENTIAN

Gentian Root, 2, Dried Bitter-Orange Peel, $\frac{3}{4}$, Cardamom Seeds, $\frac{1}{2}$, macerated with 20 of Alcohol (45 p c). (1 in 10)

Dose.— $\frac{1}{2}$ to 1 fl. dram = 1.8 to 3.6 cc

Tests.—Compound Tincture of Gentian has a sp. gr. of 0.965 to 0.970, it contains about 5 p c w/v of total solids and about 43 p c w/v of Absolute Alcohol.

Foreign Pharmacopœias—Official in Jap., Mex. and U.S., similar to Brit., Port., twice as strong as Brit. Not in the others.

Tinctura Gentianæ Composita—Gentian, 10, Bitter-Orange Peel, 4, Cardamom, 1, Alcohol (95 p c), 60 and 40 of Water (mixed). Percolate slowly until exhausted and make up with menstruum to 100.—U.S.P.

A simple tincture is official in most Foreign Pharmacopœias, see below.

Not Official

EXTRACTUM GENTIANÆ (U S P)—Macerate 100 of Gentian in No 20 powder with 40 of cold Water for 24 hours, exhaust by percolation with more Water, reduce the liquid to three fourths of its bulk by boiling, strain, then by means of a water bath evaporate to a pilular consistence

FLUIDEXTRACTUM GENTIANÆ (U S P)—Exhaust 100 of Gentian in No 30 powder with Alcohol (49 p c), reserve the first 80 of percolate, and evaporate the remainder to a soft extract, which dissolve in the reserved portion, and make up with Alcohol (49 p c) to 100

INFUSUM GENTIANÆ COMPOSITUM CONCENTRATUM—Gentian Root in No 10 powder, 10, Dried Bitter Orange Peel in No 10 powder, 10, Tincture of Lemon, 10, Tincture of Orange, 5, Alcohol (90 p c), 17 5, Dilute Chloroform Water (1 in 1000) sufficient to make 100 Mix the tinctures with the Alcohol, and re-percolate the drugs with dilute Chloroform Water, adding the mixed tinctures to the reserved portion

Dose— $\frac{1}{2}$ to 1 fl dm —*Fan* and *Wright*, *P J* '06, 1 165 and '07, 1 622, *C D* '06, 1 252, *Y B P* '07, 250

This appears in the *B P C*

MISTURA GENTIANÆ—Gentian Root, sliced, $\frac{1}{4}$ oz Bitter Orange Peel cut small, 30 grains, Coriander Fruit, bruised, 30 grains, Proof Spirit, 2 fl oz. Distilled Water, 8 fl oz —*B P* '87

Macerate the ingredients first in the Proof Spirit for two hours, then add the Water, macerate again for two hours, and strain through calico

Dose— $\frac{1}{2}$ to 1 fl oz = 14 2 to 28 4 c c

Gentian Root, sliced, 2 50, Bitter Orange Peel, cut small, 0 75, Coriander Fruit, bruised, 0 75, Alcohol (60 p c), 20, Distilled Water, 100 —*B P C*

Same directions as above

Mistura Amaro alkalina (Gentian Mixture) is official in Dan

MISTURA GENTIANÆ ALKALINA—Sodium Bicarbonate, 15 grains, Diluted Hydrocyanic Acid, 3 minims, Aromatic Infusion of Gentian, to 1 fl oz —*Brompton*

Aromatic Infusion of Gentian (*Brompton*)—Gentian, 2 oz, Lemon Peel, 6 dm, Orange Peel, 3 dm, Boiling Water, 1 gallon

MISTURA GENTIANÆ CUM SODA—Sodium Bicarbonate, 15 grains, Compound Infusion of Gentian, to 1 fl oz —*St Thomas's*

This has been incorporated in the *B P C*

MISTURA GENTIANÆ ACIDA—Diluted Nitro hydrochloric Acid, 10 minims, Spirit of Chloroform, 5 minims, Compound Infusion of Gentian, to 1 fl oz —*Royal Free*

Diluted Nitro-Hydrochloric Acid, 10 minims, Spirit of Chloroform, 10 minims, Compound Infusion of Gentian, to 1 fl oz —*B P C*

TINCTURA GENTIANÆ (Ger)—Gentian Root, 1, Alcohol (90 p c), 5, by weight

This is also official in Austr, Belg, Dan, Dutch, Fl, Ger, Ital, Jap, Mex, Norw, Port, Russ, Span and Swiss, 1 in 5 All by weight

Gentian Root, 1, Alcohol (45 p c), 10, by maceration —(*B P C*)

Not Official

LIQUID GLUCOSE

As met with in commerce, it is clear, almost colourless, devoid of smell, and resembles in consistence Canada Balsam It should be free from Arsenic

In exhausting diseases, subcutaneous injection of 25 grammes in 24 hours, of a 5 p c solution —*B M J* '02, 1 770

It forms an excellent excipient for pills, more particularly when diluted with Syrup

DILUTED GLUCOSE—Glucose, 3 oz, Syrup, 1 fl oz, mix.

A good excipient for pills
The following is introduced for this purpose, does not
answer so well, as it is adhesive

Official Preparation

SYRUPUS GLUCOSI. SYRUP OF GLUCOSE

Liquid Glucose, 1, Syrup, 2 Mix at a gentle heat

GLUSIDUM.

GLUSIDE

$C_7H_5NSO_3$, eq 181.77

BENZOYL SULPHONIMIDE

B P Syn—GLUCUSIMIDE

FR, SACCHARINE, GER, BENZOESAURESULFINID, ITAL, SACCARINA,
SPAN, SACARINA

A white crystalline powder, possessing an exceedingly sweet characteristic taste

Gluside is the anhydride of Ortho-sulphamide-benzoic Acid

Although the *B P* formula $C_7H_5COSO_2NH$ is attached to the synonym Benzoyl sulphonimide, it is not to be inferred that, commercially, Saccharin is sufficiently pure to allow of its representation by this or any other formula

Commercial Saccharin is not a pure product, but is 'standardised' to 300 times the sweetening power of Cane Sugar, the pure chemical (Saccharin puriss) to 500 times its weight of Sugar. The proportion of impurity may be estimated by treatment with Acetone, in which the pure salt is completely soluble

Orthobenzoisulphimide (commercial Saccharin) is put on the market as a white micro-crystalline powder containing a considerable proportion of Para-sulphamnebenzoic Acid

Commonly known as 'Saccharin'

The Saccharin Commission supplies Saccharin of the following strengths —
330, 450, 500, 550 The first corresponds with Glusidum, *B P*

Solubility—1 in 400 of cold Water, 1 in 28 of boiling Water, 1 in 38 of Alcohol (90 p c), 1 in 100 of Ether, 1 in 500 of Chloroform, 1 in 48 of Glycerin

It is also readily soluble in all alkaline solutions, either of Hydroxide, Carbonate, or Bicarbonate. It is the part of an acid and displacing Carbonic Acid. Soluble Saccharin'

Medicinal Properties—It is used as a substitute for Sugar in diabetes and hepatic diseases and to cover the taste of nauseous drugs. It is eliminated in the urine and saliva

1 grain sweetens 6 to 8 oz of fluid

Dose— $\frac{1}{2}$ to 2 grains = 0.032 to 0.13 gramme

Not Official—Saccharinum Solubile, F. v. Glusid and Tabelæ Saccharini (Saccharin Discs), Sacrol

Foreign Pharmacopœias—Official in Austr, Belg, Dan., Dutch, Fr, Ital, Jap, Norw (Saccharinum), Mex (Sacarina), Russ, Span, Swed, Swiss and U S (Benzosulphimide) Not in the others

Tests—The m p of pure Benzoyl sulphimide is 224°C ($435\ 2^{\circ}\text{F}$), $223\ 5^{\circ}\text{C}$ ($434\ 3^{\circ}\text{F}$) is given in the *Fr Codex*. The *BP* m p for the substance recrystallised from warm Water is between 218° and 219°C ($424\ 4^{\circ}$ and $426\ 2^{\circ}\text{F}$), the *USP* gives 219° to 220°C ($426\ 2^{\circ}$ to 428°F). It possesses an intensely sweet taste, which is perceptible in solutions up to 1 in 100,000 of Water. When moistened with an excess of Potassium Hydroxide Solution, dried, the residue gently fused for several minutes, cooled, dissolved in Water and the solution is faintly acidified with diluted Hydrochloric Acid, it yields with Ferric Chloride T S a purple violet coloration. When fused with a mixture of Potassium and Sodium Carbonates and Potassium Nitrate, the residue dissolved in Water, and the solution filtered, the filtrate yields with Barium Chloride Solution, after acidification with diluted Hydrochloric Acid, a copious white precipitate insoluble in Hydrochloric Acid. 0.01 gramme, heated with an equal weight of Resorcin and a few drops of Sulphuric Acid, yields a mixture at first yellowish red and then greenish-brown. If the residue is dissolved in cold Water and an excess of Sodium Hydroxide (15 p c) added, the mixture assumes a strong green fluorescence. It dissolves with effervescence in warm Sodium Bicarbonate Solution forming 'soluble Gluside' or 'soluble Saccharin,' 100 parts of Gluside yielding nearly 113 parts of neutral 'soluble Gluside.'

The more generally occurring impurities are organic impurities, readily charred by Sulphuric Acid, Glucose, and other reducing Sugars, e.g. Milk Sugar, Ammonium salts, Benzoic or Salicylic Acid, and inorganic impurities. The *BP* is content with a Sulphuric Acid test for Sugar, and does not include tests, other than the m p for any of the remaining impurities. It states that no blackening should occur even when the mixture is gently warmed with Sulphuric Acid. The *USP* gives the respective quantities of substance and reagent to be employed, the temperature at which the mixture is to be maintained, and the time allowed for the test. Glucose may be detected by Potassium Hydroxide Solution, a test for Milk Sugar and a supplementary test for Glucose is afforded by Potassium cupric Tartrate (Fehling's) Solution, the substance should not evolve an odour of Ammonia when warmed with Calcined Magnesia and Water, Benzoic or Salicylic Acid are detected in a saturated aqueous solution by the Ferric Chloride test described below, and inorganic impurities by the ash left on ignition, which should amount at the highest to 0.5 p c.

Alkali Hydroxide and Sodium Bicarbonate—Gluside is readily soluble in T S of Ammonia, *BP* and *USP*, in Alkali Hydroxide solutions, *USP*, in T S of Sodium Bicarbonate with evolution of Carbon Dioxide, *BP*, and *USP*.

Sulphuric Acid—If 0.2 gramme of Benzosulphimide be dissolved with agitation in 10 c c of pure Sulphuric Acid, and the solution kept at a temperature of from 48° to 50°C ($118\ 4^{\circ}$ to $122\ 2^{\circ}\text{F}$) on a water bath, it should not within 10 minutes show a brown colour, *USP*.

Potassium Hydroxide—The solution of 0.2 gramme in 5 c c of T S of Potassium Hydroxide should be clear except after prolonged heating, *USP*.

Cupric Tartrate—A solution of Benzosulphimide in T S of Potassium

Hydroxide similar to the above should not, on heating with 5 c.c. of Volumetric solution of Alkaline Cupric Tartrate, deposit any red Cuprous Oxide, *U S P*

Ferric Chloride—No precipitate or violet colour should appear when T S of Ferric Chloride is added drop by drop to a hot aqueous solution of Benzo-sulphimide, *U S P*

Not Official

SACCHARINUM SOLUBILE ('SOLUBLE GLUSIDE')—A soluble Sodium Gluside, containing about 90 p.c. of Gluside. It is much more palatable than ordinary Gluside, which leaves a disagreeable after-taste.

This powder is soluble 1 in 15 of Water.

ELIXIR GLUSIDI *Syn* ELIXIR SACCHARINI—Dissolve 5 of Gluside with 1 of Sodium Bicarbonate in 80 of Distilled Water, add 12½ of Alcohol, filter, and wash the filter with Distilled Water to produce 100—*B P C*

This is a modification of *B P C Formulary '01*

Dose—5 to 20 minims

TABELLÆ SACCHARINI (SACCHARIN DISCS)—Contain ¼ grain = 0.032 gramme Saccharin in each. Should be readily soluble in Water, and should not contain Starch or Sugar.

Sucrol (Dulcin)—Paraphenetol Carbonide is a powerful sweetening agent which occurs in small glistening crystals, it is said to possess about 200 times the sweetening power of Sugar.

GLYCERINUM.

GLYCERIN GLYCEROL

FR, GLYCERINE OFFICINALE, GER, GLYCERIN, ITAL, GLICERINA;
SPAN, GLYCERINA

A Trihydric Alcohol, $C_3H_8O_3$, eq 91.37, containing a small percentage of Water, obtained during the saponification of fats and fixed oils by the action of alkalis, or by their hydrolysis by means of superheated steam.

Glycerin is always produced during the alcoholic fermentation of Sugar to the extent of 3 p.c. of the Sugar employed, and consequently is present in all fermented liquids.

A clear, colourless and odourless thick syrupy hygroscopic liquid, possessing a characteristically sweet taste and producing a sense of warmth in the mouth. It should be kept in well-closed vessels.

Solubility.—Mixes in all proportions with Water and Alcohol, but insoluble in Chloroform, Ether and Oils.

It possesses great powers as a solvent, and is an excellent excipient for many medicinal substances.

Medicinal Properties.—Undiluted it is an irritant, but diluted with aqueous menstrua it is emollient. It is a mild laxative. Internally it is given in irritating cough, it is recommended as a rectal injection for constipation, 1 to 2 dm, or the same diluted with an equal quantity of Water produces an evacuation very soon after the injection, also combined with Gelatin or Cocoa-nut Stearin to form a suppository for the same purpose, it is very convenient, but may aggravate hæmorrhoids if present.

Externally, a useful addition to lotions and other applications in skin diseases, as pityriasis, eczema, psoriasis, prurigo and lichen.

Used for chilblains and chapped hands, and dryness of the skin on mucous membranes, but it should be diluted with 3 parts of Water for these purposes, or applied in the form of Glycerin of Starch - Used in poultices ($\frac{1}{4}$ or $\frac{1}{8}$) it keeps them soft for a long time

It is useful in fermentative dyspepsia, when taken in 1 or 2 drm doses, and does not hinder digestion—*L* '80, ii 6, '96, ii 25

Dose—1 to 2 fl drm = 3.6 to 7.1 c.c.

Smaller doses are usually prescribed

Prescribing Notes—*It is much employed as a sweetening agent in the place of Syrup, and is better for covering the unpleasant astringent taste of Iron Perchloride, it is largely used in pharmaceutical preparations as a solvent, and, being an antiseptic, it also acts as a preservative. Mixed with equal volumes of Syrup, Alcohol and Mucilage, it forms a good pill excipient. It is too hygroscopic to be used alone.*

Official Preparation—Suppositoria Glycerini Used in the preparation of Extractum Cinchonæ Liquidum, Extractum Saisæ Liquidum, of all the Glycerina and Lamellæ, Linimentum Potassii Iodidi cum Sapone, Liquor Ethyl Nitritus, Liquor Thyroidei, Lotio Hydrargyri Nigra, Mel Boracis, Pilula Ferri, Pilula Quinina Sulphatis, Syrupus Pruni Virginianæ, Tinctura Kino, Tinctura Rhei Composita, Unguentum Acidi Carbolici, Unguentum Iodi, and Unguentum Suppuris Iodidi

Not Official—Dispensing Syrup, Glycerin with Rose Water, Suppositoria Glycerini, Suppositoria Glycerini cum Stearino

Foreign Pharmacopœias—Official in Austri, sp gr 1.250, Belg, sp gr. 1.240, Dan, Ger, Hung, Jap, Norw, Russ and Swed, sp gr 1.225 to 1.235, Dutch, sp gr 1.230 to 1.235, Fr, sp gr 1.264, Ital, sp gr 1.226 to 1.260, Mex, Port and Span, sp gr 1.260, Swiss, sp gr 1.224 to 1.235, U.S., not less than 1.246 at 25° C (77° F)

Tests—Glycerin has a sp gr of 1.260, which figure is given in the *BP*, the *USP* gives not less than 1.246 at 25° C (77° F.), the *PG* 1.225 to 1.235. The aqueous solution is neutral to Litmus paper. When heated in an open capsule it yields irritating acid vapours of Acrolein. Dilute aqueous solutions are slowly volatilised with the vapour of Water, whilst stronger solutions rapidly volatilise at boiling temperatures. A loop of Platinum Wire, containing a fused bead of Borax moistened with Glycerin, imparts to the edge of a non-luminous flame a transient vivid green colour. When boiled with Potassium or Sodium Hydroxide and Potassium Permanganate Solution, the latter is immediately reduced. The filtered liquid, when made faintly acid with Acetic Acid, yields with Calcium Chloride Solution a white precipitate, insoluble in Acetic Acid, soluble in Hydrochloric Acid. This reaction with alkaline Permanganate forms the basis of a method for the determination of Glycerin which, in the absence of foreign bodies yielding Oxalic Acid on oxidation, has been proved to give very accurate results.

The more generally occurring impurities are those of an inorganic nature, *e.g.*, Arsenic, Copper, Lead, Iron, Calcium, Potassium, Sodium, Ammonium, Chlorides and Sulphates, and mineral impurities, those of an organic nature, Sugars, *e.g.*, Grape and Cane Sugar, foreign organic matter, *e.g.*, Acrolein, Formic Acid or Formates, Butyric Acid, Oxalic Acid or Oxalates, and organic impurities readily charred by Sulphuric Acid. The *BP* employs Siebold's modification of the

Gutzeit's test for the detection of Arsenic, which approximately indicates 1 part of Arsenic in 250,000 of Glycerin. The *P G* employs the Bettendorf's test, the *U S P* then modified Gutzeit's test, which indicates less than 1 in 100,000. A standard of not less than 2 parts of Arsenic per million is suggested (*C D '08*, 1796). A very great majority of about 450 samples mentioned in this reference showed less than this figure, 4 parts per million, however, may be considered by some to be a sufficiently low limit. Copper, Lead and Iron are detected by Hydrogen Sulphide Solution, the two former in slightly acid, the latter in alkaline solution, Calcium by Ammonium Oxalate Solution, Potassium and Sodium in the residual liquid after separation of the other metals, Ammonium by boiling with Potassium or Sodium Hydroxide Solution. The three latter, however, are unlikely impurities. Chlorides and Sulphates are detected by Silver Nitrate and Barium Chloride or Nitrate solutions respectively.

The *B P* and the *U S P* employ Potassio-cupric Tartrate (Fehling's) Solution as a test for Cane and Grape Sugars, the *B P* requiring that no precipitate shall be produced even after previous acidification and boiling. The *U S P* specifies quantities of substance and reagent to be used for the inversion, quantity of reagent to be used for precipitation, and time limit within which no cloudiness or precipitate is permitted. Acrolein, Formic Acid or Formates, classed by the *B P* as foreign organic matter, may be detected by Silver Ammonio-nitrate Solution. With regard to this test more explicit directions are contained in the *P G* monograph than in either the *B P* or the *U S P*, the quantities and temperature to which the mixed solutions are to be heated are given, and a definite interval of time (5 minutes), during which neither coloration nor brownish-black deposit should appear, are given. The test for Butyric Acid is, save for the difference in the strengths of the Alcohol, virtually the same in the *B P* and the *U S P*. The *U S P* and *P G* include a test for Oxalic Acid with Calcium Chloride TS, but no test appears in the *B P*. The *U S P* adopts a time limit of one hour during which, in testing for acidly charred organic impurities, the mixture of Glycerin and Sulphuric Acid is required to develop a colour not darker than yellow. The *B P* adopts no time limit. Glycerin should be entirely dissipated when heated at a high temperature, and on ignition should leave no fixed residue. Each of the above tests appears in small type below, with a further detailed comparison between the pharmacopœial methods of application.

Potassio cupric Tartrate—Even after it has been treated with mineral acid and boiled, Glycerin should give no red precipitate when mixed with excess of TS of Potassio-cupric Tartrate, *B P*, 5 c.c. of Glycerin mixed with 50 c.c. of Water and 10 drops of Hydrochloric Acid in a small flask, and heated for half an hour on a water-bath, 10 c.c. of this hot liquid mixed with 2 c.c. of Sodium Hydroxide TS and 1 c.c. of Alkaline Cupric Tartrate Volumetric Solution should show no yellowish-red cloudiness or precipitate within 6 hours, *U S P*.

Sulphuric Acid—It is officially required to yield either no coloration at all, or at the most a very pale straw coloration when 5 c.c. of Glycerin is shaken with 5 c.c. of Sulphuric Acid, care being taken to keep the mixture well cooled.

A mixture of 5 c c each of Glycerin and Sulphuric Acid should acquire, on standing for 1 hour, a colour not darker than yellow, *U S P*

Diluted Sulphuric Acid—1 c c of Glycerin, warmed gently with 1 c c diluted Sulphuric Acid, should not give off an unpleasant rancid odour, *P G*

Alcohol (90 p c) and diluted Sulphuric Acid—It is officially required that no fruity odour should be produced when equal volumes of Glycerin and a mixture of Alcohol (90 p c) and diluted Sulphuric Acid are gently heated together. 5 c c of Glycerin mixed with an equal volume of Alcohol (94.9 p c) and diluted Sulphuric Acid and gently heated, no fruity odour should be recognisable, *U S P*

Barium Nitrate or Chloride—A portion of an aqueous solution (1-5 *P G*, 1-10 *U S P*) should be unaffected by T S of Barium Nitrate *P G*, by T S of Barium Chloride, *U S P*

Ammonium Oxalate—A portion of an aqueous solution, as above, should be unaffected by T S of Ammonium Oxalate, *P G* and *U S P*

Calcium Chloride—A portion of an aqueous solution, as above, should be unaffected by T S of Calcium Chloride, *P G* and *U S P*

Silver Nitrate—A portion of an aqueous solution, as above, should yield no colour, cloudiness or precipitate with T S of Silver Nitrate, *U S P*, should yield not more than an opalescent turbidity, *P G*

Ammonia and Silver Nitrate—It is officially required that at the ordinary temperature no darkening in colour should be produced when a few drops of Silver Nitrate Solution are added to a mixture of Glycerin and Ammonia Solution in equal volumes. 1 gramme of Glycerin and 1 c c of Ammonia T S warmed on a water-bath to 60° C (140° F) and then mixed with 3 drops of Silver Nitrate T S, there should be neither coloration nor a brownish black deposit in the mixture within 5 minutes, *P G*, no colour, cloudiness or precipitate should appear when an aqueous solution of Glycerin (1-10) is treated in a test tube with Ammonio Silver Nitrate T S, the tube being loosely stoppered to protect it from impurities, and allowed to stand, protected from light, for at least 5 minutes, *U S P*

Sodium Hydroxide—1 c c of Glycerin warmed with Sodium Hydroxide T S should neither become coloured nor evolve ammonia or any odour resembling that of glue, *P G*

Stannous Chloride—A mixture of 1 c c of Glycerin and 3 c c of Stannous Chloride T S should not assume a dark colour in the course of an hour, *P G*

Hydrogen Sulphide—An aqueous solution (1-5) should not be affected by T S of Hydrogen Sulphide, *P G*, an aqueous solution (1-20), acidified with Hydrochloric Acid, should not respond to the time limit test for heavy metals, *U S P*

Gutzeit's Test—5 c c of an aqueous solution (1 in 10) should not respond to the modified Gutzeit's test for Arsenic, *U S P*. It is officially required that within 15 minutes no yellow stain should be produced on a piece of filter paper which has been previously moistened with a drop or two of Mercuric Chloride T S and dried, and which is supported over the mouth of a test-tube containing 1 gramme of Arsenic free Zinc, 5 c c of an aqueous 2.2 p c solution of Hydrochloric Acid (*B P*) and 2 c c of Glycerin.

Preparations.

SUPPOSITORIA GLYCERINI GLYCERIN SUPPOSITORIES

Using a tared basin, $\frac{1}{2}$ oz of Gelatin, cut small, is covered with Distilled Water, which after two minutes is poured away. When the Gelatin is quite soft, dissolve in $2\frac{1}{2}$ oz of Glycerin (by weight) on a water-bath, and then evaporate the excess of Water until the product weighs 1563 grams. The mass will contain about 70 p.c. w/w of

Glycerin It may be moulded into any convenient size when required

A similar preparation has been in use for many years (*Companion* 1877) as a basis for medicated Pillaries and . . . The formula in the *Companion* arrives at the same result (70 p c) *without* evaporation. It is easy by evaporation to obtain a product containing 80 p c of Glycerin. The consistency of the mass will vary somewhat with the quality of the Gelatin, see p 556

Foreign Pharmacopœias—Official in Austri, Jap and U S, Glycerin, Sodium Carbonate and Stearin, Belg, Fr, Mex, and Swiss

Glycerin Suppositories are much more convenient to use when made with Cocoa-nut Stearin, see below

Not Official

DISPENSING SYRUP—Glycerin, Syrup, Alcohol (90 p c), and Mucilage of Acacia equal volumes

An excipient for pills Glycerin by itself is too hygroscopic

GLYCERIN WITH ROSE WATER—Glycerin, 1, Rose Water, 3, mix.

SUPPOSITORIA GLYCERINI (USP)—Dissolve 1 of . . . Sodium Carbonate in 10 of Water and add to it 60 of Glycerin (t . . . 4 of Stearic Acid, heat carefully on a water-bath until effervescence ceases and the liquid is clear. This quantity is for 20 rectal suppositories, which must be kept in tightly-covered glass vessels

The *BPC* describes it as using equal parts of Monohydric and Sodium Carbonate and Water, but this is due to the omission of a decimal point

SUPPOSITORIA GLYCERINI C STEARINO—Glycerin, 20 grains, Cocoa-nut Stearin, 40 grains, melt the Stearin, and when just fluid stir in the Glycerin and continue the stirring until the mixture becomes solid. Melt the mass with the least possible heat, and pour into moulds

They can be used without any lubricant

UNGUENTUM GLYCERINI See GLYCERINUM AMYLICUM

GLYCYRRHIZÆ RADIX.

LIQUORICE ROOT

FR, RUSSESSA GLR, SSSSHOLZ, ITAL, LIQUIRIZIA, SPAN, RLGALIZ

The Root and . . . Stem, both peeled, of *Glycyrrhiza glabra*, . . .

In the *USP* the unpeeled Spanish and the peeled Russian root are both official, in the *PG* the Russian peeled root is ordered

The principle Glycyrrhizin is comparatively tasteless, the characteristic sweetness being only developed by combination with alkali. It exists in the drug as a combination with calcium

Medicinal Properties.—A demulcent and expectorant in bronchial catarrh and cough. The liquid extract helps to disguise the taste of nauseous medicines, but many persons object to the taste of Liquorice. In the form of extract and its solution it is a domestic remedy for cough. The compound powder is chiefly valuable on account of the Senna and Sulphur it contains, and is an agreeable and mild purgative, well adapted for weak persons and for cases of hæmorrhoids

Official Preparations of Liquorice—Of the Root, Extractum Glycyrrhizæ, Extractum Glycyrrhizæ Liquidum, Liquor Sarsæ Compositus Concentratus, Pilula Hydragryi, and Pulvis Glycyrrhizæ Compositus, of the **Extract**, Confectio Sennæ and Decoctum Aloes Compositum, Extractum Glycyrrhizæ Spirituosum, of the **Liquid Extract**, Mistura Sennæ Composita and Tinctura Aloes

Not Official—Elixir Adjuvans, Elixir e Succo Glycyrrhizæ seu Elixir Pectorale, Glycyrrhizinum Ammoniatum, Mistura Glycyrrhizæ Composita, Pulvis Amygdalæ Laxativus, Syrupus Glycyrrhizæ, and Trochisci Glycyrrhizæ

Foreign Pharmacopœias—Official in all the Pharmacopœias, Austr., Belg., Dan., Dutch, Fr (Régisse), Hung., Ital (Liquirizia), Jap and Ger (Liquiritia), Mex (Orozuz), Port (Alcacus), Russ., Span (Regaliz), Swiss and U.S., all *G. glabra*

Descriptive Notes—The Liquorice Root of commerce exists in several forms. The English root is never sold in the decorticated form, but either fresh or dried. Some of the fresh Liquorice Root of commerce also comes from France. The dried Liquorice Root consists of the product of at least two plants.

That derived from France, Spain and Sicily is the product of *G. glabra*, but that from Russia, Asia Minor and Persia is chiefly the product of *G. glandulifera*, and is recognisable by its redder tint, more scaly surface, and slight acidity and bitterness. As a rule the Liquorice Root of commerce consists of a larger proportion of underground stem than of root. As the root is sweeter than the stem, samples richest in root are of greater value. The root of *G. glabra* has a thin brown bark, marked here and there with short transverse scars, is yellowish within and has a radiate and porous woody structure and a fibrous fracture, a sweet taste and characteristic odour and flavour when chewed. The underground stem does not exhibit transverse scars, but at the cut ends shows a small central depression caused by shrinkage of the pith.

French Liquorice Root is usually of good quality, and is also sold in the decorticated or peeled form. Spanish Liquorice Root from Tortosa occurs in trimmed bundles of uniform size and length and of fairly uniform pieces, that from Alicante in loosely packed bales, the root being of varying size and quantity. Sicilian Liquorice is usually peeled and, like the French, often cut up into short pieces 1 inch or less in length. Russian Liquorice is sold both in the unpeeled and in the peeled state. It is often in very large tapering pieces, sometimes blackened and hollowed near the crown of the root. It gives a paler powder than the French and Sicilian, and is somewhat acid and bitter. Persian or Bussorah root is in long cylindrical pieces, an inch or more in diameter, and is not sold in the peeled state. The official root is limited to peeled root and peeled subterranean stem of *Glycyrrhiza glabra*, Linnaeus and other species. The last three words seem superfluous, since the character* given evidently excludes that of *G. glandulifera*, Waldest and Kit, which affords the Liquorice Root of Eastern Europe and Western Asia, some of the characters of the official drug being that it should be free from bitterness and that it should be dark brown in colour, longitudinally wrinkled, but not scaly, which are the distinctive characters of the root of *G. glandulifera*.

It is not stated how these characters are to be ascertained from the root which is already peeled as purchased in commerce, and directions for peeling the dried root are not given. The acidity of Eastern Liquorice Root is due to a resin contained principally in the bark, and the bitterness to a principle named Glycamarin, the sweetness is due to Glycyrrhizic Acid which exists partly in combination with Ammonia in the fresh root, in which state it is sweeter, since it is then more soluble in Water.

Tests.—The ash of Liquorice Root amounts to from 3 to 4 p c, and should not much exceed the latter figure.

Samples of fine English root examined in the author's laboratory yielded on an average 1.5 p c of ash, 1 p c of the English decorticated powdered root left from 3.4 to 3.5 p c of ash, with an average of 3.76 p c.

Preparations

EXTRACTUM GLYCYRRHIZÆ. EXACT OF LIQUORICE

In aqueous extract prepared by cold percolation, coagulation of Albumen at 212° F (100° C), and the subsequent evaporation to a soft extract.

Dose.—5 to 30 grains = 0.32 to 2 grams.

Foreign Pharmacopœias—Official in Austr., Belg., Dan., Dutch, Fr. (Ext. Reglisse), Hung., Ital., Jap., Mex., Port., S. and Spain, Prussia, root with cold Water, U.S. (Extractum Glycyrrhizæ Purum), from root with Water and Ammonia. The Crude Extract sticks (*Succus Liquiritiæ*) is official in Austr., Dan., Dutch, Fr., Germany, Jap., Norw., Russ., Swed. and Swiss, U.S. (Extractum Glycyrrhizæ), Dratum from Crude Extract is official in Austr., Ger., Hung., Norw., and Swe.

Under the name Liquorice Juice, aqueous extract, prepared by boiling the root with Water, is commercial the form of sticks, Solazzi Juice is the best known brand.

EXTRACTUM GLYCYRRHIZÆ LIQDUM. LIQUID EXTRACT OF LIQUORICE

An aqueous fluid extract, treated thence as for the extract, but evaporated to sp. gr. 1.2, to this is added of its volume of Alcohol (90 p c).

Dose.—1 to 1 fl. dr. = 1.8 to 3 c.

The finished product is slightly acid.

Ammonia is added for preserving its sweetness; so long as the alkalinity is maintained that is no danger of the forming deposit which is often seen at the bottom of the bottle of the Extract of Ice cream.

Fluidextractum Glycyrrh. (U.S.P.)—1 in 1 Fluid extract, obtained by treating 100 of the Liquorice with boiling Water until exhaustion, evaporating the liquid to 45, and adding 45 of Alcohol (95 p c), after 3 days miter, and evaporate to 50, and Glycerin 25, Ammonia Water 5, Alcohol (95 p c) 20, and Water q.s. to make.

Foreign Pharmacopœias—Belg., Alcohol (30 p c), Mex., Ammonia and Alcohol, Swed., Ammonia and Alcohol, Swiss, with Chloroform Water and Alcohol (90 p c).

Test.—Liquid Extract of Liquorice varies very considerably in its character. A good liquid extract prepared from fresh English

root had a sp gr of 1.130 to 1.135, contained from 33.6 to 37.6 p c w/v of total solids and about 18 p c w/v of Absolute Alcohol.

The palatability of commercial liquid extracts also manifests considerable variation, some being almost bitter in taste, and few bearing any comparison with a liquid extract made from fresh English root.

EXTRACTUM GLYCYRRHIZÆ SPIRITUOSUM

Dissolve 10 of Extract of Liquorice in a small quantity of Distilled Water, add 5 of Alcohol (90 p c) and make up with Distilled Water to 20.

Dose — $\frac{1}{2}$ to 1 fl drim = 1.8 to 3.6 c c

This is official in the *Ind* and *Col Add* for India and the Eastern Colonies.

Extracta Liquida—Any Liquid Extract, defined in the Text of the Pharmacopœia, containing less than one fourth of its weight of Alcohol (90 p c), may have the proportion of Alcohol (90 p c) increased, to an extent not exceeding one fourth of the weight of the Extract, in India and other tropical countries where otherwise the preparation would be liable to ferment.

PULVIS GLYCYRRHIZÆ COMPOSITUS COMPOUND POWDER

OF LIQUORICE

N O Syn—PULVIS LIQUIRITIÆ COMPOSITUS, PULVIS PECTORALIS

KURELLÆ

Senna, 2, Liquorice Root, 2, Fennel Fruit, 1, Sublimed Sulphur, 1, Refined Sugar, 6

Dose — 60 to 120 grains = 4 to 8 grammes

As a mild aperient, a teaspoonful or more for adults, less in proportion for children.

For diabetic patients the late Balmanno Squire suggested that the Sugar and Liquorice should be replaced by Almond-meal and Powdered Gum Acacia. It can be ordered as *Pulvis Amygdalæ Laxativus*. See p 574.

Tests—Compound Liquorice Powder usually contains 30 to 50 p c and should not contain more than 60 p c of moisture, from the ash ranges from 4 to 6 p c, and the soluble ash from 2 to 3 p c, averaging about 2.5 p c. The percentage of Sulphur may be determined by extracting the sample with Carbon Bisulphide, evaporating off the solvent, treating with Fuming Nitric Acid, filtering, Bromine, and a few crystals of Potassium Chlorate. A little Nitric Acid by evaporating to a small bulk with Hydrochloric Acid, removing the moistening with Hydrochloric Acid, and again evaporating to a small bulk. The Sulphur is oxidised to Sulphuric Acid, which may be determined in the usual manner by precipitation with Barium Chloride Solution. It is generally present to the extent of about 8 to 9 p c. Ground Olive stones, Maize Starch, exhausted drugs, etc., Olive stones and Maize Starch may be detected by the microscopical appearance of the specimen. A criterion of exhausted drugs is afforded by a joint determination of the percentage w/v of the total extractive matter yielded to Alcohol (70 p c) and the percentage of Sugar, the difference between these determinations should be from 10.5 to 13.0 p c. A specimen of compound Liquorice powder prepared in the author's laboratory from the finest English decorticated

TROCHISCI GLYCYRRHIZÆ—Extract of Liquorice, 18, Anise Oil, 3, Acacia Lozenge Mass, 60, to make six lozenges—*Brompton*, and *Chry Chest*

This has been incorporated in *B P C* giving the synonym 'Brompton Cough Lozenge'

U S P has a *Trochiscus Glycyrrhizæ et Opii*, containing 15 grammes of Extract of Glycyrrhiza, 0.5 gramme of Powdered Opium, and 0.2 cc of Oil of Anise in 100

Fr has *Pâte de Réglisse officinale* containing about 0.02 pc of Extract of Opium

GOA POWDER *See* ARAROA

GOSSYPIUM.

COTTON

B P Syn—COTTON-WOOL

Fr, COTON HYDROPHILE, *GER*, GEREINIGTE BAUMWOLLE, *ITAL*, COTONE ASSORBENTE, *SPAN*, ALGODON HIDROFILO

The Hairs of the Seed *Gossypium Barbadosense*, *L*, and of other species of *Gossypium*, from which, by suitable treatment, the fatty matter has been removed. This is commonly known as **Absorbent Cotton-Wool**

Cotton Wool is medicated with Carbolic Acid, Salicylic Acid, Boric Acid, Eucalyptol, Thymol, Iron salts, Mercuric Chloride, Double Cyanide, Sal Alembroth, Iodine, Iodoform, and other substances

Official Preparation—Used in the preparation of Pyroxylin

Foreign Pharmacopœias—*Austr*, *Dutch*, *Ger*, *Jap*, *Russ*, *Swed*, and *Swiss* (*Gossypium Depuratum*), *Ital* (*Cotone Assorbente*), *Mex* (*Algodon* and *Algodon hydrofilo*), *Port* (*Algodoeiro*), *Span* (*Algodon*), *US* (*Gossypium Purificatum*), *Fr* (*Coton Hydrophile*), not washed, *Belg* (*Coton hydrophile*). Not in the others. *Medicated Cottons* have been inserted in *Dutch* and *Mex*

MOUTH AND NOSE PROTECTOR—For use in poisonous and injurious trades. *Squire and Sons* exhibited this respirator at the International Health Exhibition (1884) and obtained for it a bronze medal. It consists of layers of washed and sterilised Cotton-Wool placed between layers of Perforated Zinc and Perforated Cardboard, formed into a pliable respirator which covers the mouth and nose

Gamgee Tissue or Absorbent Gauze and Cotton Wool Tissue, which consists of layers of absorbent Cotton-Wool enclosed in absorbent Gauze, is a favourite dressing, and is convenient for applying lotions

Tela Depurata Purified Mull (*Ger*)—This mull should have a breadth of 100 centimetres, and each square metre should weigh at least 30 grammes, and each square centimetre should contain at least 24 threads, when not otherwise ordered

Not Official

GOSSYPH RADICIS CORTEX

The Bark of the Root *Gossypium herbaceum*, *L*, and of other species of *Gossypium*.

It is official in the *Ind* and *Col Ad* for India and the Eastern, North American and West Indian Colonies

Medicinal Properties—The Tincture and Fluid Extract have been used in America, and occasionally in Europe, as a substitute for Ergot in labour, and to check metrorrhagia—*L* '94 u 1298

Foreign Pharmacopœias—Official in U.S. Not in the others

Descriptive Notes—The bark of the root as met with in commerce occurs in the form of thin, flat or slightly curled strips more or less curled in drying, dark brown externally, with a thin outer layer which, when abraded, shows a reddish brown coloured layer beneath. The inner surface is of a yellowish-white colour when recently dried, but darkens into brownish-red when the bark is kept, it is finely striated with projecting medullary rays. The transverse section shows the bast in radiating lines which are broader at the base. The transverse fracture is laminate and fibrous, and although the bark is easily split longitudinally, it is only broken transversely with difficulty. It has very little odour and an astringent and faintly acid taste.

A spurious cotton bark is sometimes met with which has a dark brown inner surface and is more easily broken transversely.

DECOCTUM GOSSYPII RADICIS CORTICIS (*Ind and Col Add*)—Boil 4 of Cotton Root Bark with 40 of Distilled Water until reduced to 20, strain and make up to 20.

Dose— $\frac{1}{2}$ to 2 fl oz = 14.2 to 56.8 cc

For India and the Eastern, North American and West Indian Colonies

This has been incorporated in the *B P C*

EXTRACTUM GOSSYPII RADICIS CORTICIS LIQUIDUM (*Ind and Col Add*)—A 1 in 1 fluid extract of Cotton Root Bark prepared by percolation, using as a menstruum first Alcohol (90 p c), containing 25 p c Glycerin, and finally Alcohol (90 p c)

Dose—30 to 60 minims = 1.8 to 3.6 cc

For India and the Eastern, North American and West Indian Colonies

This has been incorporated in the *B P C*

TINCTURA GOSSYPII—Dried Bark of the Root of the Cotton Plant in powder, 1, percolate with sufficient Alcohol (60 p c) to produce 4.

Dose—1 fl dr = 3.6 cc

This has been incorporated in the *B P C*

GRANATI CORTEX.

POMEGRANATE BARK

FR, Ecod, RCE DE GRENOBLE, GER, GRANATRINDE, ITAL, MELOGRANATO, SPAN, CORTEZA DE GRANADO

The dried Bark of the Stem and Root of *Punica Granatum*, L

Neither the *B P* nor the *U S P* requires the Bark to yield any definite percentage of alkaloids. The *P G* requires it to yield 0.4 p c w/w of alkaloids when determined by the process given below. The *Fr Codex* (1908) requires the dried bark to yield not less than 0.25 p c of alkaloids.

The Pomegranate-root alkaloids are Pelletierine (Punicine), Isopelletierine (Isopunicine), Granatoline, Pelletierine (Methylpunicine) and Pelletierine (Methylpunicine). The first two constitute the Pelletierine of medicine, the last two are inactive. Pelletierine is a volatile liquid, but forms stable salts.

Medicinal Properties—considered effective in killings.—Astringent and anticholeric. It is ceded and followed by a purgative tapeworm; the dose should be pre- same purpose. Pelletierine Sulphate is used for

Incompatibles.—Alkalis, Limes.

Official Preparation.—Decoctum, Water, Metallic salts, Gelatin

Not Official.—Extractum Granati, Granati Corticis Tannas, Pelletierine Sulphas and Pelletierine

Foreign Pharmacopœias—Official in Austri, Belg, Dan, Dutch, Jap, Fr (Grenadier), Ger, Hung, Ital (Melogranato), Port (Romeira), Mex, Russ and Span (Granado), Swiss and U S Not in Norw or Swed

Descriptive Notes—The commercial article consists chiefly of the stem bark, which can be distinguished by the presence of lichens and of a dark green phelloderm layer from that of the root, which has conchoidal depressions and is more or less curved or twisted, that of the stem being straight. The colour is yellowish grey externally and brownish-yellow on the inner surface. The fracture is short and of a pale yellow, and presents under a lens a tessellated or latticed appearance, from the presence of numerous fine radial lines crossed by fine tangential lines. It is about $\frac{1}{12}$ in thickness. The official bark is stated to be 2 to 4 in ($\frac{1}{2}$ to 1 dm) in length, and $\frac{1}{2}$ to 1 in (12 to 25 mm) in width. The taste is very astringent, with a slight bitterness, but it has no distinctive odour. As the root bark may contain six times as much alkaloid as the stem bark, the drug is more valuable in proportion to the amount of root bark it contains.

When examined under the microscope the powdered bark should contain no other ingredients except round, single starch grains with a diameter of 0.0025–0.008 mm, rarely compound starch grains, characteristic cork cells, sclerenchymatous cells, cells containing single or clustered crystals of Oxalate, parenchymatous cells and sieve tubes.—*P G* and *Jap*

Tests—Pomegranate Bark when allowed to macerate for an hour in slightly acidified Water, yields a yellowish solution. The addition of a few drops of Ferric Chloride Test solution to a portion of this liquid affords a bluish-black coloration, which is changed to a yellowish-red on the addition of five times the volume of Lime Water and on standing an orange red flocculent precipitate is thrown off. The process for the determination of the alkaloids officially adopted by the *P G* is as follows.—A weighed quantity of 12 grammes of Pomegranate Root dried at 100° C (212° F), in a fairly fine *Grindel* is introduced into a stoppered vessel and vigorously shaken with 90 grammes of Ether and 30 grammes of Chloroform. A measured quantity of 10 cc of a mixture of 2 parts by weight of Hydroxide Solution (15 p.c w/w) and 1 part by weight of slightly acidified Water is then added, and the mixture allowed to stand with intense shaking. A measured quantity of 10 cc of Water is added to cause the powdered root to agglomerate. The mixture is shaken and the Chloroform-ether solution is removed. A weighed quantity of 100 grammes of ether solution is filtered (after an interval of 15 minutes) when vigorously shaken, a dry, well-covered filter into a separate flask. The clear Chloroform-normal Volumetric Hydrochloric Acid (10 N) is added (10 cc), through separation the latter is filtered through a filter, and the alkaloids are washed with Water into a flask of 100 cc. The filtrate is repeated with 3 separate quantities of 10 cc of Water, the aqueous shakings being filtered through a small filter paper moistened with Water and the filtrates are diluted with Water to 100 cc. The filtrate is then filtered through a filter, the latter is washed with Water and the filtrate is diluted with Water to 100 cc. The filtrate is then filtered through a filter, the latter is washed with Water and the filtrate is diluted with Water to 100 cc.

100 c c A measured quantity of 50 c c is transferred to a stoppered flask of about 200 c c capacity, and about 50 c c of Water and sufficient Ether to form a layer of about 1 cm added After the addition of 5 drops of Iodeosin Solution, Hundredth-normal Volumetric Potassium Hydroxide Solution is added until the lower aqueous layer assumes a pale rose red coloration, the mixture being well shaken after each addition, not more than 11 c c of the solution should be necessary to produce this coloration The amount of Pelletierine corresponding to this titration figure is 0.395 p c w/w Using the mean molecular weights of Pelletierine and Methyl-pelletierine in the calculation the process amounts to not less than 0.41 p c w/w The *Ph. Code* (1900) process is a volumetric one, the result of the titration being calculated from a factor based on the mean molecular weights of Pelletierine and Methyl-pelletierine The process is carried out on the bark dried at 100° C (212° F), which is required to yield not less than 0.25 p c of alkaloids The percentage of alkaloid varies between 0.5 to 0.7 p c w/w, and may even be as high as 1.0 p c w/w The percentage of ash varies between 5.0 and 13.0 p c, and should not exceed 15.0 p c

Preparation

DECOCTUM GRANATI CORTICIS. DECOCTION OF POMEGRANATE BARK

Boil 4 oz of Pomegranate Bark with 24 fl oz of Distilled Water for ten minutes, strain and wash the residue with Distilled Water, *qs* to yield 20 fl oz (1 in 5)

Dose — $\frac{1}{2}$ to 2 fl oz = 14.2 to 56.8 c c

Foreign Pharmacopoeias — Official in Belg, 1 and 6, boil to 4, Fr (Apo. me), 1, Ital, 1 in 50, Port, 1 and $7\frac{1}{2}$, boil to 5, Spain, 1 in 10 Not in the others

0

Not Official

An excellent remedy for tapeworm is as follows —

Bruised Root-bark of Pomegranate, 2 oz, Boiling Water, 24 fl oz, macerate for 24 hours, and then boil till reduced to 18 fl oz A third part early in the morning, a third part again in half an hour, and the remainder in another half-hour A dose of Castor Oil should have been taken the previous morning, and solid food abstained from on that day This rarely fails to bring away the entire worm in two hours, and the head (at the thinnest end) should be diligently sought for This form was given in *Companion* 1873

EXTRACTUM GRANATI — Exhaust Pomegranate Root-bark with Alcohol (60 p c), distil off the Alcohol and evaporate to the consistence of an Extract 10 of Root-bark yield 34 of Extract

Foreign Pharmacopoeias — Official in Austr, Dutch, Hung, Port and Russ Not in U. S.

Fluidextractum Granati is official in U. S., is prepared by percolating 100 grammes of Pomegranate in No 80 powder with a mixture of Glycerin 10 c c and Alcohol (49 p c) *qs* to make 100 c c of Fluidextract

PELLETIERINA Pelletierine, $C_8H_{15}NO$ eq 140.10 — A colourless, oily liquid having an aromatic odour, and becoming brown on exposure to the air It should be kept in well stoppered glass bottles in a dark amber tint and in a cool atmosphere

Tests—Pelletierine has a sp gr at 0° C (32° F) of 0.988, and a boiling point of 195° C (383° F), at which temperature it distils.

It is soluble in Water and readily soluble in Alcohol (90 p c), Ether and Chloroform.

PELLETIERINÆ SULPHAS—A white, crystalline, non hygroscopic mass, which should be preserved from the light. It is official in *Fr. Codex* (1908).

Dose—6 grains = 0.4 gramme, prescribed with 7 grains = 0.46 gramme of Tannic Acid.

The **Pelletierine de Tanret** has been improperly called Pelletierine Tannate, on account of its being a mixture of Pelletierine Sulphate and Tannin, but it is quite distinct from the true Tannate.

PELLETIERINÆ TANNAS Pelletierine Tannate, Punicine Tannate—A yellowish, amorphous, odourless powder, prepared from Pomegranate Bark. It possesses an astringent taste.

Solubility—1 in about 700 of Water, 1 in 80 of Alcohol.

Dose—5 to 8 grains = 0.32 to 0.52 gramme.

Foreign Pharmacopœias—Official in Ital and U.S.

Tests—Pelletierine Tannate, dried over Sulphuric Acid and heated, turns brown at 20° C (302° F) and softens at about 165° C (329° F). It is faintly acid in reaction towards blue Litmus paper. The aqueous solution affords a precipitate with Mercuric potassium Iodide (Mayer's) Solution, the precipitate becoming granular and yellow coloured. It yields a white precipitate with Lead Acetate Solution, Mercuric Chloride T.S., and Zinc Chloride Solution, but no precipitate with Platinic Chloride T.S. Ammonia Solution produces a white precipitate soluble in Chloroform or in an excess of the reagent, the latter producing a yellowish red solution. The aqueous solution yields a black precipitate of reduced metallic Silver when heated with Silver Nitrate Solution. Sulphuric Acid produces a yellow colour, turning slowly to green on warming, and finally to purple. Sulphuric Acid containing a trace of Selenious Acid gives a light bluish green coloration, gradually becoming dark green.

Not Official **GRINDELIA**

The Leaves and Flowering Tops of *Grindelia squarrosa*, Dunal, and *Grindelia robusta*, Nutt., from California.

It is now official in the *Ind* and *Col* Add for the Australasian and the North American Colonies.

Medicinal Properties—Antispasmodic, expectorant, slightly diuretic. Has been recommended in asthma, hay fever, bronchitis, whooping-cough, laryngismus stridulus, and cystitis.

Prescribing Notes—The Liquid Extract, whether made by U.S.P. or *Ind* and *Col* Add, has a peculiar, bitter, persistent taste, which requires a good deal of covering. The addition of Spirit of Chloroform, Syrup of Orange and Glycerin, is useful for this purpose. The so-called 'Alcoholic-Fluid Extract of Grindelia,' which is now introduced into the *Ind* and *Col* Add as *Extractum Grindelie Liquidum*, mixes more readily with Water, and makes a better looking and more palatable draught than either of the others.

Foreign Pharmacopœias—Official in *Fr* and U.S. Not in the others.

Descriptive Notes—The dried Leaves of *G. squarrosa*, Dunal, and *G. robusta*, Nuttall, are given. There is some difficulty in distinguishing these two species, since both have reflexed phyllaries. But as a rule the upper leaves of *G. squarrosa* taper towards the base, whilst those which are referred in the *P.B.* to *G. robusta* are broader towards the base and are somewhat shorter in proportion. The specific distinction depends on the nature of the achenes, which in *G. squarrosa* are 4-angled and without distinct auricular appendages, whilst those of *G. robusta* are bidentate. The species of the genus are very

variable, and it has been shown by Peniédés (*Ph. Jour* (4) 23, p 433) that the plant recognised in commerce as *G. robusta*, Nuttall, is really the *G. camporum* of Greene. It is this species that is now almost exclusively imported. When *Grindelia* was first introduced into this country it consisted of *G. squarrosa*. The Leaves of *G. squarrosa* are officially described in the *Ind* and *Col Add* as alternate, pale green, smooth, coriaceous, brittle oblanceolate or oblong lanceolate or elongate lanceolate, the lower leaves tapering considerably below. But these Leaves are no longer in commerce. The leaves of *G. robusta* are described as similar in texture and colour, but shorter and more oblong, with a cordate amplexicaul base, are furnished with ~~in~~ glandular hairs, and are sharply serrate at the margin. But these characters are those of the *Grindelia camporum* of Greene. In both species the reduced bracts in the involucre and the leaves are more or less covered with glossy patches of exuded resin. The taste is pungently aromatic and bitter, and the odour is balsamic.

Preparation

EXTRACTUM GRINDELIAE LIQUIDUM. LIQUID EXTRACT OF GRINDELIA

Percolate 20 of *Grindelia* with Alcohol (90 p c) until exhausted, distil off the Alcohol, and add to the residue 10 of Distilled Water and 2 of Sodium Bicarbonate, stir together, and after the Extract is dissolved and the effervescence is over, add Distilled Water to make 15, and finally Alcohol (90 p c), *q s* to yield 20 of product.

Dose —10 to 20 minims = 0.6 to 1.2 c c

This is official in the *Ind* and *Col Add* for the Australasian and the North American Colonies.

The official text directs the Sodium Bicarbonate to be previously added to the Distilled Water, but as it will not dissolve there is no point in it. This preparation deposits on keeping.

U. S. Fluid extract (1 in 1 w/v) by percolation with a mixture of Alcohol (95 p c) 3, Water, 1, Fr. Fluid Extract (1 in 1 w/w) with Alcohol (75 p c).

Not Official

EXTRACTUM GRINDELIAE —An Alcohol (90 p c) percolate, distilled and evaporated to an Extract. 100 of *Grindelia* yield 15 of Extract.

Dose —3 grains = 0.2 gramme, three times a day.

GUAIACI LIGNUM.

GUAIACUM WOOD

FR, GUAJACUM. GER, GUAJAKHOLZ, ITAL, LEGNO GUAJACO, SPAN, LENO DE GUAIACO.

The Heart-wood of *Guaiacum officinale*, L., or of *Guaiacum sanctum*, L.

It yields about 26 p c of Resin, consisting of Guaiacic, Guaiaconic and Guaiacinic Acid. It also contains two Saponins, a neutral Guaiac-saponin and Guaiacsaponic Acid.

Imported from St. Domingo and Jamaica.

Medicinal Properties.—See 'Guaiaci Resina'.

Foreign Pharmacopœias.—Official in all except Belg., Dan., Dutch, Fr., Hung. and Swed.

Descriptive Notes.—The official *Guaiacum Wood* consists of the dark-coloured heart-wood only, but in commerce it is usually met with in the form of turnings, containing more or less of the yellowish

sapwood, and sometimes of boxwood, or other woods used in turning. The turnings often require sifting to free them from powder. As Guaiacum Wood is heavier than Water and sinks in it, such admixtures can generally be separated by this means. The Wood is distinguished from other similar heavy dark greenish-brown wood by the medullary rays being one cell broad, and four, or sometimes three to six cells high (*P G*), by the usually solitary vessels with small pits, the numerous sphaeraphides of Calcium Oxalate, and the thick walled parenchyma with narrow lumen. It has a slightly acrid taste, and when heated a faintly aromatic odour. Although the use of the wood of *G. sanctum* is also permitted by the *P B*, no distinctive characters are given for it.

Test—Guaiacum Wood, when digested with Alcohol (90 p c) and filtered, yields a filtrate which gives, on the addition of diluted Ferric Chloride Test solution, a blue coloration. The ash varies from 1 to 2 p c.

GUAIACI RESINA

GUAIACUM RESIN

FR, RESINE DE GAIAC GER, GUAJAKHAR, ITAL, RESINA DE GUAIACO
SPAN, RESINA DE GUAIACO

The Resin obtained from the Stem of *Guaiacum officinale*, L, or of *Guaiacum sanctum*, L.

On dry distillation it yields Guaiacol similar to that found in Creosote.

Solubility—About 90 p c is soluble in Absolute Alcohol, Ether, Chloroform, Aromatic Spirit of Ammonia, and alkaline solutions, almost insoluble in Petroleum Spirit.

Medicinal Properties—Stimulant, diaphoretic, and alterative. It is employed in chronic forms of rheumatism and gout, especially in old people. It is used in acute tonsillitis, also in dysmenorrhoea, amenorrhoea, and syphilitic affections.

Generally prescribed in combination with other medicines.

It is innocuous, and might be taken for an indefinite period of time, and looked upon as a condiment rather than as a drug, as harmless as Ginger or any other condiment. Guaiacum possesses a considerable power, but less than Colchicum, in directly relieving patients suffering from gouty inflammation of any part, it might be given whenever there was but little fever. Guaiacum taken in the intervals of gouty attacks has a considerable power of averting their recurrence, in fact, it is a very powerful prophylactic. Guaiacum does not appear to lose its prophylactic power by long continued use—*L* '96, 1 1494, *B M J* '96, 1 1325.

In sub acute or chronic gout, in addition to Colchicum, 5 to 10 grains of the resin may very usefully be given in cachets two or three times daily. The cachets are far preferable to the tincture in a mixture, as the latter is nauseous and the precipitated resin tends to cling obstinately to the tongue and fauces—*A P Luff*, *Pr* '07, 1 166.

Confidence expressed in the efficacy of Guaiacum in many forms of chronic gout, in irregular gout, and also as a prophylactic of gout. It is best administered in the form of tablet, or as a cachet—*B M J* '00, 1 843.

10 grains in 1 tablespoonful of Malt Extract two or three times a day, before menstruation is expected, given to relieve the pain — *U. S. Disp.* 1105

Dose — 5 to 15 grains = 0.32 to 1 gramme

Prescribing Notes — *Tragacanth* is better for the powder of *Guaiacum Resin* in Mixtures, *Mucilage of Acacia* is best for the Ammoniated Tincture — *Mucilage of Acacia*, 1 fl oz, Ammoniated Tincture, 6 fl dr, Water, to 6 fl oz

Incompatibles — Mineral Acid, Spirit of Nitrous Ether

Official Preparations — The Wood, used in the preparation of Liquor Sarsæ, of the Resin, *Mistura Guaiaci*, *Tinctura Guaiaci Ammonata*, *Trochiscus Guaiaci Resinæ*, used in the preparation of *Pilula Hydiargyri Subchloridi Composita*

Not Official — *Confectio Guaiaci Composita*, *Pulvis Guaiaci Composita*, *Tinctura Guaiaci*, and *Trochiscus Guaiaci*

Foreign Pharmacopœias — Official in Austr, Fr (Résine de Guaiac), Hung, Ital, Jap and Norw (Resina Guajaci), Mex, (Resina de Guayacan), Port, Span, Swed, Swis, and U S. Not in the others

Descriptive Notes — The Resin occurs in commerce in irregular masses, or in nearly globular tears varying in size from $\frac{1}{2}$ to 1 inch or more in diameter. The splinters of the Resin should be transparent, and of a yellowish-green or reddish-brown tint. The tear is the purest form; the Guaiacum in mass varying considerably in purity, the purest being obtained by cleaving the logs over a fire, and the inferior by boiling the chips in a solution of salt, some specimens of Guaiacum Resin in mass contain much woody matter and other impurities

Tests — Guaiacum Resin emits a balsamic odour when warmed, and possesses a slightly acid taste. A solution of the Resin in Alcohol (90 p c) yields on the addition of diluted Ferric Chloride Test-solution a blue coloration, and if the mixture be shaken with Chloroform the blue colour passes into the chloroformic layer. Paper moistened with the alcoholic solution becomes blue when exposed to the fumes of Nitric Acid. The percentage of matter insoluble in Alcohol (90 p c) should not amount to more than 10 p c. The impurities insoluble in Alcohol (90 p c) in good block Resin amount to 2.9 to 10 p c. The Acid value of crude lump Guaiacum varies from 90 to 95, the Alcohol-purified Resin from 90 to 100, the natural tears from 70 to 75. The *USP* gives the limits as not less than 70 nor more than 80. The *BP* gives neither the Acid value, the limit of matter insoluble in Alcohol (90 p c), nor the percentage of ash. The *USP* limit of matter insoluble in Alcohol (94.9 p c) is 15 p c and the ash not more than 4 p c. The ash of good commercial samples of the Resin varies from 1 to 4 p c., and should average 3.0 p c.

A standard of not less than 90 p c of matter soluble in Alcohol (90 p c) and not more than 3 p c of ash has been recommended.

The more generally occurring impurities are Colophony Resin, the similar but yellowish-brown Peruvian Guaiacum, and excess of woody fibre, Colophony may be detected by the very high Acid value. The *USP* macerates the powder with 4 or 5 times its weight of Petroleum Benzin, and requires that the filtrate should be colourless.

and that it should not give a green coloration on the addition of an equal volume of a 1 in 1000 Cupric Acetate Solution. Colophony and Peruvian Guaiacum may also be detected by dissolving the Resin in Chloroform and adding Bromine Solution. A blue coloration is yielded by the pure Resin, a red coloration by adulterated specimens. Excess of woody matter is indicated by the solubility in Alcohol (90 p c)

Preparations

MISTURA GUAIACI GUAIACUM MIXTURE

Guaiacum Resin, $\frac{1}{2}$ oz, Refined Sugar, $\frac{1}{2}$ oz, Tragacanth, in powder, 35 grains, mix these together intimately, then add gradually 20 fl oz of Cinnamon Water (1 in 40)

Tragacanth now used instead of Gum Acacia. As stated in previous editions of the *Companion*, not only does Tragacanth give a more diffusible mixture, but the colour does not change so rapidly, nor to the same extent as it does when Acacia is used.

Dose — $\frac{1}{2}$ to 1 fl oz = 14 2 to 28 4 c c

TINCTURA GUAIACI AMMONIATA AMMONIATED TINCTURE OF GUAIACUM

Add 4 oz of Guaiacum Resin in powder to $1\frac{1}{2}$ fl oz of Strong Solution of Ammonia, mixed with 16 fl oz of Alcohol (90 p c). After 48 hours, with occasional agitation, filter and add 30 minims of Oil of Nutmeg and 20 minims of Oil of Lemon. Wash the filter with Alcohol (90 p c) to make 20 fl oz of total product (1 in 5)

Dose — $\frac{1}{2}$ to 1 fl drm = 1 8 to 3 6 c c

Foreign Pharmacopœias — Official in U.S., 1 in 5 of Aromatic Spirit of Ammonia, Swed., Guaiacum Resin 3, Aqua Ammoniacæ (sp gr 0.960) 5, and Spirit 10, Port., Guaiacum Resin 3, Liquid Ammonia (sp gr 0.916) 3, Spirit 14, by weight. Not in the others.

Tests — Ammoniated Tincture of Guaiacum has a sp gr of 0.895 to 0.900, contains about 15 p c w/v of total solids and about 70 p c w/v of Absolute Alcohol.

TROCHISCUS GUAIACI RESINÆ GUAIACUM RESIN LOZENGE

3 grains of Guaiacum Resin in each, with Fruit Basis

Not Official

CONFECTIO GUAIACI COMPOSITA (*Syn* 'Chelsea Pensioner') —

Guaiacum, in powder, 1, Rhubarb, 2, Bitartrate of Potassium, 8, Sulphur, 16, one Nutmeg, Honey, 96 or q s — *Pharm. Form.*

Guaiacum Resin, 1, Rhubarb, in powder, 2, Acid Potassium Tartrate, $7\frac{1}{2}$, Nutmeg, in powder, 1, Sublimed Sulphur, $14\frac{1}{2}$, Clarified Honey, 74 — *B.P.C.*

Guaiacum Resin, in powder, $\frac{3}{4}$ oz, Mustard, 1 oz, Potassium Nitrate, in powder, $\frac{1}{2}$ oz, Rhubarb Root, in powder, $\frac{1}{2}$ oz, Sublimed Sulphur, 1 oz, Treacle, to 16 oz. Dose — 1 drm — *London.*

PULVIS GUAIACI COMPOSITUS ('Chelsea Pensioner') — Powdered Guaiacum Resin, Precipitated Sulphur, Heavy Magnesium Carbonate, Gum Acacia, Potassium Bicarbonate, of each equal parts. Dose — 20 to 40 grains — *St. George's.*

TINCTURA GUAIACI — Guaiacum Resin, 1, Alcohol (90 p c), 5

Dose — 30 to 60 minims = 1 8 to 3 6 c c

This has been incorporated in the *B.P.C.*

584 GUA [Solids by Weight, Liquids by Measure] Eng and US (Resin), 10 (Resin), all by weight

Foreign Pharmacopœias—Official in Austr, H, 1 in 5, Jap, Port and Swiss (Wood), 1 in 5, Fr, 1 in 5, for the presence of blood except US. Not in the others. Guaiacum Resin in each with

Along with Ozonic Ether it is employed as a test.
TROCHISCUS GUAIACI—2 grains of
Black Cumin Paste—*Throat*

Not Official
GUAIACOL—Obtained by fractional distillation of
Guaiacum Resin. It can also be obtained

A colourless, highly refractive liquid obtained from Wood Creosote. It has a characteristic aromatic odour (usually Beechwood) distilling from Guaiacum Resin. Synthetic Guaiacol is described as colourless rhomboid prisms, having an aromatic odour, which points to synthetic Guaiacol.

It forms the fraction of Wood Creosote between 200° and 205° C (392° and 401° F) 90, below 70° C. (1905) describes it as in colourless bottles of a dark amber tint and variety.

It should be preserved in well-closed glass bottles in all proportions with Alcohol (90 p c), Ether, Glycerin, and the fixed Oils (Almond and Olive).

Solubility—About 1 in 80 of Water, more used in place of Creosote in the (90 p c), Ether, Glycerin, and the fixed Oils (is better tolerated. Also given in

Medicinal Properties—Antiseptic, has also been used in erysipelas, internal treatment of phthisis, in which it is useful in sciatica, orchitis, and pleurisy. Olive Oil as an intralaryngeal injection. Exhaustion and profuse diaphoresis.

Disadvantages from continued use are: (1) in phthisis—B M J '96, 1 586
Applied externally: (2) toxic effects—L '98, 1 998

Hypocœmic: (under a Lanolin or Vaseline basis, in Large doses (60 minims) in phthisis with M J E '00, 1 92, '02, 1 20

A 10 to 20 p c Ointment made with L '99, 1 210

gonorrhœal epididymitis—T G '00, 145, 1 service in tuberculous cystitis—T G

Guaiacol vapour baths in bronchiectasis

Guaiacol (or the carbonate) of much use

'07, 313

Dose—1 to 5 minims=0.06 to 0.3 c. by given (mixed with Almond Oil) in

Prescribing Notes—It is generally used in mixtures with Glycerin and Water, and capsules, but it has also been given in M of Lavender, Oil of Cinnamon, or Compound Tincture of Gentian. But it can be treated in the same way as Creosote

both as regular Mixtures and Pills. in Belg, Dutch, Fr (Guaiacol), Ital, in the others

Foreign Pharmacopœias—Official 1116 to 1120. It boils at 205° C. Jap, Russ, Spain, Swiss and US. Not 205° C (892 and 401° F). Fr Codex

Tests—Guaiacol has a sp gr of 1.143, and the boiling point 205° C (401° F) and distils between 200° and 205° C. of Ferric Chloride T.S. added to a 1 in (1908) gives the sp gr at 15° C (59° F) a blue colour fading to green. It dissolves in twice its volume of 10 p c solution with 20 volumes of Water heating without residue. The sample may be shaken to a nearly white mass when the mixture should separate into two and Phenol. As a general test for the mixture should separate into two with twice its volume of Petroleum Ether. The mixture should separate into two clear layers, any turbidity or failure to separate may be taken as an indication of the presence of impurities. The failure of the solid mass to dissolve in Hydroxide solution test described above, also indicates the presence of

produce a clear solution with 20 times its volume of Water indicates the presence of oily hydrocarbons Creosote may be detected by the reddish colour produced when the specimen is treated with 10 times its volume of Sulphuric Acid Guaiacol develops a pure yellowish colour It should leave no residue on volatilisation

NEBULA GUAIACOL ET MENTHOL —Guaiacol, 10 minims, Menthol, 60 grains, Paraffin Liquid, to 1 fl oz —*A Ph F*

Guaiacol, 2, Menthol, 4, Liquid Paraffin, *q s* to produce 100 —*B P C*

VASOLIMENTUM GUAIACOLI —Guaiacol, 20, Liquid Vasoliment, 80 —*Hager*

Parogen Guaiacolis *Syn* Guaiacol Vasoliment —Guaiacol, 20, Parogen, 80 —*B P C*

GUAIACOL (Synthetic) C_9H_8O , eq 123.13 —A crystalline substance which melts at about $28^{\circ}C$ ($82.4^{\circ}F$), but frequently remains liquid much below this temperature It is said to yield more uniform results than the ordinary medicinal liquid Guaiacol, which is not so definite in composition Soluble 1 in 50 of Water

It should be kept in well closed glass bottles of a dark amber tint and protected as far as possible from the light

Dose —1 to 5 grains = 0.06 to 0.32 gramme

Tests —Synthetic Guaiacol melts at $28^{\circ}C$ ($82.4^{\circ}F$), and when melted should answer the tests and be free from the impurities mentioned under Guaiacol

GUAIACOL BENZOATE Benzosol $C_9H_7O \cdot C_6H_5O$, eq 226.38 —A white crystalline powder, having an aromatic taste and odour It contains theoretically 54.39 p c of Guaiacol Almost insoluble in Water A non irritating form of Guaiacol, recommended in phthisis and in diabetes —*MP '94*, 1 269 *L* 96, 11 551

Dose —5 to 10 grains = 0.32 to 0.65 gramme, usually given in cachets or tablets

Tests —Guaiacol Benzoate melts at about $56^{\circ}C$ ($132.8^{\circ}F$) and when prepared from synthetic Guaiacol at $59^{\circ}C$ ($138.2^{\circ}F$) It is decomposed by Alcoholic Potassium Hydroxide Solution (Semi normal) and may be volumetrically determined by means of this solution A weighed quantity of 1 gramme is dissolved in 25 c c of Alcohol (90 p c) mixed with 25 c c of Semi normal Volumetric Alcoholic Potassium Hydroxide Solution, and saponified under a reflux condenser The excess of Semi normal Alkali Solution is titrated with Semi normal Volumetric Hydrochloric Acid Solution, and the amount of Semi normal Volumetric Alkali Solution absorbed is calculated into Guaiacol Benzoate, 1 c c of Semi normal Volumetric Potassium Hydroxide Solution is equivalent to 0.11819 gramme of the pure salt A solution in Alcohol (90 p c) should yield no appreciable coloration with Ferric Chloride T.S. It leaves no weighable residue when ignited with free access of air

GUAIACOL CAMPHORATE (Guacamphol) —Colourless needles or a white or nearly white powder, having an aromatic odour Insoluble in Water, soluble in cold, readily soluble in hot Alcohol (90 p c), and in Chloroform

Used with success in the night sweats of phthisis —*C D '01*, 11 344

Dose —5 grains = 0.32 gramme

GUAIACOL CARBONATE Duotal $(C_9H_7O)_2CO_3$, eq 272.05 —A white crystalline powder, carbonaceous and tasteless It contains theoretically 90.5 p c of Guaiacol

Solubility —Insoluble in Water, about 1 in 70 of Alcohol (90 p c)

A non irritating form of Guaiacol in phthisis —*B M J E '92*, 1 8, '93, 11 83, '95, 1 8, *L* '96, 11 1374, '98 1 222, 960

Dose —3 to 10 grains = 0.2 to 0.65 gramme, which may be gradually increased to 60 grains = 4 grammes

Rheumatoid arthritis, whether acute or chronic, is of infective origin, and

infection is believed to take place from the alimentary tract. Intestinal antiseptics, *e g*, Guaiacol Carbonate, are stated to possess a high value. The great value of the drug is corroborated, but not attributed to its antiseptic action in the intestine — *L* '05, 1 718

It has the advantage of being less disagreeable than Creosote, and practically tasteless, but is much more expensive — *Edin Med Jour* '05, 463

The most convenient form of administering Guaiacol is the Carbonate in cachets. In rheumatoid arthritis, at first from 5 to 10 grains should be given three times a day, and the dose should be increased by 1 to 2 grains each week until from 15 to 20 grains are being taken in each dose. It is essential that this treatment should be continued for at least twelve months. The beneficial effects of the Guaiacol are very much increased by administering at the same time a mixture containing Potassium Iodide, the depressing effect of the Iodide should be counteracted by its combination with tonics — *A P Luff, B M J* '07, 11143

Foreign Pharmacopœias — Official in Austr, Belg, Fr, Ital, Jap, Russ, Swiss and U S

Tests — Guaiacol Carbonate melts at about 84° C (183 2° F). When heated with Alcoholic Potassium Hydroxide Solution (about 3 p c w/v) yielding Guaiacol when the liquid is acidified. No bluish-green is produced on the addition of one or two drops of Ferric Chloride T S to its solution in Alcohol (90 p c). It should leave no weighable residue on ignition.

GUAIACOL CINNAMATE Styraol $C_{15}H_{12}O$ $C_9H_7O_2$, eq 252.20 — Colourless, crystalline needles, almost insoluble in Water, soluble in Alcohol (90 p c) and in Chloroform. It contains theoretically 48.8 p c of Guaiacol. Recommended in phthisis, and also in cystitis and gonorrhœa.

It is tasteless, and does not split up into its constituents until it has passed through the pylorus. Very useful where intestinal tubercle is suspected, or where there is troublesome diarrhœa. Most serviceable in large cavities, with offensive sputum and fetid breath. Appears to be more beneficial than Guaiacol. Employed in form of powder or tablets, the latter to be bitten into minute particles lest they pass through the intestine unchanged — *F T* '07, 90

Dose — 5 grains = 0.32 gramme, 3 times daily

Tests — Guaiacol Cinnamate melts at 130° C (266° F). It should yield no weighable residue when heated with free access of air.

GUAIACOL PHOSPHATE — A white crystalline powder, insoluble in Water, soluble in Alcohol (90 p c) and in Chloroform. Useful in tuberculosis and in typhoid fever — *L* '02, 1 1711

Dose — 1½ to 3 grains = 0.1 to 0.2 gramme three or four times daily

There is also a crystalline Guaiacol Phosphite, dose, 5 to 10 grains = 0.32 to 0.65 gramme

GUAIACOL VALERIANATE (Geosote) — A yellowish, oily liquid, almost insoluble in Water. Used in tuberculous, bronchial affections and diarrhœa — *L* '97, 11 932, *B M J E* '98, 1 75, *P J* '97, 1 425

Dose — 2 to 3 minims = 0.12 to 0.18 c c or more

Tests — Guaiacol Valerianate has a sp gr of about 1.037. It boils at 245° to 265° C (474° to 509° F). It should leave no weighable residue when ignited with free access of air.

GUAIACETIN (Sodium Pyrocatechin-monoacetate) — A white crystalline powder, having a faint odour and taste of Guaiacol. Soluble in Water, insoluble in Alcohol (90 p c). Recommended in tuberculosis — *Pr* lxix 704

Dose — 4 to 8 grains = 0.25 to 0.5 gramme three or four times daily.

GUAIACYL (Calcium Oxyguaiacol-sulphide) — A greenish or greyish-mauve powder. Readily soluble in Water and in Alcohol (90 p c). A 5 to 10 p c solution is useful as a local anæsthetic.

Dose — 0.5 to 1.5 c c of a 5 p c solution, 1 c c of a 10 p c solution

GUAIIFORM (Geoform) — A yellow or brownish-yellow, tasteless powder, insoluble in Water, soluble in Alcohol (90 p c), and in Ether. Stated to be a

non-irritating preparation, and likely to be of use in pulmonary tuberculosis and typhoid fever. The Tannic Acid compound is known as 'Tannoguaiacform'—*L* '02, i 912, *P J* '02, 61

THIOCOL (Potassium Guaiacol Sulphonate)—White, glistening crystals. Readily soluble in Water, insoluble in Alcohol (90 p c). Recommended in phthisis, stated not to irritate—*L* '99, i 240, *B M J E* '01, i 16, *P J* '01, ii 645

Dose—10 to 20 grains = 0.65 to 1.3 grammes three times a day

The somewhat bitter taste of Thiocol may be disguised by Syrup of Orange. A Syrup containing 5 grammes of Thiocol in each 100 grammes is known under the name of 'Sirolin'.

Aphthisin is stated to be a mixture of Potassium Guaiacol Sulphonate and Ammonium Sulphichthyolate—*P J* '02, ii 137

Among the various other compounds containing Guaiacol which have received attention in medical literature are **Euguforn** (Acetyl methylenediguaiacol), a greenish white powder, insoluble in Water, antiseptic and anaesthetic, recommended as a dusting powder, also a 50 p c solution in Acetone. **Guaiacol Cacodylate**, a dangerously unstable salt recommended subcutaneously in $\frac{1}{4}$ to $\frac{1}{2}$ grain doses in tuberculosis. **Guaiakinol** (Quinine di bromo guaiacolate), yellow crystals, readily soluble in Water, recommended for external use in erysipelas. **Quaiquin** (Quinine Guaiacol bi sulphonate), a yellow powder, readily soluble in Water, introduced as a substitute for Guaiacol. **Guaiamar** (Glycerol ester of Guaiacol), a white, non hygroscopic crystalline powder, used as an antiseptic (dose, 5 to 10 grains). **Guaiasanol** (Diethylglycocol Guaiacol), a white crystalline powder, readily soluble in Water, used as an antiseptic. **Guaiacol Salol** (Guaiacol Salicylate), a white crystalline powder, insoluble in Water, soluble in Alcohol (90 p c), recommended in phthisis

Not Official GUARANA

The Seeds of *Paullinia Cupana*, H B and K, dried in the sun, and then roasted and reduced to a fine powder, this is moistened with a little Water, exposed to the night dew, and when it has become a hard paste is rolled into cylinders, these are further dried in the sun or in the chimneys of the huts. It is exported from Brazil.

True Guarana is very hard, heavy, and, when powdered, is reddish grey, whilst the sophisticated is much lighter in colour, it contains about 4 p c of an alkaloid **Guaranine** (dose, 1 to 5 grains = 0.06 to 0.32 grammes), generally considered to be identical with Caffeine.

The *U S P* requires that it shall yield, when assayed by the process outlined below, not less than 3.5 p c of its alkaloidal principles.

Medicinal Properties—Nervine tonic. It is used chiefly for curing sick headache, but is also useful in diarrhoea, dysentery, and as a tonic and stomachic in convalescence.

Dose—10 to 60 grains = 0.65 to 4 grammes infused in boiling Water and sweetened, and repeated if necessary in two hours.

Foreign Pharmacopœias—Official in Austr., Hung., Ital., Mex., Port., Span., Swiss and U S.

Tests—Guarana is required by the *U S P* to yield a definite percentage of alkaloidal principles. The following is an outline of the *U S P* method of determination.—A weighed quantity of 6 grammes of the specimen in No. 60 powder is shaken in an Erlenmeyer flask, at intervals, for half an hour, with 120 c c of Chloroform and 6 c c of Ammonia Solution. The mixture is allowed to stand for four hours, and is then filtered, a measured quantity of 100 c c (= 5 grammes Guarana) is collected, and the Chloroform distilled off in a water-bath. The residue is dissolved in a mixture of 2 c c of Normal Volumetric Sulphuric Acid Solution and 20 c c of warm Water. The cooled liquid is filtered into a separator, the flask and filter are washed with Water and the washings transferred

to the separator, 2 c c of Ammonia Solution added, and the alkaloids extracted by shaking the solution with 20 c c of Chloroform, the extraction being repeated with two separate portions each of 10 c c of Chloroform. The separated chloroformic solutions are mixed, the Chloroform distilled, 2 c c of Ether is added to the dry residue, the Ether carefully evaporated on a water-bath, and the residue dried at this temperature till constant in weight. The weight of residue multiplied by 20 gives the percentage w/v of alkaloids.

Preparations

ELIXIR GUARANÆ—Guarana, in No. 60 powder, 4 oz., Light Magnesia, $\frac{1}{2}$ oz., Oil of Cinnamon, 6 minims, Syrup, 2 fl. oz., Alcohol (60 p c), q s to produce 20 fl. oz.—*B P C Formulary* 1901 incorporated in the *B P C*.

Dose—30 to 120 minims = 1.8 to 7.1 c c.

The *B P C Supplement* has altered the Light Magnesia to 'Purified Talc or Kaolin'.

FLUIDEXTRACTUM GUARANÆ (U S)—Guarana, in No. 60 powder, percolated with Alcohol (49 p c), and treated in the usual manner to make 100 c c of Fluidextract.

Average Dose—30 minims (about 2 c c).

Fluidextractum Guaraniæ *U S P* is required to contain 3.5 grammes of the alkaloids from Guarana in 100 c c.

This has been incorporated in the *B P C Supplement*, using Alcohol (45 p c).

Tests—The *U S P* method of determining the alkaloids in this Fluidextractum may be briefly outlined as follows.—A measured quantity of 5 c c of the Fluid Extract is well shaken in a separator with 15 c c of Chloroform and 1 c c of Ammonia Solution, the shaking being repeated with two separate portions each of 10 c c of Chloroform. The chloroformic liquids are separated, mixed, and evaporated to dryness. The residue is dissolved in a mixture of 2 c c of Normal Volumetric Sulphuric Acid Solution and 20 c c of warm Water. The cooled solution is transferred to a separator, the vessel and filter washed with Water, and the alkaloids are extracted from the mixed solution and washing by shaking with 20 c c of Chloroform and 2 c c of Ammonia Water. The extraction is repeated with two separate portions each of 10 c c of Chloroform. The separated chloroformic liquids are mixed, the Chloroform removed by evaporation, the dry residue mixed with 2 c c of Ether, and this in turn is carefully removed by evaporation. The residue is dried till constant in weight at the water-bath temperature, and weighed when cool. This weight, multiplied by 20, yields the percentage w/v of alkaloids in the Fluid Extract.

TINCTURA GUARANÆ—Guarana, in fine powder, 1, Alcohol (60 p c), q s. to produce 4.

Dose—30 to 120 minims = 1.8 to 7.1 c c.

This has been incorporated in the *B P C*, employing Alcohol (90 p c), but in the *B P C Supplement* this has been altered to Alcohol (60 p c).

Not Official

GUMMI INDICUM.

INDIAN GUM

A gummy exudation from the Wood of *Anogeissus latifolia*, Wall., is official in *Ind* and *Col*. Add for India and the Eastern Colonies, and is used in official preparations for which Gum Acacia is used, the former being taken for every two parts ordered of the latter.

GUMMI RUBRUM.—See EUCALYPTI GUMMI

Not Official

GUTTA PERCHA

Tough, somewhat flexible pieces, of a light brown or chocolate colour, which become hard and brittle on keeping, but can be softened again in warm Water

The concrete Juice of *Dichopsis Gutta*, and of several other trees of the natural order Sapotaceæ

It was official in *B P* '85, but is replaced in *B P* '98 by Caoutchouc, a solution of which is now used for Charta Sinapis

Solubility—Almost entirely soluble in Chloroform, yielding a more or less turbid solution Entirely soluble in Oil of Turpentine, Carbon Bisulphide, and Benzol Insoluble in Water, Alcohol, alkaline solutions, or dilute acids

Medicinal Properties—Used for making splints as Gutta Percha tissue for keeping surgical dressings moist, as a solution for mixing with medicaments for chronic skin diseases, and applying like Collodion

Foreign Pharmacopœias—Official in Belg, Fr, Ger (also Percha Lamellata), Hung, Jap (also Gutta Percha Depurata), Port, Span, Swed (also Gutta Percha Laminata), and Swiss, which has also Percha Lamellata

LIQUOR GUTTA PERCHA—Gutta Percha, in thin slices, 1, Chloroform, 8, Lead Carbonate, in fine powder, 1 Add the Gutta Percha to 6 of the Chloroform in a stoppered bottle, and shake them together frequently until solution has been effected Then add the Lead Carbonate previously mixed with the remainder of the Chloroform, and having several times shaken the whole together, set the mixture aside, and let it remain at rest until the insoluble matter has subsided Lastly, decant the clear liquid, and keep it in a well stoppered bottle—*B P* '85

Traumaticine—A solution of 1 of Gutta Percha tissue in 10 (by weight) of Chloroform It produces a thin delicate film when painted on the skin, and causes neither tension nor pain It is used for medicated applications—*P J* (3) xiv 341 A vehicle for the administration of Mercury in syphilis—*L* '94, ii 590

B P C uses 1 of Gutta Percha in 10 of Chloroform by weight, the same as **Traumaticine**, and the directions for making the solution are those of *B P* '85

Foreign Pharmacopœias—Official in Austr, Belg, Dutch, Fr, Mex, Span and Swiss, Gutta Percha 1, Chloroform 9 (by weight), all have Traumaticine either as a title or as a synonym Jap (Liquor Guttaperchæ) 1 and 10, with Lead Carbonate

UNNA'S PLASTER MULLS consist of a very thin sheet of Gutta Percha coated on one side with an adhesive substance (Aluminium Oleicum) containing one or more medicinal substances, and backed on the other side with Mull (undressed muslin)—*L* '86, ii 575

Not Official

GYNOCARDIÆ OLEUM

Prior to 1900 it was supposed that the Chaulmoogra Oil of commerce was obtained from the seeds of *Gynocardium odorata*, but it was pointed out by Holmes, on the authority of Dr Plam, that Chaulmoogra Seeds and Oil are the produce of *Taraktogenos Kurzii*, King Power and Barrowcliff have extracted and examined the Oil from seeds of *Gynocardia odorata* supplied to them by Mr David Hooper

Gynocardia Oil consists, according to the above-named authors, of the glyceryl esters of the following Acids (1) Linolic or isomerides of the same series, (2) Palmitic Acid in considerable amount, (3) Linolemic and Isohnolemic Acids, the latter preponderating, and (4) Oleic Acid in relatively small amount The seeds also contain 5 p.c. of a crystalline glucoside, Gynocardin ($C_{11}H_{19}O_5N$, $1\frac{1}{2}H_2O$, eq 357.51) and a hydrolytic Enzyme, Gynocardase

Tests—Gynocardia Oil has, according to Power and Barrowcliff, a sp gr of 0.925 at 25° C (77° F). It is optically inactive. It has an Acid value of 4.9, a Saponification value of 197.0, and an Iodine value of 152.8. The oil extracted from the seeds by Ether has a sp gr of 0.927 at 25° C (77° F), an Acid value of 5, a Saponification value of 199.6, and an Iodine value of 152.

CHAULMOOGRA OIL—Chaulmoogra Oil of commerce is obtained from the Seeds of *Taraktogenos Kurzii*, King, a plant which is a native of Burma. The shells, which were separated from the fresh Chaulmoogra seeds by Power and Gornall, represented 34 p.c. of their weight, the kernels yielded, by expression, an amount of fixed oil corresponding with 30.9 p.c. of the entire seeds. A portion of the kernels, when completely extracted with Ether, yielded 55 p.c. of their weight of fixed oil, corresponding with 38.1 p.c. of the entire seed (having 30.7 p.c. of shells). It is a soft solid, having a faintly yellow colour and a characteristic odour.

The Oil prepared by these authorities from the Seeds yielded, on hydrolysis, a substance having the formula and m.p. of Phytosterol, Glycerol, and a mixture of fatty acids having a m.p. of 44° to 45° C (111.2° to 113° F), an optical rotation in Chloroform Solution of +52.6°, an Acid value of 215, and an Iodine value of 103.2. Palmitic and Chaulmoogric Acid were identified in this mixture.

The Oil has been long known and used in India, it has a disagreeable taste and smell, and can be readily melted by a gentle heat.

Oleum Gynocardiæ is official in the *Ind* and *Col Add* for India and the Eastern Colonies, with the synonym Chaulmoogra Oil.

Medicinal Properties—Recommended in leprosy, also as an external application in psoriasis, obstinate eczema, and other skin diseases, chronic rheumatism, and gout, and in phthisis.

In leprosy—*B.M.J.E.* '93, ii, 4, '01, ii, 79, *L.* '07, ii, 1515.

4 minims in capsule three times daily in leprosy, dose increased until 50 capsules per diem were taken—*L.* '02, ii, 1196.

Dose—5 to 10 minims = 0.3 to 0.6 c.c., gradually increased to 30 to 60 minims = 1.8 to 3.6 c.c. three or four times a day, should be given after meals in Milk or emulsion with Gum Acacia, or better still in capsules.

Tests—The Oil has, according to the above-named authors, a sp gr of 0.951 at 25° C (77° F), or of 0.940 at 45° C (113° F). It is dextrogyrate, the optical rotation being +52° in a tube of 100 mm. The m.p. is 22° to 23° C (71.6° to 73.4° F). It has an Acid value of 23.9, a Saponification value of 213.0, and an Iodine value of 103.2.

The Ether-extracted oil has a sp gr of 0.952 at 25° C (77° F), or of 0.942 at 45° C (113° F). It is dextrogyrate, the optical rotation being +51.8° in a tube of 100 mm. The m.p. is 22° to 23° C (71.6° to 73.4° F). It has an Acid value of 20.8, a Saponification value of 208, and an Iodine value of 104.4.

A specimen of Chaulmoogra Oil, which had been in stock for some considerable time, examined in the author's laboratory, gave an Acid value of 29.4, an Iodine value of 163, a Saponification value of 197.4, and an Iodine value of 99.06, the oil yielded 99.56 p.c. of fatty acids, having a combining weight of 288.

Chaulmoogric Acid ($C_{18}H_{32}O_2$, eq. 214.38), isolated by Power and Gornall from the Chaulmoogra Oil described above, has a m.p. of 55° C (131° F), is dextrogyrate, the optical rotation being +56°. It is soluble in Ether, Chloroform, Carbon Tetrachloride, or by Nitric Acid. It is also soluble in concentrated Sulphuric Acid, with much decomposition, forming Sulphur Dioxide.

Magnesium Gynocardate—A granular powder.

Dose—1 to 3 grains = 0.06 to 0.2 gramme.

UNGUENTUM GYNOCARDIÆ (*Ind* and *Col Add*)—A 10 p.c. Ointment of Gynocardia Oil in a mixture of 4 of Hard and 5 of Soft Paraffin.

For India and the Eastern Colonies.

HÆMATOXYLI LIGNUM.

LOGWOOD

FR, BOIS DE CAMPECHE, GER, BLAUHOLZ, ITAL, CAMPEGGIO, SPAN,
PALO DE CAMPECHEThe Heart-wood of the trunk of *Hæmatoxylon Campechianum*, L

Imported from Campeachy in Central America, from Honduras and Jamaica, that from Campeachy being the most valuable

Medicinal Properties —Astringent, without irritating properties, useful in diarrhoea of phthisis and chronic diarrhoea and dysentery, and in passive hæmorrhages, in infantile diarrhoea, it does not tend to cause subsequent constipation Also as an injection for leucorrhœa It colours the urine and fæces dark red**Incompatibles** —Mineral Acids, metallic salts, Lime Water, Tassar Emetic**Official Preparation** —Decoctum Hæmatoxyl**Not Official** —Extractum Hæmatoxyl, Extractum Hæmatoxyl Liquidum, Hæmatoxylum, and Hæmatein**Foreign Pharmacopœias** —Official in Austr, Mex (Palo de Campeche), Port (Campeche), U S Not in the others**Descriptive Notes** —Logwood consists of the heart-wood of the trunk of *Hæmatoxylon Campechianum*, a leguminous tree indigenous in Central America There are several varieties of the tree, four being recognised in Honduras and three in Jamaica, the wood of which varies in tinctorial power The kinds imported from Campeachy and San Domingo are considered the best The heart-wood of the tree only is used, the bark and sapwood being removed It is imported in logs about 3 feet long, externally often dark purplish red, and reddish or orange-brown internally In retail commerce it is sold in chips or, more rarely, in coarse powder, and for dyeing purposes is usually fermented from four to six weeks by moistening it and exposing it to the air During this process the Hæmatoxylum, which in the pure state is colourless, becomes oxidised in the presence of atmospheric Ammonia to Hæmatein, the presence of which is recognised by the bronzy-green midescence observable on the surface of the chips The unfermented wood is official for use in medicine, and is described as being purplish-red externally, and internally reddish-brown with medullary rays 4 cells wide (*U S P*) When chewed it colours the saliva pink It should have a slight, agreeable odour and a sweetish, astringent taste The odour recalls that of violets, and is perceptible in the decoction The wood contains about 9 to 12 p c of Hæmatoxylum An extract of Logwood is prepared for technical purposes which resembles Kino in appearance, but is easily distinguished by its sweet taste The only wood with which it is likely to be confounded is Brazil wood, which gives a red, not blue, colour with alkalis, and gives Picric Acid when boiled with Nitric Acid, whilst Logwood gives only Oxalic AcidSee also *P J* (4) vi 284**Tests** —Hæmatoxylum Wood when ignited with free access of air should not leave more than 2 p c of ash

Preparation

DECOCTUM HÆMATOXYLI DECOCTION OF LOGWOOD

Boil 1 oz of Logwood, in chips, with 24 fl oz of Distilled Water, adding 70 grains of bruised Cinnamon Bark towards the end of the process, strain, and wash with Distilled Water to make 20 fl oz

(1 in 20)

Iron vessels should not be used

Dose.— $\frac{1}{2}$ to 2 fl oz = 14 2 to 56 8 c c

Not Official

EXTRACTUM HÆMATOXYLI (B P 1885) —Logwood, in fine chips, 1, boiling Distilled Water, 10, infuse 24 hours, boil to 5 strain and evaporate to dryness by a water bath, stirring with a wooden spatula Iron vessels should not be used

Dose —10 to 30 grains = 0 65 to 1 94 gramme

This has been incorporated in the B P C

Foreign Pharmacopœias —Official in U S Not in the others

EXTRACTUM HÆMATOXYLI LIQUIDUM —Boil 20 of *Unfermented* Logwood, in No 16 powder with 40 of Distilled Water for half an hour, and strain, repeat the process with 40 more of Water, and again for the third time, and having mixed the strained liquors, evaporate over a water-bath (or in *vacuo*) to the measure of 17 and add 3 of Alcohol (90 p c), allow it to settle for a week, then draw off the clear liquor from the sediment

Dose —30 to 120 minims = 1 8 to 7 1 c c

The above B P C *Formulary* 1901 general process has been incorporated in the B P C, except that Logwood is in No 20 powder instead of No 16, and the product is made up to a volume of 1 in 1

HÆMATOXYLIN $C_{16}H_{11}O_8$, eq 299·84 —Bright yellow prismatic or granular crystals, sometimes brownish externally It possesses a sweet taste somewhat resembling Liquorice The prismatic crystals contain 3 molecules of Water of crystallisation, the granular crystals 1 molecule Sparingly soluble in cold Water, readily in Alcohol and Ether It is also soluble in solutions of the fixed and volatile alkalis with the production of solutions which rapidly acquire a purple colour It has the characters of a weak acid, and unites with basic ions to form compounds, which are colourless when perfectly pure, but soon pass into strongly coloured products, owing to the great avidity with which they absorb atmospheric Oxygen Used as a nuclear stain for histological and pathological sections

Tests —Hæmatoxylin loses part of its Water of crystallisation at 100° C (212 F) but the remainder only at 110° to 120° C (230° to 248° F) It fuses upon further heating, about 110° to 120° C (230° to 248° F) till higher temperature decomposes, leaving a bulky carbonaceous residue A solution yields with neutral or basic Lead Acetate a bluish-white precipitate rapidly darkening when exposed to the atmosphere Chloride Solution a permanent rose-coloured precipitate Solution of Alum yields a bright red colour, but no immediate precipitate A dilute Acetate Solution yields a fine purple precipitate Ferric Chloride Acid and Potassium Bichromate, and its solution reacts with Potassium Tartrate (Fehling's) Solution and Silver Nitrate Solution

Foreign Pharmacopœias —Official in Belg and Jap

HÆMATOXYLIN SOLUTION See Indicators of Neutrality

HÆMATEIN $C_{16}H_{12}O_8$, eq 297·84 —A brownish-red powder sparingly soluble in Water the atmospheric oxidation of an ammoniacal solution of its ammonium salt of Hæmatin being decomposed by

Acetic Acid The Ammonium salt forms a deep violet crystalline powder exhibiting a metallic lustre. It is soluble in Water, the solution readily reducing Silver Nitrate Solution. It yields with Copper Sulphate Solution a violet blue precipitate, and with Stannous Chloride Solution a violet precipitate.

Not Official

HÆMOGLOBIN

The substance to which in one or other of its modifications the blood owes its colour, and the chief solid constituent of the red blood corpuscles. Has been given with considerable success in the treatment of anæmia. It readily combines with free Oxygen to form oxyhæmoglobin or hæmato crystallin. It has been prepared in the form of crystals, but its preparation in this form is attended with some difficulty on account of its ready solubility in Water. A colloidal form is also known as colloidal hæmoglobin.—*L* '02, i 910, *B M J* '02, i 738

It occurs in commerce as an **Extract** (Pfeuffer's), in **Scales** (Merck) and as a dry powder, **Sanguis Bovinus Exsiccatus**, defibrinated and desiccated ox blood.

HÆMATOGEN—An aromatic fluid preparation, stated to contain pure hæmoglobin, the salts of the blood, the albuminous constituents of the serum, and glycerin.—*L* '99, ii 388

Under the name of **Sicc**, a solid preparation of hæmatogen has been introduced. It is a brownish black powder, soluble in Water.

LIQUOR HÆMOGLOBIN CO (Vinsip)—A fluid preparation, stated to contain hæmoglobin, and the albuminous constituents of the blood.—*L* '01, ii 735

HÆMOL—A dark brown powder, slightly soluble in Water, produced by the action of reducing substances, e.g., Zinc dust, on the colouring matter of the blood.

Dose—3 to 8 grains = 0.2 to 0.52 gramme

Under the name of **Ferrohæmol**, **Cuprohæmol** and **Zincohæmol**, compounds containing respectively Iron, Copper and Zinc with Hæmol have been introduced, **Bromo-hæmol** has been used in the treatment of epilepsy.

HÆMOGALLOL—A dark brown or reddish brown amorphous powder, slightly soluble in Water. Produced by the action of Pyrogallol on the colouring matter of the blood.

Dose—1 to 5 grains = 0.06 to 0.32 gramme

HAMAMELIS.

HAMAMELIS

Both the dried Bark, and the fresh and dried Leaves of *Hamamelis Virginiana*, L., are official.

Medicinal Properties—A local astringent and hæmostatic. Used in epistaxis, hæmatemesis, bleeding piles, and other conditions in which tannin is used.

Prescribing Notes—For local application, 1 of the Tincture is diluted with 10 or 20 of Water or the Liquor with 1 or 2 of Water. The ointment is used for piles, as is also a suppository of Hamamelin.

When equal Volumes of Tincture of Hamamelis and Tincture of Hydrastis are mixed, a precipitation will occur unless each Tincture be mixed with an equal Volume of Glycerin.

Official Preparations—Of the Bark, Tinctura Hamamelidis, of the Dried Leaves, Extractum Hamamelidis Liquidum, of the Fresh Leaves, Liquor Hamamelidis, of the Liquid Extract, Unguentum Hamamelidis

Not Official—Extractum Hamamelidis, Hamamelidis, Pasta Hamamelidis, Suppositorium Hamamelidis, Hamamelidis, and Hamamelin

Descriptive Notes—Hamamelis leaves are official in the *BP*, both fresh and dried, but in the *USP* only the dried leaves, collected in autumn. The dried leaves are more or less broken in commerce, but the fresh leaves are broadly oval, 3 to 6 inches (7 to 15 cm long) (10 cm *USP*), shortly stalked, cordate and unequal at the base, and sinuate at the margin, pinnately veined, paler below, with prominent veins furnished with stellate hairs, and an astringent taste, with slight bitterness. It has been found that the leaves contain more tannin in the autumn, and that the cells of the hairs have thicker walls, a dark line often marking the lining of the cell in the autumn, the walls becoming yellow, and the granular and oily contents. The odour of the distillate of the leaves is quite characteristic and is apparently the result of decomposition of the volatile oil, and is not perceptible in the dried leaves.

HAMAMELIDIS CORTEX. HAMAMELIS BARK *BP Syn* — WITCH HAZEL BARK

The dried Bark of *Hamamelis Virginiana*

Foreign Pharmacopœias—Official in Mex, Span and *US*

Descriptive Notes—Hamamelis Bark occurs in commerce in thin quilled pieces of pale brownish-buff or fawn colour, the outer surface or cork being thin, of a greyish tint, cracking and forming scales, and easily exfoliating, so that the inner bark, which is cinnamon-coloured or reddish-brown, often occurs free from it in commerce. The transverse fracture is short externally, but laminated internally with weak fibres. The taste is faintly astringent and somewhat mucilaginous. Its activity is apparently due chiefly to a volatile oil, as it only contains 8 to 10 p.c. of Tannin and a small quantity of bitter principle. Hamamelis Bark is about $\frac{1}{8}$ inch (1.5 mm) thick, *BP* (1 to 2 mm *USP*), 2 to 8 inches long (0.5 to 2 dm). The transverse section exhibits a complete ring of sclerenchymatous cells near the outer surface and numerous tangentially elongated bundles of bast fibres. Willow Bark bears some resemblance to Hamamelis Bark. It has a dull greyish-brown cork, is usually striated or wrinkled on the outer surface and does not exhibit a line of sclerenchymatous cells, and the bast fibres are much tougher than those in Hamamelis Bark, the taste also is more astringent.

Tests.—The Bark yields about 5 p.c. of ash and the amount yielded should not be much in excess of this figure.

An ash limit is stated not to be necessary for inclusion in the *BP*.

Preparations.

TINCTURA HAMAMELIDIS. TINCTURE OF HAMAMELIS

2 of Hamamelis Bark, percolated with Alcohol (45 p.c.) to yield 20 (1 in 10)

Dose —30 to 60 minims = 1 8 to 3 6 c c

Foreign Pharmacopœias —Official in Fr, 1 in 5 from leaves prepared with Alcohol (60 p c), Mex, 1 in 5, and Span, Bark 1 and Leaves, 1 in 20

Tests —Tincture of Hamamelis has a sp gr of 0 950 to 0 955, contains about 2 0 p c w/v of total solids and about 49 0 p c v/v of Absolute Alcohol

Not Official

EXTRACTUM HAMAMELIDIS —Hamamelis Bark in powder, percolated with Alcohol (60 p c) and the percolate evaporated to the consistence of an extract
Yield of Extract, 20 to 25 p c

Dose — $\frac{1}{2}$ to 2 grains = 0 032 to 0 13 gramme in pill

$\frac{1}{2}$ grains = 0 1 gramme, in suppositories, 1 dr in 7 dr of Soft Paraffin or other diluent, for an ointment

B P C employs Alcohol (45 p c) and evaporates to dryness and powders it
Official in Mex

GOSSYPIUM HAMAMELIDIS —Tincture of Hamamelis $\frac{1}{2}$ fl oz, Glycerin 10 minims, Cotton Wool, in a thin sheet, 60 grains Mix the Tincture and Glycerin, and saturate the wool evenly with the mixture Dry by exposure to the air Astringent and sedative

SUPPOSITORIUM HAMAMELIDIS —Extract of Hamamelis, $\frac{1}{2}$ grain, Oil of Theobroma, 15 grains —*Samaritan*

HAMAMELIN —A powdered extractive prepared from either the Leaves or the Bark of Hamamelis Virginiana

Dose —1 to 5 grains = 0 065 to 0 32 gramme

Two forms of Hamamelin are known in commerce, the green powder (non hygroscopic) prepared from the Leaves, and a chocolate brown hygroscopic amorphous powder prepared from the Bark

Hamamelin prepared from the Leaves with strong Alcohol was far more efficacious in suppositories than the resinoid from the Bark —*C D '98*, 1 86, *P J '01*, 11 231

HAMAMELIDIS FOLIA. **HAMAMELIS LEAVES** *B P Syn* —

WITCH HAZEL LEAVES

The Leaves, fresh and dried, of *Hamamelis Virginiana*

Foreign Pharmacopœias —Official in Austr, Belg, Fr, Jap, Mex, Norw, Span, Swed, Swiss and U S

Tests —The Leaves yield from 5 to 8 p c of ash The inclusion of an ash limit in the *B P* is stated not to be a necessity

Preparations

EXTRACTUM HAMAMELIDIS LIQUIDUM. **LIQUID EXTRACT OF HAMAMELIS**

20 of Hamamelis Leaves, percolated with Alcohol (45 p c) until exhausted, the first 17 reserved and the remainder evaporated to an Extract, which is dissolved in the first portion, and made up with Alcohol (45 p c) to 20 (1 in 1)

Dose —5 to 15 minims = 0 3 to 0 9 c c

Foreign Pharmacopœias —Official in Austr, to yield not less than 23 p c residue, Belg, to yield 23 p c residue, Fr, Jap, Norw, Span, Swed, Swiss and U S, all 1 in 1

Tests —Liquid Extract of Hamamelis has a sp gr of 1 025 to 1 050, contains about 21 p c w/v of total solids and about 32 p c w/v of Absolute Alcohol

LIQUOR HAMAMELIDIS. SOLUTION OF HAMAMELIS EXT.
HAMAMELIDIS DEST

Fresh Hamamelis Leaves, 50, Water 100, Alcohol (90 p c), 10
Macerate in a still for 24 hours, then distil one half

Oil It probably owes its virtues to the presence of a small quantity of essential

Pond's Extract and Hazeline are products distilled from Hamamelis
Official in U S

Tests.—The Liquor has a sp gr of 0.980 to 0.985, it contains
about 16 p c w/v of Absolute Alcohol

UNGUENTUM HAMAMELIDIS (HAMAMELIS OINTMENT)

Liquid Extract of Hamamelis, $\frac{1}{4}$, Hydrous Wool Fat, $2\frac{1}{4}$ (1 in 10)

Now made with Hydrous Wool Fat in place of simple Ointment

Not Official

WITCH HAZEL SNOW—Melt 2 oz of Stearic Acid and add it to a hot
solution of Glycerin 2 fl dm, Sodium Carbonate 180 grains, in Water 10 fl oz
the mixture for one hour on a water-bath, make up the volume
with Water to 10 fl oz and add Liquor Hamamelidis 10 fl oz. Transfer to a hot
mortar and agitate very thoroughly with an egg whisk. Continue agitation
till quite thick. Let stand 12 hours, stir well and bottle.—P J '06, 1 337

This has been incorporated in the B P C as follows —

Pasta Hamamelidis Syn Witch Hazel Snow or Foam—Stearic
Acid, 10, Sodium Carbonate, 1.50, Glycerin, 1.50, Solution of Hamamelis, by
weight, 50, Distilled Water, q s to produce by weight 100

Directions for preparing are the same as **Witch Hazel Snow** given above

Not Official

HELLEBORUS

CHRISTMAS ROSE

The Rhizome and Rootlets of *Helleborus Niger*, L.
It contains the glucosides Helleborein and Helleborin.—J C S Abs '98, 1 89
(It may be noted that 'White Hellebore' is Veratrum Album, and 'Green
Hellebore' is Veratrum Viride)

Medicinal Properties—A hydragogue cathartic and emmenagogue.
Poisonous in large doses, producing gastro-intestinal inflammation

Foreign Pharmacopœias—Official in Mex (Eleboro) and Port. Not in
the others

TINCTURA HELLEBORI—Hellebore Root, 1, percolated with Alcohol
(60 p c) to yield 8 (1 in 8)

Dose—20 to 60 minims = 1.2 to 3 f 3 c c in Water

This has been incorporated in the B P C

Official in Port, 1 in 5

HEMIDESMI RADIX.

The dried Root of *Hemidesmus Indicus*, R. Brown

Imported from India

It was brought to England by Dr Ashburner about the year 1830, and was

prescribed for the same purposes as Sarsaparilla, but it did not prove satisfactory, and is now used chiefly as a flavouring agent

Official Preparation — Syrupus Hemidesmi

Descriptive Notes — Hemidesmus Root occurs in pieces about 6 inches (15 cm) or more in length and $\frac{1}{8}$ to $\frac{1}{2}$ inch (3 to 12 mm) in thickness, rarely exceeding $\frac{1}{2}$ inch (6 mm) in diameter — *B P* It is cylindrical, slightly tortuous, and longitudinally furrowed, and has transverse fissures, and is of a reddish or dark brown colour, often with a violet grey hue. On one side the cork is frequently separated and raised above the cortex. The roots are furnished with a few slender rootlets, and at the upper end with slender woody stems $\frac{1}{10}$ inch (2.5 mm) or less thick, bearing opposite leaf scars. The root has a characteristic odour resembling that of Coumarin. Laticiferous vessels are found in the cortex, the wood is yellowish and porous, showing radiate medullary rays only in the smaller pieces, in the larger pieces the rays are visible only in the longitudinal or tangential section.

Tests — It yields from 3 to 4 p.c. of ash

Preparation

SYRUPUS HEMIDESMI SYRUP OF HEMIDESMUS

Infuse 4 of Hemidesmus Root in 20 of boiling Distilled Water for 4 hours, strain, and after standing, decant the clear fluid, in which dissolve 28 of Refined Sugar with a gentle heat. It should weigh 42 (about 1 in 8)

Dose — $\frac{1}{2}$ to 1 fl. dr. = 1.8 to 3.6 cc

HIRUDO.

THE LEECH

FR., SANGSUE, GER., B. LUTEGEL, ITAL., SANGUISUGA, SPAN.,
SANGUISUELA

- 1 *Sangsuga medicinalis*, the Speckled Leech, and
- 2 *Sangsuga officinalis*, the Green Leech
- 3 *Hirudo quinquestrata*, the Five Striped or Australian Leech, is official in the *Ind* and *Col A* and for the Australian Colonies

Leeches are imported chiefly from Hamburg. They are also collected in large numbers in Spain, France, Italy and Hungary.

Used for the abstraction of blood from congested parts, in pleurisy, typhlitis, pericarditis, and in cardiac distress.

When about to apply a Leech, it should be handled as little as possible, and the part of their body should be clean, and free from grease or soap, and, if a hairy part, it should be first shaved. Several suggestions have been made, in case the Leech should refuse to bite to smear the part with Milk, or Cream, or Sugar, to apply a sinapism and thoroughly clean the part afterwards, to scratch the part with a needle. When the Leech is required to bite a particular spot, it is useful to cut a small hole in blotting paper, and place it on the part

When applying a Leech to one of the orifices of the body, the Leech should be confined in a Leech glass. Should a Leech be swallowed, a strong solution of common salt (Sodium Chloride) should be drunk.

Bleeding from Leech bites is sometimes difficult to stop. The following remedies have been applied with advantage—Matico, Solution of Ferric Chloride, Silver Nitrate Point, saturated Solution of Alum, and pressure on the part.

Foreign Pharmacopœias—Official in Belg., Dan., Dutch, Fr. (Sanguis), Ger., Hung., Ital., Jap. (Hirudines), Port. (Sanguisugas), Swed. and Swiss. Not in the others.

Descriptive Notes.—There are two species met with in European commerce, viz., the Speckled or German Leech (*Sanguisuga medicinalis*, Savigny) and the Green or Hungarian Leech (*S. officinalis*, Savigny), the former having the ventral surface greenish-yellow, spotted with black, and the latter the ventral surface olive green and not spotted with black. Leeches should weigh 1 to 5 grammes only. In the Australian Colonies, the Flat-Sipped or Australian Leech, *Hirudo guttator*, Schmarda, may be substituted for the European Leeches. It has a brown dorsal surface with five longitudinal stripes, and a greenish-yellow ventral surface not spotted. Leeches should be kept in Distilled Water with a piece of charcoal in it and in the shade. After feeding, if placed in Camphor Water they will vomit the blood they have sucked, and can then be placed in clear Distilled Water, and will be ready for use again in about 10 days. The Water requires changing about once a week.

HOMATROPINÆ HYDROBROMIDUM.

HOMATROPINE HYDROBROMIDE

HYDROBROMATE OF HOMATROPINE—B.P. Add '90

$C_{16}H_{21}NO$, HBr, d_4^{20} 1.353.49.

Fr., BROMHYDRATE D'HOMATROPINE, GEL., Ital., BROMIDRATO DI HOMATROPINA.

Colourless, small, rhombic prisms, or a white crystalline, odourless powder. It is the Hydrobromide of Homatropine Mandelic Acid Ester, which is a lower homologue of Atropine.

It possesses a bitter taste.

It should be kept in well-closed glass bottles of a dark amber tint and protected as far as possible from the light.

Solubility.—1 in 6 of Water, 1 in 18 of Alcohol (90 p.c.), insoluble in Ether and in Chloroform.

Medicinal Properties.—Mydriatic. Dilates the pupil as rapidly, though not so energetically as Atropine, but its effects disappear much sooner—in about a quarter of the time. When used with Cocaine the action is quicker and more powerful.

When an oily solution is required, the alkaloid (not the salt) is dissolved in Castor Oil.

For hypodermic injection 4 grains of Homatropine Hydrobromide dissolved in 1 fl oz of sterilised Distilled Water, 6 minims = $\frac{1}{20}$ grain
 1 to 2 drops of a 1 p.c. solution in some cases of muscular asthenopia —
B M J '99, ii. 765

Dose — $\frac{1}{80}$ to $\frac{1}{10}$ grain = 0.0008 to 0.0032 gramme

Ph Ger maximum single dose, 0.001 gramme, maximum daily dose, 0.008 gramme

Official Preparation — Lamellæ Homatropinæ

Not Official — Guttes Homatropinæ, Guttes Homatropinæ cum Cocainæ, Lamellæ Homatropinæ cum Cocainæ, Homatropina, Oleum Homatropinæ cum Cocainæ

Foreign Pharmacopœias — Official in Dutch, Ger, Ital, Jap, Swed, Swiss and U S

Tests. — Homatropine Hydrobromide melts at 209° to 212° C (408.2° to 413.6° F). Neither the *BP* nor the *PG* includes a m.p., the *USP* gives 213.8° C (417° F). Its solution should be neutral in reaction towards Litmus paper. It exerts a powerful mydriatic action on the pupil of the eye. The 1 in 50 aqueous solution yields with Iodine Solution a brown precipitate, with Mercuric Chloride Test-solution a white precipitate, with Potassium Hydroxide Solution a white precipitate soluble in excess of the reagent, but no precipitate with Tannic Acid Solution or with Platonic Chloride Solution. The *PG* states that it also, after the addition of Hydrochloric Acid, yields no precipitate with Platonic Chloride Solution. The solution yields with Silver Nitrate Solution a yellowish curdy precipitate, readily soluble in Potassium Cyanide Solution, practically insoluble in Ammonia Solution, and insoluble in Nitric Acid. 1 cc of a 10 p.c. solution when cautiously mixed with Chlorine Water yields a brownish colour to Chloroform when shaken with one-fifth its volume of the latter fluid, the *USP* uses twice the volume of Chloroform. The crystalline alkaloid obtained by adding an excess of Potassium Hydroxide Solution to an aqueous solution of the salt and extracting with Ether (allowing the Ether to evaporate spontaneously), should possess a m.p. of 96° C (204.8° F). 1 centigramme of the salt mixed with a few drops of Fuming Nitric Acid, and evaporated to dryness on a water-bath, leaves a yellowish residue, which, when cool, yields on the addition of a freshly-prepared Alcoholic Potassium Hydroxide Solution a reddish-violet colour. The *USP* states that the salt yields an evanescent pink colour, changing rapidly to green when mixed with Sulphuric Acid containing a crystal of Potassium Bichromate.

The more generally occurring impurities are alkaloids other than Homatropine (Atropine, Hyoscyamine, and Hyoscine), and mineral matter. The *BP* states that a 2 p.c. aqueous solution yields no precipitate on the cautious addition of Ammonia Solution previously diluted with twice its volume of Water. A 5 p.c. solution of Atropine Sulphate with Ammonia Solution under these conditions gives a distinct turbidity, but with Hyoscyamine and Hyoscine Hydrobromides no reaction is visible. A 1 p.c. solution of Atropine Sulphate remains unchanged by the Ammonia and Mercuric Chloride Test described below. Any

salt of Atropine or Hyoscyamine under exactly similar conditions will give the same reaction but with Hyoscine no formation of Mercuric Oxide appears to take place. The most characteristic test for Homatropine is that described above, with fuming Nitric Acid and Alcoholic Potassium Hydroxide Solution. It distinguishes it from Atropine, the latter giving a deep purple coloration, as does also Hyoscyamine and Hyoscine, but in the case of the two latter, the coloration is less intense and more transient. It should leave no weighable residue when ignited with free access of air, indicating mineral impurity.

Ammonia and Mercuric Chloride—If 1 cc of a 1 in 100 aqueous solution of the salt (0.01 grammes of the salt) be made alkaline with ammonia water, shaken out with Chloroform, the chloroform evaporated to dryness, the residue should turn yellow on warming with about 1.5 cc of a solution made by dissolving 1 volume of Chlorine in 50 parts of a mixture of Alcohol, 5 parts of Atropine and Hyoscyamine, indicating the absence of most other alkaloids except Atropine and Hyoscyamine.

Platinic Chloride—Aqueous solution of the salt is not precipitated by TS of Platinic Chloride, after the addition of Hydrochloric Acid, *P. G.*

Nitric Acid and Alcoholic Potassium Hydroxide Solution—If 0.01 grammes of the salt be added to 5 drops of Nitric Acid and evaporated to dryness in a porcelain dish, the residue should not become a violet colour upon the addition of a few drops of Alcoholic TS of Potassium Hydroxide, *U. S. P.* 0.01 grammes evaporated with 5 drops of Fuming Nitric Acid in a porcelain dish on cooling and adding Alcoholic Solution of Potassium Hydroxide, assumes a transient violet colour, quickly becoming reddish-yellow.

Preparation.

LAMELLÆ HOMATROPINÆ DISCS OF HOMATROPINE

Discs of Gelatin and Glycerin, each weighing about $\frac{1}{10}$ grain = 0.0013 grammes, and containing 0.00065 grammes of Homatropine Hydrobromide.

Not Official.

GUTTÆ HOMATROPINÆ—Homatropine Hydrobromide, 4 grains, Distilled Water, 1 fl. oz.—*London Ophthalmic and Guy's*

GUTTÆ HOMATROPINÆ CUM COCAINA—Homatropine Hydrobromide, 4 grains, Cocaine Hydrochloride, 10 grains, Distilled Water, 1 fl. oz.—*London Ophthalmic and Westminster Ophthalmic*

LAMELLÆ HOMATROPINÆ CUM COCAINA—Each disc contains $\frac{1}{10}$ grain of Homatropine Hydrobromide and $\frac{1}{10}$ grain of Cocaine Hydrochloride.—*London Ophthalmic*

HOMATROPINA—Colourless crystals, not deliquescent, nearly insoluble in Water, but soluble 1 in 80 of Olive Oil, 1 in 20 of Castor Oil. They combine readily with Oleic Acid. An ointment is required.

Used in cases where an oily preparation is required.

Foreign Pharmacopœias—Official.

Homatropine Hydrochloride and **Homatropine Hydrobromide**—Both salts in white crystalline powders. Both salts are readily soluble in Water, and in Alcohol (90 per cent).

OLEUM HOMATROPINÆ CUM COCAINA—Homatropine, pure, 10 grains, Cocaine (alkaloid), 10 grains, Castor Oil, 1 fl. oz. Heat together till dissolved.—*London Ophthalmic*

salt of Atropine or Hyoscyamine under exactly similar conditions will give the same reaction, but with Hyoscyamine no formation of Mercuric Oxide appears to take place. The most characteristic test for Homatropine is that described above, with Fuming Nitric Acid and Alcoholic Potassium Hydroxide Solution. It distinguishes it from Atropine, the latter giving a deep purple coloration, as do also Hyoscyamine and Hyoscyamine, but in the case of the two latter, the coloration is less intense and more transient. It should leave no weighable residue when ignited with free access of air, any residue indicating mineral impurity.

Ammonia and Mercuric Chloride—If 1 cc of a 1 in 100 aqueous solution of the salt (0.01 gramme of the Salt, *U S P*) be made alkaline with Ammonia Water, shaken out with Chloroform, and the chloroformic solution evaporated to dryness, the residue should turn yellow, and finally brick red, when warmed with about 1.5 cc of a solution made by dissolving 1 part of Mercuric Chloride in 50 parts of a mixture of Alcohol, 5 volumes, and Water, 3 volumes; indicating the absence of most other alkaloids except Atropine and Hyoscyamine, *U S P* and *B P*.

Platinic Chloride—An aqueous solution of the salt is not precipitated by TS of Platinic Chloride, *U S P*, after the addition of Hydrochloric Acid, *P G*.

Nitric Acid and Alcoholic Potassium Hydroxide Solution—If 0.01 gramme of the salt be added to 5 drops of Nitric Acid and evaporated to dryness in a porcelain dish, the residue should not acquire a violet colour upon the addition of a few drops of Alcoholic TS of Potassium Hydroxide, *U S P*, 0.01 gramme evaporated with 5 drops of Fuming Nitric Acid in a porcelain dish on cooling and adding Alcoholic Solution of Potassium Hydroxide, assumes a transient violet colour, quickly becoming reddish yellow.

Preparation

LAMELLÆ HOMATROPINÆ Discs of HOMATROPINE
Discs of Gelatin and Glycerin, each weighing about $\frac{1}{10}$ grain =
0.0013 gramme, and containing $\frac{1}{100}$ grain = 0.00065 gramme of
Homatropine Hydrobromide

Not Official

GUTTÆ HOMATROPINÆ—Homatropine Hydrobromide, 4 grains, Distilled Water, 1 fl oz.—*London Ophthalmic and Guy's*

GUTTÆ HOMATROPINÆ CUM COCAINA—Homatropine Hydrobromide, 4 grains, Cocaine Hydrochloride, 10 grains, Distilled Water, 1 fl oz.—*London Ophthalmic*

Homatropine Hydrobromide, 7 grains, Cocaine Hydrochloride, 10 grains, Boric Acid, 5 grains, Distilled Water, 1 fl oz.—*Westminster Ophthalmic*

LAMELLÆ HOMATROPINÆ CUM COCAINA—Each disc contains $\frac{1}{10}$ grain of Homatropine Hydrobromide, and $\frac{1}{10}$ grain of Cocaine Hydrochloride.—*London Ophthalmic*

HOMATROPINA—Colourless crystals, not deliquescent, nearly insoluble in Water, but soluble 1 in 80 of Olive Oil, 1 in 20 of Castor Oil. They combine readily with Oleic Acid.

Used in cases where an oily preparation or an ointment is required.

Foreign Pharmacopœias—Official in Mex.

Homatropine Hydrochloride and Sesquicyclate form colourless crystals or white crystalline powders. Both salts are readily soluble in Water, and in Alcohol (90 p c.).

OLEUM HOMATROPINÆ CUM COCAINA—Homatropine, pure, 10 grains, Cocaine (alkaloid), 10 grains, Castor Oil, 1 fl oz. Heat together till dissolved.—*London Ophthalmic*.

salt of Atropine or Hyoscyamine under exactly similar conditions will give the same reaction, but with Hyoscyamine no formation of Mercuric Oxide appears to take place. The most characteristic test for Homatropine is that of the reaction with Fuming Nitric Acid, and from Atropine, Potassium Hydroxide Solution. It distinguishes it from Atropine, the latter giving a deep purple coloration, and also Hyoscyamine and Hyoscyne, but in the case of the two latter, the coloration is less intense and more transient. It should leave no weighable residue when ignited with free access of air, indicating mineral impurity.

Ammonia and Mercuric Chloride — A solution of the salt (0.01 gramme) in 10 c.c. of Ammonia Water, shaken out with 10 c.c. of Potassium Hydroxide Solution, and finally brick-red, warmed with about 15 c.c. of a solution made by dissolving 1 part of Mercuric Chloride in 50 parts of a mixture of Alcohol, 5 volumes, and Water, 3 volumes, indicating the presence of most other alkaloids except Atropine and Hyoscyamine.

Platinic Chloride — An aqueous solution of the salt is not precipitated by TS of Platinic Chloride, *USP*, at 60°C.

Nitric Acid and Alcoholic Potassium Hydroxide — If 0.01 gramme of the salt be added to 5 drops of Nitric Acid in a porcelain dish, the residue should not acquire a violet color upon the addition of a few drops of Alcoholic TS of Potassium Hydroxide, *USP*, 0.01 gramme evaporated with 5 drops of Fuming Nitric Acid in a porcelain dish on cooling and adding Alcoholic water-bath leaves a faint yellow residue which, on cooling and adding Alcoholic Solution of Potassium Hydroxide, assumes a transient violet colour, quickly becoming reddish-yellow.

Preparation

LAMELLÆ HOMATROPINÆ

Discs of Gelatin and Glycerin, each weighing about $\frac{1}{10}$ grain = 0.0013 gramme, and containing $\frac{1}{100}$ grain = 0.00065 gramme of Homatropine Hydrobromide.

HORDEUM DECORTICATUM

PEARL BARLEY

The dried Seed of *Hordeum distichum*, L. divested of its early integuments, from plants cultivated in Britain

Foreign Pharmacopœias—Official in Fr (Orge Perlé), Port (Cevada Santa), Mex and Span (Cebada). Not in the others

DECOCTUM HORDEI—Pearl Barley, 1, wash the Barley with cold Water, and reject the washings, boil the washed Barley with 15 of Distilled Water for 20 minutes in a covered vessel, and strain. Product about 10 (about 1 in 10)

This has been incorporated in the *B P C*

Foreign Pharmacopœias—Official in Fr (Tisane d'Orge), 1 in 50. Not in the others. Decoctum Hordei Compositum, 1 in 50 is official in Span

Medicinal Properties—Nutritive and demulcent, used in catarrhal conditions of the respiratory and urinary systems, as a drink in febrile diseases, and to dilute cow's Milk for feeding children, thus forming a more easily digested curd

Dose—1 to 4 fl oz = 28 to 113 c c

DECOCTUM HORDEI TARTARISATUM—Acid. Potassium Tartrate, 80 grains, the Peel of $\frac{1}{2}$ Lemon, Sugar, 2½ oz, Decoction of Barley, 40 oz, boil and strain—*St Georg's*

HYDRARGYRUM.

MERCURY

Hg, eq 198 80

Fr, MERCUR PURIFIÉ, GER, QUECKSILBER, ITAL, MERCURIO, SPAN, MERCURIO

A shining, silver-white, metallic-looking fluid obtained from native Mercuric Sulphide

It should be kept in strong, well closed bottles

Solubility—Insoluble in the usual solvents, insoluble in Hydrochloric Acid, insoluble in cold Sulphuric Acid, but dissolved by hot Sulphuric Acid with evolution of Sulphur Dioxide. It dissolves readily and completely in Nitric Acid

Medicinal Properties—Mercury as a metal is seldom given alone. In a state of minute subdivision with Chalk, or in pill form, however, it has the effect of increasing the various secretions, and is itself absorbed by all the tissues of the body. It is an alterative, indirect cholagogue, purgative, diuretic, and a glandular stimulant. When given as a purgative it is usually combined with other purgatives, or followed by a purgative saline

Of great use, internally, in primary and secondary, and with Iodides in tertiary syphilis, but the doses should not be such as to cause salivation

Externally, by means of the ointment, oleate or liniment, in syphilis, in parasitic skin diseases, and as a stimulant in chronic

synovitis, peritonitis and other chronic inflammations, and glandular enlargements

See also under the various salts of Mercury

Two cases of acute intestinal obstruction successfully treated with Quick-silver — *B M J* '02, i 1023

Of the drugs frequently used in the treatment of syphilis, Blue Ointment is regarded as of most value — *L* '01, ii 1038

As an inunction ($\frac{1}{2}$ to 1 drm of the ointment well rubbed in at night before bedtime) it forms one of the most satisfactory ways of exhibiting Mercury — *B M J* '00, ii 1762

A mercurial cream prepared with a Lanolin ointment, and containing Carbolic Acid for use as an intramuscular injection in the treatment of syphilis — *B M J* '03, i 1258

Metallic Mercury still continues to be largely used in the treatment of syphilis, and preparations for use as inunctions or for intramuscular injection are in good demand. For intramuscular injection the treatment of syphilis a preparation made according to the following formula is stated (*M P* '06, i 149) to be useful — Purified Mercury, 40 grammes, sterilised Lanolin, 12 grammes, white sterilised Vaseline, 12 grammes, sterilised liquid Vaseline, 35 grammes. One c.c. contains $\frac{1}{2}$ gramme Mercury. The average dose is 7 or 8 centigrammes.

The administration of Mercury internally is stated (*B M J* '05, i 700) to be specially apt to cause symptoms of poisoning when combined with the extensive use of Tar externally.

Of the numerous salts and preparations of Mercury which have from time to time been recommended in the treatment of syphilis, attention still seems to centre round those preparations partaking of the nature of an ointment, and which can be used by inunction. In the *L* '04, i 1405, 15 grains Ung Hydrarg are recommended to be gently rubbed over the abdomen or the inside of the thigh or arm at night, and then covered with a flannel bandage until the following morning, when it is washed off, and this treatment is repeated unless the skin shows signs of irritation.

0.03 gm. of a mixture of two parts of metallic Mercury one part of Lanolin and liquid Paraffin, has been recommended (*B M J* '04, ii 1702) for subcutaneous injection. Intramuscular or intravenous injections unsuitable in infants, owing to the pain and the risk of inflammation (*L* '04, ii 1405).

A cream containing Mercury, Lanolin and Carbolic Soft Paraffin (white) is used in the Royal Navy — *B M J* '07, ii 512.

Official Preparations — Emplastrum Ammoniaci cum Hydrargyri, Emplastrum Hydrargyri, Hydrargyrum cum Creta, Liquor Hydrargyri Nitratis Acidus, Linimentum Hydrargyri, Pilula Hydrargyri, Unguentum Hydrargyri, Unguentum Hydrargyri Compositum, and Unguentum Hydrargyri Nitratis.

Not Official — Mercurial Cream (Squire), Mercury Plaster Mull, Mercury and Carbolic Plaster Mull, Oleum Cinereum Parogenum Hydrargyri, Pilula Hydrargyri Carbolicæ, Pilula Hydrargyri cum Creta, Pilula Hydrargyri cum Rheo, Suppositoria Hydrargyri, Unguentum Hydrargyri Mitius, Unguentum Cinereum, Vasolimentum Hydrargyri, Hyrgolum, Hydrargyri Benzoes, Hydrargyrum Carbolicum, Hydrargyrol, Hermophenyl Hydrargyri Cyanidum, Injectio Hydrargyri Cyanidi, Mercury Zinco-Cyanide, Unguentum Hydrargyri et Zinci Cyanidi, Hydrargyri Ethylenediamine Citras, Hydrargyri Gallicæ, Hydrargyri-Naphthol-acetas, Hydrargyri Salicylas, Hydrargyri Succimidum, Hydrargyri Sulfides, Unguentum Hydrargyri Sulphatis Flavæ, Hydrargyri Tannas, Hydrargyri Thymolacetas.

Foreign Pharmacopœias — Official in all

Tests — Mercury has a sp. gr. of 3.5. It solidifies at -39.4°C (-39°F). It boils at 360°C (680°F), and volatilises slightly even at ordinary temperatures. The fully reduced solution in Nitric Acid, freed from excess of Nitric Acid, adds with Ammonia Solution a

white precipitate, with Potassium or Sodium Hydroxide a yellow precipitate, with Potassium Iodide Solution a bright scarlet precipitate, soluble in excess of the reagent and in a considerable excess of the Mercuric salt, excess of Hydrogen Sulphide yields a black precipitate insoluble in Ammonium Hydrosulphide Solution, and in hot diluted Nitric Acid Solution. A bright piece of Copper foil immersed in the solution is coated with a grey film which, on rubbing, shows a bright silvery lustre. When the coated foil is heated in a dry clean test-tube the Mercury condenses on the sides of the tube in minute globules. The solution yields with Stannous Chloride Solution first a greyish-white precipitate of Mercurous salt and subsequently a grey precipitate of metallic Mercury. The *U S P* requires that it shall contain not less than 99.9 p.c. of metallic Mercury, but gives no method of determination. It also requires that globules of Mercury dropped upon white paper should roll about freely and leave no streaks or traces. It should present a bright surface even after agitation in contact with air.

The more generally occurring impurities are foreign metals and fixed residue. More than slight traces of foreign metals may be detected by the Sodium Thiosulphate Test described below, fixed residue by the volatilisation test.

Sodium Thiosulphate—On boiling 5 grammes of Mercury with 5 c.c. of Water and 4.5 grammes of Sodium Thiosulphate in a test tube for about one minute, the Mercury should not lose its lustre, and should not acquire more than a slightly yellowish shade, indicating the absence of more than slight traces of foreign metals, *U S P*.

Volatilisation—At a temperature of 357.25° C (675.05° F) it is completely volatilised, leaving no appreciable residue, *U S P*; it is volatilised leaving an insignificant amount of fixed residue below visible redness, *B P*.

Preparations

EMPLASTRUM HYDRARGYRI **MERCURIAL PLASTER.**

3 oz (by weight) of Mercury is rubbed with a heated mixture of 56 grains of Olive Oil, and 8 grains of Sublimed Sulphur, and finally incorporated with 6 oz of melted Lead Plaster (about 1 in 3).

Foreign Pharmacopœias—Official in Austr, Belg, Fr, Ger, Hung, Ital, Jap, Norw, Russ and Swed, 1 in 5, Dan and U S, 8 in 10, Dutch, 1 in 4, Mex, 1 in 5.57, Span, 1 in 7.5, Swed, 1 in 3. The ingredients differ considerably.

EMPLASTRUM AMMONIACI CUM HYDRARGYRO **AMMONIACUM AND MERCURY PLASTER**

3 oz (by weight) of Mercury treated as above with Olive Oil and Sulphur and mixed with 12 oz of purified Ammoniacum (nearly 1 in 5).

Applied in glandular swelling in chronic hepatic enlargement, syphilitic nodes, and in chronic synovitis.

Foreign Pharmacopœias—Official in U S, resembles Brit. Not in the others.

LINIMENTUM HYDRARGYRI **LINIMENT OF MERCURY**

Mix 1 oz of Mercury Ointment with Liniment of Camphor to

make $1\frac{1}{2}$ fl oz, and add 160 minims of strong solution of Ammonia diluted with Liniment of Camphor to $1\frac{1}{2}$ fl oz

(1 Ointment in 3, or 1 of Mercury in 6)

A stimulating Liniment, applied as an absorbent to swollen joints, or placed with Lint in the arm pits, or rubbed into the abdominal wall in tubercular peritonitis

PILULA HYDRARGYRI MERCURY PILL *B P Syn* — **BLUE PILL**

2 (by weight) of Mercury intimately mixed with 3 of Confection of Roses, and finally with 1 of powdered Liquorice Root (1 in 3)

8 commercial samples examined contained 28 to 41 p.c. of Mercury, and little or no Oxide, 5 of the 8 samples were prepared with Confection of Hips — *P J* (3) xv 230

Dose — 4 to 8 grains = 0.26 to 0.52 gramme

Foreign Pharmacopœias — Official in Fr, *Pilules Mercurielles*, *Jap* *Mix* *de* *Azules*, Port, *Pilulas Mercuriales*, Swed, *Pilulæ* *Mercuriales*, *U S*, *Mix* *de* *Hydrargyri*, all 1 in 3. Not in the others

UNGUENTUM HYDRARGYRI MERCURY OINTMENT

Mercury (by weight), 16, Lard, 16, Prepared Suet, 1

(nearly 1 in 2)

Official Preparations. — Used in the preparation of Linimentum Hydrargyri and Unguentum Hydrargyri Compositum

Foreign Pharmacopœias — Official in Austr, Belg, Dan, *Pomada Mercurialis*, Span (*Pomada Mercurialis*), 3 in 10, Fr, Ital (*Pomata Mercurialis*), Mex (*Unguento de Mercurio Doble*), Port and US, 1 in 2, Fr has also *Pomade Mercurielle Faible*, 1 in 8, Ger, Hung, Jap, Russ, Swed and Swiss (*Ung Hydr Ciner*), 1 in 3. Span has also *Pomada Mercurialis Simple*, 3 in 20

The Brussels Conference adopted a strength of 30 p.c. for Unguentum Hydrargyri

Mercury, 50, Oleate of Mercury, 2, Suet, 3, Benzoinated Lard, 25 — *US*

UNGUENTUM HYDRARGYRI COMPOSITUM COMPOUND MERCURY OINTMENT

Mercury Ointment, 10, Yellow Beeswax, 6, Olive Oil (by weight), 6, Camphor, in flowers, 3. Mix the Beeswax, Olive Oil, and Mercury Ointment with the aid of heat, add the Camphor, triturate until cold (1 Mercury in 5)

Contains rather less Mercury Ointment than B P '65, and therefore its action is modified, as previously suggested in the *Companion*.

This is Scott's celebrated absorbent Ointment (Scott's dressing), the Soap Cerate being replaced by the Oil and Beeswax

It is an admirable Ointment to apply to chronic joint enlargement.

Not Official

MERCURY PLASTER MULL (*Unna*) — Containing 1 grain = 0.06 grammes of Mercury to the square inch

MERCURY AND CARBOLIC PLASTER MULL (*Unna*) — Containing 1 grain = 0.06 gramme of Mercury and $\frac{1}{2}$ grain = 0.02 gramme of Carbolic Acid to the square inch

MERCURIAL CREAM (*Scott*) — Boiled re-distilled Mercury, by weight, 48 grains, sterilised anhydrous Lanthanum, by weight, 240 grains, pure sterilised Olive Oil, 7 s to produce 1 fl oz.

10 minims = 1 grain of pure mercury

Dose.—10 minims = 0.6 c.c. by intramuscular injection. The preparation recommended by Dr Julius Althaus, in his paper before the International Medical Congress at its Berlin meeting in 1890, consisted of 1 part of metallic Mercury, thoroughly rubbed up with 4 parts of purest Lanolin, and then mixed with 5 parts of carbolic oil of 2% strength, 10 minims of the resultant grey cream contained 1 grain of metallic Mercury. Lang's formula, published in 1888, suggested the original principle of the process, namely the minute subdivision of the metallic Mercury by means of Lanolin, and the thinning of the emulsion with Olive Oil.

The following formula is given *B M J* '03, 1258 by Colonel F. J. Lambkin, R. A. M. C.—Mercury, 2 drms., anhydrous Lanolin, 2 drms. by weight, Carbolic Acid, 4 drms., Carbolic Acid, 2 p.c., by measure.

Dose—5 to 10 minims once a week as an intramuscular injection.

The two under-mentioned formulas are given by Colonel F. J. Lambkin, R. A. M. C., in *L* '07, 114.

Mercury, 10 grammes, absolute Rosin and Camphoric Acid (Creo Camph) of each equal parts, 20 c.c., Palmitin Basis to 100 c.c.

Calomel, 5 grammes, absolute Rosin and Camphoric Acid (Creo Camph) of each equal parts, 20 c.c., Palmitin Basis to 100 c.c.

As a basis for Calomel Injection used in Syphilis, Dr Allaire ('Nouveaux Remèdes') recommends Palmitin prepared from palm oil. It does not become rancid, easily saponifies in the body, and is readily absorbed. A little Guaiacoloid (a combination in molecular proportions of Guaiacol and Camphor) is added to the injection.—*C D* '07, 1141.

OLEUM CINEREUM (Grey Oil).—White Vaseline, 25, Mercury Ointment, 1, Mercury, 19.5, triturate in a warm mortar until the Mercury is incorporated, then add White Vaseline, 7, Liquid Vaseline, 20. All by weight.

This preparation contains 40 p.c. Mercury.—*P J* (3) xix 704.

For hypodermic injection in syphilis. **Dose**—1 to 2 minims.—*B M J* '88, 1296, *T G* '94, 819.

A modification of 'Grey Oil,' is Mercury, 1, Lanolin anhydrous, 2, Carbolic Oil (2 p.c.), 1, all by weight. 10 mms. used for each injection.—*B M J* '98, 1485.

Mercury, 40, Wool Fat, 10, Liquid Paraffin, *q s* to produce (by weight) 100. **Dose**—1 to 2 minims.—*B P C*.

The following formula appears in the *Fr. Codex* (1908) under the title of

Huile Grise.—Purified Mercury, 1, anhydrous Lanolin, 26, Vaseline Oil (Huile de Vaseline medicinale), 60. The Lanolin and the Vaseline Oil are sterilised separately in glass flasks in an autoclave at 120° C (248° F) for 20 minutes. A pestle and mortar are heated by means of burning Alcohol, and placed therein are the Mercury, and the Wool Fat. The metallic particles are triturated until they are extinguished, and then the Liquid Paraffin is added in small portions. The product should weigh 126 grammes, and measure 100 c.c., and therefore contains almost exactly centigrammes of Mercury per c.c., or 40 p.c. w/v, and should be transferred immediately to phials of two, five, and ten c.c. capacity previously sterilised at 120° C (356° F).

PILULA HYDRARGYRI CUM OPIO.—Mercury Pill Mass, 5 grains, Opium, in powder, $\frac{1}{2}$ grain.—*St. Thomas*.

This has been incorporated in the *B*.

Mercurial Pill to 32 grains, Opium, in powder, $\frac{1}{2}$ grain.—*Guy's*.

Mercury Pill, 5 grains, Opium, in powder, $\frac{1}{2}$ grain.—*University* (No. 3) and *London Ophthalmic*.

PILULA HYDRARGYRI CUM EO.—Mercury Pill Mass, 2½ grains, Compound Rhubarb Pill Mass, 2½ grains.—*Thomas's* and *London Ophthalmic and King's*.

This has been incorporated in the *B*.

SUPPOSITORIA HYDRARGYRI.—Mercury Ointment, 5 grains, Oil of Theobroma, 10 grains, in each suppository.

Dose—10 minims = 0.6 c.c. by intramuscular injection. The preparation recommended by Dr Julius Althaus, in his paper before the International Medical Congress at its Berlin meeting in 1890, consisted of 1 part of metallic Mercury, thoroughly rubbed up with 4 parts of purest Lanolin, and then mixed with 5 parts of carbolic oil of 2 p.c. strength, 10 minims of the resultant grey cream contained 1 grain of metallic Mercury. Lang's formula, published in 1888, suggested the original principle of the process, namely the minute subdivision of the metallic Mercury by means of Lanolin, and the thinning of the emulsion with Olive Oil.

The following formula is given (*B M J* '03, 1258) by Colonel F. J. Lambkin R. A. M. C.—Mercury, 2 drms., anhydrous Lanolin, 2 drms. by weight, Paroleine 4 drms., Carbolic Acid, 2 p.c., by measure.

Dose—5 to 10 minims once a week as an intramuscular injection.

The two under-mentioned formulas are given by Colonel F. J. Lambkin R. A. M. C., in *L* '07, 114.

Mercury, 10 grammes, and Camphoric Acid (Creo-Camph) of each equal parts, 20 c.c., 100 c.c.

Calomel, 5 grammes, absolute Creosote and Camphoric Acid (Creo Camph) of each equal parts, 20 c.c., Palmitic Basis to 100 c.c.

As a basis for Calomel in Syphilis, Dr. Allaire ('Nouveaux Remèdes') recommends Palm Oil. It does not become rancid, easily saponifies in the body, and is readily absorbed. A little Guaiacaloid (a combination in 100 c.c. of Guaiacal and Camphor) is added to the injection—*C D* '07, 114.

OLEUM CINEREUM (Grey Oil)—White Vaseline, 2.5, Mercury Ointment, 1, Mercury, 19.5, triturate in a warm mortar until the Mercury is incorporated, then add White Vaseline, 7, Liquid Vaseline, 20. All by weight.

This preparation contains 40 p.c. of Mercury—*P J* (3) xix 704.

For hypodermic injection in syphilis. **Dose**—1 to 2 minims—*B M J* '88, 1250; *J G* 95.

A modification of this Oil is Mercury, 1, Tincture of Iodine, 2, Carbolic Oil (2 p.c.), and Olive Oil 10 minims used—*B M J* '98, 1485.

Mercury, 40, Wool Fat, 10, Liquid Paraffin, *q.s.* to produce (by weight) 100. **Dose**—1 to 2 minims—*B P C*.

The following is in the *Fr. Codex* (1908) under the title of

Huile Gise. Purified Mercury, 40, anhydrous Lanolin, 26 Vaseline Oil (Huile de Vaseline médicale), 60. The Lanolin and the Vaseline Oil are sterilised separately in glass flasks in an autoclave at 120° C (248° F) for 20 minutes. A pestle and mortar are sterilised by means of burning Alcohol, and placed therein are the Mercury, and then the Wool Fat. The metallic particles are triturated until they are extinguished, and then the Liquid Paraffin is added in small portions. The product should measure 100 c.c., and therefore contains almost exactly 40 p.c. of Mercury per c.c., or 40 p.c. w/v, and should be transferred to phials of two, five, and ten c.c. capacity previously sterilised at 120° C (248° F).

PILULA HYDRARGYRI CUM OPIO—Mercury Pill Mass, 5 grains, Opium, in powder $\frac{1}{2}$ grain—*St. Thomass*.

This has been incorporated in the *B P C*.

Mercurial Pill to $3\frac{1}{2}$ grains, Opium, in powder, $\frac{1}{2}$ grain—*Guy's*.

Mercury Pill, 5 grains, Opium, in powder, $\frac{1}{2}$ grain—*University* (No 3) and *London Ophthalmic*.

PILULA HYDRARGYRI CUM RHEO.—Mercury Pill Mass, $2\frac{1}{2}$ grains, Compound Rhubarb Pill Mass, $2\frac{1}{2}$ grains—*St. Thomas's* and *London Ophthalmic* and *King's*.

This has been incorporated in the *B P C*.

SUPPOSITORIA HYDRARGYRI—Mercury Ointment, 5 grains, Oil of Theobroma, 10 grains, in each suppository.

make $1\frac{1}{2}$ fl oz, and add 160 minims of strong solution of Ammonia diluted with Liniment of Camphor to 1 fl oz
(1 Ointment in 3, or 1 of Mercury in 6)

A stimulating Liniment, applied is in absorbent to swollen joints, or placed with Lint in the sinu pits, or rubbed into the abdominal wall in tubercular peritonitis

PILULA HYDRARGYRI **MERCURY PILLS** *B P Sgr* — **BLU PILL**

2 (by weight) of Mercury intimately mixed with 3 of Confection of Roses, and finally with 1 of powdered Liquorice Root (1 in 3)

8 commercial samples examined contained 28 to 41 p.c. of Mercury, and little or no Oxide, 5 of the 8 samples were impure with Confection of Hips — *P J* (3) vi 230

Dose — 4 to 8 grains = 0.26 to 0.53 gramme

Foreign Pharmacopœias — Official in *B P*, *Pilulas Mercuriellæ* Simplex, *Jap*, *Mex*, *Pilulas Azules*, *Port*, *Pilulas Mercuriales*, *Swed*, *Pilula Hydrargyri*, *US*, *Massæ Hydrargyri*, all 1 in 3. Not in the others

UNGUENTUM HYDRARGYRI **MERCURY OINTMENT**

Mercury (by weight), 16, Lard, 16, Prepared Suet, 1

(nearly 1 in 2)

Official Preparations — Used in the preparation of Linimentum Hydrargyri and Unguentum Hydrargyri Compositum

Foreign Pharmacopœias — Official in *Austr*, *Belg*, *Dan*, *Den*, *Span* (*Pomada Mercurialis*), 9 in 10, *Fr*, *Ital* (*Pomata Mercurialis*), *Mex* (*Unguento de Mercurio Doble*), *Port* and *US*, 1 in 2, *Fr* also *Pomade Mercurielle Faible*, 1 in 8, *Ger*, *Hung*, *Jap*, *Russ*, *Swed* and *Swiss* (*Ung Hydr Cinei*), 1 in 3. *Span* has also *Pomada Mercurialis Simple*, 8 in 20

The Brussels Conference adopted a strength of 80 p.c. for Unguentum Hydrargyri

Mercury, 50, Oleate of Mercury, 2, Suet, 3, Benzomated Lard, 25 — *US*

UNGUENTUM HYDRARGYRI COMPOSITUM **COMPOUND MERCURY OINTMENT**

Mercury Ointment, 10, Yellow Beeswax, 6, Olive Oil (by weight), 6, Camphor, in flowers, 3. Mix the Beeswax, Olive Oil, and Mercury Ointment with the aid of heat, add the Camphor, triturate until cold
(1 Mercury in 5)

Contains rather less Mercury Ointment than *B P* '85, and the manipulation is modified, as previously suggested in the *Companion*

This is Scott's celebrated absorbent Ointment (*Scott's dressing*), the Soap Cerate being replaced by the Oil and Beeswax

It is an admirable Ointment to apply to chronic joint enlargements

Not Official

MERCURY PLASTER MULL (*Unna*) — Containing 1 grain = 0.06 gramme of Mercury to the square inch

MERCURY AND CARBOLIC PLASTER MULL (*Unna*) — Containing 1 grain = 0.06 gramme of Mercury and $\frac{3}{4}$ gr in = 0.02 gramme of Carbolic Acid to the square inch

MERCURIAL CREAM (*Squire*) — Pure re-distilled Mercury, by weight, 48 grains, sterilised anhydrous Lanolin, by weight, 240 grains, pure sterilised Olive Oil, $\frac{1}{2}$ ss to produce 1 fl oz

10 minims = 1 grain of pure metallic Mercury

Dose.—10 minims = 0.6 c.c. by intramuscular injection. The preparation recommended by Dr Julius Althaus, in his paper before the International Medical Congress at its Berlin meeting in 1890, is of 1 part of metallic Mercury, thoroughly rubbed up with 4 parts of anhydrous Lanolin, and then mixed with 5 parts of emulsified oil of 2 per cent strength, 10 minims of the resultant grey cream contained 1 grain of metallic Mercury. Lang's formula, published in 1888, is the original principle of the process, namely the minute sub-division of metallic Mercury by means of Lanolin, and the thinning of the mixture with Olive Oil.

The following formula is given (*B M J* '03, 1258) by Colonel F. J. Lambkin, R.A.M.C.—Mercury, 2 drms, anhydrous Lanolin, 2 drms by weight, Parement, 4 drms, Carbolic Acid, 2 p.c., by measure.

Dose—5 to 10 minims once a week as an intramuscular injection.

The two under-mentioned formulas are given by Colonel F. J. Lambkin, R.A.M.C., in 1907, 1144.

Mercury, 10 grammes, absolute Croosote and Camphoric Acid (Croo-Camph.) of each equal parts, 20 c.c., Palmistia Basis to 100 c.c.

Calomel, 5 grammes, absolute Croosote and Camphoric Acid (Croo-Camph.) of each equal parts, 20 c.c., Palmistia Basis to 100 c.c.

As a basis for the preparation used in Syphilis, Dr Allaire ('Nouveaux Remèdes') recommends a mixture prepared from palm oil. It does not become rancid, easily separates from the body, and is readily absorbed. A little Guaiacoloid (a combination in molecular proportion of Guaiacol and Camphor) is added to the injection.—*C D*, '07, 1141.

OLEUM CINEREUM (Grey Oil).—White Vaseline, 2.5, Mercury Ointment, 1, Mercury, 19.5, triturate in a warm mortar until the Mercury is incorporated, then add White Vaseline, 7, Liquid Vaseline, 20. All by weight.

This preparation contains 40 p.c. of Mercury.—*P J* (3) 701.

For hypodermic injection in Syphilis. **Dose**—1 to 2 minims.—*B M J*, '88, 1296, 774.

A modification of the above Oil, is Mercury, 1, Lanolin anhydrous, 2, Carbolic Oil (2 p.c.), 1, all by weight. 10 minims used for each injection.—*B M J* '98, 1485.

Mercury, 40, Wool Fat, 10, Liquid Paraffin, 95 to produce (by weight) 100.

Dose—1 to 2 minims.—*B P C*.

The following formula appears in the *Ph Codex* (1908) under the title of

Huile Grise—Purified Mercury, 40, anhydrous Lanolin, 26, Vaseline Oil (Huile de Vaseline medicinale), 60. The Lanolin and the Vaseline Oil are sterilised separately in glass flasks in an autoclave at 120° C. (248° F.) for 20 minutes. A pestle and mortar are sterilised by means of boiling alcohol, and placed therein are the Mercury, and then the Wool Fat. The anhydrous Lanolin is triturated until they are extinguished, and then the Liquid Paraffin is added in small portions. The product should be transferred to phials and measure 100 c.c., and therefore contains almost exactly 40 centigrammes of Mercury per c.c., or 40 p.c. w/v, and should be transferred immediately to phials of two, five, and ten c.c. capacity previously sterilised at 180° C. (356° F.).

PILULA HYDRARGYRI CUM OPIO—Mercury Pill Mass, 5 grains, Opium, in powder, $\frac{1}{2}$ grain.—*St. Thomas's*.

This has been incorporated in the *B P C*.

Mercurial Pill to 3½ grains, Opium, in powder, $\frac{1}{2}$ grain.—*London Ophthalmic*.

Mercury Pill, 5 grains; Opium, in powder, $\frac{1}{2}$ grain.—*London Ophthalmic* (No 8) and *London Ophthalmic*.

PILULA HYDRARGYRI CUM RHEO.—Mercury Pill Mass, 2½ grains, Compound Rhubarb Pill Mass, 2½ grains.—*St. Thomas's* and *London Ophthalmic* and *King's*.

This has been incorporated in the *B P C*.

SUPPOSITORIA HYDRARGYRI—Mercury Ointment, 5 grains, Oil of Theobroma, 10 grains, in each suppository.

Dose—10 minims = 0.6 c.c. by intramuscular injection. The preparation recommended by Dr Julius Althaus, in his paper before the International Medical Congress at its Berlin meeting in 1890, consisted of 1 part of metallic Mercury, thoroughly rubbed up with 4 parts of purest Lanolin, and then mixed with 5 parts of carbolic oil of 2 p.c. strength, 10 minims of the resultant grey cream contained 1 grain of metallic Mercury. Lang's formula, published in 1888, suggested the original principle of the process, namely the minute subdivision of the metallic Mercury by means of Lanolin, and the thinning of the emulsion with Olive Oil.

The following formula is given (*B. M. J.* '03, i 125) by Colonel F. J. Lambkin, R. A. M. C.—Mercury, 2 drim, anhydrous Lanolin, 2 drim by weight, Paroleine, 4 drim, Carbolic Acid, 2 p.c., by measure.

Dose—5 to 10 minims once a week as an intramuscular injection.

The two under-mentioned formulas are given by Colonel F. J. Lambkin, R. A. M. C., in *L.* '07, ii 11.

Mercury, 10 grammes, absolute Creosote and Camphoric Acid (Creo-Camph.) of each equal parts, 20 c.c., Palmistil Basis to 100 c.c.

Calomel, 5 grammes, absolute Creosote and Camphoric Acid (Creo-Camph.) of each equal parts, 20 c.c., Palmistil Basis to 100 c.c.

As a basis for Calomel Injection used in Syphilis, Dr Allaire ('Nouveaux Remèdes') recommends a mixture prepared from palm oil. It does not become rancid, easily saponifies in the body, and is readily absorbed. A little Guanacolid (a combination in molecular proportions of Guanacol and Camphor) is added to the injection.—*C. D.* '07, ii 111.

OLEUM CINEREUM (Grey Oil)—White Vaseline, 25, Mercury Ointment, 1, Mercury, 195, triturate in a warm mortar until the Mercury is incorporated, then add White Vaseline, 7, Liquid Vaseline, 20. All by weight.

This preparation contains 40 p.c. of Mercury.—*P. J.* (3) ix 704.

For hypodermic injection in syphilis. **Dose**—1 to 2 minims.—*B. M. J.* '88, i 1296, *T. G.* '94, 414.

A modification of Grey Oil, is Mercury, 1, Lanolin anhydrous, 2, Carbolic Oil (2 p.c.), 1, all by weight. 10 minims used for each injection.—*B. M. J.* '98, i 485.

Mercury, 40, Wool Fat, 10, Liquid Paraffin, *q. s.* to produce (by weight) 100. **Dose**—1 to 2 minims.—*B. P. C.*

The following formula appears in the *Fr. Codex* (1908) under the title of

Huile Grise—Purified Mercury, 40, anhydrous Lanolin, 26, Vaseline Oil (Huile de Vaseline medicinale), 60. The Lanolin and the Vaseline Oil are sterilised separately in glass flasks in an autoclave at 120° C (248° F) for 20 minutes. A pestle and mortar are sterilised by means of burning Alcohol, and placed therein are the Mercury, and then the Wool Fat. The metallic particles are triturated until they are extinguished, and then the Liquid Paraffin is added in small portions. The product should weigh 126 grammes, and measure 100 c.c., and therefore contains almost exactly 40 centigrammes of Mercury per c.c., or 40 p.c. w/v, and should be transferred immediately to phials of two, five, and ten c.c. capacity previously sterilised at 180° C (356° F).

PILULA HYDRARGYRI CUM OPIO—Mercury Pill Mass, 5 grains, Opium, in powder, $\frac{1}{2}$ grain.—*St. Thomas's*.

This has been incorporated in the *B. P. C.*

Mercurial Pill to $3\frac{1}{2}$ grains, Opium, in powder, $\frac{1}{2}$ grain.—*Guy's*.

Mercury Pill, 5 grains, Opium, in powder, $\frac{1}{2}$ grain.—*University* (No. 8) and *London Ophthalmic*.

PILULA HYDRARGYRI CUM RHEO—Mercury Pill Mass, $2\frac{1}{2}$ grains, Compound Rhubarb Pill Mass, $2\frac{1}{2}$ grains.—*St. Thomas's* and *London Ophthalmic* and *King's*.

This has been incorporated in the *B. P. C.*

SUPPOSITORIA HYDRARGYRI.—Mercury Ointment, 5 grains, Oil of Theobroma, 10 grains, in each suppository.

Dose.—10 minims = 0.6 cc by intramuscular injection. The preparation recommended by Dr. Julius Althaus, in his paper before the International Medical Congress at its Berlin meeting in 1890, consisted of 1 part of metallic Mercury, thoroughly rubbed up with 4 parts of purest Lanolin, and then mixed with 5 parts of carbolised oil of 2 per cent strength, 10 minims of the resultant given cream contained 1 grain of metallic Mercury. Lang's formula, published in 1892, the original principle of the process, namely the minute subcutaneous injection of metallic Mercury by means of Lanolin, and the thinning of the

The following formula is given by R A M C—Mercury, 2 dm, 1.1, R 71 '03, 1258) by Colonel F J Lambkin, 4 dm; Carbolic Acid, 2 p c, by 1.1, Lanolin, 2 dm by weight, Paroleine,

SUPPOSITORIA HYDRARGYRI Mercury Ointment, 5 grains, Oil of
Theobroma, 10 grains, in each suppository

Dose—10 minims = 0.6 c.c. by intramuscular injection. The preparation recommended by Dr Julius Althaus, in his paper before the International Medical Congress at its Berlin meeting in 1890, consisted of 1 part of metallic Mercury, thoroughly rubbed up with 4 parts of purest Lanolin, and then mixed with 5 parts of carbolic oil of 2% strength, 10 minims of the resultant grey cream contained 1 grain of metallic Mercury. Lang's formula, published in 1888, suggested the original principle of the process, namely the minute sub-division of the metallic Mercury by means of Olive Oil, and the thinning of the emulsion with Olive Oil.

The following formula is given by *B M J* '03, 1 1258 by Colonel F J Lambkin, R A M C—Mercury, 2 drms, anhydrous Lanolin, 2 drms by weight, Paroleine, 4 drms, Carbolic Acid, 2 p.c., by measure.

Dose—5 to 10 minims once a week as an intramuscular injection.

The two under mentioned formulas are given by Colonel F J Lambkin, R A M C, in *L* '07, 11 14.

Mercury, 10 grammes absolute, Creosote and Camphoric Acid (Creo Camph) of each equal parts, 20 c.c., Palmolive Basis to 100 c.c.

Calomel, 5 grammes, absolute, Creosote and Camphoric Acid (Creo Camph) of each equal parts, 20 c.c., Palmolive Basis to 100 c.c.

As a basis for Carbolic Injection, used in Syphilis, Dr Allaire ('Nouveaux Remèdes') recommends minute quantities of palm oil. It does not become rancid, easily saponifies in the body, and is readily absorbed. A little Guaiacolid (a combination in molecular proportions of Guaiacol and Camphor) is added to the injection—*C D* '07, 11 411.

OLEUM CINEREUM (Grey Oil)—White Vaseline, 2.5, Mercury Ointment, 1, Mercury, 19.5, triturate in a warm mortar until the Mercury is incorporated, then add White Vaseline, 2.5, 7, Liquid Vaseline, 20. All by weight.

This preparation contains 40 p.c. of Mercury—*P J* (3) xix 704. For hypodermic injection in syphilis. **Dose**—1 to 2 minims—*B M J* '88, 1 1296, *T G* '94, 319.

A modification of 'Grey Oil' is 1, Mercury, 1, Lanolin anhydrous, 2, Carbolic Oil (2 p.c.), 1, all by weight. 10 minims used for each injection—*B M J* '98, 1 485.

Mercury, 40, Wool Fat, 10, Liquid Paraffin, *q s* to produce (by weight) 100. **Dose**—1 to 2 minims—*B P C*.

The following formula appears in the *Fr Codex* (1908) under the title of

Huile Grise—Purified Mercury, 50, anhydrous Lanolin, 26, Vaseline Oil (Huile de Vaseline medicinale), 60. The Lanolin and the Vaseline Oil are sterilised separately in glass flasks in autoclave at 120° C (248° F) for 20 minutes. A pestle and mortar are sterilised by means of burning Alcohol, and then placed therein are the Mercury, and the Wool Fat. The metallic particles are triturated until they are extinguished, and then the Liquid Paraffin is added in small portions. The product should weigh 126 grammes, and measure 100 c.c., and therefore contains almost exactly 1 centigrammes of Mercury per c.c., or 40 p.c. w/v, and should be transferred immediately to phials of two, five, and ten c.c. capacity previously sterilised at 100° C (356° F).

PILULA HYDRARGYRI CUM OPIO—Mercury Pill Mass, 5 grains, Opium, in powder, $\frac{1}{2}$ grain—*St Thomas*. This has been incorporated in the *B C*. Mercurial Pill to 32 grains, Opium, in powder, $\frac{1}{2}$ grain—*Guy's*. Mercury Pill, 5 grains, Opium, in powder, $\frac{1}{2}$ grain—*University* (No 3) and *London Ophthalmic*.

PILULA HYDRARGYRI CUM RHEO—Mercury Pill Mass, 2½ grains, Compound Rhubarb Pill Mass, 2½ grains—*St Thomas's* and *London Ophthalmic* and *King's*.

This has been incorporated in the *B C*.

SUPPOSITORIA HYDRARGYRI—Mercury Ointment, 5 grains, Oil of Theobroma, 10 grains, in each suppository.

Dose—10 minims = 0.6 cc by intramuscular injection. The preparation recommended by Dr Julius Althaus, in his paper before the International Medical Congress at its Berlin meeting in 1890, consisted of 1 part of metallic Mercury thoroughly rubbed up with 4 parts of purest Lanolin, and then mixed with 10 parts of carbolic oil of 2 p.c. strength, 10 minims of the resultant grey cream contained 1 gram of metallic Mercury. Lang's formula, introduced in 1888, suggested the original principle of the process, namely the absorption of the metallic Mercury by means of Lanolin, and the thinning of the emulsion with Olive Oil.

R. A. M. C., in L '07, 11 14
2 dim., Carbolic Acid 2 p.c., Lanolin, 2 dim. by weight, Paroelene,

Dose—5 to 10 minims once a week as an intramuscular injection.

The two under-mentioned formulas are given by Colonel F. J. Lambkin, R. A. M. C., in L '07, 11 14.

Mercury, 10 grammes, Carbolic Acid 2 p.c., and Camphoric Acid (Creo-Camph) of each equal parts, 20 cc., to be made up to 100 cc.

Calomel, 5 grammes, absolute Creosote and Camphoric Acid (Creo-Camph) of each equal parts, 20 cc., Palmatine Basis to 100 cc.

As a basis for Calomel Injection used in Syphilis, Dr Allaine (Remedes) recommends Palmatine prepared from palm oil. It does not saponify, easily saponifies in the body, and is readily absorbed. A little (a combination in Guaiacol and Camphor) is added to the injection—C. D. '07, 11 411.

OLEUM CINEREUM (Grey Oil)—White Vaseline, 25, Mercury Ointment, 1, Mercury, 195, triturate in a warm mortar until the Mercury is incorporated, then add White Vaseline, 7, Liquid Vaseline, 20. All by weight.

This preparation contains 40 p.c. of Mercury—P. J. (3) xix 704.

For hypodermic injection in syphilis. **Dose**—1 to 2 minims—B. M. J. '88, 1296, T. G. '94 319.

A more recent form of Grey Oil is Mercury, 1, Lanolin anhydrous 2, Carbolic Oil (2 p.c.) 10 minims used for each injection—B. M. J. 98, 1485.

Mercury, 40, Wool Fat, 10, Liquid Paraffin, 95 to produce (by weight) 100.

Dose—1 to 2 minims—B. P. C.

The following formula appears in the *Fr. Codex* (1908) under the title of

Huile Grise—Purified Mercury, 10, anhydrous Lanolin, 26, Vaseline Oil (Huile de Vaseline medicinale), 60. The Lanolin and the Vaseline Oil are sterilised separately, in glass flasks in an autoclave at 120° C (243° F) for 20 minutes. A pestle and mortar are sterilised by means of burning Alcohol and placed therein are the Mercury and the Wool Fat. The metallic particles are triturated until they are extinguished, and then the Liquid Paraffin is added in small portions. The product should weigh 126 grammes, and measure 100 cc., and therefore contains almost exactly 10 centigrammes of Mercury per cc., or 40 p.c. w/v, and should be tried in a capacity previously sterilised at 120° C (243° F).

PILULA HYDRARGYRI CUM OPIO—Mercury Pill Mass, 5 grains.

Opium in powder, $\frac{1}{2}$ grain—*St. Thomas*.

This has been incorporated in the B. C.

Mercurial Pill to 3 grains Opium 1 grain—*Guy's*.

Mercury Pill, 2 grains Opium, in 10 grains—*University* (No 3) and *London Ophthalmic*.

PILULA HYDRARGYRI CUM HEO.—Mercury Pill Mass, 2½ grains, Compound Rhubarb Pill Mass, 2½ grains—*St. Thomas* and *London Ophthalmic* and *King's*.

This has been incorporated in the B. C.

SUPPOSITORIA HYDRARGYRI—Mercury Ointment, 5 grains, Oil of Theobroma, 10 grains, in each suppository.

UNGUENTUM HYDRARGYRI MITIUS—Mercurial Ointment, 1, Lard, 2 —*P L '86*

This has been incorporated in the *B P C* under the title *Unguentum Hydrargyri Dilutum*

Mercurial Ointment (*U S P*), 67, Petrolatum, 33 —*U S P*

UNGUENTUM CINEREUM—Mercury and Lanolin, of each 1 oz., best Olive Oil, $\frac{1}{2}$ fl oz —*Look*

VASOLIMENTUM HYDRARGYRI—Mercury, 40, Wool Fat, 20, Thick Vasoliment, 60 —*Hager*

Parogenum Hydrargyri Syn Mercury Vasoliment—Mercury, 30, Wool Fat, 15, Thick Parogen, 55 —*B P C*

HYRGOLUM (Colloid Mercury)—Heavy black grains exhibiting a metallic lustre, containing 73 to 80 p c of Mercury, soluble in Water. On account of its freedom from causticity and from irritating properties, it has been suggested as an anti-syphilitic remedy in the form of a 10 p c ointment, or internally in $\frac{1}{2}$ grain dose in pill form —*L '00*, 1450, *B M J '01*, 1551

HYDRARGYRI BENZOAS $\text{Hg}(\text{C}_6\text{H}_5\text{O})_2$, eq 439.06—A white crystalline salt, practically insoluble in Water and in Alcohol (90 p c), but soluble in solutions of the Benzoates of the alkali metals. Has been used in the treatment of syphilis. The hæmostatic effects of intramuscular injections in cases of uterine hæmorrhage are stated to far surpass Ergot (*B M J '04*, 11085)

Mercury Benzoate, Bimodide and Lactate are employed (*M P '05*, 11622) in the treatment of syphilis in daily doses of $\frac{1}{2}$ grain and should be sufficiently diluted (2 c c of Water). Mercury Salicylarsenate and Hermophenyl are generally but little painful in injections in syphilis, and are given in larger doses, *e g*, $\frac{1}{2}$ to 1 grain. Hermophenyl may be employed in larger doses ($1\frac{1}{2}$ grains), but only as a weekly injection.

One centigramme ($\frac{1}{5}$ grain) Benzoate is a small daily dose in the treatment of syphilis, and 2 centigrammes daily for three weeks may be safely given (*M P '06*, 1148). A good formula is Mercury Benzoate, 1 gramme, Sodium Chloride pure, $\frac{1}{2}$ gramme, Distilled Water, 100 grammes.

Six cases of general paralysis and tabes treated by hypodermic injection of 3 centigrammes Mercury Benzoate daily for 15 days alternated by a 15 days' interval —*B M J E '02*, 1187

A suitable solution (*Desessquale and B. etonneau*) for hypodermic injection in syphilis, Mercuric Benzoate, 0.3 gramme, Ammonium Benzoate, 1.5 grammes, Sterilised Distilled Water, to 30 c c —*P J '02*, 1173

Foreign Pharmacopœias—Official in Fr

Tests—Mercuric Benzoate Solution yields the tests distinctive of Mercury given under that substance. With Ferric Chloride T.S. it yields a buff coloured precipitate. When shaken with Water and filtered, the filtrate, when acidified with Nitric Acid, yields no precipitate or turbidity with Silver Nitrate Solution. Another portion of the filtrate, when mixed with an equal volume of Sulphuric Acid, keeping the mixture cool, should yield no brown ring at the junction of the two fluids on the careful addition of Ferrous Sulphate Solution. The Benzoic Acid obtained from the salt should possess the m.p., answer the tests distinctive of Benzoic Acid, and be free from the impurities mentioned under Acidum Benzoicum. 0.5 gramme ignited with free access of air should leave no weighable residue. It contains theoretically 45.3 p c of metallic Mercury.

HYDRARGYRUM CARBOLICUM (Mercury Carbolate, Mercury Phenate) (*Schadek*)—Colourless crystals, or a white powder. Obtained by precipitating an alcoholic Solution of Mercuric Chloride with an alcoholic Solution of Phenol and Potassium Hydroxide, and evaporating nearly to dryness, with subsequent washings.

Nearly insoluble in Water, and soluble with difficulty in cold Alcohol.

Medicinal Properties—Recommended in secondary syphilis —*L '87*, 1943, *L '87*, 11277, *P J (3)* xviii 695.

Dose— $\frac{1}{2}$ to $\frac{1}{4}$ grain = 0.02 to 0.05 gr. 3 or 4 times a day in pill, also hypodermically suspended in M.

Pilula Hydrargyri Carbolicæ—Mercury Carbolate, $\frac{1}{2}$ grain, Extract of Liquorice, 1 grain, Powdered Liquorice, 1 grain, in each pill.

Dose—Two to four pills daily

Hydrargyrol (Mercury Phenol-para-sulphonate)—Brownish-red crystalline scales or crusts. Decomposed by Water with the formation of basic salts. Insoluble in Alcohol (90 p c). Introduced as an antiseptic.

A combination of the above salt with Ammonium Tartrate is known under the name of 'Asterol,' a white or reddish-white micro-crystalline powder, soluble in Water. Introduced as an antiseptic, used in the form of 2 to 5 p c solution.—*B.M.J.E.* '01, ii 64, *P.J.* '99, i 538, '99, ii 216, *C.D.* '01, ii 872

Hermophenyl—A white amorphous solid. Introduced as a disinfectant.—*P.J.* '01, ii 245

HYDRARGYRI CYANIDUM $\text{Hg}(\text{CN})_2$, eq 250.5—Colourless or white prismatic crystals.

It contains theoretically 79.36 p c of metallic Mercury. It should be kept in well-stoppered glass bottles of a dark amber tint in a cool atmosphere and protected as far as possible from the light.

Solubility.—1 in 18 of Water, 1 in 20 of Alcohol (90 p c)

Medicinal Properties—A powerful antiseptic. Used as a local application (5 to 15 grains in 1 fl oz of Water = 0.3 to 1 gramme in 28.4 cc) to syphilitic rashes and sores of the throat, tongue, etc.—*Ringer*

In syphilis.—*P.J.* '95, ii 91 $\frac{1}{2}$ p c solution as an antiseptic.—*P.J.* '96, ii 19.

Subconjunctival and intravenous injections, in the treatment of serous syphilitic disease of the eye.—*B.M.J.* '03, ii 269

A lotion containing 0.25 gramme per 1000 grammes of Water used in acute conjunctivitis.—*M.P.* '05, ii 863

Solutions of the Cyanide or Oxycyanide are used for intravenous injection (*M.P.* '06, i 149), as they do not coagulate the blood. One cc of a solution containing Mercury Cyanide, 1 gramme, Distilled Water, 100 grammes, is injected daily in syphilis. The intravenous injections appear to act very promptly, but the most absolute sepsis must be insisted on.

Dose—Internally $\frac{1}{16}$ to $\frac{1}{8}$ grain = 0.004 to 0.008 gramme

Ph. Ger. maximum single dose, 0.02 gramme, maximum daily dose, 0.06 gramme

Foreign Pharmacopœias—Official in Belg (*Cyanuretum Hydrargyri*), Fr (*Cyanure Mercurique*), Ger, Hung and Russ (*Hydrargyrum Cyanide*), Port (*Cyaneto Mercurico*), Mex. (*Cianuro de Mercurio*)

Tests—Mercuric Cyanide is decomposed on heating into metallic Mercury and Cyanogen gas, which burns with a purple flame. The aqueous solution is neutral in reaction towards Litmus paper. On the addition of Hydrochloric Acid it evolves the characteristic and highly poisonous odour of Hydrocyanic Acid. Neither Potassium Hydroxide Solution nor Ammonium Sulfate Potassium Iodide Solution yields a precipitate. On the addition of Hydrochloric Acid, when the solution behaves in a similar manner to Mercuric Chloride Solution, Hydrocyanic Acid Solution yields a black precipitate soluble in Ammonium Hydroxide Solution and in diluted Nitric Acid, Stannous Chloride Solution yields at first a whitish precipitate of Mercurous salt and subsequently a grey deposit of metallic Mercury. When gently heated with an equal part of Iodine in a dry test-tube it yields in the lower portion of the tube a yellow sublimate subsequently becoming red, and in the upper portion a colourless needle-shaped crystalline deposit.

The more generally occurring impurities are Mercuric Chloride and mineral residue. A delicate test for the former is to add to the 5 p c aqueous solution faintly acidified with Nitric Acid, one or two drops of Silver Nitrate Solution, no precipitate or turbidity should result. A solution of similar strength to the above

Pilula Hydrargyri Carbolicæ—Mercury Carbolate, $\frac{1}{2}$ grain, Extract of Liquorice, 1 grain, Powdered Liquorice, 1 grain, in each pill

Dose—Two to four pills daily

Hydrargyrol (Mercury Phenol para sulphonate)—Brownish red crystalline scales or crusts Decomposed by Water with the formation of basic salts Insoluble in Alcohol (90 p c) Introduced as an antiseptic

A combination of the above salt with Ammonium Tartrate is known under the name of 'Asterol,' a white or reddish white micro crystalline powder, soluble in Water Introduced as an antiseptic, used in the form of 2 to 5 p c solution—*B M J E* '01, 11 64, *P J* '99, 1 588, '99, 11 216, *C D* '01, 11 872

Hermophenyl (Sodium Mercuro-phenol Disulphonate)—A white amorphous powder, readily soluble in Water It contains about 40 p c Mercury Introduced as an antiseptic—*P J* '01, 11 245

HYDRARGYRI CYANIDUM $\text{Hg}(\text{CN})_2$, eq 250.5—Colourless or white prismatic crystals

It contains theoretically 79.86 p c of metallic Mercury It should be kept in well stoppered glass bottles of a dark amber tint in a cool atmosphere and protected as far as possible from the light

Solubility—1 in 13 of Water, 1 in 20 of Alcohol (90 p c)

Medicinal Properties—A powerful antiseptic Used as a local application (5 to 15 grains in 1 fl oz of Water = 0.8 to 1 gramme in 28.4 cc) to syphilitic rashes and sores of the throat, tongue, etc—*Ringer*

Intravenous injection in syphilis—*P J* '95, 11 91 $\frac{1}{2}$ p c solution as an antiseptic in ophthalmic practice—*P J* '96, 11 19

Subconjunctival and intravenous injections, in the treatment of serous syphilitic disease of the eye—*B M J* '03, 11 269

A lotion containing 0.25 gramme per 1000 grammes of Water used in acute conjunctivitis (*M P* '05, 11 303)

Solutions of the Cyanide and Oxycyanide are used for intravenous injection (*M P* '06, 1 149), as they do not coagulate the blood One cc of a solution containing Mercury Cyanide, 1 gramme, Distilled Water, 100 grammes, is injected daily in syphilis The intravenous injections appear to act very promptly, but the most absolute sepsis must be insisted on

Dose—Internally $\frac{1}{16}$ to $\frac{1}{8}$ grain = 0.004 to 0.008 gramme

Ph Ger maximum single dose, 0.02 gramme, maximum daily dose, 0.06 gramme

Foreign Pharmacopœias—Official in Belg (Cyanuretum Hydrargyri), Fr (Cyanure Mercurique), Ger, Hung and Russ (Hydrargyrum Cyanæ), Port (Cyaneto Mercurico), Mex (Cianuro de Mercurio)

Tests—Mercuric Cyanide is decomposed on heating into metallic Mercury and Cyanogen gas, which burns with a purple flame The aqueous solution is neutral in reaction towards Litmus paper, on the addition of Hydrochloric Acid it evolves the characteristic and highly poisonous odour of Hydrogen Cyanide, neither Potassium Hydroxide Solution nor Ammonia Solution yields a precipitate, Potassium Iodide Solution yields no precipitate until after the addition of Hydrochloric Acid, when the solution behaves in a similar manner to Mercuric Chloride Solution, Hydrogen Sulphide Solution yields a black precipitate, insoluble in Ammonium Hydrosulphide Solution and in diluted Nitric Acid, Stannous Chloride Solution yields at first a whitish precipitate of Mercurous salt and subsequently a grey deposit of metallic Mercury When gently heated with an equal part of Iodine in a dry test tube it yields in the lower portion of the tube a yellow sublimate subsequently becoming red, and in the upper portion a colourless needle shaped crystalline deposit

The more generally occurring impurities are Mercuric Chloride and mineral residue A delicate test for the former is to add to the 5 p c aqueous solution faintly acidified with Nitric Acid, one or two drops of Silver Nitrate Solution, no precipitate or turbidity should result A solution of similar strength to the above

should yield no reddish precipitate soluble in an excess of the reagent on the gradual addition of Potassium Iodide solution. Mineral residue is indicated by the ash left when the sample is ignited with free access of air.

Injectio Hydrargyri Cyanidi (Intravenous) —Mercuric Cyanide, 1 p c , inject 20 minims. —*Lot*

Mercury Oxycyanide as an antiseptic, in aqueous solution, 1 in 200 — *B M J E* '95, ii 104, *T G* '96, 405

Mercury Oxycyanide is official in Mex

MERCURY ZINCO-CYANIDE —A product which has been found by Lord Lister to have valuable anti-septic properties. —*P T* (3) xx 653, (3) xxii 769

There is also a gauze prepared with it —*B M J* '89, ii 1025, *L* '89, ii 943
Mercurialism resulting from use of the Cyanide gauze as a dressing —*P J* '96, ii 382

Unguentum Hydrargyri et Zinci Cyanidi —Mercury Zinc Cyanide, 2, 4 or 8 grains, Soft Paraffin, 1 oz —*London Ophthalmic*

HYDRARGYRI ETHYLENEDIAMINE CITRAS (Mercuramine) —A clear, colourless liquid, stated to be a 10 p c aqueous solution of Mercury Citrate containing 4 p c Ethylenediamine

Introduced as an antiseptic —*B M J* '01, ii 85, *P J* '01, ii 142

Under the title of **Sublamin** a combination of Mercury Sulphate and Ethylenediamine has been introduced. A 8 p c solution has been recommended as a disinfectant for the hands —*B M J E* '02, i 56

This salt is stated (*B M J* '05, i 727) not to injure the skin or discolour steel instruments in alcoholic solution. As a 2 in 100 alcoholic solution it gave results in sterilisation of the hand superior to any claimed for other methods, especially with regard to the power of penetration. May be conveniently kept as a 10 p c solution in Alcohol (50 p c)

HYDRARGYRI GALLAS (Mercury Gallate) —A dark grey or greyish-green amorphous powder, insoluble in Water. Is stated to be a more effective antiseptic than the Tannate. Used in syphilis

Dose. — $\frac{1}{2}$ to 1 grain = 0.016 to 0.06 gr., in a pill

HYDRARGYRI NAPHTHOLACETAS —Colourless, needle-shaped crystals, or as a white amorphous powder, insoluble in Water, has been used in syphilis

Dose — $\frac{1}{2}$ to 1 grain = 0.032 to 0.06 gr., in a pill

HYDRARGYRI SALICYLAS ($\text{HgCl}_2 \cdot \text{H}_2\text{O}$, eq 333.81) —A white or whitish amorphous odourless powder, practically insoluble in Water, and in Alcohol (90 p c). It is insoluble in 5 p c of metallic Mercury. It is soluble in Potassium or Sodium Hydroxide solution with the production of double salts. It is not dissolved in the cold by halogen compounds of the alkali metals, but dissolves on warming and when the solution cools double salts crystallise out.

Employed internally and by hypodermic injection, also as a dusting powder, in syphilis. Is stated to be as powerful a skin antiseptic as corrosive sublimate. An injection of 0.05 grammes recommended —*B M J* '04, ii 69 in tables

Intramuscular injection or Mercury Salicylate, 5, Liquid Paraffin, 50, one Pravaz syringe-full in syphilis —*B M J* '09, i 122

Maximum single dose, 0.02 grammes maximum daily dose, 0.06 grammes

In a large number of cases of syphilis intramuscular injections of 1 c c of the following emulsion Mercury Salicylate M 1, Liquid Paraffin, 10. Injections once a week, and not more than six injections, followed by an interval of rest of about a couple of months —*B M J* '04, i 609, ii 816

Foreign Pharmacopœias —Official in Ger, Jap, Mex, Russ, Swed and Swiss

Tests —Mercuric Salicylate does not answer the tests distinctive of Mercuric salts. It yields no precipitate with Hydrogen Sulphide or Ammonium Hydro-sulphide. It is decomposed by concentrated Hydrochloric, Nitric, and Sulphuric Acids, the solutions then yielding the distinctive tests given under Mercury. It yields a sublimate of metallic Mercury when heated in a dry

test tube A saturated aqueous solution yields with Ferric Chloride T S a violet coloration The method adopted by the *PG* for the determination of the Mercury is to mix a weighed quantity of 0.3 gramme with ten times its weight of Sodium Chloride and to dissolve the mixture in 100 c.c. of boiling Water, diluting the resulting solution to 400 c.c. The solution when slightly acidified with Hydrochloric Acid shall yield when completely precipitated with Hydrogen Sulphide 0.2 gramme of Mercuric Sulphide corresponding to 57.4 p.c. of metallic Mercury and 96.4 p.c. of pure Mercuric Salicylate An alternative method is to dissolve the salt in 8.5 c.c. of Nitric Acid and 13 c.c. of Hydrochloric Acid, evaporate to dryness, the residue is rendered acid with Hydrochloric Acid dissolved in Water, filtered, and the filtrate precipitated with Hydrogen Sulphide

The more generally occurring impurities are free Salicylic Acid and Sodium Salicylate The former may be detected by the marked acid reaction of the salt towards a piece of moistened blue Litmus paper, the latter by any residue remaining when the specimen is ignited with free access of air

HYDRARGYRI SUCCINIMIDUM ($\text{Hg}(\text{C}_4\text{H}_4\text{O}_2\text{N})_2$, eq 398.48) — White crystalline powder, soluble in Water It should be kept in well-closed glass bottles of a dark amber tint and protected as far as possible from the light It contains theoretically 50.5 p.c. w/w. of metallic Mercury Its solutions are stated not to precipitate albumen, and are therefore useful for hypodermic use Used as a solution of Mercury Succinimide, 38.2 grains, Cocaine Hydrochloride, 15.1 grains, Distilled Water, 775 grains — *L* '02, 1712

The use of Cocaine Nitrate in place of the Hydrochloride would avoid the precipitation of Calomel
